The Port Harcourt Electricity Distribution Company (PHEDC) is one of the most important organizations in Nigeria's energy industry. It distributes power to millions of homes and businesses in the Niger Delta. PHEDC connects the national grid to the people who use it, therefore its performance has a direct effect on the economy, social well-being, and overall energy security in the area. But PHEDC still has a lot of challenges, like unstable energy supply, enormous technical and financial losses, and a lot of energy theft (Ibunge, 2024). Because of this, PHEDC needs to look at options that will last longer. Smart renewable energy systems is one of the best solutions to help Nigeria meet its energy transition goals. This can e achieved by improving service delivery and reducing the country's dependency on fossil fuels.

Smart renewable energy systems are being recognized around the world as the way to distribute electricity in the future. They use renewable energy sources like solar and wind, as well as digital technologies like smart meters, automated grids, and data-driven energy management have improved the quality of lives in many countries that have already adopted it (Abbasi, 2025; Leaders International, 2023). These systems not only make electricity supply steadier and more efficient, they also provide individuals the power to monitor and regulate how much energy they consume. In Nigeria, though, progress in implementing these new technologies has been slow, even with government plans like the Renewable Energy Master Plan (Energy Commission of Nigeria, 2022). Because the goals of the laws do not match up with how things are done in the real world, distribution companies like PHEDC are having a hard time serving the growing demand for energy while keeping costs low and maintaining a healthy environment.

This situation provides opportunity for adjustments to the rules and policies. People have claimed that Nigeria's old energy policies are out of date, focusing so much on quick fixes, and are too spread out (Olujobi et al., 2023; Onuh et al., 2024). Policies that are more flexible and focuses in the future are called innovative reforms. They promote investment in renewable energy, make sure that standards are obeyed, and urge the government, private investors, and distribution companies to work together. The Meter Asset Provider regulation and the National Mass Metering Program (NERC, 2021; NERC, 2024) are two recent measures that show progress in making things more accountable and efficient. But these steps are not adequate on their own. More improvements are needed that will directly support the integration of renewable energy at the distribution level.

The problem is that PHEDC has not yet found a good method to use smart renewable energy systems in its work, even though it is believed that they have a lot of potential. The gap exists because there are no any new, tailored policy changes that link national-level frameworks to the real-world problems in distribution of electricity. Nigeria's legislation set high standards for renewable energy, but companies like PHEDC are still limited because there are no enough institutional support and changes at the distribution end. As a result of this difference between policy and reality, PHEDC is more likely to be inefficient, have disgruntled consumers, and not being able to help Nigeria meet its energy transformation goals.

Most of the current research on Nigeria's renewable energy policy has focused on national strategies and significant institutional challenges (Ajia, 2025; Onuh et al., 2024); however, insufficient attention has been given to the operational dynamics of specific distribution enterprises. Global studies highlight the transformative effects of smart grids and renewable

systems in enabling urban energy transitions (Leaders International, 2023; Yang, 2025); however, there is a lack of research that contextualizes these findings within Nigeria's distribution sector. This gap highlights the need for a more thorough analysis that clearly connects creative policy advances on the operations of PHEDC.

This study seeks to fill the highlighted gap by examining the capacity of innovative policy reforms to improve smart renewable energy systems within PHEDC. The study situates PHEDC's challenges within Nigeria's national policy framework and global renewable energy experiences, providing a context-specific understanding of how policy innovation can enhance distribution efficiency, reduce losses, and support Nigeria's sustainable energy transition.

Objectives of the Study

The main aim of this study is to examine how innovative policy reforms can advance smart renewable energy systems within the Port Harcourt Electricity Distribution Company (PHEDC). The specific objectives are to:

i. Assess the current challenges and opportunities for integrating smart renewable energy systems.
ii. Examine the extent to which existing policy frameworks support or hinder renewable energy adoption.
iii. Propose innovative policy reforms that can enhance PHEDC's capacity to advance smart renewable energy systems and improve electricity distribution efficiency.

Research Questions

i. What are the current challenges and opportunities associated with integrating smart renewable energy systems within the Port Harcourt Electricity Distribution Company (PHEDC)?
ii. To what extent do existing policy frameworks support or hinder renewable energy adoption at the distribution level in PHEDC?
iii. What innovative policy reforms can be proposed to enhance PHEDC's capacity to advance smart renewable energy systems and improve electricity distribution efficiency?

Theoretical Framework

This study integrates technical, social, and institutional aspects of change within a multidisciplinary framework that draws from Energy Transition Theory and Innovation Diffusion Theory.

Energy Transition Theory

Energy transition theory explains how energy systems are changing from ones that rely on fossil fuels to ones that are more sustainable and rely on renewable sources. It knows that changes are hard and that they are affected by things like new technology, changing rules, social and cultural considerations, and global energy governance. The theory suggests that these kinds of changes don't happen in a straight line. Instead, they happen along many distinct paths that are shaped by politics, economics, and the environment (**Sadeghi E.M.** 2019). Germany's Energiewende is an example of how national initiatives combine the usage of renewable energy with larger goals like energy security and sustainability. Kern and Markard (2016) assert that understanding these dynamics requires an interdisciplinary approach, integrating insights from transition studies and social sciences. This theory provides a framework for examining how organizations like PHEDC

might manage risks while facilitating the integration of renewable energy into Nigeria's electrical sector (Loorbach & Verbong, 2012; Yang et al., 2024).

Diffusion of Innovation Theory

Rogers (1962) came up with the Diffusion of Innovations theory, which explains how new ideas and technologies spread across groups of people. It talks about four important things innovation, communication channels, time, and social system that make adoption possible. He stresses that adoption depends on how people see certain traits, such as relative advantage, compatibility, complexity, trialability, and observability. The idea outlines five phases of adoption: awareness, interest, evaluation, trial, and acceptance. This theory elucidates the reasons behind the varying acceptance of smart energy systems among individuals, particularly in the context of renewable energy. PHEDC can establish regulations and communication plans that help renewable technology spread more quickly among individuals and enterprises (Rice, 2011; Hornor, 2022).

Literature Review

Overview of the Electric Power Sector Reform Act (EPSRA, 2005)

The Electric Power Sector Reform Act (EPSRA, 2005) marked the foundation of Nigeria's modern electricity market by unbundling the vertically integrated state utility, the National Electric Power Authority (NEPA), into generation companies (GENCOs), distribution companies (DISCOs), and a transmission company. The Act also created the Nigerian Electricity Regulatory Commission (NERC) to oversee tariffs, licensing, and market regulation (Arowolo & Perez, 2020). Despite its intentions to liberalize the sector and attract private investment, implementation challenges of such as weak governance, regulatory uncertainty, and financial illiquidity of DISCOs have persisted (Olujobi et al., 2023). While the EPSRA provided the legal foundation, many analysts argue that reforms have stalled the growth of PHEDC, necessitating the more recent Electricity Act of 2023 to address persistent inefficiencies (Andersen Nigeria, 2023; PwC Nigeria, 2024).

Global Experiences

The European Union has pioneered comprehensive policies to advance smart grids as a backbone for renewable energy integration. Through initiatives like the Smart Grids Task Force and the EU Strategy for Energy System Integration, the EU aims to digitalize the energy infrastructure, improve system flexibility, and empower consumers via smart meters and energy management services. Significant investments exceeding €580 billion by 2030 are planned for grid digitalization and modernization to support renewable penetration and demand response technologies. The Renewable Energy directive mandates member states to adopt smart and bi-directional technologies, fostering greater renewable self-consumption. Regulatory frameworks also emphasize data protection, interoperability, and consumer rights to ensure smooth digital transition and inclusivity (Interreg Europe, 2024; European Court of Auditors, 2025).

However, India's renewable energy policies increasingly focus on empowering distribution companies (Discoms) to drive renewable integration and smart grid adoption. The government's reforms target on improving Discom financial health and infrastructure modernization under schemes like the Smart Grid Mission and UDAY (Ujwal DISCOM Assurance Yojana). Policies incentive renewable energy sourcing, smart metering roll-out, and demand-side management to enhance grid reliability and reduce losses. India prioritizes decentralized generation and prosumer

models, enabling Discoms to better manage variability and meet ambitious solar and wind capacity targets. Regulatory commissions promote performance-based tariffs encouraging Discoms to innovate in renewable integration and customer engagement (Central Electricity Authority India, 2023; Ministry of Power India, 2024).

On the other hand, South Africa is transitioning from centralized fossil fuel dominance to a more diversified energy mix emphasizing renewables. Policy shifts include the Renewable Energy Independent Power Producer Procurement Programme (REIPPPP), which has successfully attracted private investment in solar and wind. The country's Integrated Resource Plan (IRP) updates reflect commitments to smart grid technologies and grid flexibility to accommodate renewables. Regulatory reforms foster investor confidence, streamline approvals, and promote energy storage and digitalization in distribution networks overseen by Eskom and municipal utilities. The challenges of legacy coal infrastructure and financial strains require policies balancing energy transition urgency with grid stability and economic sustainability (Department of Energy South Africa, 2023; World Bank, 2022).

Innovative Policy Reforms

Nigeria's energy sector is increasingly being called to embrace innovative policy reforms that can fast-track the adoption of renewable energy. While initiatives such as the Renewable Energy Master Plan (REMP), the National Renewable Energy and Energy Efficiency Policy (NREEEP) have laid an important foundation, their impact has been undermined by persistent challenges. These include limited funding, regulatory inefficiencies, weak institutional capacity, policy inconsistencies, and poor enforcement (Okhirebhu et al., 2025; Ajia, 2025). Recent research emphasizes the necessity of developing a more centralized and cohesive regulatory framework to enhance inter-agency collaboration and stimulate private sector investment. Strengthening policies through clearer legal backing, better governance, and targeted financial incentives is therefore essential. At the same time, public-private partnerships, off-grid solar solutions, and geothermal energy are offering Nigeria new ways to obtain energy that are more sustainable and resilient (Ajia, 2025; Okhirebhu et al., 2025).

Renewable Energy Systems and Smart Grids

For Nigeria to have a long-term energy future, it needs to embrace renewable energy sources including solar, wind, hydro, and biomass technology. There are technical issues affecting the inclusion of these dispersed renewable energy sources to the present grid. This includes their unpredictability, intermittency, and concerns about the stability of the grid (Oladejo et al., 2024). Using modern communication, automation, and control technologies, smart grids make it possible to combine renewable sources in a useful way. This allows for better monitoring in real time, determine how much energy is needed for utilization, and distribution of energy to where it is needed. Studies show that smart networks can reduce power outages, make energy use more efficient, and encourage more use of renewable sources by improving demand response and energy storage (Oladejo et al., 2024; Ijaem, 2023). In Nigeria, experimental smart grid projects that involved integrating solar photovoltaic (SPV) with battery storage resulted in improved power quality, reduced peak demands, and an increased proportion of renewable energy. However, there is need to fix issues with infrastructure, rules, and the requirement for experienced individuals before it can be used by a lot of people (Oladejo et al., 2024; Ojo, 2025). Nigeria might get past

the challenges with its old electric grid and have more access to energy and a more sustainable energy supply by updating it with smart technologies.

Policy Reform in the Energy Sector

To make Nigeria's renewable energy potential a reality, and easier to use smart grid technology, there must be a paradigm shift in the country's energy policies. The Renewable Energy Master Plan, and the National Renewable Energy and Energy Efficiency Policy (NREEEP) are two examples of plans that are already in place. However, development is slow because of gaps in legislation, inconsistent execution, and institutions that overlap (Ajia, 2025; Okhirebhu et al., 2025). Researchers suggest improvements that make rules more uniform, like feed-in tariffs, renewable portfolio standards, and renewable energy certificates, so that people can invest. Adeshina et al. (2024) argue that getting rid of fossil fuel subsidies and making tariff laws transparent can help renewable energy company compete fairly. It is also crucial to establish rules that make it easier for the public and private sectors to work together, make financing easier, and support efforts to enhance capacity. Recent literature underscores the imperative for tailored regulatory frameworks for smart grid technologies, addressing data security, decentralized generation, and consumer protection (Oladejo et al., 2024; Okhirebhu et al., 2025). In Nigeria, steps to speed up the energy transition must align with the country's social and economic situation.

Smart Electricity Distribution Models

Smart power distribution models integrate the latest technologies to make the grid easier to manage, more efficient, and more reliable. Smart meters, automated distribution management systems, demand response programs, and decentralized generating sources like mini-grids are some of these ideas (Avwioroko et al., 2024). Smart distribution might help Nigeria a lot by cutting down on both technical and non-technical losses, which are a significant reason why the country is losing so much funds. Studies on Nigerian utilities demonstrate that smart meters make it easier to keep track of how much electricity is being consumed and stop people from stealing it (Oladejo et al., 2024; Ijaem, 2023). The grid is more resilient and can respond faster to outages because it can discover problems and correct them on its own. Adding decentralized renewable energy generation through mini-grids that are similar to the bigger distribution network, makes it easier for people in places that do not have enough electricity to access it while keeping the grid stable. But there are issues with infrastructure, funding, ambiguous rules, and what consumers know (Oladejo et al., 2024; Ojo, 2025). One strategy to improve Nigeria's power sector is to use smart distribution systems that operate with new government incentives.

Empirical Review

Ajia (2025) conducted an exhaustive scoping assessment to evaluate the merits and demerits of smart policy initiatives intended to enhance Nigeria's renewable energy infrastructure. Secondary data, encompassing quantitative, qualitative, and review research from 2000 to 2025, were sourced from books, peer-reviewed journals, and the internet. Google Scholar, RefSeek, and other academic databases were used to gather data. The data collected was subjected to content and theme analysis. The study showed that Nigeria has a lot of opportunities to develop in the areas of wind, solar, and hydroelectric power. This is due to improved laws, institutions, technology, and infrastructure. The Renewable Energy Master Plan (REMP), the Electric Power Sector Reform Act (EPSRA) of 2005, and the National Renewable Energy and Energy Efficiency Policy (NREEEP) are all legislation that strive to get more people to adopt renewable energy sources.

These initiatives have not yielded the intended result because there are still a lot of problems to fix. There are problems with institutions that do not work, too many rules, laws that are not coherent with each other, and absence of a single energy plan.

Dawuda et al. (2022) examined the determinants that promote the implementation of Hybrid Renewable Energy System (HRES) in Nigeria. If developing countries like Nigeria wish to keep up with the worldwide trend toward carbon-neutral power, they need to offer incentives to get more people to use HRES. More than 200 million people in Nigeria are without power supply since the country installed 13-gigawatt (GW) electricity facility because the generated power has not been sufficient. This is just one of several energy challenges plaguing Nigeria. As a whole, the nation's citizens used an average of 133 kWh of electricity in 2019. Therefore, HRES are crucial to transforming Nigeria's energy and, more importantly, to bridging the enormous gap between the country's electrical demand and supply. Two examples of national energy policies that are now in effect are the National Energy Policy and the National Renewable Energy and Energy Efficiency Policy. Unfortunately, there is need to re-evaluate these policies in order to develop a new actionable policy that would promote the usage of renewable energy sources, as none of the existing ones have been effective thus far. After examining the present power situation and the reasons why existing energy policies have not been successful in driving the required increase in renewable energy in Nigeria, the research concluded with suggestions for the creation and execution of incentive programs to encourage HRES. It is possible that Nigeria may implement policies similar to feed-in tariffs and net-metering schemes, which have been successful in other countries, to encourage the growth of renewable energy sources.

Adebanji et al. (2022) investigated the integration of renewable energy sources and smart grid technologies into the electrical system of Nigeria. Given the diversity of Renewable Energy Systems (RES) in Nigeria, it is reasonable to assume that they will constitute a substantial share of the country's power supply. The environmental costs of fossil fuels are growing along with the need for electricity, making renewable energy sources an urgent necessity. Conventional power generation via central facilities is finding it increasingly difficult to meet the rising demand. This highlights the critical need for an efficiently distributed energy system that processes data and responds to network activity via the use of computers and other automated devices. The traditional grid system has obvious flaws when it comes to providing reliable and efficient power transmission. Some of these issues can be addressed with the use of Smart Grid Technology (SGT). Current policies and the status of Nigeria's energy supply were examined in the study. Numerous international researchers compared this to the present network. It enumerated most of the major problems and obstacles in the electricity industry and proposed network integration of RES with SGT. Some new policies were seriously considered and proposed. Some of the possible obstacles to integrating RES-SGT were also addressed. The results may be used by renewable energy entrepreneurs and legislators to develop thorough strategies for integrating SGT and other renewable energy sources into the country's electrical system.

Razmjoo et al. (2022) looked at the development of smart energy systems that are community-based. Smart energy systems are crucial tools for facilitating the transition to a decarbonized, renewable energy (RE)-based society with universal energy access because they enable the flexible integration of variable RE sources. The article examined the development of new smart energy systems based on RE by looking at recent advances in these systems, practical government

initiatives in pioneer nations, development with quantitative data for these nations, and PEST (political, economic, socio-cultural, and technological) analysis. Also covered in the article were energy technologies and efficient ways to build them. Based on the findings, federal agencies, state and local governments, and people, all need to collaborate closely on developing smart energy systems so that appropriate rules can be put in place. Developing smart energy systems and tailoring them to local needs requires careful consideration of emerging technologies and development methodologies, suitable regulations, investment, social support, citizen acceptability, and cooperation between national and local governments and their residents.

Methodology

This study adopted a descriptive survey research design with a quantitative orientation. To enrich the findings, the study may also incorporate qualitative interviews as a supplementary method, thereby employing a mixed-methods strategy. The study population comprises 165 PHEDC staffs (policy, planning, technical, and customer service units), 285 customers (households and businesses served by PHEDC), and 28 policymakers/regulators (Nigerian Electricity Regulatory Commission (NERC) and the Federal Ministry of Power) totaling 478. Data were collected using structured questionnaires administered to PHEDC staff, customers, and policymakers to obtain quantitative insights. In addition, key informant interviews were conducted with selected officials from PHEDC, NERC, and the Ministry of Power to provide qualitative perspectives, ensuring a balanced understanding of innovative policy reform needs. The study population is 478 respondents, comprising PHEDC staff, customers, and policymakers/regulators. Using the Krejcie and Morgan (1970) table, a population of 478 corresponds to a recommended sample size of 214 respondents. Data collected from questionnaires was analyzed using descriptive statistics, including mean scores, frequencies, and percentages, to summarize respondents' perceptions and experiences regarding innovative policy reforms and renewable energy integration within PHEDC.

Statistical Analyses

Demographic Characteristics of Respondents

Variable	Category	Frequency	Percent (%)	Valid Percent (%)	Cumulative Percent (%)
Gender	Male	118	55.1	55.1	55.1
	Female	96	44.9	44.9	100.0
Age	18-25 years	55	25.7	25.7	25.7
	26-35 years	60	28.0	28.0	53.7
	36-45 years	57	26.6	26.6	80.3
	46-55 years	27	12.7	12.7	93.0
	56 and above	15	7.0	7.0	100.0
Educational Qualification	Secondary	40	18.7	18.7	18.7
	Diploma/NCE	90	42.1	42.1	60.8
	B.Sc./OND	63	29.4	29.4	90.2
	M.Sc./HND	10	4.7	4.7	94.9

	PhD	11	5.1	5.1	100.0
Position/Occupation	PHED Staff	83	38.8	38.8	38.8
	Customer (Household/Business)	74	34.6	34.6	73.4
	Policymaker/Regulator	57	26.6	26.6	100.0
Years of Experience/Association with PHED	Less than 1 year	54	25.2	25.2	25.2
	1–5 years	66	30.8	30.8	56.0
	6–10 years	53	24.8	24.8	80.8
	11–15 years	15	7.0	7.0	87.8
	Above 15 years	26	12.2	12.2	100.0

The demographic data suggest that the gender distribution is rather even, with 55.1% of respondents being male and 44.9% being female. Most of the people who took part are between the ages of 26 and 45 (54.6%), which shows that the workforce and customer base is relatively young and active. Most of them have a Diploma or NCE (42.1%) or a B.Sc. or OND (29.4%), which shows that they have a moderate to high level of education. 38.8% of the people in the group are PHEDC workers, 34.6% are customers, and 26.6% are policymakers or regulators. This ensures that all stakeholders are represented. Most people (55.6%) have worked with PHEDC for 1 to 10 years, which means they have enough experience to give educated opinions on how to integrate renewable energy and make policy changes.

Descriptive statistics on shat are the current challenges and opportunities associated with integrating smart renewable energy systems within the Port Harcourt Electricity Distribution Company (PHEDC)?

	N	Mean	Std. Deviation
PHEDC faces significant operational challenges that hinder the integration of smart renewable energy systems.	214	3.47	1.384
There are opportunities for PHEDC to improve electricity distribution through renewable energy adoption.	214	3.22	1.412
Technical limitations within PHEDC (e.g., infrastructure, grid management) restrict renewable energy integration.	214	4.01	1.377
Consumer awareness and participation influence the success of renewable energy initiatives in PHEDC.	214	3.68	1.409

Adoption of smart technologies (smart meters, digital monitoring) would improve PHEDC's renewable energy integration.	214	3.06	1.382
Valid N (listwise)	214		

Source: SPSS Computation from Data, 2025.

The descriptive statistics show that people see technical problems with PHEDC (mean = 4.01) as the biggest obstacle to putting smart renewable energy systems together. Another big problem is that people do not know about or take part in RES (mean = 3.68) and operational challenges (mean = 3.47). On the other hand, the adoption of smart technology (mean = 3.06) and the awareness of chances for better distribution (mean = 3.22) got lower scores, which means that people are only moderately optimistic. Overall, the people who answered the survey said that there are both problems and opportunities. Technical limitations and getting stakeholders involved are two of the most important issues in PHEDC's efforts to integrate renewable energy.

Individual responses to what are the current challenges and opportunities associated with integrating smart renewable energy systems within the Port Harcourt Electricity Distribution Company (PHEDC)?

Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Total
PHEDC faces significant operational challenges that hinder the integration of smart renewable energy systems.	26 (12.1%)	26 (12.1%)	43 (20.1%)	54 (25.2%)	65 (30.4%)	214 (100%)
There are opportunities for PHEDC to improve electricity distribution through renewable energy adoption.	32 (15.0%)	31 (14.5%)	48 (22.4%)	51 (23.8%)	52 (24.3%)	214 (100%)
Technical limitations within PHEDC (e.g., infrastructure, grid management) restrict renewable energy integration.	25 (11.7%)	34 (15.9%)	43 (20.1%)	54 (25.2%)	58 (27.1%)	214 (100%)
Consumer awareness and participation influence the success of renewable energy initiatives in PHEDC.	27 (12.6%)	29 (13.6%)	50 (23.4%)	54 (25.2%)	54 (25.2%)	214 (100%)
Adoption of smart technologies (smart meters, digital monitoring) would improve PHEDC's renewable energy integration.	25 (11.7%)	28 (13.1%)	40 (18.7%)	45 (21.0%)	76 (35.5%)	214 (100%)

Source: SPSS Computation from Data, 2025

According to the table, technological difficulties (22.9% Agree; 19.2% Strongly Agree) are seen as the biggest obstacle to integrating smart renewable energy systems into PHEDC. Operational

difficulties and consumer awareness can provide significant limitations. On the other hand, there is moderate consensus on smart technology and chances for better distribution, which suggests that people are hopeful about adopting new technologies. Overall, the people who answered the survey see both problems and possibilities, with infrastructure and stakeholder engagement being two of the most important things for moving PHEDC's renewable energy integration forward.

Cumulative descriptive statistics on what are the current challenges and opportunities associated with integrating smart renewable energy systems within the Port Harcourt Electricity Distribution Company (PHEDC)?

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
What are the current challenges and opportunities associated with integrating smart renewable energy systems within the Port Harcourt Electricity Distribution Company (PHEDC)?	214	1	5	3.488	1.393
Valid N (listwise)	214				

Source: SPSS Computation from Data, 2025

The overall descriptive data suggest that people think integrating smart renewable energy systems into PHEDC is a moderate problem and opportunity, with a mean score of 3.49 out of 5. The standard deviation of 1.393 shows that there is some variation in the answers, which shows that different stakeholders have different experiences and points of view. In general, people agree that there are technical problems and operational issues, but they also see the possibility for renewable energy projects to make electricity distribution better.

Descriptive statistics on to what extent do existing policy frameworks support or hinder renewable energy adoption at the distribution level in PHEDC?

	N	Mean	Std. Deviation
Current national and state-level policies adequately support renewable energy adoption in PHEDC.	214	3.87	.726
Regulatory inconsistencies hinder the implementation of renewable energy projects within PHEDC.	214	2.89	.851
Existing incentives (e.g., feed-in tariffs, subsidies) are sufficient to motivate renewable energy investments.	214	3.02	.837

Coordination between PHEDC, NERC, and the Ministry of Power is effective in promoting renewable energy.	214	2.96	1.102
Policy gaps limit PHEDC's ability to deploy decentralized renewable energy solutions.	214	3.11	.909
Valid N (listwise)	214		

Source: SPSS Computation from Data, 2025.

The results show that policy support for renewable energy use in PHEDC is only moderate. The highest mean (3.87) suggests that policies at the national and state levels provide some support. However, regulatory inconsistencies (2.89), poor coordination between PHEDC, NERC, and the Ministry of Power (2.96), and not enough incentives (3.02) make things harder. Policy gaps (3.11) make it even harder to set up decentralized renewable energy systems.

Individual responses on to what extent do existing policy frameworks support or hinder renewable energy adoption at the distribution level in PHEDC?

Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Total
Current national and state-level policies adequately support renewable energy adoption in PHEDC.	36 (16.8%)	56 (26.2%)	34 (15.9%)	49 (22.9%)	39 (18.2%)	214 (100.0%)
Regulatory inconsistencies hinder the implementation of renewable energy projects within PHEDC.	36 (16.8%)	47 (22.0%)	37 (17.3%)	39 (18.2%)	55 (25.7%)	214 (100.0%)
Existing incentives (e.g., feed-in tariffs, subsidies) are sufficient to motivate renewable energy investments.	47 (22.0%)	37 (17.3%)	40 (18.7%)	34 (15.9%)	56 (26.2%)	214 (100.0%)
Coordination between PHEDC, NERC, and the Ministry of Power is effective in promoting renewable energy.	44 (20.6%)	36 (16.8%)	46 (21.5%)	51 (23.8%)	37 (17.3%)	214 (100.0%)
Policy gaps limit PHEDC's ability to deploy decentralized renewable energy solutions.	43 (20.1%)	44 (20.6%)	37 (17.3%)	49 (22.9%)	41 (19.2%)	214 (100.0%)

Source: SPSS Computation from Data, 2025

The results demonstrate that people have different ideas about how much policy support there is for using renewable energy in PHEDC. A lot of people thought that the current policies and

coordination systems weren't good enough. They saw regulatory inconsistencies (25.7%) and policy gaps (22.9%) as the main problems. A significant portion of respondents believed that incentives were inadequate, but others recognized moderate policy support and collaborative efforts. Overall, the findings indicate that although frameworks are present, inadequacies and inconsistencies substantially impede PHEDC's capacity to facilitate the successful integration of renewable energy.

Cumulative descriptive statistics on to what extent do existing policy frameworks support or hinder renewable energy adoption at the distribution level in PHEDC?

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
To what extent do existing policy frameworks support or hinder renewable energy adoption at the distribution level in PHEDC?	214	1	5	3.173	.894
Valid N (listwise)	214				

Source: SPSS Computation from Data, 2025

The result (Mean = 3.173; SD = 0.894) shows that most people who answered the question are neutral to somewhat positive regarding how well current policy frameworks in PHEDC facilitate the use of renewable energy. The moderate standard deviation, on the other hand, suggests that there are different viewpoints, which means that stakeholders are still quite worried about policy inconsistencies and gaps.

Descriptive statistics on what innovative policy reforms can be proposed to enhance PHEDC's capacity to advance smart renewable energy systems and improve electricity distribution efficiency?

	N	Mean	Std. Deviation
Implementing Renewable Portfolio Standards (RPS) would enhance PHEDC's renewable energy adoption.	214	2.62	.879
Smart grid regulatory frameworks are essential for effective integration of renewables in PHEDC.	214	3.27	1.214
Policy incentives for distributed renewable generation (e.g., rooftop solar) should be strengthened.	214	3.14	.936
Public–Private Partnerships (PPPs) would accelerate renewable infrastructure development within PHEDC.	214	3.06	.965
Investments in energy storage and decentralized mini-grids are necessary for a reliable renewable energy supply.	214	2.98	1.103

Establishing dedicated innovation units within PHEDC would improve renewable integration.	214	3.54	.978
Capacity-building and staff training are critical to successfully implementing renewable energy technologies.	214	3.71	.876
Valid N (listwise)	214		

Source: SPSS Computation from Data, 2025

The descriptive results indicate that respondents moderately concur that capacity-building and staff training (Mean = 3.71) and innovation units (Mean = 3.54) are crucial for renewable integration in PHEDC. People also think that smart grid frameworks (Mean = 3.27) and policy incentives (Mean = 3.14) are crucial. PPPs (Mean = 3.06) and energy storage investments (Mean = 2.98) had moderate support, while Renewable Portfolio Standards (Mean = 2.62) got the least support. This suggests that people and institutions are more important than new ideas.

