DEDICATION

I dedicated this project to the King of Kings and Lord of Lords, the Almighty God, who has seen me through my course of study. Furthermore, to my parents and friends who because of their love for education for me, put in all they can to get me educated.

ACKNOWLEDGEMENT

I wish to express my gratitude and deep appreciation to my supervisor Engr Oritola for the wonderful, careful supervision, invaluable assistance and encouragement received in making this project work a reality.

I am particularly indebted to my project supervisor, Engr Oritola S.F who, despite his tight schedule, took pain to go through the manuscript and offered useful suggestions at all stages of this project report

My special thanks goes to the head of department Engr Prof S. Sadiku, Dr Sudo [PGD Coordinator] all lecturers and members Mr P.N Ndoke, Engr Alhassan, Engr Kudu, Mr Saidu, Engr James, Engr [Dr] O D Jimoh, Engr Abudullar, Mallam Sule A, their humble guidance, encouragement and assistance towards sharpening the pen of my mind and making this project possible.

I deem it imperative to express my heart felt appreciation to my parent's Mr & Mrs Samson Agunbiade, my lovely wife' Olanike Samson, my precious daughter Oluwaferanmi Samson, lastly my brother and sister Ariyo Samson, Kayode Samson, Mary Samson, for their moral assistance which enable me to carry out the project work easily.

Finally, to the great I am that I am for his continually sustenance and guidance.

ABSTRACT

This project covers the analysis, design and detailing of proposed 4 units of 3 bedroom maisonette at Logokoma satellite town of Abuja, the project was prepared based on the standard and principle set out by the structural use of concrete B58110 parts 1, 2 and 3 to achieve the desired objectives. The roof members, Beams slabs, stair - case, column and the foundations were analyzed and designed in accordance to B58110. The results were used to produce simple and neat structural detailed drawing to ease estimation and construction of the proposed project.

CHAPTER TWO

2. LITERATURE REVIEW

As the title of the project is structural design of two storey residential building {4 unit of 3 bedroom maisonette}. It will be important to discuss prehistory residential building, types of residential building known up to date.

2.1 PREHISTORIC RESIDENTIAL BUILDING

Years ago, early man lived on mountains, in caves for protection against Unfriendly weather, early detection of enemies and defense of war.

Those who choose to live on mountains suffered hot scorching of Sunlight and cold experienced after heavy rainfall because of lack of coverage. Others living in Cave suffered hotness of cave in day and night tirre because some of the cave had no vent or opening to provide ventilation.

After peace reigned for several years, early man decided to build a structure that has a roof and wall [like cave] and opening to allow fresh air [ventilation] into the structure. The modern types of building today originated from the erection of tall, old historic buildings of the early man.

2.2 TYPES OF RESIDENTIAL BUILDING

- (1) BUNGALOW; is a type of modern residential building constructed on one level, that is very wide but not very deep from front to back and has a roof that is very flat without stairs or suspended slab.
- (2) DUPLEX; is a type of modern residential building constructed into two separate homes having stairs and apartments with rooms on two floors.
- (3) STOREY BUILDING; is a type of residential building constructed into levels of floors ranging from 2 to 10 with stairs usually with one major entrance.

(4) MAISONNETTE; is a type of storey building constructed into apartment with a rooms on two or three floors within and usually with a separate entrance.

2. DESIGN LITERATURE REVIEW

It is important to note that steel and concrete structural member are among the commonly used material in building and construction industries. The design of an engineering structure must ensure that

- (1) Under the worst loading, the structure is safe.
- (2) During normal working condition, the deformation of the member does not detract from the appearance, durability or performance of the structure. Despite the difficulty in assessing the precise loading and variation in the strength of the concrete and steel, this requirement must be met.

Three basic methods using factors of safety to achieve safe, workable structure have been developed and they are

- (a) The permissible stress method; which ultimate strength of the material are divided by factor of safety to provide design stress which are usually within the elastic range
- (b) The load factor method; which the working loads are multiplied by a factor of safety
- (c) The limit state method; which multiplies the working loads by partial factor of safety and also divides the material ultimate strength by further partial factor of safety.