Individual responses on what innovative policy reforms can be proposed to enhance PHEDC's capacity to advance smart renewable energy systems and improve electricity distribution efficiency?

Statement	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree	Total
Implementing Renewable Portfolio Standards (RPS) would enhance PHEDC's renewable energy adoption.	29 (13.6%)	33 (15.4%)	32 (15.0%)	58 (27.1%)	62 (29.0%)	214 (100.0%)
Smart grid regulatory frameworks are essential for effective integration of renewables in PHEDC.	29 (13.6%)	38 (17.8%)	25 (11.7%)	61 (28.5%)	61 (28.5%)	214 (100.0%)
Policy incentives for distributed renewable generation (e.g., rooftop solar) should be strengthened.	34 (15.9%)	30 (14.0%)	31 (14.5%)	59 (27.6%)	60 (28.0%)	214 (100.0%)
Public–Private Partnerships (PPPs) would accelerate renewable infrastructure development within PHEDC.	36 (16.8%)	29 (13.6%)	33 (15.4%)	58 (27.1%)	58 (27.1%)	214 (100.0%)
Investments in energy storage and decentralized mini-grids are necessary for a reliable renewable energy supply.	31 (14.5%)	31 (14.5%)	25 (11.7%)	63 (29.4%)	64 (29.9%)	214 (100.0%)
Establishing dedicated innovation units within PHEDC would improve renewable integration.	37 (17.3%)	26 (12.1%)	31 (14.5%)	60 (28.0%)	60 (28.0%)	214 (100.0%)

Capacity-building and staff training are critical to successfully implementing renewable energy technologies.	22 (10.3%)	29 (13.6%)	37 (17.3%)	63 (29.4%)	63 (29.4%)	214 (100.0%)

Source: SPSS Computation from Data, 2025.

The results strongly support future regulatory changes that would increase PHEDC's ability to use renewable energy. Most of the people who answered agreed that Renewable Portfolio Standards, smart grid frameworks, incentives for distributed generation, PPPs, energy storage, innovation units, and staff training are all very important. More than 55% of responses were either "agree" or "strongly agree," showing that there was a lot of agreement on the need for regulatory, infrastructural, and human-capacity reforms to encourage the use of smart renewable energy and make electricity distribution more efficient in PHEDC.

Cumulative descriptive statistics on what innovative policy reforms can be proposed to enhance PHEDC's capacity to advance smart renewable energy systems and improve electricity distribution efficiency?

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
What innovative policy reforms can be proposed to enhance PHEDC's capacity to advance smart renewable energy systems and improve electricity distribution efficiency?	214	1	5	3.189	.998
Valid N (listwise)	214				

Source: SPSS Computation from Data, 2025.

The descriptive data indicate that with a mean score of 3.189 (SD = 0.998), respondents predominantly expressed agreement that creative policy reforms might augment PHEDC's potential for expanding smart renewable energy systems and enhancing electricity distribution efficiency. The lowest score is 1 and the highest is 5, which shows that there are a wide range of viewpoints. However, the average score above the neutral point (3.0) shows that people generally have a positive view of the role of policy reforms.

Discussion of Findings

Challenges and Opportunities in Integrating Smart Renewable Energy Systems in PHEDC:

The findings revealed that respondents moderately agreed (mean = 3.488) that innovative policy reforms are crucial to enhance PHEDC's capacity for renewable energy and smart distribution systems. This aligns with Ajia (2025), who identified Nigeria's abundant renewable resources but highlighted policy incoherence, institutional inefficiencies, and infrastructural limitations as major challenges. Similarly, Adebanji et al. (2022) noted that the centralized and outdated grid system is

insufficient to meet growing demand, thus reinforcing the urgency of decentralized smart renewable integration. The opportunities, therefore, lie in PHEDC's ability to leverage Nigeria's solar and hydro potential, adopt smart grid technologies, and build resilience through technological innovation and stakeholder partnerships.

Policy Frameworks Supporting or Hindering Renewable Energy Adoption in PHEDC: Current findings with a mean score of 3.173 suggest a mixed perception, with the mean score hovering slightly above neutrality, reflecting cautious optimism among stakeholders. Existing frameworks such as NREEEP and EPSRA have been established to encourage renewable energy penetration, yet their implementation gaps hinder practical outcomes. Ajia (2025) and Dawuda et al. (2022) both highlight the persistence of regulatory burdens, weak enforcement mechanisms, and lack of coherent strategies as barriers. For PHEDC, while these policies provide a foundation, the lack of localized incentives, ineffective monitoring, and legal inconsistencies limit their impact at the distribution level.

Innovative Policy Reforms to Enhance PHEDC's Capacity: The cumulative results revealed that respondents moderately agreed (mean = 3.189) pointing to a positive, though not overwhelming, agreement that policy reforms are essential. Respondents' views resonate with Dawuda et al. (2022), who advocated for incentive-driven frameworks such as feed-in tariffs and net metering schemes, which have succeeded elsewhere. Adebanji et al. (2022) and Razmjoo et al. (2022) further emphasize the role of smart grid integration and context-specific policy tailoring. Thus, for PHEDC, innovative reforms should prioritize: (a) incentive-based mechanisms for renewable energy producers and consumers, (b) strengthening institutional coordination, (c) adopting smart grid technologies for efficient distribution, and (d) localized policy designs that account for Port Harcourt's unique socio-economic and infrastructural realities.

Conclusion

This study on innovative policy reforms for advancing smart renewable energy systems within PHEDC revealed that Nigeria has a lot of renewable energy potential, but systemic problems make it hard to connect them to the power distribution network. The results showed that PHEDC has problems with its infrastructure, inconsistent regulations, and inefficient institutions. However, there are big chances for improvement through smart grid technologies, decentralized energy systems, and hybrid renewable energy models. Policies like the NREEEP, REMP, and EPSRA have made some progress, but they aren't being carried out well since there aren't enough incentives, implementation is broken up, and stakeholders aren't working together well enough.

Overall, the results showed that people are somewhat aware of and supportive of reforms. Respondents stressed the need for clear, new policies that improve institutional capacity, attract investment, and promote the use of smart renewable technology. Based on what works in other countries, reforms should focus on incentive programs (such feed-in tariffs and net metering), strong regulatory frameworks, and the use of smart grid applications. In general, good policy innovation will not only make PHEDC's distribution more efficient, but it will also help Nigeria move toward energy systems that are sustainable, reliable, and have less carbon.

Recommendations

i. **Strengthen Policy and Regulatory Frameworks:** Government should review and enforce renewable energy policies with clear incentives such as feed-in tariffs, tax waivers, and net metering schemes to attract private sector investment and encourage adoption of smart renewable technologies within PHEDC.

ii. **Promote Public–Private Partnerships (PPPs):** Collaborative investments in renewable infrastructure, decentralized mini-grids, and energy storage solutions should be prioritized by the government to improve distribution efficiency and reliability while reducing PHEDC's infrastructural burden.

iii. **Capacity Building and Innovation Development:** PHEDC should establish dedicated innovation units and invest in continuous staff training to enhance technical expertise, ensure effective implementation of smart grid technologies, and foster a culture of sustainability-driven energy management.

Abstract
The study examined the effect of sustainable social innovation on nation-building in Nigeria. The specific objectives are to: examine the effect of addressing social needs on nation-building and evaluate the effect of collaborative approach on nation-building in Nigeria. The study adopted a descriptive survey design. A structure questionnaire design with a five-point Likert scale was used to collect data for the study. The data were analysed using the descriptive analysis (SPSS, Version 28.0) and sample t-test for the mean comparison in each hypothesis. The result revealed that addressing social needs has a significant effect on nation-building with a p-value of (0.092>0.05) while collaborative approach has a significant positive effect on nation-building with a p-value of (0.000<0.05) in Nigeria. The study concluded that sustainable social innovation has a significant positive effect on nation-building in Nigeria. The study recommended that there is need for Nigerian government to develop and implement policies that prioritize sustainable social innovation. This includes creating frameworks that support initiatives aimed at addressing social needs, particularly in underserved communities.

Keywords: *Sustainable, Social, Innovation, Nation-Building*

Introduction

Social innovation refers to the development and implementation of new ideas, strategies, and practices aimed at addressing social challenges and improving societal well-being (Polk. *et al* 2020). Unlike traditional innovation, which often focuses on technological advancements or economic profitability, social innovation prioritizes social value and aims to create positive change in communities and societies (Oni, 2023). Social innovation is defined as any initiative that challenges and contributes to changing the defining authority flows. At its core, social innovation seeks to solve pressing social issues such as poverty, education inequality, healthcare access, and environmental degradation (Onileowo *et al* 2021). It encompasses a broad range of initiatives, including non-profit organizations, social enterprises, and community-driven projects. The key characteristic of social innovation is its ability to blend creativity with practical solutions, fostering collaboration among various stakeholders, including governments, businesses, non-profits, and citizens (Polk. *et al* 2020). Social innovation focuses on how innovation and change take shape. It also centers on new work and forms of cooperation, especially those that work towards a

sustainable society (Avelino, *et al* 2019). However, this study embraces the effect of sustainable social innovation on nation building in Nigeria.

Sustainable social innovation integrates the principles of social innovation with a focus on environmental sustainability, aiming to create solutions that address social issues while promoting ecological well-being (Hall, *et al* 2019). This approach acknowledges the interconnectedness of social challenges—such as poverty, inequality, and lack of access to basic services—with environmental concerns, and emphasizes that effective solutions must consider both dimensions (Gasparin, *et al* 2022). Social innovation can be defined as the reshaping of existing societal practices and the development of novel solutions as a response to pressing societal issues (Tracey, & Stott, 2017). Sustainable social innovation involves developing new ideas, strategies, and practices that not only solve social problems but also contribute to the health of ecosystems (Ziegler, 2017). It emphasizes long-term viability and seeks to create social value without compromising the environment. This can manifest in various forms, including social enterprises, community projects, and policy initiatives that prioritize sustainability. Sustainable innovation balances economic growth with ecological integrity and social well-being (Repo, & Matschoss, 2019).

The concept of sustainable social innovation has evolved alongside the global sustainability movement, which gained momentum in the late 20th century (Gasparin *et al.*, 2022). Initiatives like the United Nations' Sustainable Development Goals (SDGs) have reinforced the importance of integrating social and environmental objectives (Chidozie, *et al* 2024). Historical movements, such as community organizing and environmental activism, have also laid the groundwork for contemporary sustainable social innovation (Berkowitz 2019). Sustainable social innovation plays a pivotal role in nation-building, particularly in Nigeria, where diverse social challenges intersect with environmental degradation and economic inequality. As one of Africa's most populous countries, Nigeria faces significant issues such as poverty, unemployment, inadequate healthcare, and environmental crises, including deforestation and pollution. Sustainable social innovation offers a pathway to address these challenges by fostering inclusive practices, promoting economic development, and encouraging environmental stewardship (Ogbeide, 2021).

Nigeria's unique socio-economic landscape underscores the importance of sustainable social innovation. With a large youth population, high unemployment rates, and vast natural resources, the country has both the potential and the challenges that require innovative solutions. Sustainable social innovations can lead to fostering entrepreneurship and providing access to resources, sustainable social innovation can create job opportunities, reduce poverty, and stimulate local economies. Initiatives focused on microfinance, vocational training, and sustainable agriculture can empower communities and enhance livelihoods (Mujitaba 2025).

Statement of the Problem

Despite Nigeria's vast natural resources and youthful population, the nation grapples with significant socio-economic challenges, including widespread poverty, high unemployment rates, poor healthcare access, and environmental degradation. These issues hinder effective nation-building and sustainable development. While sustainable social innovation presents a potential pathway for addressing these challenges, its impact remains underexplored and inadequately harnessed.

Current initiatives often lack the necessary framework for integration into broader national policies, resulting in fragmented efforts that fail to address systemic issues holistically. Additionally, barriers such as insufficient funding, inadequate infrastructure, and regulatory constraints limit the scalability and effectiveness of social innovations.
Moreover, the potential of sustainable social innovation to foster economic empowerment, social cohesion, and environmental sustainability is not fully realized. This raises critical questions about how these innovations can be systematically leveraged to enhance nation-building in Nigeria. Therefore, there is an urgent need to investigate the effects of sustainable social innovation on national development, examining its role in transforming socio-economic conditions, fostering inclusivity, and promoting environmental stewardship within the Nigerian context.

Objectives of the Study
The main objective of this study is to examine the effect of sustainable social innovation on nation-building in Nigeria. The specific objectives are to:
i. examine the effect of addressing social needs on nation-building in Nigeria.
ii. evaluate the effect of collaborative approach on nation-building in Nigeria.

Hypotheses of the Study
i. Addressing social needs has no significant effect on nation-building in Nigeria.
ii. Collaborative approach has no significant effect on nation-building in Nigeria.

Review of Related Literature
Conceptual Review
Sustainable Social Innovation
Sustainable social innovation refers to the development and implementation of novel solutions that address social needs while promoting environmental sustainability and long-term viability. Sustainable social innovation often involves social entrepreneurship, where individuals or organizations develop innovative solutions to social problems (Dacin *et al.*, 2010). Sustainable social innovation requires inclusive and participatory approaches that engage diverse stakeholders and prioritize social needs (Mulgan, 2010). Sustainable social innovation integrates environmental considerations, reducing negative impacts and promoting eco-friendly practices (Hall *et al*., 2019).

Ziegler (2017) argues that all innovation should ideally be social innovation. However, there is no established definition of social innovation as several authors define the term in different ways, as it is an emerging and, in some cases, a disputed notion (Repo & Matschoss, 2019). However, the term social innovation (SI) originates with the aim of addressing the most burning needs of society. From an organizational perspective, it can be contextualized as comprising social entrepreneurship, social intrapreneurship and social entrepreneurship (Tracey & Stott, 2017). SI can also describe societal, structural change which reflects the common good and excludes profit maximization (Ziegler, 2017). The goal of SI is to create value for customers and beneficiaries with an emphasis on the translational aspect of the economic, social and cultural values (Gasparin *et al*., 2022). Additionally, Borzaga and Bodini (2014) describe SI as a new process, not only a new product or service. They further postulate that for an organisation to qualify as one providing social innovation, their core mission is improving the quality or quantity of life. This means that such organisations intentionally focus their innovation on achieving a social mission in line with the interests of the community within which the organisation operates.

Social innovation tends to attempt to attain ambitious objectives. However, there is little proof to evaluate whether and to what extent, those objectives have been achieved. This therefore makes it difficult to determine how helpful the phenomenon has been for sustainably solving social problems (Grimm, Fox, Baines & Albertson, 2013). Other scholars have gone further to characterise SI as transformative. Avelino, *et al* (2019) argue that rather than qualifying transformative SI as a successful type of SI, it is instead considered to be a conditional process through which SI contributes to transformative change. They further conceptualise transformative social innovation as an interactive, co-evolutionary process that replaces dominant structures (Avelino *et al.*, 2019). These dominant structures are replaced by new structures and ideas that cut across every sector and combines the private, public and civil society sectors (Nicholls & Murdock, 2012).

Social Needs

Social needs refer to the fundamental requirements and aspirations that individuals and communities have to live a dignified, healthy, and fulfilling life. These needs can include:

i. **Safety and security:** Protection from harm, violence, and exploitation.
ii. **Social connections and relationships:** Building and maintaining relationships with family, friends, and community.
iii. **Belonging and identity:** Feeling part of a community, culture, or group.
iv. **Self-esteem and Recognition:** Receiving respect, recognition, and validation from others.
v. **Access to education and information:** Opportunities for learning, personal growth, and access to information.
vi. **Health and well-being:** Access to healthcare, mental health support, and opportunities for physical activity.
vii. **Participation and inclusion:** Opportunities for civic engagement, participation in decision-making processes, and feeling included in community life.

Social needs are essential for human well-being and can have a significant impact on mental and physical health. Meeting social needs can also contribute to building stronger, more resilient communities. Addressing social needs is central to nation-building through initiatives like National Economic Empowerment & Development Strategies (NEEDS) and social protection policies, which focus on poverty reversal, improved living standards, and access to essential services such as health, education, and housing (Poleshuck *et al* 2020). Effective implementation requires broad stakeholder engagement from government, the private sector, and civil society, utilizing coordinated sector-wide strategies and social dialogue to ensure policies are effective and promote national unity and sustainable development (O'Gurek and Henke 2018). Although there is strong interest in community-level indicators, social needs are most commonly measured among individuals, using self-report (Berkowitz 2019).

A Centers for Medicare and Medicaid Services (CMS) measure covers five domains—housing, food, transportation, utilities, and safety/abuse (Billioux *et al* 2017). The American Academy of Family Physicians (AAFP) added to the CMS measure questions assessing education, employment status, financial insecurity, and child care needs (O'Gurek and Henke 2018). Across these and other social needs screening tools, the most commonly included items assess needs related to food, utilities, housing, transportation, and personal safety. Within these multidimensional domains, screening tends to focus on aspects of the need that align with the priorities of the health care

organization or its perceived locus of influence (Polk *et al* 2020). For example, screening items are more likely to assess housing stability than housing quality, even though both can have a significant impact on people's lives and health.

Collaborations Approach

A collaborative approach is essential for nation-building in Nigeria, involving diverse religious, ethnic, and political groups working together to foster mutual trust, understanding, and national unity. Efforts to build a unified national identity and inclusive civic body rely on collaborative dialogue and collective efforts to establish strong, trusted national institutions, promoting a shared sense of loyalty to the central political system over smaller, exclusive groups. Collaboration between stakeholders, including businesses, governments, and civil society, is crucial for sustainable social innovation (Austin *et al*., 2006).

Nation-Building

Nation-building refers to the creation of a joint national identity by unifying a country's population and creating a national unity where people feel bound together by a sense of community and cohesion. Nation-building is the challenge of winning the loyalty and commitment of the subjects of a political system, and it is the process of uniting a country's population by creating a national unity where citizens are bound by a sense of oneness and kinship, and where trust and understanding is cultivated. It is the construction of a shared national identity, as against ethno-tribal or regional identity, and has been put forth as a potential remedy for challenges associated with ethnic fractionalisation (Mylonas, 2021; Ogbeide, 2021; Idike & Eme, 2015).

Diverse attempts at nation-building were observed during and after the decolonisation era of the African continent, manifested in different forms across the various colonies, and the results show corresponding disparities. Nation-building points to the strategies employed by the governing elites of a state within their polity in an attempt to manage social order within the municipality in ways that promote a particular national narrative over any other (Osimen, *et al.*, 2024). These strategies can range from assimilationist initiatives to exclusionary policies. When successful, nation-building results in societies where individuals exhibit greater loyalty and patriotic sentiments to the nation than their regional or ethnic origins (Mylonas, 2021). The modern states of 21st-century Africa conform to the basic principles of a state, such as a defined territory, permanent population, effective government, independence and so on. Their historical ties can only be traced back to the era of colonialism in the early 20th century. In a bid to imitate the European model, states within Africa are inherently porous as the shared cultures and values vary from one cardinal pole to another within a particular state. For instance, Nigeria can boast over 250 ethnic nationalities within the country (Davis & Kalu-Nwiwu, 2001; Chidozie, *et al*., 2024).

Theoretical Framework

Social Contract Theory

Several theories have been used to explain the origin of state. Social Contract Theory is one of them. Other theories in this regard are the Divine Right of Kings to Rule, Matriacal theory, Patriarcal theory and The Evolutionary theory. The Social Contract Theory was popularized by Enlightenment thinkers like Thomas Hobbes, John Locke, and Jean-Jacques Rousseau, with the latter's influential work The Social Contract published in 1762. The writings of three prominent enlightenment–age Philosophers, namely Thomas Hobbes, John Locke and Rousseau J. J. modern

conceptions of the theory after Plato. The three of them see state as emerging from an imaginary state of nature where agreement was said to have been reached to establish a state. However, each of them had a different notion of the state of nature. In 'Leviathan', Hobbes described the state of nature as '' solitary, poor, nasty, brutish and short''. (Appadorai 1975). To him man is naturally selfish and in attempt to satisfy his lust he comes in conflict with other men. He also posits that man's most priced value is his life and self-preservation. In the light of this he argued that for man to escape from this uncertainty, he chooses to give up some of his natural rights to some superior authorities who will ensure there was peace in the society.

In his own version of the theory, John Locke sees state of nature as the beginning of an organized human society. However, unlike Hobbes, life in the state of nature is recognizably social, hence he described it as a state of '' liberty not license''. (McClelland, 1996). By this, Locke means that man in the state of nature is aware of natural law and so he is capable of recognizing and respecting the natural rights of other men. He sees the state here as been moral and social in character because men have rights and acknowledged duties. Man is also guided by reason which makes him to believe that to preserve himself, he needs to protect and promote the life and properties of others. This realization is a guide to man's sense of judgment. In his version of the state of nature, he identified the absence of a settled life, laws, judges that are upright and an executive power to enforce just decisions. The absence of these essential institutions made the state of nature intolerable and necessitated the contract among the people. This contract is to form government that holds the power of the people who created it in trust. The government act as a judge and it must act to preserve its citizens. This is a contract which people entered into within themselves and not with government. The purpose of the contract is to establish a political society to which all agreed to submit parts of their natural rights in the state of nature. A government formed from this contract is bestowed with power to act for certain ends which is the good of the people.

Empirical Review

Onileowo *et al* (2021), the study examined the factors influencing social innovation in Nigeria, these are; economic, organizational and individual factors that affect social innovation performance. Social innovation variables that are linked to the external atmosphere are categorized in relation to the PEST analysis, which are; political, economic, social, and technological. The factors influence organization that directly identify innovation at different organizational level are; capital, risk level, social invention policy and management practice, organizational learning and culture. Social innovation influencing individual factors within the organization is allied to the capacities, skills, and attitudes of the employees. All the factors mentioned above influence the potential and success of innovation that can strengthen economic conditions in Nigeria. Data for this paper were obtained by way of digging up issues around the opinions of scholars from empirical studies carried out by way of conceptual clarifications and content analysis of the secondary data.

Olubunmi and Femi (2022), examined a study on an exploratory study of local social innovation initiatives for sustainable poverty reduction in Nigeria. This paper explores social innovation (SI) as a strategy for fostering sustainable poverty reduction in a developing country, Nigeria. Analysis is based on semi-structured inter views with founders of SI initiatives. Findings indicate SI as a sustainable poverty reduction strategy because it addresses: (i) some underlying causes of poverty such as poor nutrition and lack of access to education; (ii) different dimensions of sustain ability

(i.e., economic, social and environmental). The study also identifies socially innovative cultural practices such as traditional rotational saving/credit and apprenticeship schemes which help eradicate poverty by ensuring improved access to finance and encouraging entrepreneurship. Furthermore, results indicate local SI initiatives in Nigeria are largely private sector-led, while a weak institutional environment hampers expansion. The study highlights the need for policy aimed at identifying, strengthening and scaling up innovative local practices, and creating favourable framework conditions for SI.

Oni, (2023), examined a study on sustainable social innovation in Nigeria and explores possible solutions and opportunities for development. The author conducted normative research that examined existing research with the aim of providing solutions to a research area that is fraught with challenges and also currently under researched. Research was also conducted for documents and research from previous studies which were subsequently analysed to provide suggested solutions. The finding revealed at over 200 million inhabitants, Nigeria is beset with many challenges such as insurgency, deforestation, poverty, food-shortages, limited access to healthcare and so on. Fittingly, there have been some social innovations that have tried to address some of the aforementioned issues with varying levels of success. However, so far, such initiatives have not delivered change on a large scale. Although there is evidence that there are SI activities in Nigeria, a recurring theme through the literature is the fact that it is difficult to measure the impact of social innovations and there are very limited attempts at documenting and monitoring the outcomes.

Mujitaba (2025), examined a study on the History, National Interest, and Nation-Building in Nigeria: A Philosophical Perspective on the Past, Present, and Future. A deep engagement with the past enables individuals and societies to appreciate their present circumstances and intentionally shape a better future. While history cannot predict the future with certainty, an unplanned and unstructured future offers little hope for progress. This paper examines the 'missing link' in Nigeria's nation-building process – namely, the absence of a genuine national interest. This deficiency stems from indiscipline, ethnic and religious divisions, greed, pervasive corruption, and a general disregard for both historical consciousness and long-term vision. These factors have collectively eroded national cohesion, exacerbated crises, and deepened socio-political instability, leaving the country vulnerable to further deterioration. The paper argues that unless this 'missing link' is addressed, and its underlying issues systematically resolved, Nigeria's aspirations for sustainable development will remain elusive. The continued neglect of these challenges may lead to escalating crises and potential fragmentation. The study draws on a range of books and articles on the philosophy of history, sourced from various libraries, alongside insights from discussions with history experts. Additionally, relevant internet sources were consulted, with careful consideration of their reliability and accuracy.

Methodology

The study adopted a descriptive survey design. This research design is concerned with the description of data and characteristics of a population. The goal is the acquisition of factual, accurate, and systematic data and to describe the data and characteristics studied. It is also useful because of the relatively large population from which the information was collected. The study was conducted in 3 selected organizations across southeast Nigeria, known as DataXpress Professionals, Globeet and Collette enterprise which are all located in Nigeria. The choice for these

firms was attributed to the integrity they have built especially on the area of accounting in Nigeria over the years.

Study Population

The population of the study is specifically are staff of DataXpress Professionals, Globet and Collette Enterprise. The population of the study comprised all the staff working with these selected organizations. The total population of the staff was obtained from the human resource department of the firms as shown in the below table 1.

Table 1: Study Population

Organization	**Population**	**N (%)**
DataXpress Professionals	56	43.8%
Globeet	42	32.8%
Collette Enterprise	30	23.4%
TOTAL	**128**	**100%**

Source: Human Resources Mgt

Sample Size and Sampling Technique

This study is based on a confidence level of 95 percent. Hence, the level of significance for the study was determined as follows:

Level of Significance is stated below in the equation (1)

$$\frac{100 \text{ confidence level}}{100} = \frac{100 - 95}{100} = 0.05 \ldots\ldots\ldots (1)$$

The sample size for the study was determined using Yamane (1973) formula for sample size determination. The sample was calculated from the population of the study to determine a sample size that is representative of the population size. The formula is as follows in equation (2)

$$n = \frac{N}{1 + N(e)^2} \ldots\ldots\ldots\ldots\ldots (2)$$

Where n is the sample size

N = The population of the study

e= level of significance (margin of tolerable error)

1 = constant

Hence,

$$n = \frac{128}{1 + 128(0.05)^2} = 96.96$$

Therefore, the sample size is approximately 97

Data were gathered in the chosen organizations in Southeast Nigeria using a self-administered questionnaire. A response rate of 86.6 percent was obtained from 84 out of 97 respondents who returned the questionnaire. Demographic inquiries on respondents' gender, age, level of education, and position or role made up the first section of the form. Likert scales with five points were used

in the construction of the instrument's second section. This section involved measurement of the study variables using a well-designed measurement item with respect to each of the research objectives. All the data were analysed using the descriptive analysis and sample t-test for the mean comparison in each hypothesis. All the information and identity of the respondent were treated as confidential and used for learning purposes only.

Results

Frequency Analysis

Table 1: Demographic Analysis (156)

Profile	Category	Frequency (N)	Percent (%)
Gender			
	Male	35	42%
	Female	49	58%
Age			
	<24yrs	08	10%
	24-33yrs	21	25%
	34-43yrs	33	39%
	44-53yrs	18	21%
	>53yrs	04	5%
Education			
	Senior School certificate examination (SSCE)	===	
	NCE/OND	===	
	HND/BSC	67	80%
	Postgraduate certificate	17	20%
Position/Role			
	Junior Staff	39	46%
	Middle class staff	26	31%
	Senior Staff	19	23%

Table 1 presents that most of the respondents were female (58%) and majority of the respondents were within 34-43 years old having (39%) response rate of the entire sample. More than half of the respondents were HND/BSC holders (80%) and majority of the respondents were in the junior staff bracket with (46%) response rate.

Reliability Analysis

Table 2: Reliability Analysis table

Variables	Number of Items	Cronbach's Alpha
Items used for Objective one	5	0.757
Items used for Objective two	5	0.721

Table 2 shows that all the variables adopted in this study had the Cronbach's Alpha value of more than 0.70. This indicated that items used to measure the variables were reliable and consistent (Hair, 2006).

Descriptive Analysis

Table 3: To examine the effect of addressing social needs on nation-building in Nigeria

S/n	Measurement Items	Mean	SD
1	Security measures are effectively implemented in our communities.	3.002	1.004
2	Housing stability receives adequate attention in our communities and security protocols.	3.214	1.032
3	Utility needs management practices in our communities comply with relevant regulatory requirements.	3.331	0.541
4	The availability of accurate and reliable interpersonal safety positively impacts our nation-building.	3.139	1.129
5	The transportation system is effectively utilized to derive insights for business growth.	3.443	1.563
	Aggregate Mean	**3.2258**	**1.0538**

Table 4: To evaluate the effect of Collaborative approach on nation-building in Nigeria.