Construction structural members are;

- (1) Roof trusses member carries lateral load and is compose of strut and ties which is transfer to roof beam
- (2) Beam is a member carrying lateral load in bending and shearing which is transfer to the column.
- (3) Column is a member carrying axial load in compression and is often subjected to bending also transfer the entire load of structure to the foundation.
- (4) Foundation transfer load from the super structure to sup structure or stable soil in efficient uniform manner.

2.4 DESIGN METHOD

The limit state method of design is used in this project work, because the design method overcomes many of the disadvantages and inconsistencies of the two methods discussed earlier. Limit state method, the design of each individual member or section of a member must satisfy two separate criteria of

- * The ultimate limit state which ensure that the probability of failure is acceptably low
- * The limit state of serviceability which ensure satisfactory behavior under service (i.e working) load. The principal criteria relating to serviceability are the prevention of excessive vibration, but with certain types of structure and in special circumstances. Other limit state criteria may have to be considered are fatigue, durability and fire resistance.

2.5 DESIGN CODES AND STANDARDS

The project work is done to satisfy the requirement of the B.S 8110; PART 1; 1997, and PART 2; 1995 standard use of concrete.

2.6 DESIGN STRESSES

The project work is concerned with two material namely; concrete and rbd reinforcement (steel). The steel is either mild steel, round bar (R-bar) or high Yild steel (high tensile) bars (Y-bar). Concrete characteristic strength, f_{cu} section 3.1.2 of B.S 8110 of standard specified minimum of grade 25 ($f_{cu}=25 \text{ N/mm}^2$) or reinforced concrete. Characteristic strength of reinforcement are given in B.S 4449, BS 4461 and BS 4483. For mild steel round bars, the characteristic strength is 250 N/mm^2 while for high tensile bar is 460 N/mm^2 . Experience has shown, however, that a value of 410 N/mm^2 is the most appropriate of high tensile bars in this country.

2.7 CONCRETE AND REINFORCEMENT

Concrete is a composite inert material comprising of a binder course e.g cement and mineral filler (body) or aggregate and water. There are basically two types of concrete, viz

- * Dense concrete, is the common form of concrete for reinforced concrete work and the average density is 2400 kg/m^3
- * Light weight concrete can be defined as those weighing less than 1920 kg/m^3 and are made in densities down to about 160 kg/m^3

REINFORCEMENT

Section 7, of BS 8110; part 1, specifies that reinforcement should comply with BS 4449, BS 4462 or BS 4483 and that different types of reinforcement may be used in the same structural member. Hence, for a beam, the main reinforcement might be high yield bars while mild steel bars are used for the links,

CHAPTER THREE

3.1 LOADING

The load on a structure is divided into two ways; dead load and live/imposed load.

3.1.1 DEAD LOAD

Dead load is the load of constant magnitude and that is acting permanently on the structure, including self weight.

3.1.3 LIVE/IMPOSED LOAD

Imposed loads are all the loads without constant magnitude and position of acting e.g man

3.1.3 WIND LOAD

This is the load due to forces been exerted on the structure as a result of wind action. Although, the wind load is an imposed load, it is kept in a separate category when its partial factors of safety are specified. And when the load combinations on the structure are being considered.

3.1.4

FACTOR OF SAFETY AND LOAD COMBINATION

Various combinations of the characteristic values of dead load G_k , imposed load Q_k , wind load and their partial factor of safety must be considered for the loading of the structure. The partial factors of safety specified by BS 8110 and for the ultimate limit state. The loading combinations are

Dead and imposed load = $1.4G_k + 1.6Q_k$

Dead and wind load = $1.0G_k + 1.4W_k$

Dead, imposed and wind load = $1.2G_k + 1.2Q_k + 1.2W_k$

The partial factor of safety specified by BS 8110 and for the serviceability limit state, the load combination is usually $\gamma_f 1.0$ applied to all load combination.

3.2 ROOF DESIGN

MOMENT ON COLUMNS

COLUMN 1

Roof level moment

$$M_{x-x}=6.06\text{KNm} \quad M_{y-y}=15.61\text{KNm}$$

BS81 10

$$K_{col}=71.191$$

$$L \quad K_{Beam}=3417+284.8=626.5$$

$$M_{col[x-x]}=[6.06 \times 71.191] / [71.191 + 626.5]$$

$$= 1.62\text{KNm}$$

$$M_{col[y-y]}=0.62 \times 15.61 / 16.06$$

$$= 1.98\text{KNm}$$

Second floor level

$$M_{x-x}=15.58\text{KNm} \quad M_{y-y}=71.57\text{KNm}$$

$$K_{col}=71.191, 67.801$$

$$K_{beam}=1322, 1168$$

Moment on foot of column

$$M_{col[x-x]}=$$

$$[15.58 \times 71.191] / [71.191 + 61.8 + 1322 + 1168]$$

$$= 1.42\text{KNm}$$

Moment on top of column

$$M_{col[y-y]}=0.42 \times 67.801 / 171.191$$

$$= 1.4\text{KNm}$$

First floor level

In the x-x direction moment on foot and top of column are the same

$$M_{col[x-x]}=$$

$$15.58 \times 67.801 / [67.801 + 61.80 + 1322 + 1158]$$

$$= 1.34\text{KNm}$$

Moment in y-y direction

Mt on roof of col second floor

$$M=0.42 \times 71.57 / 15.58 = 1.93\text{KNm}$$

$$\text{Others} = 1.34 \times 71.57 / 15.58 = 1.56\text{KNm}$$

According to the standard, design moment on column

$$M=0.4M_1+0.6M_2$$

M₁ is the smaller of the two moment

M₂ is the higher foot and top

BS8 10

$$\begin{aligned} 2nd\ roof\ M_{xx} &= 0.4 \times 1.62 + 0.6 \times 1.42 \\ &= 1.492\text{KNm} \end{aligned}$$

$$\begin{aligned} M_{yy} &= 0.4 \times 1.6 + 0.6 \times 1.56 \\ &= 1.58\text{KNm} \end{aligned}$$

$$1st_2nd\ M_{xx} = M_{yy}$$

$$0.4 \times 1.4 + 0.6 \times 1.34 = 1.364\text{KNm}$$

COLUMN 2

This is a truly central column in which all the opposite beams have their moments balancing out

The design summary

	M[x-x]	1.4	1.422	1.34

4.1.3 DESIGN OF FOUNDATION

Based on the column with similar loadings, the following foundations basis are design as representative being the most critical in each group

BS8110
Part 1-2&3
1997

	Base type	Col. No	ID	Loads (KN)	B - classification
Oyenuga V	1	CL 1		433.2	Square Pad
	2	CL2		876.55	Square Pad

DESIGN DATA

$$f_y = 460 \text{ N/mm}^2, \quad f_{cu} = 25 \text{ N/mm}^2$$

$$b = 230 \text{ mm} \quad p_b = 150 \text{ KN/m}^2$$

BASE TYPE-1

$N = 433.2 \text{ KN}$ @ Ultimate limit state

$h = 400 \text{ mm}$

column size = 225×450

$d = 400 - 50 - 10 = 340 \text{ mm}$

For serviceability limit state;

Design axial load = $433.2 / 1.46$

= 296.71 KN

Allowing for 10% of design load as the self weight of the base.

Therefore, self weight of base = $296.71 \times 10\%$ - 29.67 KN

Therefore, total load = $296.71 + 29.67$ = 326.38 KN

Required base area = Axial load / $p_b = 326.38 / 150 = 2.18 \text{ m}^2$

1st_2nd floor level, $N=464.21\text{KN}$

Ground floor-Ist floor $N=876.55\text{KN}$

$$A_{sc} = N - 0.35F_{cu}bh$$
$$0.7F_y - 0.35F_{cu}$$

$$876.55 \times 10^3 - 0.35 \times 25 \times 225 \times 225$$
$$0.7 \times 410 - 0.35 \times 25$$

$$A_{sc} = 1652.68\text{mm}^2$$

Provide 6-y16 bars[1884mm²]
Provide RIO @200mm c/c

Provide 6 y16
RIO @200mm

$$A_{req} = 2.18 \text{ m}^2$$

Provide 1.5 x 1.5 x 0.4 m, (Area = 2.25 m²)