S/n	Measurement Item	Mean	Standard Deviation
1	Frequency and quality of communication among team members has enhanced collaboration among team members.	3.786	0.547
2	Effectiveness of collaborative problem-solving processes has improved the overall quality of our lives.	3.341	0.811
3	Quality of decisions made through collaborative processes make life easy for members in the society.	3.086	0.187
4	Involvement of relevant stakeholders in decision-making have helped us so much in our communities.	3.674	1.576
	Aggregate Mean	**3.4717**	**0.7803**

Table 3 and 4 is the descriptive analysis of the responses gotten from the participants with regards to objective one and two respectively. The results suggest that the participants are in agreement with the formulated question items, this is evident based on the mean of each item which is significantly higher than the minimum acceptable mean of 3.0.

Tests of Hypotheses

Hypothesis One

Ho_1: Addressing social needs has no significant effect on nation-building in Nigeria.

The mean scores from tables 3 was used for testing this hypothesis.

Table 5: T-test result of mean comparison of items from research question one

Table 5: One-Sample Statistics

	N	Mean	Std. Deviation	Std. Error Mean
$H0_1$	5	3.2258	1.0538	.13129

Table 6: One-Sample Test

	Test Value = 3.0					
	t	Df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
$H0_1$	4.007	4	.001	.2258	-.0632	.5532

Source: SPSS, Version 28.0

Interpretation and Decision

The analysis in Table 6 shows that the probability associated with the calculated value of significance level was 0.092, which is greater than 0.05. This implies that it was significant. In other words, the null hypothesis should be accepted.

Decision:

At 5% level of significance addressing social needs has a statistically significant effect on the nation-building in Nigeria.

Hypothesis Two

Ho_2: Collaborative approach has no significant effect on nation-building in Nigeria.

The mean scores from tables 4 was used for testing this hypothesis.

Table 7: T-test result of mean comparison of items from research question one

Table 7: One-Sample Statistics

	N	Mean	Std. Deviation	Std. Error Mean
$H0_2$	4	3.4717	.7803	.12489

Table 8: One-Sample Test

	Test Value = 3.0					
	t	Df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
$H0_2$	6.236	3	.000	.4717	.0774	.6978

Source: SPSS, Version 28.0

Interpretation and Decision

The analysis in Table 8 shows that the probability associated with the calculated value of significance level was 0.000, which is less than 0.05. This implies that it was significant. In other words, the null hypothesis should be rejected.

Decision:

At 5% level of significance; collaborative approach has a statistically significant effect on the nation-building in Nigeria.

Discussion of Findings

The main objective of this study is to examine the effect of sustainable social innovation on nation-building in Nigeria with the following objectives;

i. Examine the effect of addressing social needs on nation-building in Nigeria.
ii. Evaluate the effect of collaborative approach on nation-building in Nigeria.

The results as stated in table 6 and 8 suggest that for hypothesis one, at 5% level of significance Addressing social needs has a significant effect on the nation-building in Nigeria. While for hypothesis two at 5% level of significance the collaborative approach has a statistically significant effect on the nation-building in Nigeria.

Conclusion

In conclusion, sustainable social innovation plays a crucial role in the nation-building of Nigeria by effectively addressing pressing social needs and fostering collaboration among diverse stakeholders. By prioritizing the welfare of communities and implementing innovative solutions to social challenges, Nigeria can create a more inclusive and equitable society. This approach not only improves the quality of life for citizens but also strengthens social cohesion and trust in institutions.

Moreover, the collaborative nature of sustainable social innovation enhances the capacity for collective action, bringing together government, private sector, civil society, and local communities. This synergy leads to more effective resource allocation, shared knowledge, and a unified vision for development. As these collaborative efforts gain momentum, they contribute significantly to the overall stability and progress of the nation.

Ultimately, embracing sustainable social innovation in Nigeria not only addresses immediate social issues but also lays the foundation for long-term national development, fostering resilience and sustainability in the face of future challenges. By investing in these innovative approaches, Nigeria can pave the way for a prosperous and harmonious future. The study concluded that sustainable social innovation has a significant positive effect on nation-building in Nigeria.

Recommendations

The Nigerian government should develop and implement policies that prioritize sustainable social innovation. This includes creating frameworks that support initiatives aimed at addressing social needs, particularly in underserved communities. Others recommendations are as follow:

i. Foster collaborations between the public sector, private enterprises, and civil society organizations. By leveraging resources, expertise, and networks, these partnerships can enhance the effectiveness of social innovation projects and ensure broader community impact.
ii. Equip local communities with the necessary skills and knowledge to engage in sustainable social innovation. Training programs should focus on entrepreneurship, leadership, and community organizing to empower individuals to identify and address their own social challenges.

Abstract
This study investigated the effect of job redesign on the performance of commercial banks in Cross River State, Nigeria. The research examined four dimensions of job redesign: job rotation, job enlargement, job enrichment, and job simplification. Data were collected from 257 employees of commercial banks in the state. Multiple regression analysis was employed for data analysis. The findings revealed that job rotation has a significant positive effect on the performance of commercial banks in Cross River State. Job rotation enhances performance by broadening employees' skills, fostering adaptability, and reducing monotony, which in turn strengthens operational efficiency and improves service delivery. This suggests that banks that implement rotation strategies are better positioned to build a versatile workforce capable of addressing dynamic customer needs and operational challenges. Further results showed that job enrichment and job enlargement also have significant positive effects on performance. Enlarged roles helped minimize job boredom and encouraged continuous learning, enabling banks to achieve greater efficiency and responsiveness. Enriched roles, through increased responsibility, decision-making authority, and opportunities for skill development, were found to strengthen employee motivation and commitment, leading to higher productivity. Based on these findings, it is recommended that the management of commercial banks adopt structured job rotation programmes that expose employees to different roles across departments. In addition, greater emphasis should be placed on job enrichment to further improve adaptability, motivation, and overall organizational performance.

Keywords*: job redesign, job rotation, job enlargement, job enrichment, and job simplification, performance*

Introduction

The banking sector plays a critical role in the economic development of any nation, and commercial banks in Nigeria are no exception. Commercial banks operate in a highly competitive environment where performance is often measured by revenue growth. To enhance productivity and maintain a competitive edge, banks frequently adopt various job redesign strategies, including job rotation, job enlargement, job enrichment, and job simplification. These strategies are designed to optimize employee performance, which in turn influences performance growth. Job redesign offers a framework for restructuring work to optimize employee engagement and productivity (Amodu et al., 2023). This framework aims to align job structures with both employee capabilities and organizational objectives.

Job rotation involves the systematic movement of employees across different roles within an organization. This strategy aims to reduce monotony, enhance skill diversity, and improve employee adaptability (Achieng et al., 2005). In commercial banks, job rotation can help employees gain a broader understanding of banking operations, which may lead to improved efficiency and innovation. However, frequent rotation without proper training may disrupt workflow and reduce specialization, potentially affecting revenue growth.

Similarly, job enlargement is the horizontal expansion of job roles by adding more tasks of a similar nature. Unlike job rotation, which shifts employees between different positions, job enlargement increases the scope of work within the same role (Kapoor & Agrawal, 2019). The rationale behind this strategy is to reduce boredom and increase engagement by providing employees with a wider variety of tasks. In commercial banks, job enlargement could involve assigning tellers additional responsibilities such as customer service or basic account management. While this may enhance job satisfaction, it could also lead to role overload if not properly managed.

Furthermore, job enrichment is a vertical expansion of job roles, where employees are given more autonomy, responsibility, and opportunities for professional growth (Ondiba et al., 2021). This approach focuses on enhancing the intrinsic motivational aspects of work by allowing employees to take on more challenging tasks, make decisions, and see the impact of their contributions. In commercial banks, job enrichment might involve empowering loan officers to approve certain credit requests without higher-level authorization (Kapoor & Agrawal, 2019).

Job simplification is the process of breaking down complex tasks into smaller, more manageable components to improve efficiency and reduce errors (Ngugi, 2016). This approach is often used in repetitive or highly structured work environments, such as back-office operations in banks. While this approach can lead to operational efficiencies, it may also result in decreased job satisfaction due to the repetitive nature of simplified tasks (Farid & El-Sawalhy, 2018). In banking operations, this might involve streamlining back-office processes to focus solely on data entry, potentially impacting employee engagement.

However, performance in commercial banks may be influenced by various factors, though job redesigned can stimulate by fostering a more engaged and versatile workforce, capable of delivering superior customer service and adapting to changing market demands. For instance, employees exposed to job rotation may develop a holistic understanding of banking operations,

enabling them to identify cross-selling opportunities and improve customer retention, thereby contributing to revenue growth and overall performance (Daniels et al., 2017).

The relationship between job redesign and organizational performance has been studied in various industries, but few studies (Achieng et al., 2014) have specifically examined commercial banks in Nigeria. Most existing research focuses on employee satisfaction or individual productivity rather than revenue growth, which is a critical performance indicator for banks (Amodu et al., 2023). Additionally, while some studies explore (Ngugi, 2016; Farid & El-Sawalhy, 2018) isolated aspects of job redesign, there is limited empirical evidence on how these strategies collectively influence banks performance. This study seeks to fill these gaps by investigating how job rotation, job enlargement, job enrichment, and job simplification influence performance of commercial banks in Cross River State, Nigeria.

Literature Review Hypotheses Development

The Job Characteristics Theory (JCT)

The Job Characteristics Theory (JCT), developed by Hackman and Oldham (1975), offers a comprehensive framework for understanding how specific job attributes influence employee motivation and performance. This theory emerged as a response to the limitations of earlier job design models, emphasizing the psychological processes that mediate the relationship between job characteristics and work outcomes. At the heart of JCT are five core job dimensions: skill variety, task identity, task significance, autonomy, and feedback. These dimensions are posited to influence three critical psychological states: experienced meaningfulness of the work, experienced responsibility for outcomes, and knowledge of the actual results of work activities. When these psychological states are present, they lead to positive outcomes such as high internal work motivation, job satisfaction, and improved performance (Hackman & Oldham, 1976; Obiora & Okon, 2023).

The theory operates under several key assumptions. Firstly, it assumes that individuals will experience greater motivation and satisfaction when their jobs are designed to enhance the aforementioned psychological states. Secondly, it posits that the presence of these psychological states is contingent upon the design of the job itself, rather than external factors. Lastly, the theory acknowledges that individual differences, such as an employee's growth need strength, can moderate the relationship between job characteristics and outcomes, suggesting that not all employees will respond uniformly to job design interventions (Ugwu & Eze, 2022). In commercial banks, the application of JCT is particularly pertinent. The banking sector is characterized by dynamic environments and the need for high levels of employee engagement and performance. Implementing job redesign strategies such as job rotation, job enlargement, job enrichment, and job simplification can be instrumental in enhancing employee motivation and, consequently, organizational performance.

Concept of Job Redesigned

Job redesign is a strategic approach to structuring work roles and responsibilities to enhance employee performance and organizational effectiveness. In the context of commercial banks in Cross River State, Nigeria, job redesign is pivotal for adapting to evolving market demands and technological advancements (Farid & El-Sawalhy, 2018). The concept of job redesign encompasses modifications in job structures to improve job satisfaction, motivation, and

performance. This includes altering tasks, responsibilities, and workflows to align with organizational goals and employee capabilities. In the banking sector, where precision, customer service, and adaptability are crucial, job redesign can lead to significant improvements in operational efficiency and service delivery.

The concept of job redesign is rooted in theories of organizational behavior and human resource management, particularly the Job Characteristics Model (JCM) proposed by Hackman and Oldham (1975). This model suggests that well-designed jobs with core dimensions such as skill variety, task identity, task significance, autonomy, and feedback lead to higher motivation, job satisfaction, and performance. When applied to commercial banks, job redesign can mitigate burnout, enhance employee engagement, and foster innovation in service delivery. For instance, restructuring teller roles to include customer relationship management tasks rather than limiting employees to cash transactions can improve both job satisfaction and customer service quality.

Concept of Job Rotation

Job rotation is a strategic human resource practice that involves systematically moving employees across different roles or departments within an organization (Daniels et al., 2017). This lateral movement is designed to enhance employees' skills, knowledge, and experience, thereby contributing to both individual and organizational growth. In commercial banks, job rotation serves as a vital tool for workforce development and performance enhancement (Siengthai et al., 2016). The concept of job rotation is rooted in the idea that exposing employees to various functions within the bank can lead to a more versatile and adaptable workforce. Rotating through different roles, employees gain a comprehensive understanding of the bank's operations, which fosters a more integrated approach to service delivery. This holistic exposure not only broadens employees' skill sets but also enhances their problem-solving abilities and decision-making skills, which are crucial in the dynamic banking environment (Holman & Axtell, 2016).

In the Nigerian banking sector, job rotation has been recognized as an effective means of on-the-job training (Zareen et al., 2013). A study focusing on the Nigerian banking industry revealed that a significant majority of employees acknowledged the benefits of job rotation in enhancing their knowledge and aiding their career progression (Adagbabiri & Okolie, 2019). Specifically, 70.6 percent of respondents agreed that job rotation had enhanced their knowledge, and 83.6 percent of those who had attained leadership positions attributed their advancement to experiences gained through job rotation (Adagbabiri & Okolie, 2019).

Concept of Job Enlargement

Job enlargement represents a strategic approach to work design that involves expanding the scope of an employee's responsibilities by incorporating additional tasks of similar complexity within their existing role (Chilgong et al., 2021). Unlike job rotation which moves employees between different positions, job enrichment which increases depth of responsibility, or job redesign which may restructure entire workflows, job enlargement specifically focuses on horizontal expansion of work activities. In commercial banks, this concept translates to broadening the range of duties assigned to bank employees without necessarily increasing the challenge level or authority associated with their positions. The theoretical foundation of job enlargement stems from early organizational behavior research that recognized the limitations of extreme task specialization. Where traditional banking operations often compartmentalized functions into narrow, repetitive

tasks, job enlargement seeks to create more varied work experiences by combining related activities. For instance, a customer service representative in a commercial bank might traditionally handle only account inquiries, but through job enlargement could also process basic transactions, assist with card requests, and provide initial loan application guidance. This horizontal expansion of duties maintains the same general skill level while reducing monotony and increasing task variety.

Commercial banks operate in a highly competitive financial services environment where customer expectations continue to rise while operational efficiency remains paramount. Job enlargement offers these institutions a mechanism to enhance employee capabilities while maintaining operational control (Hawa, 2018). When tellers are empowered to handle multiple transaction types or relationship managers can address both savings and loan products, the bank benefits from increased flexibility in workforce deployment. This becomes particularly valuable in branches with limited staff, where the ability to cross-utilize employees can significantly improve service delivery. The relationship between job enlargement and bank performance manifests through several key mechanisms.

Concept of Job Enrichment

Job enrichment represents a sophisticated approach to work design that fundamentally enhances the quality and depth of employees' work experiences by incorporating greater responsibility, autonomy, and opportunities for personal growth within their existing roles. This human resource strategy moves beyond superficial task adjustments to create more meaningful and challenging work environments (Obiora & Okon, 2023). In commercial banks job enrichment involves restructuring positions to include higher-level responsibilities, decision-making authority, and task variety that align with employees' professional capabilities and aspirations. Commercial banks operate within a dynamic financial landscape characterized by increasing competition, technological disruption, and evolving customer expectations. These institutions face the dual challenge of maintaining operational efficiency while fostering innovation and customer-centric service. Job enrichment serves as a strategic lever to enhance organizational performance by developing more engaged, skilled, and accountable employees. When bank staff are entrusted with greater responsibility and autonomy, they typically demonstrate higher commitment levels and produce superior work outcomes (Ugwu & Eze, 2022).

Concept of Job Simplification.

Job simplification, a concept rooted in the principles of scientific management, involves the reduction of job tasks to their most basic elements to enhance efficiency and productivity. This approach seeks to streamline work processes by minimizing the complexity of tasks, thereby allowing employees to focus on specific, repetitive functions (Saddam et al., 2023). In commercial banks, job simplification has been employed as a strategy to improve operational efficiency and service delivery. The implementation of job simplification in the banking sector often entails the standardization of procedures and the use of technology to automate routine tasks. For instance, the adoption of automated teller machines (ATMs) and online banking platforms has reduced the need for manual processing of transactions, thereby simplifying the roles of bank tellers and customer service representatives. This technological integration aligns with the McDonaldization thesis, which posits that the principles of efficiency, calculability, predictability, and control are increasingly dominating various sectors, including banking (Ondiba et al., 2021).

While job simplification can lead to increased productivity by enabling employees to perform tasks more quickly and with fewer errors, it also has implications for employee satisfaction and performance. The repetitive nature of simplified tasks may result in monotony, reducing job satisfaction and potentially leading to higher turnover rates. Moreover, the emphasis on efficiency and standardization can limit employees' autonomy and opportunities for skill development, which are critical factors in job enrichment and motivation (Farid & El-Sawalhy, 2018). In the Nigerian banking industry, the drive for efficiency through job simplification has also led to increased job insecurity. The replacement of human labor with technology has resulted in the downsizing of staff, particularly in roles that have been automated. This shift has created a workforce that is often characterized by casual or contract employment, lacking the stability and benefits associated with permanent positions (Akhimien et al., 2023). The prevalence of such employment arrangements can negatively impact employee commitment and performance, as workers may feel less valued and more expendable.

Commercial Banks Performance

The concept of commercial bank performance represents a comprehensive evaluation framework that assesses how effectively financial institutions meet their operational, financial, and strategic objectives. Performance in this context extends beyond simple profitability metrics to encompass multiple dimensions of organizational effectiveness. In the banking sector, performance measurement serves as a critical tool for assessing institutional health, market positioning, and contribution to economic development (Adeoye & Adeyinka, 2022). This multidimensional construct incorporates financial indicators, operational metrics and customer service measurements (Okafor, 2021).

In Nigeria, commercial banks operate within a dynamic environment characterized by technological advancements, regulatory changes, and evolving customer expectations. These factors necessitate continuous evaluation and enhancement of performance to remain competitive and sustainable. The Central Bank of Nigeria's policies, such as the cashless policy and naira redesign, have significant implications for banking operations, influencing both cost structures and service delivery models (Adeleke et al., 2022). Job redesign involves the deliberate alteration of job structures to improve employee satisfaction and organizational outcomes. It encompasses changes in task variety, autonomy, skill requirements, and feedback mechanisms (Okafor, 2021). In the banking sector, job redesign has been employed to adapt to technological changes, improve service quality, and enhance employee engagement.

Empirical Review

Empirical review were carryout to form empirical foundation to the study. Studies on job redesigned and performance relationship were selected and reviewed. The 5Cs framework of literature review was adopted in carrying out the empirical review in the study, stating with cite: Achieng et al. (2014) investigated the effect of job redesign on employee performance in commercial banks in Kisumu, Kenya. The study focused on 12 commercial banks, targeting a population of 850 employees, from which a sample of 265 was selected using stratified random sampling. Data were collected through structured questionnaires, and regression analysis was employed to test the hypotheses. Findings revealed that job redesign significantly improved employee performance, particularly through enhanced task variety, autonomy, and feedback mechanisms. Employees in redesigned roles demonstrated higher efficiency, reduced errors, and

greater job satisfaction. The study concluded that job redesign serves as a strategic tool for optimizing workforce productivity in the banking sector.

Chukwuma (2023) explored the relationship between job design, job analysis, and employee performance in deposit money banks within the Federal Capital Territory (FCT), Abuja, Nigeria. The study adopted a survey research design, targeting 420 employees across 15 banks, with a sample size of 204 determined using the Taro Yamane formula. Data were analyzed using multiple regression, and results indicated that job design and analysis significantly influenced employee performance. Specifically, role clarity and task significance were identified as critical factors that enhanced productivity and service delivery. The study recommended that Nigerian banks adopt systematic job redesign strategies to align employee roles with organizational objectives.

Amodu, et al. (2023) examined job redesign and employee productivity in vegetable oil firms in Anambra State, Nigeria, providing insights applicable to the banking sector. The study surveyed 300 employees, with a sample of 171 selected through simple random sampling. Using Pearson correlation and regression analysis, the study found that job redesign positively impacted productivity by reducing monotony and improving task engagement. Employees who experienced role expansion and skill diversification exhibited higher output levels. The findings suggested that financial institutions could replicate similar job redesign interventions to enhance operational efficiency.

Ngugi (2016) conducted a case study on Equity Bank in Kenya to assess the effects of job design on employee performance. The study targeted 200 employees, with a sample of 132 selected through purposive sampling. Data were analyzed using descriptive and inferential statistics, revealing that job rotation and task enrichment significantly improved employee adaptability and performance. Employees in redesigned roles reported higher motivation and reduced burnout, leading to better customer service outcomes. The study emphasized the importance of continuous job evaluation to sustain performance gains in dynamic banking environments.

Farid and El-Sawalhy (2018) investigated job redesign as a tool for improving individual work performance in Egyptian hotels, offering comparative insights for the banking sector. The study involved 150 employees, with data collected through structured interviews and analyzed using regression techniques. Results showed that job redesign interventions, particularly those enhancing task autonomy and responsibility, led to measurable improvements in employee output. The study concluded that financial institutions could leverage similar strategies to enhance workforce performance and service quality. Based on the literature review, the following hypotheses were developed to guide this study:

Ho1: Job rotation does not have significant effect on the performance of commercial banks in Cross River State, Nigeria.
Ho2: Job enrichment does not have significant effect on the performance of commercial banks in Cross River State, Nigeria.
Ho3: Job enlargement does not have significant effect on the performance of commercial banks in Cross River State, Nigeria.
Ho4: Job simplification does not have significant effect on the performance of commercial banks in Cross River State, Nigeria.

Methodology

The cross-sectional survey design was adopted for the study. A cross-sectional survey is a research method used to collect data from a diverse group of individuals at a specific point in time. It aims to gather information about the characteristics, opinions, behaviours, or attitudes of a population or a subset of that population (Babbie, 2016). The study was carried out in commercial banks in Cross River State, Nigeria. The population of the study consist of the entire 721 employees and management staff across 10 commercial banks and their respective branches operating within Cross River State. This study adopted a stratified sampling technique to ensure balanced representation of commercial banks across Cross River State, while Taro Yamane formula was used the determined the sample size for the study:

$$n = \frac{N}{1 + N(e)^2}$$

Where n = sample size
N = Population
1 = Constant
e = error limit (0.05)

$$n = \frac{721}{1 + 721(0.05)^2}$$

$$= \frac{721}{2.8025}$$

$$= 257.270 \approx 257$$

The study adopted the multiple regression model for the purpose of this study. The multiple regression model is presented thus:

$Y = \alpha + \beta X + \varepsilon$……... (i)

$Y = \alpha + \beta 1X1 + \beta 2X2 + \beta 3X3 + \beta 4X4 + \varepsilon$ ……..... (ii)

$EP = f$ (SC, TC, STC, LC) ……. (iii)

$EP = \alpha + \beta_1 JR_1 + \beta_2 JEnl_2 + \beta_3 JEnr_3 + \beta_4 JS_4 + \varepsilon$…….. (iv)

Where = (α, β1, β2 - - - - β4 $\neq$0…….) are regression coefficients.
Where Perf = Performance
JR = Job Rotation
JEnl = Job Enlargement
JEnr = Job Enrichment
JS = Job Simplification
bo = Regression constant
b_1- b_4 = Regression parameters to be estimated
e = Stochastic error

Results

Table 1 presents the distribution of responses from 200 participants on the key variables of the study: job rotation, job enlargement, job enrichment, job simplification, and performance. Each of these variables was measured on a scale ranging from a minimum of 1 to a maximum of 5, which shows that the survey instrument allowed respondents to express varying levels of agreement or experience. The mean values for all the job redesign variables and performance are consistently high, ranging from 4.3118 to 4.3954. This indicates that respondents generally perceived job

rotation, job enlargement, job enrichment, and job simplification as strongly present within the operations of commercial banks in Cross River State.

TABLE 11: Summary of descriptive statistics of all the variables

Variables	N	Minimum	Maximum	Mean	Std. Deviation	Variance
Job rotation	200	1	5	4.3535	0.32653	0.102
Job enlargement	200	1	5	4.3786	0.26643	0.071
Job enrichment	200	1	5	4.3654	0.40735	0.168
Job simplification	200	1	5	4.3118	0.34194	0.116
Performance	200	1	5	4.3954	0.38443	0.148

The results in Table 2 present the normality test for the study variables, focusing on job rotation, job enlargement, job enrichment, job simplification, and performance of commercial banks in Cross River State, Nigeria. A sample size of 200 was used consistently across all variables, ensuring uniformity in the analysis. The skewness values show the extent to which the distribution of data departs from symmetry. Job rotation and performance both record negative skewness values of -0.626 and -0.692 respectively, indicating a slight leftward lean in their distributions. Job enlargement, job enrichment, and job simplification also present negative skewness, though less pronounced, suggesting that responses for these constructs are relatively balanced but with marginal clustering toward higher values. The standard errors for skewness remain constant at 0.079, highlighting the reliability of the estimates across all measures. Kurtosis values examine the sharpness of the data distribution compared to a normal curve. The results for all variables fall below zero, pointing to platykurtic distributions. This implies that the data for job redesign strategies and performance are flatter than the normal curve, with fewer extreme responses.

TABLE 2: Normality test results

Variables	N Statistic	Skewness Statistic	Std. Error	Kurtosis Statistic	Std. Error
Job rotation	200	-0.626	0.079	-0.602	0.159
Job enlargement	200	-0.201	0.079	-1.071	0.159
Job enrichment	200	-0.135	0.079	-1.371	0.159
Job simplification	200	-0.162	0.079	-1.020	0.159
Performance	200	-0.692	0.079	-1.089	0.159
Valid N (listwise)	200				

The results in Table 3 present the Levene's test of homogeneity of variances for job rotation, job enlargement, job enrichment, job simplification, and performance. The test is used to determine whether the assumption of equal variances holds across groups, which is an important requirement for parametric tests such as ANOVA and regression. A significance value greater than 0.05 indicates that the variances are not significantly different, meaning the assumption of homogeneity has been met.

TABLE 3: Levene's test of homogeneity of variances

Variables	Levene statistic	df1	df2	Sig.
Job rotation	1.543	1	199	.253
Job enlargement	0.484	1	199	.473
Job enrichment	0.662	1	199	.452
Job simplification	2.371	1	199	.183
Performance	0.283	1	199	.531

The correlation matrix presented in Table 4 provides insight into the relationship between job redesign practices specifically job rotation, job enlargement, job enrichment, and job simplification and the performance of commercial banks in Cross River State, Nigeria. The coefficients indicate positive and statistically significant relationships at the 0.01 level, meaning the associations are strong enough not to be attributed to chance.

TABLE 4: Correlations among variables

Variables	Perf	JR	JEnl	JEnr	JS
Perf	1				
Job rotation	.567**	1			
Job enlargement	.566**	.554**	1		
Job enrichment	.554**	.573**	.587**	1	
Job simplification	.652**	.688**	.754**	.653**	1

**. Correlation is significant at the 0.01 level (2-tailed).

The collinearity statistics in Table 5 provide insight into the extent to which the independent variables job rotation, job enlargement, job enrichment, and job simplification are related to one another in the context of their influence on the performance of commercial banks in Cross River State, Nigeria. The tolerance values range from .497 to .561, while the variance inflation factor (VIF) values fall between 1.783 and 2.012. These figures indicate that multicollinearity is not a concern in the model, since tolerance values are well above the threshold of .10 and VIF values remain comfortably below the critical value of 10.

TABLE 5: Summary of collinearity statistics of variables

	Collinearity Statistics	
Variables	Tolerance	VIF
Job rotation	.519	1.926
Job enlargement	.505	1.980
Job enrichment	.561	1.783
Job simplification	.497	2.012

Source: Fieldwork, 2025

The confirmatory factor analysis presented in Table 6 was carried out to validate the measurement model for the study on job redesign and the performance of commercial banks in Cross River State, Nigeria. The constructs examined include job rotation, job enlargement, job enrichment, job simplification, and performance. Each construct is represented by a set of observable items with their corresponding standardized factor loadings (SFL), average variance extracted (AVE), and

composite reliability (CR). These values provide insight into the reliability and validity of the constructs in capturing the underlying dimensions of job redesign and performance. The SFL, AVE and CR were all satisfactory. The model fit indices further reinforce the robustness of the measurement model. The CMIN/DF of 2.773 falls within the recommended threshold for a good fit, while the RMSEA of 0.0632 indicates an acceptable error of approximation. The comparative fit index (CFI) of 0.922 exceeds the benchmark of 0.90, confirming that the hypothesized model fits the data well. The results establish the reliability and validity of the constructs, showing that the measures of job redesign and performance are both statistically sound and conceptually appropriate for the study.

TABLE 16: Confirmatory factor analysis results

Source: Researcher Compilation, 2025

The results presented in Tables 7, 8, and 9 collectively explain the effect of job redesign captured through job rotation, job enlargement, job enrichment, and job simplification on the performance of commercial banks in Cross River State, Nigeria. Table 7 shows the model summary where the correlation coefficient (R = .795) indicates a strong positive relationship between job redesign

practices and performance. The coefficient of determination (R Square = .624) reveals that 62.4 per cent of the variance in bank performance can be explained by job redesign variables. The adjusted R Square (.601) confirms the model's reliability when accounting for the number of predictors. The Durbin-Watson value of 1.642 suggests that autocorrelation is not a major concern, meaning the data fit the regression assumptions well.