For the ultimate limit state,

$$\text{Design axial load} = 326.38 \text{ kN}$$

$$\text{Earth pressure} = \text{axial load} / \text{area provided} = 326.38 / 2.25 = 145.06 \text{ kN/m}^2$$

BS8110

at the column face, shear stress =

$$\begin{aligned} \text{NICol. Perimeter} \times d &< 0.8 \cdot V / e_u = 326.38 \times 10^3 \\ / 1350 \times 340 &< 0.8 \cdot 25 \\ &= 0.71 < 4 \end{aligned}$$

CHECK FOR PUNCHING SHEAR

Critical perimeter =

$$(\text{column perimeter}) + (8 \times 1.5d)$$

$$= (1350) + (8 \times 1.5 \times 340)$$

$$= 5430 \text{ mm}$$

$$\text{Area within perimeter} = (450 + 3d)^2$$

$$= (450 + 1020)^2$$

$$= 2.2 \times 10^6 \text{ mm}^2$$

Punching Shear force, V =

$$145.06 (\text{Base Area} + \text{Area within per.})$$

$$= 145.06 (1.5 \times 1.5 - 2.2)$$

$$= 7.25 \text{ kN}$$

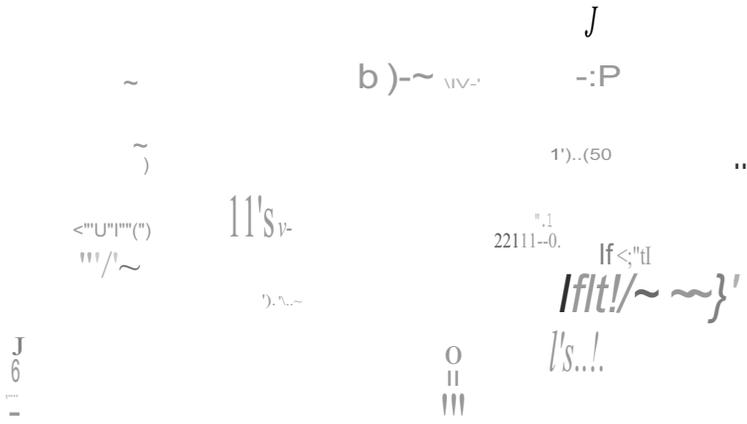

Therefore, punching shear stress, $v = V / \text{perimeter} \times d$

$$= 7.5 \times 10^3 / (1350 \times 340)$$

$$= 0.016 \text{ N/mm}^2$$

Comparing this value with the permissible shear of 0.34 N/mm² of table 3.9 of BS 8110; part 1; 1985 (Assuming the minimum 0.15% steel), shows that the base is safe against punching shear with a depth of 400 mm

BS8110

MOMENT $SI\{EA\}$

$$Wf/;jjl \quad l'$$

Moment

At the column face, span=1.45m
 $M=wL^2/2 = 145.06 \times 1.45^2 / 2 = 152.49\text{KNm}$ per
 mrun

Reinforcement

$$K = M / bd^2 f_{cu} = 152.29 \times 10^6 / 1000 \times 340^2 \times 25$$
$$= 0.053 < 0.156$$
$$Z = 0.94d = 0.94 \times 340 \text{ (from table of lever arm)}$$
$$= 319.6 \text{ mm}$$

BS8110

$$A_s = M / 0.95f_y Z$$
$$= 152.49 \times 10^6 / 0.95 \times 460 \times 319.6$$
$$= 1091 \text{ mm}^2$$

Minimum steel = 0.13%bh

$$0.0013 \times 1000 \times 400 = 520 \text{ mm}^2$$

Provide Y16 @ 150 P bottom ($A_s = 1340 \text{ mm}^2$)

Provide
y16 @150B

FINAL CHECK OF PUNCHING SHEAR

$$100 A_s / bd = 100 \times 1340 / 1000 \times 340 = 0.39$$

$V_c = 0.63 \text{ N/mm}^2$ (by interpolation)

Punch shear stress was 0.016 N/mm^2 ; therefore, a 400mm thick pad is adequate.

SHEAR STRESS

At critical section for shear, 1.0d from the column face.

$$V = 145.06 \times 0.75 = 108.8 \text{ kN}$$

$$N = V / bd = 108.8 \times 10^3 / 10^3 \times 340 = 0.32 \text{ N/mm}^2$$

Therefore, $0.32 \text{ N/mm}^2 < 0.63$

The section is adequate in shear

BASE TYPE - 2

$N = 876.55\text{KN}$ @ Ultimate limit state

$h = 400\text{mm}$

Column size = 450×225

$D = 400 - 50 - 10 = 540\text{mm}$

BS8110

For serviceability limit state;

Design axial load = $876.55 / 1.046$

= 600.37KN

Allowing for 10% of design load as the self weight of the base.

Therefore, self weight of base = $600.3 \times 10\%$
= 60.04KN

Therefore, total load = 660.41KN

Required base area = Axial load / p_b

= $660.41 / 1.50 = 440\text{m}^2$

Provide $2.1 \times 2.1 \times 0.4\text{m}$, (Area $\sim 404\text{m}^2$)

For the ultimate limit state,

Earth pressure =

Design axial load / area provided = $660.41 / 4.41$
= 149.75KN/m^2

At the column face, shear stress

= $N / \text{Col. Perimeter} \times d < 0.8 - 1 f_{cu}$

= $660.41 \times 10^3 / 12 (450 + 225) \times 340 < 0.8 - 125$

= $1044 < 4 \text{ N/mm}^2$

CHECK FOR PUNCHING SHEAR

Critical perimeter = (Column Perimeter) + (8 x 1.5d)

$$= [2(450 + 225) + (8 \times 1.5 \times 340)]$$

$$= 5430 \text{ mm}$$

$$\text{Area within perimeter} = (450 + 3d_i)$$

$$= (450 + 1020)$$

$$= 2.2 \times 10^6 \text{ mm}^2$$

Punching Shear force,

$$V = 149.75 (\text{Base Area} + \text{Area within } p)$$

$$= 149.75 [4.41 - 2.2]$$

$$= 330.95 \text{ kN}$$

BS8110

Punching shear stress $v =$

$$V / (\text{perimeter} \times d)$$

$$= 330.95 \times 10^3 / (5430 \times 340)$$

$$= 0.72 \text{ N/mm}^2$$

Comparing this value with the permissible shear of 0.34 N/mm^2 of table 3.9 of BS 8110; part 1; 1985 (Assuming the maximum 0.15% steel), shows that the base is safe against punching shear with a depth of 400mm

Reinforcement

$$K = M/bd^2 \quad f_{cu} = \\ 363.23 \times 10^6 / 1000 \times 340^2 \times 25 \\ = 0.13 < 0.156$$

$$Z = 0.95d = 0.95 \times 340 \quad (\text{from table of lever arm}) \\ = 323 \text{mm}$$

$$A_s = M / 0.95 f_y Z =$$

$$363.23 \times 10^6 / 0.95 \times 460 \times 323$$

$$= 2573.34 \text{ mm}^2$$

Minimum steel = 0.13%bh

$$0.0013 \times 1000 \times 400 = 520 \text{ mm}^2$$

Provide Y20 @ 125 P bottom ($A_s = 2510 \text{ mm}^2$)

Provide
y20 @125 b

BS8110

FINAL CHECK OF PUNCHING SHEAR

$$100 A_s / bd = 100 \times 2510 / 1000 \times 340 = 0.74$$

$v_c = 0.72 \text{ N/mm}^2$ (by interpolation)

from table

Punch shear stress was 0.72 N/mm^2 ; therefore, a 400mm thick pad is adequate.