Table 8 presents the ANOVA results, which test the overall significance of the regression model. The F-statistic of 81.055 with a significance level of .000 indicates that the model is highly significant, confirming that job redesign as a whole significantly predicts performance in commercial banks. This provides strong evidence to reject the null hypothesis that job redesign does not influence performance.

Table 9 provides detailed coefficients for each predictor variable. Job rotation has a positive unstandardized coefficient (B = .574) with a highly significant p-value (.000), meaning it exerts a strong and significant influence on performance. This supports the rejection of Ho1 and acceptance of the alternative hypothesis that job rotation significantly improves performance. Job enlargement (B = .483, Sig. = .000) also has a positive and significant impact, leading to the rejection of Ho3 in favor of the alternative that job enlargement enhances performance. Similarly, job enrichment (B = .573, Sig. = .001) exerts a strong, statistically significant effect, justifying the rejection of Ho2. Job simplification (B = .463, Sig. = .000) also significantly contributes to performance, requiring the rejection of Ho4 and confirming that job simplification improves organizational performance.

The findings demonstrate that each dimension of job redesign considered in the study significantly predicts the performance of commercial banks in Cross River State. The strength of the coefficients and their levels of significance highlight that job rotation, job enrichment, job enlargement, and job simplification all have significant positive effect on the performance of commercial banks in Cross River State. The model explains more than half of the variance in performance, confirming that job redesign is a key driver of competitiveness and operational effectiveness in the banking sector.

Discussion of Findings

The test of hypotheses revealed that job rotation has significant positive effect on the performance of commercial banks in Cross River State, Nigeria. In the dynamic banking environment where customer needs and regulatory demands change rapidly, rotation helps staff develop problem-solving competencies and reduces monotony, ultimately boosting service delivery. These results corroborate the findings of Ondiba et al. (2021), who reported that cross-functional rotation in Kenyan banks enhanced financial performance through greater operational flexibility. Similarly, Achieng et al. (2014) highlighted that job rotation in Kisumu banks reduced employee fatigue while improving accuracy and efficiency. Agu et al. (2023) also confirmed that rotation not only improves performance but strengthens teamwork, a factor essential in customer-centered industries like banking. For managers, this finding implies that structured rotational schemes can be leveraged as both a performance tool and a succession planning mechanism.

Also, job enrichment has significant positive effect on the performance of commercial banks in Cross River State, Nigeria. Enrichment motivates employees by linking their roles to meaningful outcomes, which improves commitment and innovation. This aligns with the arguments of Ugwu and Eze (2022), who demonstrated that enrichment practices in Nigerian banks increased productivity by cultivating ownership of tasks. Chilgong et al. (2021) similarly found that enriched work designs in Kenyan universities improved staff output by fostering creativity and accountability. Magaji et al. (2017) also showed that enrichment deepens employee loyalty, reducing turnover risks while enhancing performance. The implication of the findings is that management should prioritize enrichment initiatives such as participatory decision-making, skill development programs, and role expansion to sustain high levels of performance.

Job enlargement has significant positive effect on the performance of commercial banks in Cross River State, Nigeria. Enlarged roles often encourage a sense of competence as employees handle broader responsibilities, which can result in better service delivery and improved operational efficiency. This is consistent with Adagbabiri and Okolie (2019), who demonstrated that job enlargement in the Nigerian Bottling Company led to higher performance through increased role variety. Opiyo et al. (2014) observed that enlarged tasks in Kenyan commercial banks reduced delays and improved customer satisfaction, while Amodu et al. (2023) reported that enlargement in manufacturing firms contributed to higher productivity by enhancing employee engagement. The implication for banks is that enlargement strategies must be carefully structured to balance

workload distribution and avoid employee burnout, ensuring that expanded tasks lead to empowerment rather than pressure.

Job simplification has significant positive effect on the performance of commercial banks in Cross River State, Nigeria. Simplification minimizes errors, reduces training time, and ensures that even complex processes become easier to manage in customer service and operations. Achieng et al. (2014) confirmed that simplification improved banking operations in Kenya by streamlining repetitive functions. Similarly, Farid and El-Sawalhy (2018) found that simplification in Egyptian hotels enhanced performance by standardizing procedures and reducing time wastage. Agu et al., (2023) also noted that simplified roles increased employee confidence and organizational efficiency in Nigerian banks. For banks in Cross River State, the implication is that adopting simplification strategies can significantly reduce operational risks, particularly in transaction processing and compliance management, while ensuring faster service delivery.

Conclusion

The study affirms that strategic redesign of jobs holds a powerful influence on the effectiveness and competitiveness of commercial banks in Cross River State. In a sector marked by rapid technological changes, intense regulatory pressures, and shifting customer expectations, the way work is structured directly shapes organizational outcomes. Evidence from this research underscores the fact that when banks purposefully restructure roles, they not only enhance operational efficiency but also strengthen the capacity of employees to deliver consistently high performance. Job redesign, therefore, emerges as a central lever for improving productivity, employee engagement, and service delivery.

Commercial banks thrive on systems that balance efficiency with adaptability. The findings suggest that well-thought-out redesign initiatives make work more meaningful, stimulate motivation, and position employees to respond effectively to dynamic market demands. These adjustments do not merely reorganize tasks; they elevate the quality of human capital utilization. In a competitive environment like banking, where customer satisfaction and speed of service are critical, the structuring of jobs becomes a strategic resource. It can determine whether an institution remains relevant, resilient, and profitable in the face of economic and industry challenges.

The evidence also highlights the broader organizational gains that flow from redesigning work. Beyond immediate performance outcomes, these interventions foster long-term institutional stability. Employees who experience well-structured roles are more likely to build commitment to their organizations, reduce turnover tendencies, and demonstrate initiative in solving workplace problems. In turn, banks benefit from a workforce that is both skilled and dedicated, ensuring continuity and growth. Job redesign is not simply an operational adjustment but an investment in the sustainability of the institution.

Effect Of Occupational Safety and Health Management Practices on Quality Service Delivery of Oil and Gas Companies in Cross River State, Nigeria

Inyang, Stephanie Effiong & Ekpenyong Bassey Obo
Department of Business Management, University of Calabar, Nigeria

Abstract
The study examined the effect of occupational safety and health management practices on quality service delivery of oil and gas companies in Cross River State, Nigeria. These practices were evaluated across four dimensions: hazard control, risk assessment, safety training, and safety monitoring, with job satisfaction serving as the moderating variable. Ex-post facto design involving survey was used for the study. Multiple regression analysis was employed to test the study's hypotheses. Findings revealed that hazard control has a significant positive effect on performance of oil and gas companies, indicating that effective hazard management enhances operational outcomes by reducing accidents and disruptions that undermine productivity. Risk assessment also showed a significant positive effect, as firms that systematically identify, evaluate, and mitigate risk are better able to sustain stable operations. Similarly, safety training was found to positively affect quality service delivery of oil and gas companies, highlighting the value of equipping employees with the knowledge and skills to manage workplace hazards. Furthermore, job satisfaction significantly moderated the relationship between safety management practices and performance of oil and gas companies. Based on these results, it was recommended that oil and gas companies invest in engineering controls, protective equipment, and safer work processes to minimize incidents. Organizations should adopt hazard prevention and control measures aligned with global best practices to enhance safety, promote job satisfaction, and boost productivity. Additionally, regular and comprehensive risk assessments should be carried out to identify potential hazards in the work environment before implementing control policies

Keywords: *Occupational safety, health management practices, hazard control, risk assessment, safety training, job satisfaction*

Introduction

In today's dynamic industrial environment, the well-being of employees is paramount to organizational success. Safety practices within the workplace not only safeguard employees from potential hazards but also play a crucial role in enhancing service delivery. This relationship is particularly significant in specialized economic sector like the oil and gas. Safety practices are policies and procedures put in place to ensure employee protection from workplace hazards. They involve a range of protocols and measures designed to protect employees from workplace hazards. These include hazard control, risk assessment, and safety training etc (Lindawati et al., 2024). Effective safety practices are not merely reactive; rather, they are proactive systems designed to prevent accidents and mitigate risks before they materialize. High-quality safety practices can lead

to reduced accidents and injuries, enhancing not only the well-being of employees but also the overall health of the organization (Ehiaguina et al., 2024).

While the benefits of occupational health and safety practices are well-documented (Bautista-Bernal, 2023), many oil and gas in developing countries like Nigeria prioritize profitability at the expense of employee well-being. With the expansion of oil and gas exploration and the resulting increase in industrial accidents and exposure to hazardous chemicals, health and safety management practice has become increasingly critical. Effective hazard control practice plays a vital role in occupational health and safety management. Hazard control measures in the oil and gas companies involve identifying, assessing, and mitigating workplace risks. Major hazards include mechanical injuries, exposure to toxic substances, fires, explosions, and environmental contamination (Mutiara et al., 2024).

Furthermore, risk assessment, a major component of safety management, involves systematically identifying, evaluating, and prioritizing risks. The process is foundational for preventing incidents in the oil and gas companies, where risks include pipeline failures, equipment malfunctions, and operational hazards are prevalent (Nkrumah et al., 2021). However, many Nigerian oil and gas firms, especially in downstream and upstream operations, struggle to implement robust risk assessment frameworks. Safety training is another critical aspect occupational safety, equipping employees with the knowledge and skills needed to handle workplace hazards effectively. Comprehensive training programmes ensure compliance with safety standards, promote a culture of safety, and reduce workplace accidents. However, many oil and gas facilities operate under tight budgets, resulting in inadequate training that compromises employee preparedness and operational efficiency. Enhancing safety training can directly improve service delivery by fostering a well-informed and proactive workforce (Otu-Boateng, 2022).

Despite the recognized importance of occupational safety, a number of Nigerian oil and gas companies continues to face persistent challenges. Regulatory gaps, insufficient safety investments, and high incident rates limit the companies' quality service delivery and performance (Abdullahi & Aremu, 2021). While many studies such as Amah and Onuoha (2022), Bautista-Bernal et al. (2024) have explored the impact of OSHM practices on safety outcomes, limited research has examined their influence on quality service delivery within the Nigerian oil and gas companies. This study aims to address these gaps by providing empirical insights into how occupational safety influence quality service delivery of oil and gas companies.

In recent years, the global emphasis on workplace safety has garnered significant attention, underscoring an urgent need for improved safety practices in organisations, including oil and gas companies. However, the Nigerian oil and gas industry is fraught with occupational safety challenges that undermine worker well-being and quality service delivery. Oil and gas environment are inherently hazardous, involving activities that expose workers to risks such as explosions, toxic chemical exposure, and machinery accidents. Over the years, a number of workers in the oil and gas companies have temporarily or permanently been disabled by work-related accidents, injuries, respiratory disease, cancer and other illness which impede on workers' health and safety. However, poor hazard control practices increase the risks in the oil and gas companies. Similarly, the absence of robust risk assessment practices compounds these issues.

Risk assessment is a critical tool for identifying potential hazards and determining the likelihood of adverse outcomes.

Furthermore, insufficient safety training practices compromise worker preparedness in managing occupational risks. In most oil and gas firms, safety training is inconsistent, outdated, or inaccessible to workers. Therefore, this study examines the effects of occupational safety and health management on quality service delivery of oil and gas companies in Cross River State. Specifically, the study seeks to:

1. Determine the effect of hazard control on quality service delivery.
2. Investigate the effect of risk assessment on quality service delivery.
3. Examine the effect of safety training on quality service delivery.
4. Examine the moderating effect of job satisfaction on the relationship between health and safety management practices on quality service delivery.

Theoretical Framework

Accident Prevention Theory by Heinrich (1931)

Heinrich's Domino Theory, developed by Herbert W. Heinrich in 1931, conceptualizes accident causation as a sequential chain of events, likened to a row of falling dominoes. The theory posits that an accident results from a series of interconnected factors: an unsafe social environment or personal traits, individual faults or unsafe behaviors, unsafe acts or conditions, the accident itself, and the resulting injury. In this model, hazard control is crucial as it targets the removal of unsafe conditions such as poorly maintained equipment or inadequate safeguards that could precipitate an incident. Risk assessment aligns with identifying and mitigating the precursors to unsafe acts, such as evaluating potential hazards in operational processes like drilling or transportation within the oil and gas sector. Safety training practice plays a preventive role by shaping workers' behaviors and reducing faults, ensuring that employees are equipped with the knowledge to operate machinery safely or handle hazardous materials. Safety monitoring practice serves as an ongoing mechanism to detect and correct deviations in the sequence, such as lapses in protocol adherence, before they cascade into accidents (Mukherjee, 2024).

The relevance of accident prevention theory extends deeply into contemporary practices of hazard control, risk assessment and safety training. These dimensions ideally align with the essential aspects of employee quality service delivery, including efficiency, commitment, service delivery, and product quality. Examining these variables through the lens of accident prevention theory, one can appreciate how proactive approaches to workplace safety foster a culture of well-being, which, in turn, promotes higher levels of employee engagement (Zhang & Kim, 2024). The concept of occupational safety revolves around the systematic approach to identifying, assessing, and controlling workplace hazards to ensure the well-being of employees while enhancing organizational efficiency (Zacchaeus et al., 2024). For instance, Hughes and Ferrett (2015) define occupational safety as systematic approaches implemented in workplaces to prevent accidents and injuries, which are pivotal to maintaining a healthy and productive workforce. Similarly, Hallowell and Gambatese (2009) emphasize the role of occupational safety and health management practices in influencing organizational culture, thereby advocating for an integrated approach that entangles safety with operational performance.

Literature Review

Occupational safety practices encompass a wide range of activities, including risk assessment, hazard identification, implementation of safety protocols, training and education of employees, and continuous monitoring and improvement of workplace conditions (Mohammed et al., 2024). In oil and gas industry, which is inherently hazardous due to the nature of its operations, occupational safety and health management practices are critical for preventing accidents, minimizing health risks, and ensuring the overall well-being of workers. The oil and gas sector is characterized by high-risk activities such as drilling, exploration, refining, and transportation, which expose workers to potential hazards like chemical spills, fires, explosions, and exposure to toxic substances. Therefore, effective occupational safety practices are not just a regulatory requirement but a fundamental aspect of operational excellence and corporate responsibility. The relationship between occupational safety and quality service delivery of oil and gas companies and interconnected. At its core, the quality service delivery of any organsiations is influenced by the well-being and productivity of its workforce. When workers are safe, healthy, and motivated, they are more likely to perform their tasks efficiently and contribute to the overall success of the company (Thomas et al., 2024).

Occupational hazard control is a critical component of occupational safety management, particularly in high-risk industries such as oil and gas. These practices refer to the systematic identification, assessment, and mitigation of risks and hazards that workers may encounter in their workplace. The goal of occupational hazard control is to create a safe and healthy work environment by minimizing or eliminating the potential for accidents, injuries, and illnesses (Nkrumah et al., 2021). This is achieved through a combination of engineering controls, administrative controls, and personal protective equipment (PPE). Engineering controls involve modifying the physical workplace or equipment to reduce hazards, such as installing ventilation systems to control airborne contaminants.

Administrative controls focus on changing work practices or policies, such as implementing safety training programs or rotating workers to limit exposure to hazardous conditions. PPE, on the other hand, provides a last line of defense by equipping workers with gear such as helmets, gloves, and respirators to protect them from residual risks. Bautista-Bernal et al. (2023) emphasizes the prevention of workplace injuries through the management of hazards, underscoring the necessity of a proactive approach to safety. Moreover, as highlighted by Garcia et al. (2022), effective hazard control is pivotal to the development of a culture of safety within an organization. These perspectives highlight that hazard control practices are not merely legal obligations but integral to fostering a safe work environment that contributes to overall organizational performance.

Hazard control practices typically evolve through the implementation of strategies that span from risk elimination to risk minimization. This structured approach ensures that organizations prioritize the most effective means of control, thus safeguarding employees while also improving operational efficiency. Risk assessment practice is a fundamental component of occupational safety and health management (OSH) systems, particularly in high-risk industries such as oil and gas. It involves the systematic process of identifying, evaluating, and controlling hazards that could potentially harm workers, damage equipment, or disrupt operations. In oil and gas companies, risk assessment is a proactive approach to ensuring that workplace hazards are recognized and mitigated before they result in accidents, injuries, or environmental damage. This practice is essential for

maintaining a safe working environment, complying with regulatory standards, and safeguarding the well-being of employees.

According to Kumarasinghe and Dilan (2022) risk assessment is a systematic and proactive approach designed to anticipate and mitigate the likelihood of adverse events by implementing measures to reduce or eliminate risks. Risk assessment is a fundamental aspect of safety management and is widely applied across various sectors. Kiran and Sindhiya (2024) describe risk assessment as not merely a tool for identifying hazards but also as a mechanism for understanding the potential consequences of these hazards, discussing both their probability and impact. The aim of risk assessment is to provide a basis for mitigating identified risks in order to protect employees and enhance their quality service delivery. Effective safety practices arise from a thorough understanding of risk assessment processes. Such practices not only contribute to the physical safety of employees but also play an instrumental role in their overall quality service delivery. When employees perceive their workplace as safe, they are more likely to experience enhanced morale and engagement, which ultimately contributes to productivity (Lari, 2023). Research shows that organizations prioritizing safety through effective risk assessment contribute significantly to a positive psychological climate, which in turn elevates quality service delivery.

The concept of safety training practice within the framework of occupational safety management is a structured and intentional process aimed at equipping workers with the knowledge, skills, and awareness necessary to identify, mitigate, and respond to workplace hazards (Okezie et al., 2023). Specifically tailored to the oil and gas companies, safety training practice involves a comprehensive approach to educating employees about the unique risks they face, such as explosions, chemical exposures, and equipment malfunctions, while fostering a culture of safety that aligns with organizational goals (Anireddy, 2024). It goes beyond mere compliance with regulations, encompassing hands-on exercises, theoretical instruction, and continuous learning to ensure that workers at all levels from rig operators to supervisors can perform their duties without compromising their well-being or that of their colleagues. This practice is rooted in the understanding that the oil and gas sector, with its high-stakes operations in drilling, refining, and transportation, demands a workforce that is not only technically proficient but also safety-conscious.

Safety training is the organized process of educating employees about workplace hazards, safe practices, and the measures necessary to prevent accidents and injuries. It aims to equip workers with the knowledge, skills, and attitudes required to perform their tasks safely while maintaining compliance with regulatory standards and organizational policies. Safety training encompasses a wide range of topics, including the proper use of equipment, hazard identification, emergency response procedures, and awareness of occupational health and safety regulations. The importance of safety training lies in its role in creating a safe work environment, reducing workplace injuries, and ensuring employees are aware of their rights and responsibilities regarding safety. Effective safety training fosters a culture of prevention and readiness, where employees are proactive in identifying risks and adopting safe practices. It also helps organizations meet legal and industry-specific safety standards, thereby minimizing liabilities and enhancing overall productivity.

The concept of service delivery is a fundamental aspect of organizational effectiveness. Service delivery involves the processes and actions through which public and private entities provide

essential services to individuals and communities. The effectiveness of service delivery is often evaluated based on how well it meets or exceeds the expectations of recipients, highlighting its importance in both public and private sectors (Riak & Bill, 2022). Service delivery is the process through which an organization provides its services to its stakeholders, primarily focusing on meeting the needs and expectations of its employees and clients. Several authors have offered definitions of service delivery that underscore its multifaceted nature. According to Motsitsi (2024), service delivery can be viewed as a process that involves not just the transaction of services but also an interaction that enhances the value provided to customers. Similarly, Wachira (2023) define service delivery as the manner in which a service is provided to customers, emphasizing the importance of the overall customer experience in shaping perceptions of quality service delivery. The relationship between service delivery and safety practices can be visualized as a dynamic relationship. Service delivery hinges on the quality and integrity of services rendered, which directly correlates with the organization's commitment to ensuring employee safety. An organization that effectively communicates its safety practices and integrates them into its service delivery model is likely to cultivate a work environment where employees feel secure and empowered.

Empirical Review

Studies on occupational health and safety management practices and performance were reviewed to form the empirical foundation of the study. Zacchaeus et al. (2024) conducted a study aimed at improving occupational health and safety management performance in Nigeria's oil and gas industry through a comparative risk model analysis. Employing a mixed-methods approach, the study analyzed safety data from multiple oil and gas companies and developed a risk-based model to enhance safety outcomes. The findings highlighted that companies implementing robust risk assessment frameworks experienced fewer safety incidents and improved operational efficiency. The study concluded that integrating comparative risk models into safety management practices could significantly enhance safety performance in high-risk industries like oil and gas. Nkrumah et al. (2021) examined the moderating and mediating influence of work motivation on the relationship between occupational health and safety management (OHSM) practices and work performance in the oil and gas sector. Using a structural equation modeling approach, the study found that work motivation significantly mediated the impact of OHSM practices on performance outcomes. The study highlighted the importance of fostering a motivated workforce to maximize the benefits of safety initiatives. These findings suggest that organizational efforts to improve safety performance should also address motivational factors to achieve optimal results.

Ehiaguina and Moda (2020) conducted a study assessing the impact of occupational health and safety management and safety culture on workers' safety behavior in Nigeria's oil and gas industry. The study found that a strong safety culture positively influenced workers' adherence to safety protocols, leading to improved safety performance. The authors recommended fostering a safety-oriented organizational culture as a strategic approach to enhancing safety outcomes. This study aligns with the broader literature emphasizing the role of cultural factors in shaping safety behavior. Okechukwu et al. (2022) examined the relationship between health and safety planning, training programs, and performance in manufacturing firms in Enugu State, Nigeria. The study employed a quantitative methodology and revealed a strong positive impact of safety training on both output and quality service delivery. These findings suggest that structured safety programs

can enhance quality service delivery, particularly in industrial zones like where comprehensive safety measures are crucial for fostering employee engagement and productivity.

Reinati and Liu (2024) analyzed the influence of occupational safety and health practices on quality service delivery at PT Hasrjat Abadi in Kupang. The study employed regression analysis and found that safety and health practices accounted for only 9.61 percent of the variance in quality service delivery, suggesting that other factors played a more significant role. This research provides a baseline for exploring additional variables affecting quality service delivery in diverse contexts, such as Nigeria's Oil and gas companies, where workplace dynamics and employee priorities may differ.

Methods

The research design adopted for this study was ex-post facto design involving survey. The study was carried out in Oil and gas companies in Cross River State, Nigeria. The population of the study comprise of the entire 1245 employees from the 21 selected oil and gas companies representing approximately 26 per cent of the 80 registered oil and gas companies currently in operation in Cross River State. This study adopts a stratified sampling technique to ensure balanced representation of oil and gas companies in Cross River State. Taro Yamane formula was used to determine the sample of two hundred and nineteen (219).

Model Specification

The multiple regression model was use to establish the relationship between the variables in the study. The multiple regression model was presented thus:

$Y = \alpha + \beta 1X1 + \beta 2X2 + \beta 3X3 + \varepsilon$ …… (i)

QSD = *f* (HCP, RAP, STP) …… (ii)

$QSD = \alpha + \beta_1 HCP_1 + \beta_2 RAP_2 + \beta_3 STP_3 + \varepsilon$…….. (iii)

Where	=	(α, $\beta 1$, $\beta 2$ - - - - $\beta 3 \neq 0$…….) are regression coefficients.
QSD	=	Quality Service Delivery
OHSMP	=	Occupational Health and Safety Management Practices
HCP	=	Hazard Control Practice
RAP	=	Risk Assessment Practice
STP	=	Safety Training Practice
X	=	Predictor
β	=	Coefficient
α	=	Intercept, Constant
ε	=	Stochastic error term

Analysis and Results

Tests of hypotheses

Ho_1: Hazard control practice does not have a significant effect on the performance of oil and gas companies in Cross River State, Nigeria.

Ho_2: Risk assessment practice does not have a significant effect on the performance of oil and gas companies in Cross River State, Nigeria.

Ho_3: Safety training practice does not have a significant effect on the performance of oil and gas companies in Cross River State, Nigeria.

Ho_4: Job satisfaction does not have a significant moderating effect on the relationship between health and safety management practice and the performance of oil and gas companies in Cross River State, Nigeria.

Multiple regression analysis was used to test the study hypotheses. The Model Summary in Table 1 indicates a strong linear relationship between the set of occupational safety and health (OS&H) management practices and company quality service delivery; the multiple correlation coefficient (R) equals 0.853, and the model explains 72.3 per cent of the variance in performance ($R^2 = 0.723$). After accounting for the number of predictors, the adjusted R^2 remains high at 0.715, which shows the four predictors collectively retain substantial explanatory power. The standard error of the estimate is 0.16817, quantifying the average distance between observed and predicted quality service delivery scores, and the Durbin–Watson statistic is 1.721, which is sufficiently close to 2 to indicate no serious first-order autocorrelation in the residuals for this cross-sectional analysis. The analysis is based on 215 observations (total df = 214).

The ANOVA Table 2, confirms that the regression model is statistically significant. The regression sum of squares is 323.652 with 4 degrees of freedom, giving a regression mean square of 80.913; the residual sum of squares is 123.970 with 210 degrees of freedom and a residual mean square of 0.590. The resulting F statistic is 137.141, and its probability is reported as $p < 0.001$, indicating that the combined set of OS&H predictors explains significantly more variance in service delivery than would be expected by chance. Table 3 examine the coefficient estimates of the model and shows that each OS&H practice has a positive and statistically significant partial effect on performance when the other practices are held constant. The intercept is 5.068 (SE = 0.740, t = 6.844, $p < 0.001$), indicating the model's baseline predicted performance when predictor scores are zero. Hazard control practice (HCP) has an unstandardized coefficient of 0.529 (SE = 0.126), a standardized beta of 0.417, t = 4.198, and p = 0.001, indicating a positive and significant association.

Risk assessment practice (RAP) shows an unstandardized coefficient of 0.655 (SE = 0.121), a standardized beta of 0.341, t = 5.413, and $p < 0.001$, also positive and significant. Safety training practice (STP) has an unstandardized coefficient of 0.628 (SE = 0.119), a standardized beta of 0.372, t = 5.277, and $p < 0.001$. These unstandardized coefficients indicate the expected change in quality service delivery measure for a one-unit increase in each practice score, holding other predictors constant; the standardized betas facilitate comparison across predictors, with hazard control practice showing the largest standardized effect, followed by safety training, risk assessment.

Formal hypothesis testing using $\alpha = 0.05$ leads to rejection of each null hypothesis. Hazard control practice is statistically significant (t = 4.198, p = 0.001), so the null that it has no effect on performance is rejected in favor of the alternative that it has a significant effect. Risk assessment practice is statistically significant (t = 5.413, $p < 0.001$), so the null that it has no effect is rejected. Safety training practice is statistically significant (t = 5.277, $p < 0.001$), so the null that it has no effect is rejected. Safety monitoring practice is statistically significant (t = 5.416, p = 0.001), so the null that it has no effect is rejected. The evidence therefore supports the proposition that each of the four OS&H practices included in the model has a positive and statistically significant association with the service delivery of oil and gas companies in Cross River State. The collective

findings indicate a robust and practically important relationship: the four practices together account for the majority of explained variation in performance ($R^2 = 0.723$), and each practice contributes positively when controlling for the others

TABLE 1
Model Summary[b] results for OS&H practices and performance

a. Dependent Variable: Quality service delivery

Tables 4 to 7 present the results of the hierarchical regression analysis conducted to test whether job satisfaction moderates the relationship between occupational safety and health (OSH) management practices; hazard control practice (HCP), risk assessment practice (RAP), safety training practice (STP) and quality service delivery of oil and gas companies in Cross River State, Nigeria. The model summary, which establishes overall model fit and the incremental contribution of job satisfaction. The table presents the ANOVA results, confirming that the models are statistically significant. The Table provides the coefficients for the direct effects of the OSH practices and job satisfaction, while it reports the interaction coefficients for HCP*JS, RAP*JS, STP*JS, and SMP*JS, which test the presence of moderation.

The model summary shows that the four OSH practices together explain a substantial proportion of the variance in performance. In the baseline model, which includes HCP, RAP, STP the regression returns $R = 0.853$ and $R^2 = 0.723$, indicating that these predictors account for 72.3 per cent of the variance in performance. The adjusted R^2 (0.715) shows minimal correction for model complexity, and the standard error of estimate is 0.16817. When job satisfaction and the interaction

terms are added in the second model, the overall fit improves. R increases to 0.915 and R^2 rises to 0.801, with an adjusted R^2 of 0.796 and a slightly lower standard error of 0.16110. The change in explained variance attributable to adding job satisfaction and the interactions is 0.078, and this improvement is statistically significant (F change = 81.93, $p < 0.001$). These results demonstrate that job satisfaction and its interactions significantly enhance the explanatory power of the model.

The ANOVA results corroborate the findings from the model summary. For the baseline model, the regression sum of squares is 323.652 (df = 4), and the residual sum of squares is 123.970 (df = 210), yielding F (4,210) = 137.141, which is highly significant ($p < 0.001$). In the second model, the regression sum of squares increases to 366.601 (df = 5), while the residual sum of squares decreases to 91.022 (df = 209). The overall test yields F(5,209) = 168.358, also highly significant ($p < 0.001$). The reduction in residual mean square from 0.590 to 0.4355 confirms a better fit and improved predictive accuracy once job satisfaction and its interactions are included. The total sample size used in the analysis is 215 (df = 214).