SHEAR STRESS

At critical section for shear, 1.0d from the column face.

$$V = 660.41 \times 0.19 = 125.48 \text{ kN}$$

$$v = V / bd = 125.48 \times 10^3 / 1000 \times 340 = 0.36 \text{ N/mm}^2$$

Therefore, $0.36 \text{ N/mm}^2 < 0.72$

The section is adequate in shear

CHAPTER FIVE

5.0 ANALYSIS AND DISCUSSION OF RESULTS

.1 ANALYSIS OF RESULTS

5.1.1 ROOF

The critical dead and impose loads on the roof is 1.5KN/m which is the higher force in the roof members governs the design. This load is acting on member AB and number of trusses is 6

The reaction at AB members is 5.175KN with magnitude of permissible stress of 2.4N/mm^2 and applied stress of 1.82N/mm^2

However, the critical load that governs the design of strut is 12.213KN acting on members. Similarly the uniform moment acting on the roof beam 5.66KNm . provision of $100 \times 50\text{mm}$ strut was made

Meanwhile the effect of wind load was not taken into consideration as the slope angle calculated is $28.3^\circ < 30^\circ$. Satisfy the condition of not determine the wind

5.1.2 TYPICAL FLOOR SLAB

All the slabs are design typically as two - ways spanning slab except the propel cantilever slab spanning 2m as P6, slab with PI having $l_y/l_x = 4.5/4 = 1.13$ and the mid span moment for short and long span of 13.18KNM and 10.18KNM respectively.

Continuous edges have moment of 17.37KNM and 13.48KNM respectively. This implies that the moment in longer direction is move critical than in longer direction. Also slab panel P2 with $l_y/l_x = 5/4 = 1.25$ have mid span moment of 13.48KNM and 8.39KNM continuous edges have moment of 17.67KNM and 11.08KNM hogging respectively which also indicates that the moment in shorter

direction is greater than that in longer direction. This behavior is similar to that of other slab panels while that of cantilever slab is 7.488KNM running through the slab panel as uniform distributed load (udl).

5.1.3 ROOF BEAM

The critical roofbeam - 5 is two-span continuous beam but symmetrical and hence assumed simply supported. It has the maximum span moments 14.60KNM, 47.87KNM and 34.94KNM at span AC, CD and DE respectively while the maximum shear force at each span are; 26.02KN, 22.53KN and 19.31KN for span AC, CD and DE respectively.

However, because the critical beam which is roof beam 5 is nominal reinforcement, other roof beam members are generally taken to be nominal reinforcement

5.1.4 FLOOR BEAMS

Floor beam - 1 is a three-span continuous beam but symmetrical and hence assumed simply supported. The maximum span moments for spans, AC, CD and DE are 171.47KNM, 318.20KNM and 605.90KNM respectively. Shear force and bending moment at supports A, C, D and E are 87.70KN, 284.24KN, 304.46KN, 161.95KN, 0, 91.36KNM, 201.92KNM and 0 respectively.

Floor beam -2 is also a three-span continuous beam having maximum span moments for spans AC, CD, and DE as 218.88KNM, 384.77KNM and 698.02KNM respectively.

The shear force and bending moment at support is such that, at A, C, D and E are 110KN, 349, 8KN, 355.94KN, 185.03KN, 0, 118.35KNM, 234.55KNM, 0 respectively.

imilarly roof beam 3 is a two span continuous beam. The maximum span moments for span 1-4, 4-5, are 188.42KNM and 102.49KNM respectively. Shear forces and bending moment at support, (1), (4), and (5) are; 158.59KNM, 24.89KN, 16~.96KN, 100.44KNM and 0 respectively.

Floor beam - 4 and 7 are typical two-span continuous beam. The maximum span moment that governs the design for span 1-4 and 4-5 are 251.08KNM and 136.56KNM respectively. Shear force and bending moments at support (1), (4) and (5) are 211.32KN, 166.41KN, 155.85KN, 133.84KNM and 0 respectively.

For floor beam - 6 are typical two-span continuous beams having the maximum span moments that governs the design for span respectively. The shear forces and bending moment at support (1), (4) and (5) are 244.23KN, 192.33KN, 180.12KN, 154.68KNM and 0 respectively.

However, the floor beam - 8 also a two-span continuous having the maximum span moments governs the design for span 1-4 and 4-5 as 172.05KNM and 93.44KNM respectively. The shear forces and bending moment at support (1), (4), and (5) are 144.7KN, 113.76KN, 106.64KN; 91.58KNM and 0 respectively.