The Table shows that the four OSH practices have positive and statistically significant main effects on performance, both without and with job satisfaction in the model. In the baseline model, HCP (B = 0.529), RAP (B = 0.655), STP (B = 0.628) all yield highly significant results ($p \leq 0.001$). After including job satisfaction, the estimates increase slightly: HCP (B = 0.628), RAP (B = 0.755), STP (B = 0.528) Because these coefficients are unstandardized, each unit increase in the respective OSH practice or job satisfaction corresponds to the reported increase in quality service delivery, holding other factors constant.

The interaction coefficients provide direct evidence of moderation. All interaction terms are positive and statistically significant: HCP*JS (B = 0.724, SE = 0.136, t = 5.323, p = 0.001), RAP*JS (B = 0.763, SE = 0.097, t = 7.865, $p < 0.001$), STP*JS (B = 0.634, SE = 0.118, t = 5.372, p = 0.001). These results indicate that job satisfaction moderate the relationship between OSHM practices and quality service delivery of oil and gas firms. Hypothesis five directly tests whether job satisfaction moderates the relationship between health and safety management practices and performance. The HCP*JS interaction has an estimated coefficient of 0.724 with t = 5.323 and p = 0.001, well below conventional significance thresholds. This leads to the rejection of the null hypothesis and supports the conclusion that job satisfaction significantly moderates the relationship between hazard control practice and quality service delivery. The same conclusion holds for RAP, STP as their interaction terms are likewise positive and significant. The improvement in model fit resulting from the inclusion of job satisfaction and its interactions (R^2 increase = 0.078, F change = 81.93, $p < 0.001$) further confirms that job satisfaction plays a critical moderating role on the relationship between OSHM and performance of oil and gas companies.

Moderator: Job Satisfaction (JS)

Summary of findings

The study investigated the effect of occupational safety and health management practices on the performance of oil and gas companies in Cross River State, Nigeria. Occupational safety and health management practices were evaluated in four dimensions: hazard control practice, risk

assessment practice and safety training practice. Based on the test of hypotheses, the study found that hazard control practice has a significant positive effect on the performance of oil and gas companies in Cross River State, Nigeria. Also, it was found that risk assessment practice has a significant positive effect on the performance of oil and gas companies in Cross River State, Nigeria. Job satisfaction has a significant positive moderating effect on the relationship between health and safety management practice and the performance of oil and gas companies in Cross River State, Nigeria.

Conclusion and Recommendations

The study establishes that effective occupational safety and health management is not only a regulatory requirement but a driver of organizational performance in the oil and gas sector of Cross River State. The results show that systematic approaches to controlling hazards, assessing risks and training employees to create a safer working environment that directly supports operational efficiency and productivity. Overall, the evidence points to the conclusion that sustained investment in occupational safety and health practices yields measurable organizational benefits. For oil and gas companies in Cross River State, prioritizing safety is both a moral obligation and a business imperative, positioning them to achieve long-term resilience, regulatory compliance, and improved stakeholder trust.

1. Management of oil and gas companies should invest in engineering controls, protective equipment, and safer work processes to reduce incidents and accidents. Also, companies should implement proper hazard prevention and control measures in line with global best practices to ensure workers safety, job satisfaction and improve productivity.
2. The management of oil and gas companies should often carry out proper risk assessment in order to identify potential hazard in the work environment before implementing hazard prevention and control policy. Also, all accidents should be investigated to determine the causes and prevent a recurrence. Embedding structured risk identification and evaluation processes into daily operations ensures that potential threats are addressed before they escalate into costly incidents.
3. Regular safety training and orientation, workshops and seminar should be organized for employees in order to improve their skills, knowledge and inculcate adequate safety behaviours and culture on them to carry out task safely. Also, safety training and orientation should be provided to new employees and when workers are transferred to a new department.
4. Attention should also be given to job satisfaction as a moderating factor in maximizing the impact of safety practices. Employees who feel valued, supported, and motivated are more likely to comply with safety measures and contribute positively to company goals

Abstract
The manufacturing sector in Nigeria grapples with a significant problem of weak resilience, as firms struggle to adjust to economic crises, shifting market demands, and customer preferences. This study examined the relationship between operations improvement functions, (dimensioned by management control systems and preventive maintenance) and resilience, measured through adaptability and robustness, among manufacturing firms in Rivers State, Nigeria. Grounded in the Theory of Production Competence and Dynamic Capabilities Theory, and adopting a positivist philosophy, the research employed a cross-sectional survey design with a structured five-point Likert-scale questionnaire. The accessible population comprised 440 middle- and top-level managers from 25 firms affiliated with the Manufacturers Association of Nigeria (Rivers State Chapter). A sample of 205 respondents was determined using Krejcie and Morgan's table, with Bowley's proportional allocation and simple random sampling. Hypotheses were tested via partial least squares-structural equation modeling at a 0.05 significance level. Findings reveal a strong, significant positive relationship between management control systems and adaptability, but an insignificant weak positive link with robustness. Preventive maintenance showed a moderate significant positive association with adaptability and a strong significant positive relationship with robustness. These The study concludes that resilient manufacturing operations in this context require prioritizing preventive maintenance alongside targeted management control systems deployment. Recommendations include investing in management control systems for agility, complementing them with diversification strategies for robustness, and integrating analytics into preventive maintenance programs. Contributions to knowledge include novel empirical insights in an underexplored Nigerian context, delineation of differential effects on resilience dimensions, and refinements to the underpinning theories, highlighting boundary conditions for dynamic capabilities.

Key words*: Operations improvement function, resilience, manufacturing firms*

Introduction

The manufacturing sector in Nigeria significantly contributes to economic development, accounting for approximately 9.62% of the Gross Domestic Product (GDP) in the first quarter of 2025, a slight decline from 9.8% in the same period of 2024, while employing around 12% of the formal workforce and driving value addition that reached 13.51% of GDP in 2024 (National Bureau of Statistics, 2025; Chukwu & Nduka, 2025). Despite these contributions, manufacturing firms face substantial challenges, including high interest rates at 27.25%, persistent inflationary pressures eroding consumer purchasing power, foreign exchange volatility escalating operational costs, soaring energy expenses, and inadequate infrastructure such as unreliable power supply and

poor road networks, particularly in Rivers State (PwC, 2025; Okoisama et al., 2022). The resilience of manufacturing firms is critical in navigating these adversities, enabling organizations to withstand disruptions, recover swiftly from crises, and sustain long-term performance in Nigeria's volatile economic landscape marked by policy inconsistencies and infrastructural deficits (Akpan et al., 2022; Edafioghor, 2018; Okoisama et al., 2023a). Resilience enhances adaptability to market shifts, mitigates risks from economic challenges like currency fluctuations, and fosters competitive advantage, with studies showing resilient Nigerian firms achieve superior operational efficiency during uncertainty (Umoh & Amah, 2013; Sede et al., 2023). Resilience is measured through adaptability, the ability to adjust strategies and processes via strong leadership and supportive organizational culture, and robustness, the capacity to endure shocks while maintaining core functions (Bagshaw & Okoisama, 2023; Akpan et al., 2022). For instance, adaptability enables agile responses to supply chain disruptions, while robustness ensures operational continuity amid power outages or economic volatility. The antecedents of resilience include dynamic capabilities for resource reconfiguration, human capital development through skills and knowledge management, and social capital via collaborative networks (Edafioghor, 2018; Umoh & Amah, 2013; Sede et al., 2023; Akpan et al., 2022). The operations improvement function refers to structured managerial processes aimed at optimizing manufacturing operations by enhancing efficiency, reducing waste, and improving system performance through continuous workflow refinement, particularly vital in Nigeria's challenging environment (Okoisama et al., 2023a). Key dimensions of the operations improvement function include management control systems, which encompass internal controls for asset protection, fraud prevention, and policy adherence and enhanced financial performance in Nigerian firms, and preventive maintenance, involving proactive scheduling to avert equipment failures, with high efficacy to minimize downtime (Adelana, 2020; Okoisama et al., 2022; Eluu et al., 2024; Eti et al., 2004). Therefore, this study sought to establish the relationship between operations improvement function and resilience of manufacturing firms in Rivers State, Nigeria.

Statement of the Problem

The manufacturing sector in Nigeria grapples with a significant problem of weak resilience, evidenced by the closure of approximately 820 manufacturing enterprises between 2000 and 2008, followed by at least 800 additional closures from 2009 to 2011, and around 322 organized private enterprises shutting down between 2009 and 2014, with 50 more plants ceasing operations in 2016 alone due to harsh economic conditions (Osita-Ejikeme & Amah, 2022). This vulnerability is further highlighted by over 850 firms halting operations between 2000 and 2010, with the sector's capacity utilization stagnating at around 53% amidst reliance on imported goods (Umoh & Amah, 2013). The weak resilience manifests in low adaptability, where firms struggle to adjust to economic crises, shifting market demands, and customer preferences, leading to high liquidation rates and failure to capitalize on government policies, and weak robustness, seen in the inability to withstand persistent disruptions like energy shortages, with over 70% of manufacturing energy needs met through costly self-generation (Bagshaw & Okoisama, 2023; Sede et al., 2023). The causes of this issue include infrastructural deficiencies such as inconsistent power supply and poor road networks, socio-economic challenges like multiple taxation, corruption, and labor strikes, and operational constraints including low technological adoption, high production costs, and external threats like terrorism and natural disasters (Oke & Moradeyo, 2025). The effects are severe, contributing to unemployment rates soaring to 56.1% in 2020, pushing 133 million Nigerians into multidimensional poverty, reducing economic productivity with manufacturing GDP growth at

just 2% in Q1 2025, increasing overhead costs, diminishing global competitiveness, and exacerbating reliance on imports (Oke & Moradeyo, 2025). Scholars have proposed solutions such as fostering strategic flexibility through operational adjustments (Osita-Ejikeme & Amah, 2022), promoting proactiveness for better adaptability (Baba & Nwuche, 2021), implementing knowledge management to enhance resilience (Sede et al., 2023), developing dynamic capabilities (Akpan et al., 2022), adopting mitigation strategies like flexible production and outsourcing (Oke & Moradeyo, 2025), and prioritizing digitalization and supply chain localization (Orji & U-Dominic, 2024). However, a critical gap persists in the literature concerning the use of operations improvement functions, specifically management control systems and preventive maintenance, to address resilience in manufacturing firms in Rivers State, Nigeria, with limited empirical studies exploring their integration with adaptability and robustness to foster sustained resilience. Therefore, this study sought to fill the lacuna by critically assessing the relationship between operations improvement function and resilience of manufacturing firms in Rivers State, Nigeria. In view of the foregoing, the specific objectives were to:

i. Ascertain the relationship between management control systems and adaptability of manufacturing firms in Rivers State, Nigeria.
ii. Determine the relationship between management control systems and robustness of manufacturing firms in Rivers State, Nigeria.
iii. Investigate the relationship between preventive maintenance and adaptability of manufacturing firms in Rivers State, Nigeria.
iv. Assess the relationship between preventive maintenance and robustness of manufacturing firms in Rivers State, Nigeria.

Based to the stated objectives, the following research questions were listed:

i. What is the relationship between management control systems and adaptability of manufacturing firms in Rivers State, Nigeria?
ii. How does management control systems relate with robustness of manufacturing firms in Rivers State, Nigeria?
iii. What is the relationship between preventive maintenance and adaptability of manufacturing firms in Rivers State, Nigeria?
iv. How does preventive maintenance relates with robustness of manufacturing firms in Rivers State, Nigeria?

Accordingly, the following null hypotheses were formulated to provide tentative answers for the research questions:

H_{01}: There is no significant relationship between management control systems and adaptability of manufacturing firms in Rivers State, Nigeria.

H_{02}: There is no significant relationship between management control systems and robustness of manufacturing firms in Rivers State, Nigeria.

H_{03}: There is no significant relationship between preventive maintenance and adaptability of manufacturing firms in Rivers State, Nigeria.

H_{04}: There is no significant relationship between preventive maintenance and robustness of manufacturing firms in Rivers State, Nigeria.

The Operations Improvement Function
RES = OIF (MCS + PM)
Where:
RES= Resilience
OIF = Operations Improvement Function
MCSs = Management Control Systems

Literature Review

Conceptual Framework:

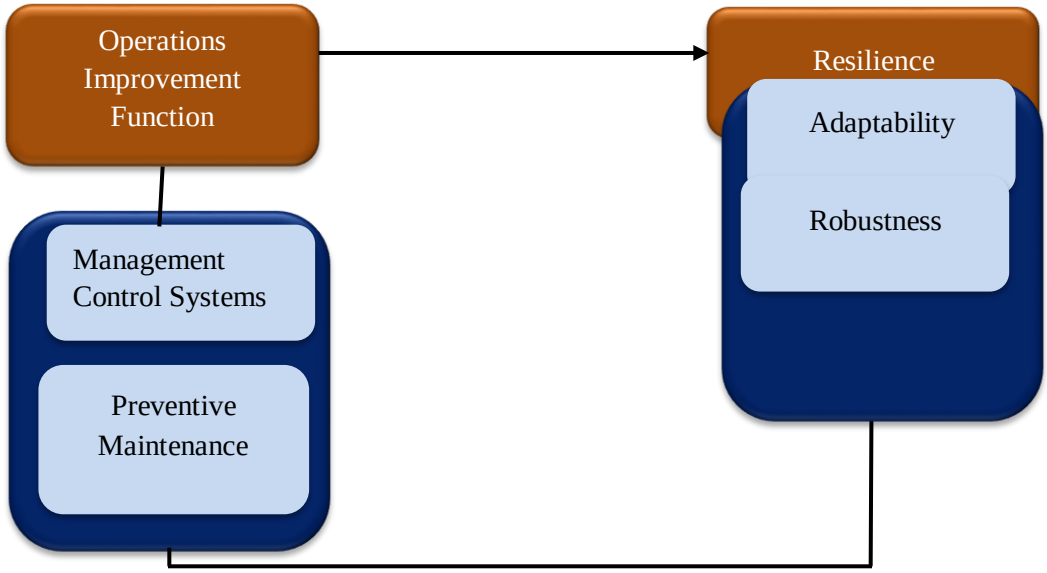

Figure 1: Conceptual Framework of operations improvement function and resilience
Source: Conceptualized by the Researcher. Dimensions of operations improvement function were adopted from Bagshaw and Okoisama (2023), while measures of resilience were adopted from Chu (2015); Kantur and Iseri-Say (2015).

Operations Improvement Function: refers to the systematic processes and methodologies employed by organizations to enhance their operational performance, enabling faster, more sustained advancements in efficiency, quality, and competitiveness over time. This function goes beyond mere incremental changes or adopting transient trends; it involves creating long-term improvement pathways that allow firms to outpace competitors by building capabilities for rapid adaptation and continuous enhancement (Upton, 1996). In the context of the present study, the operations improvement function serves as a critical framework for boosting productivity, where global market pressures and local resource constraints demand ongoing refinements in production processes to reduce costs, minimize waste, and improve output reliability (Ehinomen & Adeleke, 2012).

Management Control Systems: encompass the structured processes, procedures, and tools used by managers to monitor, measure, and correct organizational performance against predefined standards, ensuring alignment with strategic objectives. These systems involve establishing benchmarks, assessing actual outcomes, identifying deviations, and implementing corrective

actions, functioning as an embedded mechanism across all levels of an organization to promote efficiency and accountability (Anthony & Govindarajan, 2007). In this study's context, management control systems act as a proxy for the operations improvement function by facilitating oversight of key areas such as quality assurance, inventory management, and personnel performance.

Preventive Maintenance: involves regularly scheduled inspections, servicing, and repairs of equipment and machinery to prevent unexpected failures, breakdowns, or degradation, thereby extending asset lifespan and maintaining optimal operational conditions. This proactive approach contrasts with reactive maintenance by anticipating potential issues through time-based or usage-based schedules, incorporating tasks like lubrication, calibration, and component replacements to minimize downtime and associated costs (Salonen & Gopalakrishnan, 2021). Within the current study, preventive maintenance serves as another proxy for the operations improvement function, where it is applied to safeguard critical machinery in industries vulnerable to environmental factors like humidity or power fluctuations (Levitt, 2009).

Resilience: denotes the capacity of an organization to anticipate, absorb, adapt to, and recover from disruptions while maintaining essential functions and achieving long-term sustainability. It encompasses not just survival in the face of adversities but also the ability to thrive by leveraging internal strengths and external opportunities post-disruption (Akpan et al., 2021). In the framework of this study, resilience is conceptualized through proxies like adaptability and robustness, allowing firms to withstand economic shocks, supply chain interruptions, or regulatory changes prevalent in the Nigerian context (Hollnagel et al., 2006).

Adaptability: represents the ability of an organization to adjust its strategies, processes, and structures in response to changing internal or external conditions, enabling flexible decision-making and innovation to navigate uncertainties effectively. In this study's context, adaptability as a proxy for resilience facilitates responses to disruptions like supply shortages or technological advancements (Reeves & Deimler, 2011). For example, manufacturing firms can adopt digital transformations, such as automated inventory systems, to reconfigure supply chains, enhancing their ability to innovate and maintain performance in dynamic markets (Aslam et al., 2024).

Robustness: is the inherent strength of a system to maintain high and stable performance levels despite exposure to disturbances, variations, or uncertainties, without significant degradation in output or efficiency. It emphasizes resistance to risks through built-in safeguards, differing from flexibility by focusing on enduring impacts rather than adapting after the fact (Stricker & Lanza, 2014). Applied to the present research, robustness as a proxy ensures that production systems can sustain operations amid common disturbances such as equipment failures or demand volatility (Wieland & Wallenburg, 2013). For instance, by analyzing potential risks and incorporating redundancy measures, such as backup power systems, manufacturing firms can minimize performance deviations, supporting overall resilience in a region prone to logistical and economic challenges (Stricker & Lanza, 2014; Wieland & Wallenburg, 2013).

Theoretical Framework: The theoretical foundation of this study was underpinned by the Theory of Production Competence (Cleveland, Schroeder & Anderson, 1989) and the Dynamic Capabilities Theory (Teece, Pisano & Shuen (1997).

Theory of Production Competence: The Theory of Production Competence, introduced by Cleveland, Schroeder, and Anderson in 1989, originated from research aimed at understanding how manufacturing firms can align their operational capabilities with market demands to achieve competitive advantage. The theory posits that a firm's production competence is determined by the degree of fit between its manufacturing structure (e.g., processes, technology, and capacity) and its competitive strategy, emphasizing that effective alignment enhances performance outcomes such as cost efficiency, quality, and delivery reliability (Cleveland et al., 1989). Competence is not merely about internal efficiency but about strategically leveraging production resources to meet market requirements, thereby creating a sustainable competitive edge. In the context of the present study on manufacturing firms in Rivers State, Nigeria, the Theory of Production Competence is highly relevant as it provides a framework for assessing how manufacturing firms can align their operations improvement functions, specifically management control systems and preventive maintenance, with market needs, such as consistent product quality or cost competitiveness, despite challenges like infrastructural deficits or supply chain volatility (Ehinomen & Adeleke, 2012).

Dynamic Capability Theory: The Dynamic Capabilities Theory, developed by Teece, Pisano, and Shuen in 1997, emerged from strategic management literature to address how firms sustain competitive advantage in rapidly changing environments. The theory defines dynamic capabilities as a firm's ability to integrate, build, and reconfigure internal and external competences to address dynamic market conditions, focusing on three core processes: sensing opportunities and threats, seizing opportunities through strategic decision-making, and transforming organizational resources to maintain competitiveness (Teece et al., 1997). Unlike static capabilities, dynamic capabilities emphasize adaptability, innovation, and learning to navigate environmental uncertainties. In the context of the current study, this theory underpins the resilience proxies of adaptability and robustness, as it explains how firms can respond to disruptions such as economic fluctuations, regulatory changes, or supply chain interruptions (Akpan et al., 2021).

2.3 EMPIRICAL REVIEWS:

Table 1: Webometrics of Empirical Reviews

S/N	Author(s)/Year	Topic/Objectives	Methodology	Findings	Conclusion	Gaps	Comparison with Current Study
1	Bagshaw & Okoisama (2023)	Examined the nexus between operations improvement function and organizational adaptability in petroleum tank farms.	Cross-sectional survey; 262 managers in South-South Nigeria; PLS-SEM.	Contingency planning, benchmarking, and continuous improvement significantly enhance adaptability.	Operations improvement is critical for adaptability in volatile environments.	Limited focus on robustness; specific to petroleum sector.	Current study includes robustness and adaptability, broader manufacturing focus.
2	Miidom et al. (2016)	Investigated the relationship between operations management activities and organizational sustainability in oil and gas companies in Rivers State.	Cross-sectional survey; 234 department heads and operational managers; Spearman's Rank Order Correlation Coefficient;	Positive and significant relationship between operations management activities and organizational sustainability.	Operations management activities enhance sustainability.	Limited generalizability; not all operations management dimensions covered; lacks parametric statistical approach.	Current study uses PLS-SEM for parametric analysis and focuses on specific proxies (management control systems, preventive maintenance).
3	Sari et al. (2015)	Developed a framework for sustainable maintenance performance measures in Malaysian automotive companies.	Pilot survey; 20 respondents from 185 automotive companies; validated questionnaire; descriptive statistics.	Social factor most crucial in sustainable maintenance performance, followed by economic and environmental factors.	Social factors are critical for sustainable maintenance performance.	Limited to descriptive statistics; lacks inferential analysis like PLS-SEM.	Current study employs PLS-SEM and focuses on resilience (adaptability, robustness) in Rivers State, Nigeria.

4	Gschwantner & Hiebl (2016)	Reviewed management control systems and organizational ambidexterity as antecedents to firm survival and performance.	Literature review; qualitative analysis of existing studies.	A package of management control systems supports organizational ambidexterity, balancing exploitative and explorative activities.	Complementary management controls enhance ambidexterity and firm survival.	Qualitative approach; lacks quantitative validation; not specific to Nigeria.	Current study uses quantitative PLS-SEM and is contextualized to Rivers State manufacturing firms.
5	Mantovani & Pereira (2017)	Assessed customer-focused management control systems in Brazilian companies using contingency theory.	Cross-sectional survey; 83 Brazilian companies; PLS-SEM.	Customer-focused MCSs act as diagnostic tools for monitoring, budgeting, and identifying threats/opportunities.	MCSs enhance customer-focused decision-making and firm performance.	Limited to quantitative methods; lacks qualitative insights; not Nigeria-specific.	Current study integrates qualitative insights via theoretical grounding and focuses on Rivers State.
6	Ussahawanitchakit (2017)	Examined effects of management control systems on firm sustainability in Thai textile and apparel businesses.	Mail survey; 186 businesses; PLS-SEM.	Management control systems positively impact organizational renewal and firm sustainability but not management development or business excellence.	MCSs drive sustainability through organizational renewal.	Limited to Thailand; needs broader population and varied statistical methods.	Current study uses Nigerian context and specific resilience proxies (adaptability, robustness).
7	Elisabeth (2019)	Studied the contribution of management control systems to environmental capabilities at Xerox.	Qualitative; face-to-face interviews; documentary data; QSR NVivo analysis.	MCSs foster stakeholder integration, shared vision, organizational learning, and continuous innovation.	MCSs enhance environmental capabilities and sustainability.	Qualitative approach; lacks quantitative validation; not Nigeria-specific.	Current study uses PLS-SEM for quantitative validation in Rivers State manufacturing.

Lean MCSs positively affect competitive advantage and firm performance.	MCSs integral to lean management for performance enhancement.	Lacks qualitative data; not Nigeria-specific.	Current study includes Nigerian context and resilience proxies (adaptability, robustness).
10	Mantovani & Pereira (2017)	Studied customer-focused management control systems in Brazilian companies using contingency theory.	Cross-sectional survey; 83 Brazilian companies; PLS-SEM.	Customer-focused MCSs support monitoring, budgeting, and opportunity identification.	MCSs enhance customer-focused resilience.	Limited to quantitative methods; not Nigeria-specific.	Current study uses Nigerian manufacturing context and PLS-SEM for resilience analysis.

Methodology:

The underlying philosophy for this study was positivism. The research adopted a cross-sectional survey design, with a structured questionnaire based on a Likert's five-point scale. The population of this study comprised all the manufacturing firms in Rivers State. To ensure accessibility, this study focused on the 25 manufacturing firms in Rivers State, which are members of Manufacturing Association of Nigeria, Rivers State, Chapter. The elements of the accessible population are 440 middle and top-level managers (with designations such as: Operations Managers; Quality Control Managers; Maintenance Managers; Chief Financial Officer (CFO); Marketing Managers; HR Managers; Supply Chain/Procurement Managers; R&D Managers**.** The Krejcie and Morgan's sample size determination table used to determine a sample size of 205 respondents. The study utilized the Bowley's proportional sample allocation formula (nh = nNh/N), to get the representative proportionate sample from each of the manufacturing firm. The simple random sampling was adopted. The Partial least squares-structural equation modeling was deployed to test the hypotheses at 0.05 significance level via SmartPLS 4.1.1. While 205 copies of the questionnaire were administered, however, only 180 (87.8%) copies of the research instrument were retrieved, while 165 copies were found to be adequately completed and usable, representing 80.45% questionnaire usage rate. A Cronbach 's Alpha and composite reliability coefficients of 0.7 was adopted as reliability cut-off point for this study. Hulland (1999) recommends (outer loadings) **β** threshold of 0.70, and indicator reliability ($\boldsymbol{\beta}^2$) ≥ 0.50. Moreso, an average variance extracted (AVE) above 0.5 implied convergent validity, while discriminant validity was confirmed when the square root of a construct 's AVE is greater than its correlation with all other constructs (Fornell & Larcker, 1981). Furthermore, as suggested by Hair et al. (2014), t-values >1.96 and p-values<0.05 were cut-off points for statistical significance.

Source: SPSS output of Research Data (2025)

As revealed in table 3, the aggregate for management control systems shows a mean of 17.53, indicating a moderate level of perceived effectiveness in these systems among the firms. However, the mean for performance evaluation for feedback, learning, and continuous improvement has a mean of 3.01, suggesting slight agreement. The regularity of formalized performance evaluations scores a mean of 2.99, implying marginal disagreement or neutrality. The use of predetermined criteria for evaluating and compensating employees has a mean of 3.09, showing slight agreement, with higher variability possibly due to differences in firm sizes or sectors. The role of controls in rewarding or correcting based on performance measures has a mean of 2.96, leaning neutral-to-disagree. The statistics show that manufacturing firms in Rivers State are moderately equipped in operations improvement functions, with a strong emphasis on management controls than preventive maintenance details. The resilience leaning toward adaptability over robustness, though with room for enhancement given the neutral-to-moderate means and variability. The aggregate mean of 4.832 suggests strong overall perceptions of preventive maintenance practices, with engineers' freedom to order spare parts scoring a mean of 2.93. The reliability and quality of spare parts average 2.54, indicating disagreement. Having dedicated skilled planners has the highest mean at 3.82, showing agreement but higher variability. Management commitment to execution averages 3.23, slightly agreement, with a mean of 3.23. Timely auditing of the program mirrors the unstructured problem item at 3.05. Employee understanding of the link to strategy averages 3.09, slight agreement, spread 1.127, negative skewness (-0.081), and kurtosis -0.603. In summary, the statistics portray manufacturing firms in Rivers State as moderately equipped in operations improvement functions, with stronger emphasis on management controls than preventive maintenance details, and resilience leaning toward adaptability over robustness, though with room for enhancement given the neutral-to-moderate means and variability. Distributions are largely normal-like, with minor asymmetries and flatness suggesting diverse but not extreme opinions across the sample.

Source: SmartPLS4.1.0.5 Output of Research Data, 2025

As revealed in Figure 2, and table 4 & 5, the results from the Reflective Measurement Model validates the constructs with generally high reliability and validity, particularly for management control systems and adaptability. The seven items for management control systems show outer loadings ranging from 0.761 to 0.862, with five exceeding the recommended threshold of 0.70. Corresponding indicator reliabilities range from 0.579 to 0.743, meaning the construct explains over 50% of the variance in most indicators and affirms satisfactory reliability. Convergent validity is solidly supported by an AVE of 0.659, well above 0.50, implying that the construct captures more than half of the variance in its indicators collectively. Internal consistency is excellent, with a composite reliability of 0.931 and Cronbach's alpha of 0.914, both far exceeding 0.70 and indicating high reliability without redundancy. Predictive accuracy, as measured by R^2 of 0.292, falls in the weak range (close to 0.25), suggesting that exogenous variables explain about 29.2% of the variance in management control systems. Preventive maintenance presents a more mixed profile, with some adjustments made to enhance model fit. The remaining outer loadings vary from 0.548 to 0.876, with three items meeting or exceeding 0.70, dedicated skilled planners (0.876), timely auditing (0.823), and engineers' freedom to order parts (0.748). The lowest loading (0.548) for critical machines coverage is notably weak, potentially indicating it is a less central reflector of the construct, though retained perhaps for theoretical relevance. Indicator reliabilities span 0.466 to 0.648, indicating mixed reliability where the construct explains over 50% for most but not all indicators. Adaptability demonstrates strong convergent validity, underscored by an AVE of 0.677, well above 0.50 and indicating that 67.7% of the variance in its six indicators is explained by the construct. This suggests high cohesion among items related to adopting new techniques, processes, strategies, and technologies, aligning with resilience's dynamic aspect. Robustness shows adequate convergent validity with an AVE of 0.568, exceeding 0.50 and signifying that the construct explains 56.8% of the variance in its six indicators, which cover resource sufficiency, position preservation, solution generation, resistance, production consistency, and system reliability. Overall, Convergent validity is established for all constructs, as evidenced by AVEs ranging from 0.579 to 0.677, all meeting the ≥ 0.50 criterion, which validates their measurement in the reflective model. Management control systems and adaptability exhibit the strongest convergence, while preventive maintenance and robustness are acceptable but reveal opportunities for enhancement through higher item reliabilities. These findings affirm the constructs' suitability for examining the relationship between operations improvement function and resilience, providing a solid foundation for subsequent structural analyses in the study. Therefore, evidence of convergence validity was established.

Table 6: Discriminant Validity of the Constructs (Fornell-Larcker Criterion)

	Management _Control_Systems	**Preventive_ Maintenance**	**Adaptability**	**Robustness**
Management _Control_Systems	**0.812**			
Preventive_ Maintenance	0.659	**0.771**		

Adaptability	0.621	0.501	**0.711**	
Robustness	0.430	0.669	0.680	**0.805**

Source: SmartPLS4.1.0.5 Output of Research Data, 2025

Table 6 shows the discriminant validity of the constructs, assessed using the Fornell-Larcker criterion. For management control systems, the square root of its AVE is 0.812, reflecting a strong level of variance captured by its indicators. This value exceeds all inter-construct correlations involving management control systems: 0.659 with preventive maintenance, 0.621 with adaptability, and 0.430 with robustness. The highest correlation (0.659 with preventive maintenance) is notably lower than 0.812, confirming that management control systems is distinct from the other constructs. For preventive maintenance, the square root of the AVE is 0.771 which surpasses its correlations with other constructs: 0.659 with management control systems, 0.501 with adaptability, and 0.669 with robustness. The highest correlation, with robustness at 0.669, remains below 0.771, supporting discriminant validity. This indicates that preventive maintenance, encompassing activities like spare parts ordering, maintenance planning, and auditing, is distinct from the other constructs, particularly the resilience proxies. These findings validate the use of these constructs in the structural model, ensuring that they measure unique aspects of operations improvement and resilience in Rivers State's manufacturing firms, providing a robust foundation for further analysis of their relationships. Thus, evidence of discriminant validity was established.

Discussions of Findings

1. Relationship between Management Control Systems and Adaptability: As revealed in figures 3 & 4, and table 7, the first null hypothesis (H_{01}) posited that there is no significant relationship between management control systems and the adaptability of manufacturing firms in Rivers State, Nigeria. The results from the analysis lead to a decisive rejection of this null hypothesis. The path coefficient (β value), which indicates the strength and direction of the proposed relationship, was

found to be 0.528. The statistical significance of this relationship is confirmed by the t-value of 5.754 and the p-value of 0.000. Therefore, it is statistically affirmed that there is a significant, strong, and positive relationship between management control systems and the adaptability of manufacturing firms in Rivers State, Nigeria. This means that an improvement in management control systems within these manufacturing firms is associated with a substantial and strong increase in their adaptability. Finally, the R^2 value of 0.531 reveals that 53.1% of the variance observed in the adaptability of the surveyed manufacturing firms can be explained by the model's predictor, which in this case is management control systems. This finding is not surprising as it agrees with Gschwantner and Hiebl (2016) who found that a package of management control systems (MCSs) supports organizational ambidexterity. Similarly, this finding agrees with Ussahawanitchakit (2017) who found that MCSs positively impact organizational renewal and sustainability. Moreso, this finding further validates the theoretical assertions of the theory of production competence which posits that a firm's production competence is determined by the degree of fit between its manufacturing structure (such as: processes, technology, and capacity) and its competitive strategy.

2. Relationship between Management Control Systems and Adaptability: As shown in figures 3& 4 and table 7, the second null hypothesis (H_{02}) stated that there is no significant relationship between management control systems and the robustness of manufacturing firms in Rivers State, Nigeria. The results from the analysis provide insufficient evidence to reject this null hypothesis. The path coefficient (β value = 0.274) signifies a weak, positive correlation between management control systems and firm robustness. This suggests that while there may be a slight tendency for improved management control systems to be associated with greater robustness, the relationship is not pronounced. Crucially, the relationship is not statistically significant. This is determined by the t-value of 1.580 and the p-value of 0.114. This means that the probability that this observed relationship occurred by chance is high (11.4%), and thus, it is not statistically significant. The R^2 value of 0.237 for the endogenous latent variable, robustness, indicates that management control systems explain 23.7% of the variance in firm robustness, reinforcing the conclusion that management control systems, while accounting for some of the variance, are not a strong or reliable predictor of robustness in this model. Therefore, it is reaffirmed that there is no statistically significant relationship between management control systems and the robustness of manufacturing firms in Rivers State, Nigeria. This is a surprise finding, as it disagrees with Mantovani and Pereira (2017) who found that ustomer-focused MCSs act as diagnostic tools for monitoring, budgeting, and identifying threats/opportunities. Again, this finding disagrees with the theoretical assertions of the dynamic capabilities theory, which suggests that a firm's ability to integrate, build, and reconfigure internal and external competences will enable it address dynamic market conditions.

3. Relationship between Preventive Maintenance and Adaptability: As indicated in figures 3& 4 and table 7, the third null hypothesis (H_{03}) proposed that there is no significant relationship between preventive maintenance and the adaptability of manufacturing firms in Rivers State, Nigeria. The results from the analysis provide strong evidence to reject this null hypothesis. The path coefficient (β value) was found to be 0.348 indicating a moderate, positive correlation between preventive maintenance and firm adaptability. The statistical significance of this relationship is robustly confirmed. The analysis yielded a t-value of 4.547, that is further reinforced by a p-value of 0.000. These metrics offer conclusive evidence that the observed moderate positive relationship is statistically significant and highly unlikely to have occurred by

random chance. Furthermore, the R^2 value of 0.354 indicates that the model explains 35.4% of the variance observed in the adaptability of the manufacturing firms. This suggests that while preventive maintenance is a significant and important predictor of adaptability, there are other factors not included in this model that also contribute to a firm's adaptive capabilities. Thus, it is statistically affirmed that there is a moderate positive and significant, relationship between preventive maintenance and the adaptability of manufacturing firms in Rivers State, Nigeria. This finding is not surprising, as it agrees with Bagshaw & Okoisama (2023) who found that Contingency planning, benchmarking, and continuous improvement significantly enhance adaptability. Similarly, this finding further validates the theoretical assertion of the theory of production competence, which posits that a firm's production competence is determined by the degree of fit between its manufacturing structure and its competitive strategy, emphasizing that effective alignment enhances performance outcomes such as cost efficiency, quality, and delivery reliability.

4. Relationship between Preventive Maintenance and Adaptability: As indicated in figures 3& 4 and table 7, the fourth null hypothesis (H_{04}) stated that there is no significant relationship between preventive maintenance and the robustness of manufacturing firms in Rivers State, Nigeria. The results from the analysis provide overwhelming evidence to reject this null hypothesis ($\beta = 0.576$; t-value of 5.575; p-value of 0.000; R^2 value of 0.576). Finally, the R^2 value of 0.576 for the endogenous latent variable, robustness, is particularly noteworthy. This metric reveals that 57.6% of the variance observed in the robustness of the surveyed manufacturing firms can be explained by their implementation of preventive maintenance. The analysis provides robust empirical evidence to reject the null hypothesis (H_{04}). Therefore, it is statistically affirmed that there is a strong, positive and significant relationship between preventive maintenance and the robustness of manufacturing firms in Rivers State, Nigeria. Preventive maintenance is shown to be a key operational driver of resilience in this context. This finding is not surprising as it agrees with Miidom et al. (2016) who found that is a positive and significant relationship between operations management activities and organizational sustainability. Besides, this finding supports the theoretical assertion of the dynamic capabilities theory, which suggests that the adoption of adaptability, innovation, and learning, are pivotal to navigating environmental uncertainties.

Conclusion:

This study investigated the relationship between operations improvement functions and the resilience of manufacturing firms in Rivers State, Nigeria. The findings conclusively demonstrate that preventive maintenance is a cornerstone for building resilient manufacturing operations in the studied context. Conversely, the role of Management Control Systems (MCS) is more nuanced. While MCSs demonstrate a strong, significant positive relationship with Adaptability, their relationship with Robustness was found to be positive but weak and statistically insignificant. This indicates that MCSs are effective for enabling firms to adjust and change but are less impactful in strengthening their inherent ability to withstand shocks without degradation. In essence, a holistic approach to building resilience in Rivers State's manufacturing sector must prioritize robust preventive maintenance regimes while strategically deploying management control systems primarily to enhance adaptive capabilities, supplementing them with other measures to build robustness.

Recommendations:

Based on the specific findings of this study, the following recommendations were made:

1) Management of manufacturing firms in Rivers State should **invest in and strengthen their Management Control Systems, with a specific focus on their use for enhancing adaptability**. This includes implementing sophisticated budgeting, performance monitoring, and reporting systems that provide real-time data on market shifts, internal processes, and competitor actions. Managers should be trained to use these systems not just for diagnostic control but also interactively, to facilitate strategic debates, identify new opportunities, and trigger organizational learning and renewal, thereby making the firm more agile and responsive to change.
2) Since **Management Control Systems (**MCS) alone are insufficient for building robustness, managers of manufacturing firms should **complement their (**MCS) **with other strategic initiatives specifically designed to enhance operational robustness**. This includes diversifying supply chains to avoid single points of failure, investing in redundant systems or backup capacity for critical processes, stockpiling essential raw materials to buffer against supply disruptions, and strengthening physical infrastructure against environmental threats.
3) Managers of manufacturing firms should **leverage their Preventive Maintenance programs as a platform for building adaptive capacity**. This can be achieved by integrating data analytics from maintenance logs and IoT sensors to predict not just machine failure, but also process inefficiencies and potential bottlenecks.
4) Management of manufacturing firms should **prioritize and allocate substantial resources to a comprehensive, well-funded, and meticulously scheduled Preventive Maintenance program as a primary strategy for achieving operational robustness**. This can be achieved by investing in modern predictive maintenance technologies, high-quality spare parts inventory, and skilled maintenance personnel, in order to ensure that machinery and production lines can operate continuously under stress and withstand disruptions without catastrophic failure.

Contributions to Knowledge:

This study makes several distinct contributions to the existing body of knowledge:

i. The study provides novel empirical evidence on the specific drivers of resilience within the unique and challenging operational environment of manufacturing firms in Rivers State, Nigeria, a context previously underexplored in this specific nexus.
ii. This study moves beyond a generic view of "resilience" by delineating and empirically demonstrating that different operations improvement functions have **differential effects on the distinct measures of resilience**. This nuanced finding clarifies that not all improvement functions contribute to resilience in the same way.
iii. The study refines the application of the **Theory of Production Competence** and the **Dynamic Capabilities Theory** in the context of resilience. It validates the role of manufacturing structure (Preventive Maintenance) in achieving fit and performance (resilience), while also highlighting a boundary condition for Dynamic Capabilities by showing that internal competences like MCS may be more potent for adaptation than for creating inherent robustness.

Suggestions for Further Research: Despite its contributions, this study has limitations that present opportunities for future research:

I. **Geographical Limitation:** The study was confined to manufacturing firms in Rivers State, Nigeria. This limits the generalizability of the findings to other states in Nigeria or other countries with different economic and regulatory environments. A future study could adopt a broader geographical scope, covering multiple states or a comparative study between different countries.

II. **Cross-Sectional Design:** The use of a survey-based, cross-sectional research design provides a snapshot in time. It establishes relationships but cannot definitively prove causality or capture how these relationships evolve. Further studies could adopt longitudinal design to track the long-term interplay of the study variables.

Organisational Fluidity and Robust Business Health of Commercial Banks in Nigeria, Nigeria.

[1]Dr. OKOISAMA, Thomas Chinye; & [2]Dr. AGBIRIOGU, Ejike Kenneth
[1,2]University of Port Harcourt, East West Road, Port Harcourt, Nigeria
Corresponding Author: Email: okoisamatom@gmail.com

Abstract
The robust business health of commercial banks in Nigeria remains a critical concern, as persistent vulnerabilities threaten their operational sustainability and broader economic contributions. Therefore, this study investigated the relationship between organisational fluidity and robust business health of commercial Banks in Nigeria. Organisational fluidity was dimensioned with two proxies: structural fluidity and resource fluidity, while robust business health was measured by operational efficiency and adaptability. Grounded in the Dynamic Capabilities Theory, the study adopted a positivist philosophy and a cross-sectional survey design. Data was collected from 302 regional/zonal managers across all 25 commercial banks in Nigeria using a structured questionnaire. The hypotheses were tested using Partial Least Squares-Structural Equation Modeling via SmartPLS software. The findings revealed a nuanced relationship: resource fluidity demonstrated a strong positive and significant relationship with both operational efficiency and adaptability. Conversely, structural fluidity showed no significant relationship with either operational efficiency or adaptability. The study concluded that the dynamic reallocation of resources is a critical driver of robust health for banks in Nigeria, while the flexibility of organizational structure appeared to be less impactful. It was recommended that management of commercial banks in Nigeria, should prioritize investments in agile resource allocation systems over frequent structural reorganizations. This research contributes to knowledge by providing empirical evidence from a developing economy and clarifying the distinct roles of different dimensions of organisational fluidity.

Key words*: Organizational fluidity, robust business health, commercial banks*

Introduction

Commercial banks in Nigeria play a pivotal role in fostering economic development through financial intermediation, credit allocation, and support for key sectors. However, challenges abound in the industry, including weak corporate governance, insider abuses, money laundering, and inexperienced management, which exacerbate asset quality deterioration and raise the risk of bank failures (Ezu & Jeff-Anyeneh, 2023). Additional obstacles involve inadequate infrastructure, high non-performing loans, cultural resistance to digital financial services, volatile operating environment, characterized by economic fluctuations, stringent regulatory changes, intense competition from fintech companies, and evolving cybersecurity threats (Ofoeda, 2017; Ozili, 2018). These challenges underscore the non-negotiable importance of maintaining a **robust business health** for banks, not merely to ensure profitability for shareholders but, more critically,

to guarantee financial system stability, protect depositor funds, and sustain confidence in the economy. Moreso, robust business health is essential for banks to sustain operations, mitigate risks, and support broader economic stability, as it enables institutions to safeguard customer funds, optimize resource allocation, and foster long-term growth. Key measures of robust business health include operational efficiency and adaptability. Operational efficiency is gauged by metrics such as the efficiency ratio (expenses divided by net revenues) and operating margin, which reflect cost control and resource utilization (Ullah et al., 2023). On the other hand, adaptability, often linked to agility in responding to market changes, is measured by overall resilience in volatile environments, ensuring banks can pivot strategies without compromising stability. Moreso, while adaptability is the capacity to perceive and respond swiftly to market shifts, technological disruptions, and changing customer preferences, often evidenced by the rapid adoption of digital banking services which saw a 534% increase in transaction volume between 2019 and 2022 (Nigeria Inter-Bank Settlement System [NIBSS], 2023). Antecedents of robust business health include strong corporate governance, effective risk management, and organizational fluidity (Ullah et al., 2023). Corporate governance, particularly board independence and frequent oversight, has been shown to enhance operational efficiency by 15% in Nigerian banks (Afolabi, 2015).

Organizational fluidity, defined as the ability to adapt swiftly through flexible structures and resource reallocation, is vital in dynamic environments (Schreyögg & Sydow, 2010). In Nigeria's unstable business climate, characterized by currency fluctuations and policy shifts, fluidity enables banks to reconfigure operations rapidly, as seen in the swift adoption of digital banking platforms post-2020 (Ogunkoya, 2018). Organizational fluidity comprises structural fluidity and resource fluidity. Structural fluidity involves adaptable organizational frameworks that reduce bureaucratic delays, enabling banks to respond to market shifts, as evidenced by First Bank's restructuring in 2019, which improved service delivery speed by 25% (Onodugo et al., 2015). On the other hand, resource fluidity entails the agile reallocation of assets like capital and human resources, with studies showing that banks with high resource fluidity improved customer satisfaction by 37% and operational performance by 45% in Nigeria's banking sector (Oyedijo, 2022; Chibueze, 2022). Therefore, this study sought to establish the relationship between organizational fluidity and robust business health of commercial banks in Nigeria.

Statement of the Problem

The robust business health of commercial banks in Nigeria remains a critical concern, as persistent vulnerabilities threaten their operational sustainability and broader economic contributions. Despite their pivotal role in financial intermediation, Nigerian banks struggle with poor business health, evidenced by declining profitability, operational inefficiencies and high chances of entropy. For instance, between 2018 and 2023, the average return on equity (ROE) for Nigerian commercial banks dropped from 15% to 10%, signaling weakened financial performance (Chibueze, 2022). This decline underscores the urgency of addressing factors undermining banks' resilience in Nigeria's volatile economic environment. The manifestations of poor robust business health are evident in weak operational efficiency and low adaptability. Operational efficiency, measured by the cost-to-income ratio, has deteriorated, with Nigerian banks reporting ratios averaging 60-65% from 2019 to 2023, significantly higher than the global benchmark of 50% (Asogwa, 2016; Odekina et al., 2019). This inefficiency stems from high operational costs, redundant processes, and inadequate technological integration, which inflate expenses relative to revenue. Similarly, low adaptability is reflected in banks' slow response to market dynamics, such as the Central Bank

of Nigeria's (CBN) 2021 monetary policy adjustments, which increased cash reserve ratios to 27.5%. Many banks struggled to realign strategies, with only 40% of deposit money banks achieving compliance within six months, highlighting rigidity in operational frameworks (Ezu & Jeff-Anyeneh, 2023).

Indeed, the causes of poor robust business health are multifaceted. High non-performing loans (NPLs), averaging 5-7% of total loans from 2018 to 2023, erode profitability and capital adequacy (Chibueze, 2022). Weak corporate governance, characterized by insider abuses and lack of board independence, further exacerbates inefficiencies, with 30% of Nigerian banks facing regulatory sanctions for governance lapses between 2020 and 2023 (Ezu & Jeff-Anyeneh, 2023). Additionally, inadequate infrastructure, such as unreliable power supply, increases operational costs by up to 20% annually, while economic volatility, including naira devaluation, disrupts financial planning (Adesanya, 2017; McKinsey, 2020). Low technological adoption also hampers efficiency, with only 25% of banks fully integrating digital banking platforms by 2022 (Ogunkoya, 2018). The effects of poor business health are far-reaching. Declining profitability reduces banks' ability to extend credit, with credit to the private sector dropping by 10% between 2020 and 2022, stifling economic growth (Anyanwu et al., 2017). Customer trust erodes, as evidenced by a 15% decline in deposit growth rates in 2021, impacting liquidity (Chibueze, 2022). Systemic risks also increase, with the potential for bank failures threatening Nigeria's financial stability, as seen in the 2011 banking crisis, costing the CBN over ₦600 billion in bailouts (Onodugo et al., 2015). Moreover, inefficiencies limit financial inclusion, with only 45% of Nigerians accessing formal banking services by 2023, hindering sustainable development goals (Adesanya, 2017). Scholars propose several solutions to address these challenges. Strengthening regulatory frameworks through stricter compliance monitoring can reduce governance lapses, as suggested by Ezu and Jeff-Anyeneh (2023), who advocate for real-time audits to curb insider abuses. According to Ogunkoya (2018), investment in technology, such as adopting AI-driven risk management systems, could enhance operational efficiency by 20-30%. Also, diversifying revenue sources beyond public sector funds, as recommended by McKinsey (2020), can mitigate economic volatility risks, while training programs for operational risk awareness can reduce errors by 15% (International Policy Brief, 2023). Additionally, improving capital adequacy through recapitalization, as seen in the 2004 banking reforms, can bolster resilience, with studies showing a 12% increase in operational efficiency post-reform (Odekina et al., 2019). Despite these solutions, a significant gap exists in the literature regarding the role of organizational fluidity in addressing poor business health in Nigerian banks. While studies like Oyedijo (2022) explore resource fluidity in Nigeria's manufacturing sector, showing a 45% improvement in performance, there is limited research applying structural and resource fluidity to the banking context. Existing studies focus heavily on traditional determinants like capital adequacy and risk management, with little attention to how flexible organizational structures or agile resource reallocation can enhance operational efficiency and adaptability (Afolabi, 2015; Odekina et al., 2019). This gap underscores the need for empirical investigation into organizational fluidity as a strategic tool to bolster the robust business health of Nigerian commercial banks. Therefore, this study sought to fill the gap by critically assessing the relationship between organizational fluidity and robust business health of commercial banks in Nigeria. In view of the foregoing, the specific objectives were to:

v. Ascertain the relationship between structural fluidity and operational efficiency of commercial Banks in Nigeria.

vi. Determine the relationship between structural fluidity and adaptability of commercial Banks in Nigeria.
vii. Investigate the relationship between resource fluidity and operational efficiency of commercial Banks in Nigeria.
viii. Assess the relationship between resource fluidity and adaptability of commercial Banks in Nigeria.

Accordingly, the following research questions were listed:
i. What is the relationship between structural fluidity and operational efficiency of commercial Banks in Nigeria?
ii. How does structural fluidity relates with adaptability of commercial Banks in Nigeria?
iii. What is the relationship between resource fluidity and operational efficiency of commercial Banks in Nigeria?
iv. How does resource fluidity relates with adaptability of commercial Banks in Nigeria?

Accordingly, the following null hypotheses were formulated to provide tentative answers for the research questions:
H_{01}: There is no significant relationship between structural fluidity and operational efficiency of commercial Banks in Nigeria.
H_{02}: There is no significant relationship between structural fluidity and adaptability of commercial Banks in Nigeria.
H_{03}: There is no significant relationship between resource fluidity and operational efficiency of commercial Banks in Nigeria.
H_{04}: There is no significant relationship between resource fluidity and adaptability of commercial Banks in Nigeria.

Literature Review
Conceptual Framework:

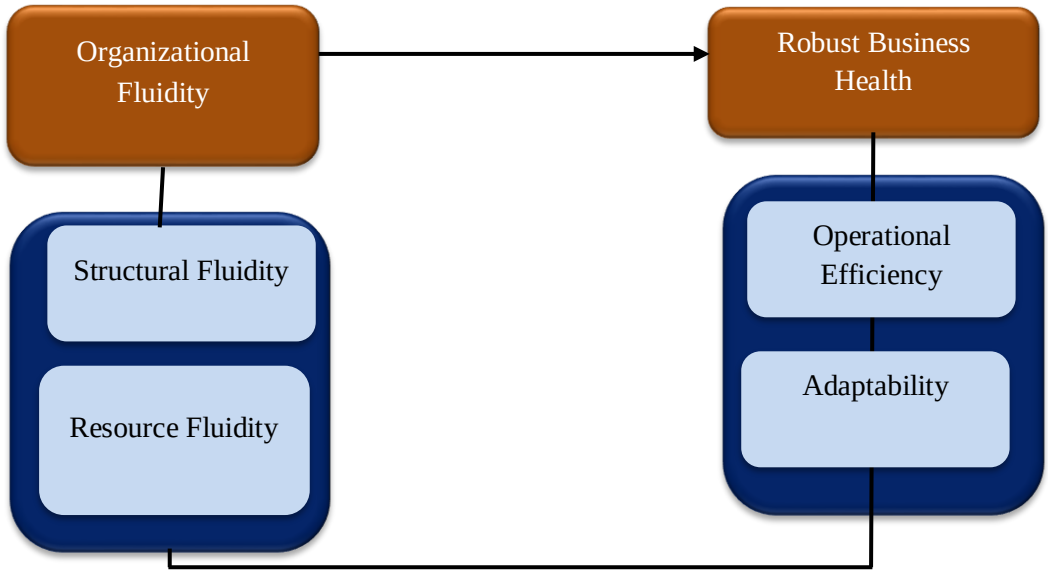

Figure 1: Conceptual Framework of Organisational Fluidity and Robust Business Health
Source: Conceptualized by the Researcher. Dimensions of Organizational Fluidity were adopted from (Efeomo et al. 2022; Schreyögg & Sydow, 2010), while measures of Robust Business Health were adopted from Afolabi (2015).

Organizational Fluidity: refers to an organisation's capacity to maintain highly flexible and adaptive forms, enabling rapid responses to environmental changes through improvisation, ad-hoc strategies, and minimal reliance on rigid boundaries (Schreyögg & Sydow, 2010). It embodies a dynamic capability that allows firms to reconfigure structures, processes, and resources swiftly to align with shifting market or regulatory demands. In essence, organisational fluidity reflects an organisation's agility in balancing stability with adaptability to thrive in turbulent settings.

Structural Fluidity: Structural fluidity is the dimension of organisational fluidity that pertains to flexible organisational designs, characterized by reduced hierarchical layers, decentralized decision-making, and dynamic team configurations (Schreyögg & Sydow, 2010; Onodugo et al., 2015). It allows organisations to adjust their structural frameworks to facilitate rapid decision-making and cross-functional collaboration, minimizing bureaucratic delays.

Resource Fluidity: Resource fluidity refers to the agile reallocation and reconfiguration of resources—such as capital, human resources, and technology—to meet strategic objectives in response to changing conditions (Oyedijo, 2022). It involves the ability to shift resources dynamically to capitalize on opportunities or mitigate risks, ensuring optimal resource utilization.
Robust Business Health: Robust business health denotes a bank's ability to maintain financial stability, operational resilience, and customer trust while contributing to economic growth (UNCDF, 2022). It encompasses sustained profitability, effective risk management, and the capacity to withstand economic shocks, ensuring long-term viability and stakeholder confidence.
Operational Efficiency: Operational efficiency refers to a bank's ability to optimize resources, minimize costs, and maximize output while maintaining service quality (Asogwa, 2016; Ullah et al., 2023). It is typically measured by metrics like the cost-to-income ratio, which reflects how effectively a bank manages expenses relative to revenue.
Adaptability: Adaptability is the capacity of a bank to adjust its strategies, operations, and offerings in response to environmental changes, such as regulatory shifts, market trends, or economic fluctuations (Investopedia, 2023; Afolabi, 2015). It involves maintaining solvency, innovating products, and aligning with customer needs to ensure resilience.

Theoretical Framework: This study was underpinned by the Dynamic Capabilities Theory. The Dynamic Capabilities Theory, pioneered by Teece, Pisano, and Shuen (1997), provides a crucial framework for understanding how organizations achieve lasting success in unpredictable environments. It argues that a firm's competitive edge derives not merely from possessing valuable resources, but from its higher-order ability to continuously integrate, reconfigure, and renew those assets. This dynamic capacity is broken down into three essential skills: sensing new opportunities and threats, seizing those opportunities through decisive action, and transforming the organization itself to maintain strategic agility. Ultimately, it is the theory of how a company must orchestrate change within itself to thrive amidst external turbulence. For commercial banks in Nigeria, this

theory is not academic but a vital prescription for survival and robust health. The sector is defined by its high-velocity nature, including rapid regulatory shifts from the Central Bank, macroeconomic volatility, and relentless disruption from agile FinTech firms. A bank's ability to sense digital trends allows it to pivot before a crisis; its capacity to seize opportunities enables the swift launch of new products to meet evolving customer demands; and its skill in transforming ensures it can shift investments from brick-and-mortar branches to digital infrastructure, future-proofing its entire operation. Therefore, the relevance of Dynamic Capabilities to Nigerian banks is pivotal. Hence, a bank that masters this orchestration of change builds a robust business model characterized by strong profitability, solid asset quality, and profound customer loyalty. It evolves from a rigid institution into a fluid entity that can withstand economic shocks and capitalize on new frontiers. Conversely, a bank that fails to cultivate these capabilities risks stagnation, becoming vulnerable to more agile competitors and ultimately witnessing the erosion of its market position and financial health. Therefore, in the fierce arena of Nigerian finance, dynamic capabilities are the very engine of sustained relevance and prosperity.

Table 1: Webometrics Table of Empirical Reviews

S/N	Author(s)/Year	Topic/Objectives	Methodology	Findings	Conclusion	Gaps	Comparison with Current Study
1	Efeomo et al. (2022)	Impact of resource fluidity on firm performance in Nigerian manufacturing industry, using Dynamic Capabilities Theory.	Population: Employees of selected manufacturing firms; Sample: 196 employees (161 valid responses) via purposive sampling; Data: Structured questionnaires; Analysis: PLS-SEM.	Resource fluidity significantly enhances firm performance by improving adaptability and operational efficiency through dynamic resource allocation.	Resource fluidity is critical for firm performance, particularly through dynamic resource allocation.	Conducted in manufacturing, not banking; did not address structural fluidity or separate operational efficiency and adaptability as distinct outcomes.	Aligns with current study's use of resource fluidity, PLS-SEM, and Dynamic Capabilities Theory but differs in industry context and scope of fluidity proxies.
2	Onodugo et al. (2017)	Influence of organisational structure on performance of commercial banks in South East Nigeria.	Population: Managerial and non-managerial staff; Sample: 543 respondents via stratified sampling; Data: Self-administered questionnaires; Analysis: Descriptive statistics and regression analysis.	Flexible organisational structures significantly enhance bank performance, particularly in operational efficiency and adaptability to market changes.	Flexible structures are key to improving bank performance.	Did not incorporate resource fluidity, use PLS-SEM, or adopt Dynamic Capabilities Theory; lacked specific focus on adaptability.	Shares focus on structural fluidity and banking context but differs in methodology (no PLS-SEM) and theoretical framework.
3	Akims et al. (2023)	Firm characteristics and liquidity transformation in Nigerian commercial banks (2010–2017).	Population: 17 commercial banks; Sample: 15 banks via purposive sampling; Data: Secondary	Management efficiency significantly influences liquidity transformation,	Management efficiency drives liquidity transformation in banks. Population: Managerial staff; Sample: 200 respondents via purposive sampling; Data: Questionnaires;	Flexible designs improve operational efficiency and adaptability, enhancing performance.	Flexible designs are critical for bank performance.	Did not use PLS-SEM, adopt Dynamic Capabilities Theory, or address resource fluidity.	Shares focus on structural fluidity and banking context but differs in methodology and theory.