5.1.5 COLUMNS

Column A1 starts from foundation and extends to the roof floor level. The bi axial loads acting on the column are 84.16KN, 210.62KN, 157.0 KN, 193.55KN respectively. (third floor level to roof level, second floor level to first floor level).

Column C2 is axially loaded and starts from foundation and terminates at roof level. The axial loads acting on the column are 101.986KN, 164.892KN, 227.798KN, and 290.740KN respectively, (third floor level to roof level, second floor level to third floor level, first floor level to second floor level, ground floor level to first floor level to second floor level, ground floor level to first floor level).

column A1 is biaxial and starts from foundation and terminates at roof level. The axial loads and moments acting on the column are 84.16KN, $M_{xx} = 79.00\text{KNM}$, $M_{yy} = 86.42\text{KNM}$ (third floor to roof level), 120.625KN and $M_{xx} = 59.60\text{KNM}$, $M_{yy} = 63.13\text{KNM}$ (first floor to second floor level), 290KN, and $M_{xx} = 59.60\text{KNM}$, $M_{yy} = 63.13\text{KNM}$ (ground floor to first floor level) respectively. Similarly column G1 is also biaxial and starts from foundation and terminates at roof level. The axial loads and moments acting on the column are 96.50KN, $M_{xx} = 91.34\text{KNM}$, $M_{yy} = 91.65\text{KNM}$ (third floor to roof level), 135.182KN, $M_{xx} = 59.60\text{KNM}$, $M_{yy} = 59.80\text{KNM}$ (first floor level to second floor level), 212.54KN, $M_{xx} = 59.60\text{KNM}$, $M_{yy} = 56.80\text{KNM}$ (ground floor level to first floor level) respectively.

5.2.0 DISCUSSION OF RESULTS

It was observed from the above floor analysis that the combination of dead and imposed loads is more critical as the wind load is not considered. This may be as a result of difference in the magnitude of the force acting on the truss. Then, the dead and imposed load is used in the design analysis.

For the analysis of roof beam, it was observed that there is comparatively large difference in moment which may be due to significant difference in span. Therefore, each span was designed separately.

For the floor beams analysis of a continuous beam, the differences in moments may be due to difference in loads as well as in span. While some have a very close span moment value, the latter was used for the design of reinforcement in the span and some are designed separately because of large difference in moment.

However, for the column design, for the axially loaded column, it was observed that the difference in axial loads may be due to the member of floors the incidental beams are carrying. For the biaxial type column. The difference in axial loads may also be due to the member of floor~the incidental beams are carrying.

5.3 CONCLUSIONS AND RECOMMENDATIONS

CONCLUSIONS

A structure is designed to perform a certain function. To perform this function satisfactorily it must have sufficient strength and rigidity. Certain factors must, therefore, be taken into consideration when designing structure of any kind, especially a public structure. These factors are safety, economy, durability, fire resistance etc. It is against this background that all these factors are exclusively and strictly borne in mind when the design aspect of this project thesis was done.

However, detailed structural drawing of various structural elements such as roof, slabs, beams, columns, and foundations were successfully produced for use by the construction team such as contractor responsible for the supply of steel (reinforcement), iron fixer (or bender) quantity surveyor in the production of bill of quantities etc.

Therefore, if this proposed residential building structure given the architectural and structural drawings specifications is translated into physical structure, will stand the test of time.

RECOMMENDATIONS

Although this thesis effectively dealt with the analysis and design of both super and substructures, it does not include detailed analysis of the nature of the soil strata in the project site with a view to determining the bearing capacity of the soil, I therefore, recommend that this area should be greatly improved upon by students willing to do any project work on design of structure of any kind.

The bearing capacity of the soil used for this design was assumed to be $150\text{KN}/\text{m}^2$. For further study, I hereby recommend that adequate soil analysis should be carried out before preliminary assumption of the bearing capacity of the proposed site.

For economical factor, I hereby recommend that the roof design can be carried out using timber material.