			Analysis: Regression analysis.				
10	Adebayo & Olowe (2018)	Liquidity management and profitability in Nigerian commercial banks.	Population: Four banks over ten years; Sample: Purposive sampling; Data: Secondary financial reports; Analysis: Regression analysis.	Effective liquidity management, linked to resource fluidity, enhances operational efficiency and profitability.	Liquidity management drives efficiency and profitability.	Did not address adaptability, use PLS-SEM, or adopt Dynamic Capabilities Theory; relied on secondary data.	Shares banking context and resource fluidity focus but differs in methodology, data, and theory.
11	Okonkwo & Egbunike (2021)	Resource management and operational performance in Nigerian commercial banks.	Population: Bank employees; Sample: 280 respondents via stratified sampling; Data: Questionnaires; Analysis: Multiple regression analysis.	Effective resource management enhances operational efficiency and adaptability.	Resource management improves bank performance.	Did not use PLS-SEM, reference Dynamic Capabilities Theory, or address structural fluidity.	Shares banking context and resource fluidity focus but differs in methodology and theoretical framework.

Methodology:
The study adopted a cross-sectional survey design, with an underlying philosophy of positivism. The population of this study comprised all the entire 25 Commercial Banks in Nigeria with international, national and regional authorizations. As obtained from the Central Bank of Nigeria, the elements of the accessible population were 1,400 Regional/Zonal Managers who work in the 329 regional offices of the Commercial Banks in Nigeria, with designations such as Regional/Zonal Business Managers, Regional/Zonal Operations Managers and Regional/Zonal Internal Control Managers. A sample size of 302 respondents were drawn using the Krejcie and Morgan's table and the Simple random sampling technique was adopted. The hypotheses were tested at 0.05 level of significance by adopting the Partial Least Squares-Structural Equation Modeling via SmartPLS 4.1.0.5 software. From the 302 copies of the administered instrument, 249 (82.45%) copies were retrieved, while 230 copies (71.16%) of the instrument were adequately completed, and coded for the study. The study adopted the Cronbach's Alpha and composite reliability coefficients of 0.7, outer loadings **(β)** values of 0.70 and indicator reliability (β^2) values $\geq$ 0.50 as benchmarks (Hulland, 1999). Also, as recommended by Fornell and Larcker (1981) an average variance extracted (AVE) of 0.5 and above as indication of sufficient convergent validity, while discriminant validity was confirmed when the square root of a construct's AVE was greater than the construct correlations. Furthermore, t-values >1.96 and p-values<0.05 are significant, while R^2 values of 0.75, 0.50 and 0.25 indicated substantial, moderate or weak levels of predictive accuracy, respectively (Hair et al., 2014).

Categorization of Banks in Nigeria
As announced by the Central Bank of Nigeria, the new minimum capital requirements for Banks in Nigeria effect 31st March, 2026 are as follows:

1. **Commercial Banks with International Authorization: ₦500 billion**.
2. **Commercial Banks with National Authorization: ₦200 billion**.
3. **Commercial Banks with Regional Authorization: ₦50 billion**.
4. **Merchant Banks: ₦50 billion**.
5. **Non-Interest Banks with National Authorization: ₦20 billion**.
6. **Non-Interest Banks with Regional Authorization: ₦10 billion**.

Table 2: Commercial Banks in Nigeria

Source: SPSS output of Research Data (2025)

As revealed in table 3, the descriptive analysis of 230 respondents indicates that Nigerian commercial banks demonstrate a moderate level of organizational fluidity, though perceptions vary considerably. The mean scores for the constituent items of structural fluidity, such as the ability for quick decision-making (Mean = 2.89, SD = 1.17) and the support for seamless communication (Mean = 2.94, SD = 1.05), cluster near the neutral point, suggesting room for improvement. Similarly, the resource fluidity dimension reveals a critical weakness in the rapid reallocation of financial resources (Mean = 2.54, SD = 1.01), which is the lowest score in the dataset, contrasted by a relative strength in the flexible reassignment of human resources (Mean = 3.82, SD = 1.18). Furthermore, the high standard deviations, consistently around or above 1.0 across all items, signify a pronounced lack of consensus among bankers regarding these practices. Importantly, the skewness (ranging from -0.701 to 0.401) and kurtosis (ranging from -1.16 to 0.48) statistics for all variables fall within acceptable thresholds, confirming the data's suitability for subsequent parametric tests. This pattern of moderate performance extends to the measures of robust business health. The operational efficiency dimension shows means

hovering around the midpoint, with the most favorable view on streamlined processes (Mean = 3.35, SD = 1.16) and the least favorable on updating systems (Mean = 2.91, SD = 1.19).

The data for adaptability, while containing a presentation error for some items, suggests a comparable moderate perception where scores are available (e.g., Mean = 3.26, SD = 1.09 for incorporating market trends). The collective findings, moderate central tendency, high variability (SD = 1.0-1.24), and normal distribution, paint a picture of a sector in transition. They establish that while elements of fluidity and health are present, they are not consistently or uniformly experienced, providing a foundational basis for investigating the strength and significance of the relationship between these constructs.

Table 5. Quality Criteria (Construct Reliability and Validity)

	Cronbach's alpha	**Composite reliability (rho_a)**	**Composite reliability (rho_c)**	**Average variance extracted (AVE)**
Adaptability	0.866	0.874	0.898	0.596
Operational_Efficiency	0.892	0.901	0.917	0.648
Resource_Fluidity	0.908	0.919	0.927	0.645
Structural_Fluidity	0.763	0.772	0.849	0.587

As revealed in Figure 2, and table 4 & 5, the results from the reflective measurement model assessment demonstrates that the constructs of Organisational Fluidity (comprising Structural and Resource Fluidity) and Robust Business Health (comprising Operational Efficiency and Adaptability) have evidence of convergent validity. For **Structural Fluidity**, three items were deleted to improve the model, leaving four indicators that all meet the recommended threshold for outer loadings ($\beta > 0.70$), with values ranging from 0.666 to 0.810. Although the loading for item 1 (0.666) is slightly below the 0.70 ideal, it was retained, as it is close and its removal would have reduced content validity. The construct exhibits strong internal consistency, with a Composite Reliability of 0.849 and Cronbach's Alpha of 0.763, both exceeding the 0.70 benchmark. It also demonstrates convergent validity, as its Average Variance Extracted (AVE) of 0.587 is above the 0.50 requirement, meaning the construct explains more than 58.7% of the variance in its indicators. The second proxy, **Resource Fluidity**, shows even stronger measurement properties. All seven indicator loadings are well above the 0.70 threshold (ranging from 0.730 to 0.900), resulting in high indicator reliability ($\lambda^2 > 0.50$).

The construct's Composite Reliability (0.927) and Cronbach's Alpha (0.908) are excellent, indicating a highly reliable scale. Its convergent validity is also robust, with an AVE of 0.645. For the endogenous constructs, both proxies of Robust Business Health perform exceptionally well. **Operational Efficiency** shows strong loadings (0.728 to 0.830), high composite reliability (0.917), high Cronbach's Alpha (0.892), and a high AVE of 0.648. Similarly, **Adaptability** has strong loadings (0.745 to 0.846), high composite reliability (0.898), high Cronbach's Alpha (0.866), and a satisfactory AVE of 0.596. Furthermore, the model's predictive power and the influence of the exogenous constructs are substantial. The R^2 values, which indicate the proportion of variance explained, show that Organisational Fluidity has a moderate to substantial predictive accuracy on Robust Business Health. The R^2 for Operational Efficiency is 0.535 (moderate) and for Adaptability is 0.426 (approaching moderate). This is supported by the effect size (f^2), which measures the change in R^2 when an exogenous construct is omitted. The f^2 values for Operational Efficiency (0.307) and Adaptability (0.293) are both large, indicating that Organisational Fluidity has a strong substantive influence on both proxies of Robust Business Health. In summary, the measurement model confirms that the constructs are reliably measured and that a strong, substantive relationship exists to be explored in the structural model. Therefore, evidence of convergent validity is established.

Table 6: Discriminant Validity of the Constructs (Fornell-Larcker Criterion)

	STRUCTURAL Fluidity	**RESOURCE Fluidity**	**OPERATIONAL EFFICIENCY**	**ADAPTABILITY**
STRUCTURAL Fluidity	**0.754**			
RESOURCE Fluidity	0.459	**0.747**		

OPERATIONAL EFFICIENCY	0.444	0.501	**0.811**	
ADAPTABILITY	0.430	0.569	0.680	**0.795**

Source: SmartPLS4.1.0.5 Output of Research Data, 2025

The results from the Fornell-Larcker criterion presented in Table 6 conclusively demonstrate that the measurement model has established strong discriminant validity, confirming that each of the four constructs, Structural Fluidity, Resource Fluidity, Operational Efficiency, and Adaptability, is empirically distinct and uniquely measured. This is evidenced by the fact that the square root of each construct's Average Variance Extracted (AVE), displayed on the diagonal (0.754, 0.747, 0.811, 0.795), is greater than any of its correlations with other constructs off the diagonal. For instance, the strongest correlation exists between the two endogenous constructs, Operational Efficiency and Adaptability (r = 0.680), yet the square root of the AVE for Operational Efficiency (0.811) exceeds this value, a pattern that holds true for all constructs. The positive off-diagonal correlations further provide preliminary evidence for the theoretical model, indicating meaningful and significant relationships, such as the notable link between Resource Fluidity and Adaptability (r = 0.569), while firmly establishing that each latent variable shares more variance with its own indicators than with any other variable in the model. Therefore, evidence of discriminant validity is established.

Two Null Hypotheses were supported while Two Null Hypotheses were not supported

Discussions of Findings

Relationship between Structural Fluidity and Operational Efficiency: As revealed in figures 3 & 4, and table 7, the results of the analysis lead to a failure to reject the null hypothesis (H_{01}), which stated that there is no significant relationship between Structural Fluidity and the Operational Efficiency of commercial banks in Nigeria, (β value = 0.055 , p value = 0.482, t value = 0.702, and R^2 value = 0.312). The path coefficient, which, at a value of $\beta = 0.055$, indicates a very weak positive relationship between the two constructs. Crucially, this relationship is not statistically significant, as evidenced by a p-value of 0.482, which is substantially greater than the accepted alpha level of 0.05, and a t-value of 0.702, which falls well below the critical threshold of 1.96 required for significance in a two-tailed test. Furthermore, the coefficient of determination (R^2 value) of 0.312 indicates that Structural Fluidity, as an exogenous variable, has a weak level of predictive accuracy on Operational Efficiency, explaining approximately 31.2% of its variance. In summary, the statistical evidence is insufficient to support a claim that a change in a bank's structural fluidity leads to a significant change in its operational efficiency, suggesting that other factors not included in this model may play a more pivotal role in determining the operational efficiency of commercial banks in Nigeria. This finding is surprising, as it disagrees with Onodugo et al. (2017) who found that flexible organizational structures significantly enhance bank performance, particularly in operational efficiency and adaptability to market changes. Besides, this finding disagrees with the Dynamic Capabilities Theory, which states that a firm's competitive edge derives not merely from possessing valuable resources, but from its higher-order ability to continuously integrate, reconfigure, and renew those assets.

Relationship between Structural Fluidity and Adaptability: As shown in figures 3& 4 and table 7, the results indicate that the null hypothesis (H_{02}), which posits no significant relationship between Structural Fluidity and Adaptability, cannot be rejected. The path coefficient ($\beta = 0.173$) suggests a weak, positive relationship between the two constructs. However, this apparent relationship is not statistically significant, as evidenced by a p-value of 0.184, which is substantially greater than the 0.05 threshold for significance. This finding is further supported by a t-value of 1.328, which falls below the critical value of 1.96 required for a two-tailed test. Consequently, this weak positive association cannot be generalized to the population of Nigerian commercial banks and may be attributable to random sampling variation rather than a true effect. Furthermore, the coefficient of determination ($R^2 = 0.358$) indicates that Structural Fluidity alone provides a weak level of predictive accuracy for Adaptability, explaining approximately 35.8% of its variance. This implies that while Structural Fluidity accounts for a portion of the variability in banks' adaptability, a larger share (64.2%) is influenced by other factors not included in this specific model. Thus, the analysis finds insufficient evidence to conclude that a significant relationship exists between Structural Fluidity and the Adaptability of commercial banks in Nigeria. This is a surprise finding, as it disagrees with Oke & Adeyemo (2020) who found that Flexible structures enhance bank performance. Moreso, this finding fails to further validate the theoretical assertion of the dynamic capabilities theory which states that dynamic capacity is broken down into three essential skills: sensing new opportunities and threats, seizing those opportunities through decisive action, and transforming the organization itself to maintain strategic agility.

Relationship between Resource Fluidity and Operational Efficiency: As indicated in figures 3& 4 and table 7, the results of the analysis led to a decisive rejection of the null hypothesis (H_{03}),

which stated that there is no significant relationship between Resource Fluidity and the Operational Efficiency of commercial banks in Nigeria (β value = 0.590 , p value = 0.000, t value = 6.798, and R^2 value = 0.576). This means that the dynamic reallocation of financial, human, and technological resources explains approximately 57.6% of the variance observed in the operational efficiency of Nigerian commercial banks. Thus, the analysis provides robust empirical evidence that a significant, strong, and positive relationship exists, suggesting that enhancing a bank's ability to fluidly reallocate its resources is a crucial factor in achieving higher levels of operational efficiency, characterized by optimized processes, reduced costs, and improved performance. This finding is not surprising, as it agrees with Efeomo et al. (2022) who found that Resource fluidity significantly enhances firm performance by improving adaptability and operational efficiency through dynamic resource allocation. Likewise, this finding further validates the theoretical assertion of the dynamic capabilities theory, which states that a firm's competitive edge derives not merely from possessing valuable resources, but from its higher-order ability to continuously integrate, reconfigure, and renew those assets.

Relationship between Resource Fluidity and Adaptability: As indicated in figures 3& 4 and table 7, the null hypothesis (H_{04}), which posits no significant relationship between Resource Fluidity and Adaptability, is rejected. The analysis reveals a statistically significant, positive relationship between these two constructs (β value = 0.420 , p value = 0.002, t value = 3.097, and R^2 value = 0.531). Furthermore, the coefficient of determination (R^2 value) of 0.531 indicates that Resource Fluidity has a moderate level of predictive accuracy on Adaptability. This means that the dynamic reallocation of resources explains approximately 53.1% of the variance observed in the adaptability of Nigerian commercial banks. Therefore, the results provide robust evidence that a bank's capacity to fluidly reallocate its financial, human, and technological resources is a significant and moderately strong driver of its ability to adapt to regulatory changes, market trends, and customer preferences. This finding is not surprising, as it underscores the strategic importance of resource flexibility in fostering organizational resilience and responsiveness within the Nigerian Banking sector, and agrees with Ogbu & Okeke (2022) who found that Organisational agility, linked to fluid structures and resource allocation, enhances resilience, including adaptability and operational efficiency. Furthermore, this finding further validates the theoretical assertion of the dynamic capabilities theory which suggests that firm's competitive advantage is derived from its higher-order ability to continuously integrate, reconfigure, and renew its assets.

Conclusion:

This study investigated the relationship between organizational fluidity (comprising structural and resource fluidity) and robust business health (measured by operational efficiency and adaptability) in the Nigerian commercial banking sector. The empirical evidence leads to a nuanced conclusion. While the proposition that organizational fluidity enhances robust business health is supported, this relationship is almost entirely driven by **resource fluidity**. The study found no statistically significant evidence that **structural fluidity,** concerning aspects like departmental restructuring, cross-functional teams, and policy flexibility, contributes meaningfully to either operational efficiency or adaptability within this specific context. Conversely, the dynamic reallocation of financial, human, and technological resources (resource fluidity) was identified as a powerful and significant driver of both operational efficiency and adaptability. Therefore, it is concluded that for Nigerian commercial banks, the strategic reallocation and renewal of tangible resources is a far more

critical capability for achieving robust health than the flexibility of the organizational structure itself.

Recommendations: Based on the specific findings of this study, the following recommendations were made:

i. Managers of commercial Banks in Nigeria should redirect resources away from frequent structural reorganizations and instead invest in identifying and strengthening alternative drivers of operational efficiency, such as technology integration or process automation, to achieve cost reductions and performance optimizations without relying on structural changes.
ii. To improve adaptability to market and regulatory shifts, Management of Banks are advised to explore factors beyond structural fluidity, such as leadership development programs or external partnerships, ensuring that adaptability strategies are not overly dependent on organizational restructuring.
iii. Managers of Nigerian commercial banks should implement policies that enhance the dynamic reallocation of financial, human, and technological resources, such as cross-training programs and flexible budgeting systems, to significantly boost operational efficiency through optimized resource utilization.
iv. Management of Banks should foster resource fluidity by adopting agile resource management frameworks, including real-time resource tracking tools and incentive structures for resource redeployment, to strengthen their ability to adapt to changing customer preferences, market trends, and regulatory environments.

Contributions to Knowledge: This study makes several notable contributions to the existing body of knowledge on organizational fluidity and business health in the banking sector, particularly within the Nigerian context.

i. Firstly, it provides empirical evidence that challenges prior assumptions about structural fluidity's role in enhancing operational efficiency and adaptability and highlighting the context-specific limitations of flexible structures in regulated environments like Nigeria's banking industry.
ii. Secondly, it reinforces and extends the dynamic capabilities theory by demonstrating that resource fluidity, rather than structural fluidity, is a key mechanism for achieving competitive advantage through resource integration and reconfiguration.
iii. Thirdly, by focusing on commercial banks in an emerging economy, the research fills a gap in the literature, which is predominantly based on developed markets, offering insights into how organizational fluidity manifests in resource-constrained settings.
iv. Finally, the application of Partial Least Squares-Structural Equation Modeling (PLS-SEM) in this domain adds methodological rigor, providing a robust framework for future studies on similar constructs in African financial institutions.

Suggestions for Further Research: While this study offers valuable insights, it is not without limitations.

i. For further studies, researchers are suggested to adopt a longitudinal design to track changes in organizational fluidity and business health over time, enabling causal inferences.
ii. Further studies could expand the sample to include diverse bank employees and possibly customers, in order to provide a more holistic view.

iii. Moreso, incorporating additional variables, such as digital transformation or environmental turbulence, as moderators or mediators could enhance the model's explanatory power.
iv. Future studies could conduct a comparative studies across African countries or between banking and non-banking sectors, to test the findings' robustness.
v. Finally, further studies could employ mixed-methods approaches, combining quantitative data with qualitative interviews, in order to gain deeper insights into the contextual factors influencing these relationships.

Enhancing Diversity, Equity, and Inclusion in Nigerian Public Service Recruitment: A Technology-Driven Approach within a Geographical Context.

Dr. Jakpa, Grace Ufuoma
Department of Office and Information Manegement
Southern Delta Universty, Ozoro Nigeria

Abstract
This research explores the complex relationship between the assimilation of technology and Diversity, Equity, and Inclusion (DEI) results in Nigerian governmental hiring practices, paying particular attention to the conditional influence of geographical and population-based characteristics. Given the historical imbalances in regional representation within the public sector, the study assesses whether technology functions as an instrument for parity or unintentionally intensifies existing inequalities. Employing a quantitative methodology, data were gathered from both current public sector workers and prospective candidates, subsequently analyzed using basic and hierarchical regression techniques via SPSS (versions 23 and 25). The results indicate a statistically significant and notably positive association between technological integration and DEI indicators ($R^2 = 0.873$, $B = 0.976$, $p < .001$), affirming that technological integration is a key catalyst for improved diversity results. Nevertheless, a noteworthy moderating influence was observed ($p = .002$), revealing that the advantages derived from technology are not evenly spread. Perceptions of justice and ease of use concerning technology-supported recruitment processes vary considerably based on an applicant's geographic location and demographic traits. This suggests that while technology possesses substantial transformative capacity, its effectiveness hinges on contextual elements such as digital connectivity and proficiency. The study concludes that technology is a powerful, yet inherently biased, mechanism for promoting DEI. Its effective implementation necessitates a conscious, contextually-aware strategy that addresses infrastructural and demographic differences. Recommendations involve investment in equitable digital infrastructure, the execution of algorithmic assessments, and the initiation of digital training programs to ensure technology achieves its potential in cultivating a genuinely inclusive and representative public sector in Nigeria.

Keywords: *Technology-Enabled recruitment to foster Diversity, Equity, and Inclusion, Reforming Public Service in the Digital Age, Nigeria Geographical Context and DEI through Technological Integration*

Introduction

In current academic discussion, the necessities of variety, fairness, and integration (DEI) have progressively gained importance for successful leadership, especially within governmental organizations (Andrews et al., 2021). This study investigates the specific use of technology-based approaches to strengthen DEI in Nigerian governmental hiring practices, highlighting the

significant effect of regional location. The Nigerian governmental division, notwithstanding its fundamental purpose in national advancement, has traditionally faced obstacles concerning fair portrayal, often demonstrating variations based in local, cultural, and financial elements (Oluwatoyin & Adebayo, 2022). These imbalances can affect the efficacy, accountability, and validity of governmental bodies, impeding the accomplishment of inclusive advancement aims (Nwanegbo & Odigbo, 2021).

The adoption of technological innovations provides a strong method for lessening biases present in conventional hiring methods (Fryer, 2019). By utilizing virtual platforms, data examination, and automated procedures, governmental institutions can possibly increase openness, expand candidate groups, and impartially evaluate applicant abilities, thus creating a more merit-based setting (Riccucci et al., 2020). Nevertheless, the effective execution of technology-based DEI projects needs attentive consideration of Nigeria's varied regional situation. Entry to technology, digital proficiency levels, and structural ability differ considerably across the nation's areas, possibly intensifying current differences if not thoughtfully managed (Akinwale & Akinsanya, 2023). Therefore, this research seeks to analyze the possibilities and difficulties related to using technology to support DEI in Nigerian governmental hiring, while remaining highly conscious of the regional variations that mold the functional setting. It intends to contribute to a fuller comprehension of how technology can be utilized to construct a more inclusive and representative governmental division, ultimately reinforcing leadership and encouraging fair advancement throughout Nigeria.

Objectives of the Study:

1. To ascertain the extent to which the implementation of technology-enabled recruitment processes impacts the representation of diverse groups within the Nigerian public service, considering the nation's geographical variations.
2. To examine the perceived fairness and accessibility of technology-enhanced recruitment strategies in the Nigerian public sector among applicants from diverse geographical locations and backgrounds.

Research Questions:

1. How does the adoption of technology in public service recruitment affect the diversity profile of new hires across different geographical regions in Nigeria?
2. What are the perceptions of potential applicants from diverse backgrounds and geographical locations regarding the fairness and accessibility of technology-based recruitment methods used by the Nigerian public sector?

Research Hypothesis:

H_1. There is no statistically significant relationship between the utilization of technology-based recruitment strategies and the degree of diversity achieved in the Nigerian public service, taking into account geographical factors.

H_2. The perceived level of fairness and accessibility of technology-enabled recruitment methods in the Nigerian public sector does not differ significantly across applicants from various geographical locations and diverse demographic backgrounds.

Literature Review

Technology-Enabled recruitment to foster Diversity, Equity, and Inclusion (DEI)

Technology is increasingly recognized as a crucial element in advancing Diversity, Equity, and Inclusion (DEI) efforts, particularly within hiring processes. Across various sectors, specialists acknowledge its potential to address systemic barriers and foster more equitable environments. One important application is in breaking down language barriers. Artificial intelligence-driven translation tools are vital for promoting inclusivity and fairness by facilitating communication across diverse teams and situations, ensuring participation and benefit for all, regardless of their linguistic background (Gupta, 2023). Digital collaboration platforms can also connect organizations with a wider talent pool, encouraging cultural exchange, varied perspectives, and flexible work arrangements. This improves accessibility and inclusivity for individuals from different backgrounds (Llorca, 2023).

The strategic use of data is also essential. Compiling extensive and representative datasets is important (Meucci, 2023). By incorporating a wide array of internal and external resources, organizations can establish a more comprehensive foundation that reflects societal diversity and reduces potential biases in decision-making, especially in fields like healthcare. Data analytics can also be used to assess the effectiveness of DEI programs (Westerheim, 2023). By analyzing data by department, position, and compensation, organizations can gain deeper insights into their progress and identify areas for improvement, ensuring that diversity and inclusion are evident at all levels.

Technology also enables more equitable hiring methods and promotes remote work (Coger, 2023). This expands access to a diverse applicant pool, fostering DEI throughout the organization. Technology can equalize opportunities by facilitating fair and inclusive learning and collaborative environments, particularly in the public sector (Lefebvre, 2023). This allows organizations to leverage the collective knowledge of their entire workforce. Artificial intelligence can be used for policy evaluation and improvement to address structural obstacles to DEI (Kaushik, 2023). By analyzing existing policies and practices, AI can identify potential barriers to diversity and inclusion and suggest evidence-based improvements, contributing to a more inclusive organizational setting.

The incorporation of DEI principles into broader organizational frameworks is gaining momentum. Evidence suggests that DEI is a key driver of performance, especially in the public sector (Diversity Council Australia, 2023; Intel, 2023; International Labour Organization, 2022). In Australia, DEI practices are being integrated into Environmental, Social, and Governance (ESG) objectives, with many ASX 200 companies reporting gender diversity statistics (PricewaterhouseCoopers Consulting Australia, 2022). However, as DEI expands beyond gender to include other dimensions such as disability, age, and sexual orientation (World Economic Forum, 2023), Australian organizations, like their international counterparts, face significant challenges. Employees increasingly expect proactive measures regarding pay equity and inclusive hiring practices (Vercoe, 2023), emphasizing the need for organizations to demonstrate their commitment to DEI through clear and transparent statements in job postings (Perrin, 2022). Despite these expectations, a lack of trust in ESG disclosures, including DEI claims, remains a concern (Vercoe, 2023). Nonetheless, most Australian employees believe that employers are working to improve DEI in the workplace (Diversity Council Australia, 2021), often motivated by

adherence to federal and state regulations and economic benefits (Australian Human Rights Commission, 2014; Lee et al., 2023; Mansouri, 2023; Wadley, 2023).

Currently, Equal Employment Opportunity (EEO) is the most common manifestation of DEI within hiring, aiming to protect vulnerable groups from discrimination (Burgess et al., 2009). EEO statements, often legally required (Sutton et al., 1994), focus on creating opportunities for disadvantaged or underrepresented groups (Westen, 1985). While diversity has become a central hiring goal, with diversity messaging enhancing employer appeal (Perrin, 2022), the concept of inclusion, based on a sense of belonging and individual uniqueness (Shore et al., 2011), is receiving increased attention. Navigating the complexities of inclusive messaging requires careful consideration of both in-group and out-group responses (Fleischman et al., 2024). The global trend toward supportive work environments, combined with technological advancements, is promoting the integration of DEI practices into the early stages of hiring, ultimately fostering more equitable and inclusive workplaces.

Reforming Public Service in the Digital Age

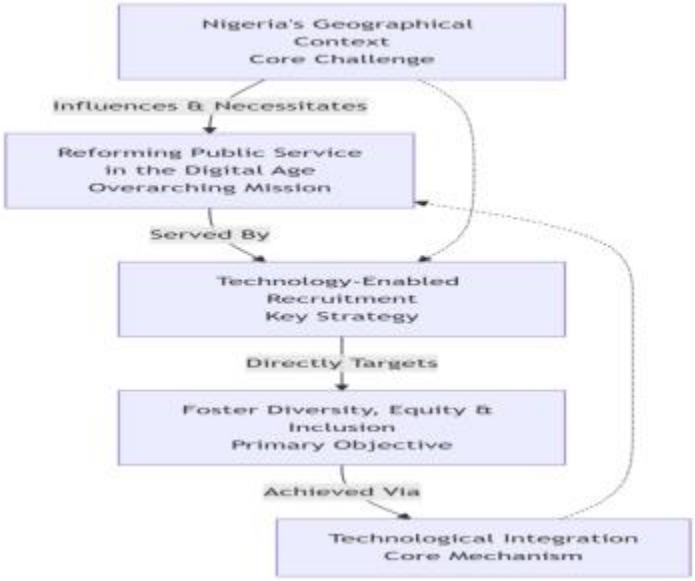
Digital transformation, a concept of substantial interest across diverse fields, is characterized by its complex and engaging nature. Fundamentally, it represents change occurring at two interconnected levels: internally, by influencing core functions and established processes within an organization, and externally, by affecting business approaches, offerings, and the connections between users and the organization (Hanelt et al., 2021; Mergel et al., 2019). This shift is largely driven by the incorporation of digital technologies, which reshape user and public expectations regarding public service delivery, emphasizing coherence and improved usability, while also introducing new methods of delivery. Scholarly research in public administration and management has explored how digital technologies restructure and subsequently enhance governmental organization and public service provision (Fischer et al., 2021).

While complete digitization of all public services and operations remains a goal for many governments, the increasing use of modern digital technologies has led to significant alterations within public sector bodies (Enang et al., 2020; Gil-Garcia et al., 2018; Hinings et al., 2018). A key objective of these efforts is that digitization not only incrementally improves but fundamentally transforms governmental entities and their interactions with citizens, businesses, and external parties (Bannister & Connolly, 2014; Mergel et al., 2019). Digital transformation can serve as a strategic objective within broader policy programs implemented in a top-down manner. It emphasizes fostering deep cultural changes within organizational frameworks, public service provision, and stakeholder relationships. This endeavor results in both tangible short-term benefits, such as increased access to digital public services, and lasting long-term effects, including enhanced organizational effectiveness and improved citizen satisfaction (Bannister & Connolly, 2014).

The incorporation of technology within the public sector to advance diversity, equity, and inclusion (DEI) can be viewed as a specific instance of digital governance. Research indicates that digital DEI considerations are a significant element (80%) in the examined academic settings (N=93). The concept of "e-government" effectively brings together aspects of public administration, technological advancement, and contemporary administrative strategies (Giritli Nygren, 2012). Although varied interpretations of this concept exist in the literature, technology can be generally

defined as the digital facilitation of all services provided or acquired by the public sector. Specifically, this includes the sharing of information and the delivery of services through online platforms and digital tools (Tolbert et al., 2008; West, 2005). Furthermore, acknowledging service recipients introduces a dynamic perspective, framing e-government as a mechanism that digitally connects citizens to government, enabling access to information and services from public agencies. The application of Information and Communication Technologies (ICTs) fundamentally changes patterns of information exchange and interaction, thereby promoting increased participation and equity (Lau et al., 2008).

The relationship between technology and the public sector has considerable implications for governance structures, service delivery models, and citizen engagement. Academic studies suggest that technology has the potential to enhance the operational efficacy, efficiency, and transparency of public sector organizations (Bertot et al., 2016). Digital tools, including e-government platforms and social media applications, enable public institutions to establish communication channels with citizens, deliver services, and gather feedback (Mergel, 2013). However, technology also presents challenges for public entities, particularly regarding issues such as the digital divide, cyber resilience, and data protection (Jaeger & Bertot, 2010). Consequently, it is essential for public sector organizations to prioritize technology through strategic initiatives, including robust digital governance frameworks, resilient IT infrastructure, and strengthened cyber-security measures.



Nigeria Geographical Context and DEI through Technological Integration

Within the specific context of Nigeria, the incorporation of technology into governmental structures is increasingly recognized as a crucial facilitator of advancements in Diversity, Equity, and Inclusion (DEI). Scholarly research suggests that digital instruments possess the potential to mitigate pre-existing prejudices, augment representation, and cultivate equitable governance (Adegbite & Adetunji, 2023). Given the documented historical inequalities pertaining to ethnicity and gender within Nigeria's public sector personnel, targeted technological interventions designed to bolster transparency and accessibility offer significant advantages (Okafor & Ibrahim, 2022).

A salient illustration of technology's ability to facilitate DEI lies in the deployment of online candidate acquisition platforms, aimed at minimizing partiality during the selection process. Empirical evidence indicates that the application of AI-supported mechanisms within Nigeria's civic service has correlated with increased gender and ethnic heterogeneity via the automated, competence-based evaluation of applicants (Okeke et al., 2023). Likewise, the utilization of data analysis aids officials in pinpointing marginalized communities and allocating resources equitably (Eze & Onyebuchi, 2024). It is crucial, however, to acknowledge that impediments to progress persist, encompassing deficits in digital proficiencies and infrastructural limitations, notably in economically challenged locales (Bello & Adeoye, 2023).

Furthermore, digitally disseminated educational programs furnish a route for promoting workforce inclusiveness. Studies demonstrate that virtual instructional content has contributed to enhanced skill development among underrepresented demographics, specifically individuals with impairments (Nwachukwu & Danjuma, 2023). In addition, decentralized record-keeping innovations have been put forth as a means to fortify responsibility in career advancements and assignment of duties, thereby diminishing the influence of preferential treatment (Yusuf & Mohammed, 2024).

Conceptual Framework Diagram

Theoretical Framework

The study is anchored on Giddens' (1984) structuration theory, a prominent framework in late 20th-century sociology, provides a lens for understanding human social organizations. Challenging the traditional separation of individual behavior and societal systems, Giddens proposed a reconceptualization where "agency", the capacity for independent action, and "structure", the complex network of societal influences, institutions, and norms, are mutually constitutive. While conventional sociological perspectives often treated agency and structure as distinct forces, Giddens argued for their inherent interconnectedness, asserting that each reciprocally shapes the other.

Methodology of the Study

Research Design

This study adopts a **quantitative research design** to examine enhancing diversity, equity, and inclusion in nigerian public service recruitment: A technology-driven approach within a geographical context. A survey-based approach will be used to collect data from employees and management across various sectors to assess how Technology-Enabled recruitment foster diversity, equity, and inclusion, reforming public service in the digital \age, nigeria geographical context and DEI through technological integration.

Population and Sampling

The target population of 200 consists of employees and administrative staff in Nigerian public organizations across s different industries (e.g., banking, education, healthcare, and government agencies). A **stratified random sampling technique** will be used to ensure representation from various sectors. The sample size of 150 will be determined using **Cochran's formula** for finite populations, ensuring statistical reliability.

Data Collection Methods
Primary data will be collected through:
Structured Questionnaires – Designed using a **5-point Likert scale** to measure perceptions of technology-enabled recruitment to foster Diversity, Equity, and Inclusion; Reforming Public Service in the digital age, Nigeria geographical context and DEI through technological integration
Variable

Variable Type	Variable Name	Description	Example Measures
Dependent	**DEI in Recruitment**	The outcome to be enhanced.	Demographic representation of hires; fairness metrics in pass rates; perception surveys.
Independent	**Technology-Driven Approach**	The primary method or intervention.	Use of specific tech tools (e.g., AI, online portals, blind screening software, digital outreach).
Independent	**Geographical Context**	The critical contextual factor that influences the relationship.	Urban/rural classification; state/region of origin; level of digital infrastructure.

Test of Hypotheses
The hypotheses were tested by simple regression analysis through the use of SPSS Computer Package Version 23 and 25.

Hypothesis One
H_0: There is no significant positive relationship between technology and diversity, equity and inclusion (DEI) in Nigeria's public service.
H_1: There is a significant positive relationship between technology and diversity, equity and inclusion (DEI) in Nigeria's public service.

R = 0.935
R^2 = 0. 873
F = 3156.979
T = 56.187
DW = 0. 080

Interpretation:
The regression analysis furnished statistically significant and substantial support for a positive link between technological integration and initiatives promoting diversity, equity, and inclusion (DEI) within the Nigerian public sector. Therefore, the null hypothesis was rejected in favor of the alternative, affirming the existence of a relationship.

The model exhibited a strong capacity to explain the variance in DEI, as shown by a high coefficient of determination. A correlation coefficient of 0.935 indicated a marked positive association between technology use and DEI. Furthermore, the R-squared value of 0.873 revealed that technology use explained 87.3% of the variance in DEI scores. This suggests that technology is a prominent factor influencing DEI results within the context of this study.

Analysis of variance (ANOVA) corroborated the overall significance of the regression model, producing a large F-statistic ($F(1, 458) = 3156.979$, $*p* < .001$). This outcome signified that the model offered a considerably better prediction of DEI compared to a baseline model using only the mean DEI value.

Examination of the coefficients provided particular insight into the predictive equation. The intercept, although statistically significant ($B = -0.696$, $*p* < .001$), indicated a negative predicted DEI level when technology use was absent. Crucially, the unstandardized coefficient for technology ($B = 0.976$) demonstrated that a one-unit increase in technology adoption was linked with a predicted increase of 0.976 units in DEI scores. The standardized coefficient (Beta = 0.935) reinforced the strong positive effect of technology on DEI. Furthermore, the t-value of 56.187, in conjunction with a significance level of $*p* < .001$, highlighted the high statistical significance of this association.

However, the Durbin-Watson statistic of 0.080 deviated considerably from the ideal value of 2, suggesting the potential presence of positive autocorrelation in the residuals. This implies a

possible breach of the assumption of independent errors. While this does not invalidate the important discoveries, it represents a limitation that should be acknowledged. Future investigations should contemplate employing techniques, such as time-series analysis or the inclusion of relevant control variables, to address this issue.

In conclusion, the regression analysis provided compelling evidence supporting Hypothesis 1. The statistically significant positive relationship between technology adoption and DEI (B = 0.976, β = 0.935, *p* < .001) warranted the rejection of the null hypothesis. This study concludes that a noticeable positive association exists between the integration of technology and the advancement of diversity, equity, and inclusion within the Nigerian public service. Greater technological integration is strongly correlated with improvements in DEI outcomes.

Hypothesis Two

H_0: The level of fairness and accessibility of technology-enabled recruitment methods in the Nigerian public sector does not differ significantly across applicants from various geographical locations and diverse demographic backgrounds.

H_1: The level of fairness and accessibility of technology-enabled recruitment methods in the Nigerian public sector differ significantly across applicants from various geographical locations and diverse demographic backgrounds.

Interpretation

A hierarchical multiple regression analysis, performed using IBM SPSS Statistics Version 25, was conducted to test the proposed hypothesis that geographical location and demographic characteristics moderate the relationship between technology use and the perceived fairness and accessibility of recruitment practices. The analysis sought to determine if the association between the independent variable (technology) and the dependent variable (perceived fairness and accessibility) varied depending on an individual's background.

Results indicated a statistically significant moderating effect, leading to the rejection of the null hypothesis. The findings suggest the relationship between technology and perceptions of fairness and accessibility is not uniform and is significantly influenced by applicant background.

The moderation effect was examined through a two-step hierarchical regression. Model 1 included the primary effects of the centered independent variable (technology scores) and the centered moderator variable (geographical/demographic background scores). Model 2 added the interaction term, created by multiplying the two centered variables, to directly assess the moderation effect.

Model 1 demonstrated a strong fit, accounting for a considerable proportion of the variance in the dependent variable (R^2 = .731, *F*(2, 97) = 131.52, *p* < .001). The addition of the interaction term in Model 2 resulted in a significant increase in explained variance (ΔR^2 = .026, *F*(1, 96) = 10.41, *p* = .002). This statistically significant improvement in model fit (*p* = .002), below the α level of .05, provided strong support for the existence of a moderation effect.

An examination of the coefficients for Model 2 revealed the following: Technology remained a significant positive predictor of perceived fairness and accessibility (B = 0.471, β = 0.298, *p* < .001). Furthermore, background was also a significant positive predictor of perceived fairness and accessibility, exhibiting an even stronger effect (B = 1.930, β = 0.855, *p* < .001). Critically, the

interaction term was statistically significant (B = 0.249, β = 0.170, *t*(96) = 3.226, *p* = .002), indicating that the association between technology and fairness/accessibility is contingent upon the level of the moderator variable. The positive B coefficient suggested that the positive impact of technology on fairness/accessibility is amplified for applicants from specific geographical or demographic backgrounds.

In summary, the analysis provided substantial evidence for the hypothesized relationship. The statistically significant interaction effect (*p* = .002) supports the assertion that the relationship between technology use and the perception of fairness and accessibility in recruitment is not consistent across the Nigerian public sector. Rather, it is significantly moderated by an applicant's geographical location and demographic background.

Discussion of Findings

This study examined the intricate relationship between the assimilation of technology and its effects on Diversity, Equity, and Inclusion (DEI) within the Nigerian public sector, concentrating specifically on talent acquisition procedures. The results, derived from the testing of two hypotheses, present a sophisticated and multi-faceted understanding of this dynamic.

Initially, the investigation of Hypothesis 1 yielded compelling and definitive confirmation of a significant positive association between technology and DEI. The model's exceptionally high predictive power ($R^2 = 0.873$) intimates that the incorporation of technological solutions – likely manifested through platforms such as online application systems, unbiased assessment tools, and digital outreach strategies – serves as a critical factor in advancing DEI metrics within the public sector. This observation is consistent with global discussions surrounding technology's capacity to mitigate human partiality, standardize methodologies, and broaden the applicant pool, thereby promoting more diverse and equitable recruitment practices.

However, the findings pertaining to Hypothesis 2 introduce a vital qualification to this optimistic perspective. The identification of a statistically significant moderating influence (*p* = .002) signifies that the advantages of technology are not disseminated uniformly. The positive connection between technology and perceived impartiality/accessibility is substantially conditioned by an applicant's geographical location and demographic characteristics. This suggests that while technology generally exerts a strong positive effect, its effectiveness is either amplified or diminished depending on the user's specific context. This finding introduces critical nuance to the initial observation, implying that without deliberate design and implementation, technology may inadvertently perpetuate or even intensify existing disparities related to digital access, proficiency, and cultural biases embedded within algorithms.

In essence, the discussion must reconcile two principal findings: technology is a valuable instrument for promoting DEI (Hypothesis 1), yet its deployment is not neutral, and its advantages are moderated by socio-demographic attributes (Hypothesis 2). This positions technology not as a straightforward solution, but rather as a complex enabler whose influence is determined by the context in which it is utilized.

Conclusion

Based on the empirical data, this study concludes that:

1. A substantial positive relationship exists between the integration of technology and the advancement of diversity, equity, and inclusion in Nigeria's public service recruitment. Technology emerges as a considerable contributing element to enhanced DEI outcomes.
2. The link between technology and perceived fairness/accessibility is not universally experienced. The degree of fairness and accessibility of technology-enabled recruitment methods varies significantly among applicants originating from diverse geographical locations and demographic backgrounds. Consequently, the efficacy of technological interventions is contingent upon these factors.

In summary, technology holds considerable potential for transforming the Nigerian public sector into a more diverse, equitable, and inclusive institution. However, the realization of this potential is conditional. Its successful implementation necessitates a thoughtful approach that acknowledges and actively addresses the diverse circumstances of its intended beneficiaries.

Recommendations

To capitalize on the advantages of technology while mitigating its potential to generate inequity, the following recommendations are proposed for policymakers and public sector administrators in Nigeria:

1. Invest in Equitable Digital Infrastructure: To address geographical moderation, the government must prioritize investments in digital infrastructure (e.g., broadband connectivity, power supply) in marginalized regions. This ensures that technological recruitment tools are readily available to all candidates, irrespective of their location.
2. Conduct Algorithmic Audits: To mitigate demographic moderation, recruitment software and algorithms must undergo regular evaluations for latent biases (e.g., gender, ethnic, socioeconomic) that could disadvantage certain groups. Procurement policies should mandate transparency from vendors regarding the design and testing of their algorithms.
3. Implement Complementary Blended Approaches: Technology should not entirely supplant human oversight. A blended strategy that integrates technological efficiency with human empathy and judgment is essential. This could involve utilizing technology for initial screening while reserving final evaluations for trained panels cognizant of unconscious partiality.
4. Launch Digital Literacy Programs:: The government should initiate targeted educational programs to enhance the digital literacy skills of prospective applicants, particularly in rural and demographically marginalized communities, ensuring their capacity to effectively navigate online recruitment platforms.

Future Research

1. Qualitative Exploration: A future qualitative study is warranted to comprehensively examine the nature of the moderating influence identified in Hypothesis 2. In-depth interviews and focus groups with applicants from diverse backgrounds could reveal the specific obstacles they encounter (e.g., data costs, complex interface design, algorithmic bias, cultural distrust), providing rich contextual understanding to the statistical findings.
2. Longitudinal Research: A longitudinal study monitoring DEI outcomes before, during, and after the implementation of specific technologies would provide stronger causal evidence of technology's impact and its evolving relationship with moderating factors over time.

3. Expanding the Moderators: Future research should investigate other potential moderating variables, such as age, disability status, socioeconomic standing, and educational attainment, to construct a more comprehensive model of how technology affects different subgroups.
4. Cross-National Comparative Study: A comparative analysis involving other public sectors in West Africa or developing nations could identify common challenges and effective strategies, providing valuable insights for Nigeria's ongoing reforms.

Board Diversity, Ownership Structure and Environmental Waste Management Disclosure of Listed Companies in Nigeria

EGBERI, Agbarha Kelvin PhD;
Department of Business Administration, Faculty of Administration and Management, Southern Delta University, Ozoro, Nigeria

Abstract
This study investigated the nexus between board ownership structure, board diversity and environmental waste management disclosure of listed industrial goods companies in Nigeria. Expo-facto research design was employed and secondary data of board ownership, board diversity, environmental waste management disclosure and control variable(firm size -natural logarithm of total assets) were obtained for twelve (12) listed industrial goods companies from 2014 to 2024. Data obtained were analyzed using descriptive statistics (mean, standard deviation, and Pearson correlation), post-estimation statistics (variance inflation factor), and inferential statistics(fixed and random effects panel regression). The fixed and random effects panel regression revealed that board ownership structure and board diversity significantly influence environmental waste management disclosure of listed industrial goods companies in Nigeria. Interestingly, it was found that firm size moderates the relationship between board ownership structure, board diversity and environmental waste management disclosure of the listed industrial companies in Nigeria. The study recommends the need for increased waste management disclosure by industrial goods companies and the imperativeness of including more females on the board who are experienced on environmental waste management related matters to make products/services of listed industrial goods companies more environmentally friendly.

Keywords: *Board ownership structure; Board diversity; Environmental management; Waste management disclosure; Nigeria*

Introduction

Practically, companies emit waste that pollutes or degrades the environment, hence posing a severe danger to companies' ability to establish and sustain ecological equilibrium. As noted by Enudi, Chizoba and Amahalu(2024), companies and the environment have reciprocal link, as evidenced by the impact companies have on the environment and environment's reciprocal impact on companies. Consequently, accurate understanding of the many aspects of good environmental waste management is essential to sustainable development that satisfies both current and future generations' needs. Businesses now understand that fulfilling stakeholder expectations is just as important to sustainability as achieving overarching strategic corporate goals (Islam, Uddin & Hossain, 2024; Onyali & Okafor, 2018; Daferighe, Akpanuko & Offiong, 2019).

Diverse interest groups have started to put pressure on businesses to take on greater environmental obligations beyond their economic role as human civilisation develops and the relationship and interdependence between the environment and the firm become more apparent (Ladini, Orbunde & Kayode, 2024). Therefore, a crucial idea that is currently being promoted emphasises how vital

it is for companies to improve the environment to reduce the likelihood that their operations will degrade global resources, both for the present and for future generations (Nwaiwu & Oluka, 2018). Although businesses are working to implement effective environmental accounting, the literature has concentrated on the negative effects of environmental waste management disclosure, particularly on financial performance, which has received a lot of attention recently.

Despite the vast amount of study on environmental waste management disclosure, findings remain unclear and conflicting. Furthermore, there is a dearth of empirical data evaluating the relationship between board ownership structure, board diversity and environmental waste management disclosure in relation to Nigerian listed industrial goods companies (Usiomon & Iyoha, 2024). Evaluating the link between environmental waste management disclosure and these governance variables will help us comprehend why different companies have different perspectives on environmental waste management and directors' duty to make governance environmentally responsible.

Consequent upon the above, it is necessary to evaluate how board ownership structure and board diversity influence waste management disclosure of listed industrial goods companies in Nigeria. Also, Uwuigbe, et al (2018) showed that public attention and pressure to adopt environmental waste management standards are higher for larger companies. As a result, firm size has an impact on the relationship between board ownership structure and board diversity; however, there is not much information in the management literature about how firm size influences this relationship. In light of the aforementioned, the study aims to evaluate how board ownership structure, board diversity and environmental waste management relate to Nigerian industrial enterprises that are publicly traded.

Review of Related Literature

Environmental Waste Management Disclosure (EWMD)

The management of a firms' environment is the focus of environmental waste management. According to Usiomon and Iyoha (2024),, environmental waste management relates to a vision or objective aimed at guiding a process to the use of a set of instruments, to a philosophical exercise aimed at establishing fresh viewpoints on human civilisations and the environment, and much more. Environmental waste management (EWM) as observed by Almaqtari, et al (2023), is linked with describing and tracking changes in the environment, forecasting future changes, and making efforts to maximise human benefit and reduce environmental deterioration brought on by human activity.

Goal-setting, information management, decision-making support, environmental waste management, implementation and control, communication, internal among others are the vital components of effective environmental waste management (Emenyi & Okpokpo, 2023; and Badingatus & Ukhti, 2021). Accurate and good understanding of the many aspects of good environmental waste management is essential to sustainable development that satisfies the needs of both the current and future generations (Egbunike & Okoro, 2018; Powei, 2020; and Agyemang, et al, 2021).

Cleaner production, supply chain management, "given" product or service design, environmentally friendly purchasing, and environmental waste management systems are just a few examples of

internal management activities that benefit greatly from EWM (Onoh, Biradawa & Ndubuisi, 2023). Furthermore, the environment takes into account every vital circumstance needed for business sectors to survive, and neglecting the environment results in significant ecological harm, hence environmental waste management disclosure (EWMD) has been considered as a vital aspect of companies, particularly those of listed industrial goods companies.

Board Diversity

One of the most important governance concerns facing contemporary organisations is board diversity, namely the presence of women on the board and board performance. As noted by Ezeagba, John-Akamelu and Umeoduagu (2017), one explanation for this is that increasing the number of women on boards has been promoted as a way to boost organisational value and performance by introducing boards to fresh perspectives, knowledge, and insights that aid in decision-making (Kiran & Bomi, 2019). Research indicates that women are especially adept at addressing problems, which equips them with powerful abilities to handle ambiguity, disagreement, and uncertainty (Krivacic & Jankovic, 2017)

According to Nkwoji (2021), women might be more knowledgeable about consumer behaviour, customer demands, and business prospects to satisfy those needs. Companies are under pressure to include more women on their boards as a result of public feeling that organisations should represent the society they serve. According to research, women are frequently appointed to significant board committees rather than serving as token board members. This suggests that, although legitimacy may be a significant consideration, it is not the sole justification for choosing female directors (Manning, Braam & Reimsbach, 2018).

In addition, shareholders feel that boards with more female appointees are better at making sure their investments do not conflict with managerial misappropriation, but they also think that boards with more female representation enforce ethical behaviour more strictly (Olaniyan, Efuntade & Efuntade, 2021). In this study, board diversity was used as a measure of corporate governance in describing how it relates with environmental waste management disclosure of listed industrial goods companies on the floor of the Nigerian Exchange Group (NGX) Limited.

Board Ownership Structure

Environmental waste management disclosure has been proven to be impacted by board ownership in corporate organisations. In industrialised countries, the existing literature on environmental waste management disclosure and board ownership structure has produced contradictory results (Rodrigues, et al, 2021; and Ahmad, et al, 2018). Although there are few studies on the relationship between board ownership structure and environmental waste management disclosure, especially in the industrial subsector in Nigeria have looked at the relationship between board ownership structure and financial performance (Ashok, 2018).

Board ownership structure has a major impact on environmental accounting, according to evidence from industrialised countries (Wang, 2016). These researches demonstrated that board ownership has a favourable and significant impact on environmental accounting using both fixed and random effects. Based on the recommendations of Hassan, et al (2018), and Wang (2016), we used the percentage shareholdings of executive directors with direct and indirect shareholdings to quantify board ownership in our analysis.

Firm Size

One of the key factors influencing a company's overall performance is its size. In terms of both business and geography, organisations that expand in size have greater options to operate in larger segment environments, according to Hassan, et al (2018).. Additionally, it has been demonstrated that firm size is associated with vertical integration, concentration, industry sunk costs, and overall industry profitability (Nwaiwu & Oluka, 2018). As observed by Abdullah, (2018), larger companies are more likely than smaller ones to have more levels of management, more departments, more specialised skills and functions, more centralisation, and more bureaucracy.

Larger companies are under more public pressure to demonstrate their environmental accounting responsibilities since they often receive more attention from the broader public, according to Hassan, et al (2018). According to the stakeholder theory, big businesses have more stakeholders than small businesses. To satisfy the needs of stakeholders for information pertaining to their interests, big businesses should disclose information more widely. The entrepreneur and top management team's personal and cohesive social relationships, such as their relationships with family and friends, appear to be more important to small businesses than to large ones. These relationships are crucial for obtaining resources, gaining legitimacy and overcoming the constraints of their small size.

On the other hand, larger companies might look for commercial partnerships for a variety of strategic reasons, including financial need, market access, innovation, and so on. Indicators of firm size utilised in earlier research include total assets, total sales, and total personnel; these parameters were used to measure firm size. Nonetheless, this study used the natural logarithm of total assets as a thoughtful and suitable measure of firm size and to find out whether it interacts with environmental waste management disclosure.

Theoretical Framework

Stakeholder theory is the foundation of this investigation. The stakeholder theory describes how management may meet the interests of stakeholders in a corporation and was initially put forth in R. Edward Freeman's book Strategic Management: A Stakeholder Approach. According to Manning, et al, (2018), stakeholders are any group or individual who can affect or is affected by the achievement of the firm's goals. Nkwoji (2021) opined that stakeholders are groups that either have an impact on or are influenced by the company's operations.

The stakeholders include owners of wealth (shareholders), employees, government, local communities, customers and silent stakeholders. Future generations and the environment are examples of silent stakeholders who require representation from other organisations(Usiomon & Iyoha, 2024). It requires that there be investors to give them money, customers to buy their goods and services, employees to serve the customers, suppliers to sell them the goods they will sell and a community within which they can thrive. If any of these groups are absent, the business cannot be successful (Enudi, et al, 2024).

Stakeholder theory's central claim is that a company's ability to succeed depends on how well it manages all of its interactions with its stakeholders. Understanding the stakeholder environment and improving business managers' ability to manage within it are the goals of the stakeholder theory (Islam, et al, 2024). According to Ladini, et al (2024), stakeholder theory is predicated on

the idea that a company's ability to accomplish its goals will be facilitated by the strength of its relationships with other interested parties. Stakeholder theory serves as the foundation for this study since it adds to the corporate sustainability idea by providing additional commercial justifications for why businesses ought to pursue sustainable development.

Methodology

The ex-post facto research design was used in this investigation; this design was used because the study aims to identify the elements associated with specific occurrences by examining previous events of conditions that already exist; therefore, there is no control over some variables because the event has already occurred. Twelve (12) listed industrial goods firms that are publicly traded on the NGX as of December 31, 2024, made up the study population.

The listed industrial goods firms were chosen for this study because of the significant impact of the activities of the industrial firms on the environment

The dependent variable is environmental waste management disclosure (EWMD), Independent variable is board diversity, ownership structure while the control variable is firm size. Data for the study were obtained from audited annual reports and accounts of the listed industrial goods companies. The regression models are given in the following equations:

$EWMD = f(BODG, BOWS, FSIZE)$ [Eq.1]

$EWMDt_{it} = \beta_0 + \beta_1 BODG_{it} + \beta_2 BOWS_{it} + \beta_3 FIZE_{it} + \mu_{it}$ [Eq.2]

Where: EWMD is Environmental waste management disclosure; BODS is Board diversity, BOWS is Board Ownership Structure; í individual industrial goods companies t is Time period; µ is Error term

Initially, the study included descriptive statistics of the variables (mean, standard deviation, minimum, and maximum values); second, Pearson correlation matrix; third, the normality test and variance inflator factor; fourth, heteroscedasticity; and fifth, the fixed and random effects tests. To establish appropriateness of fixed-or-random effects model, Hausman specification test was conducted.

Table 1: Measurement of Variables

Variable Type	Indicators	Measurement
Independent	Board Diversity	**Number of women on the board**
	Board Ownership Structure	% holdings of executive directors with direct/indirect holdings
Dependent	Environmental Waste Management Disclosure	0 for coy with environmental impact; 1 if otherwise
Control	Firm Size	Natural logarithm of total assets

Source: Researcher's Compilation (2025)

Results

Table 2: Summary of Descriptive Statistics

Variable	Mean Score	Std. Dev. Score	Minimum Score	Maximum Score
EWMD	0.0992	0.3001	0	1
BODG	9.7903	0.9384	0	1
BOWS	10.267	0.9668	9.2401	23.045
FSIZE	6.6980	0.3396	6.9303	21.939

Source: Researcher's Computation via STATA 13.0

Each variable's mean (average) and corresponding standard deviation (degree of dispersion) are displayed in Table 2. The characteristics of the chosen industrial goods companies that are publicly traded on the NGX are clarified by the results above. With the mean value of 10.267, board ownership (BOWS) has the highest average in the study. Board diversity comes in second (9.7903), and environmental waste management disclosure (EWMD) comes in last. With a standard deviation of 09668, BOWS has the most dispersion, whereas EWMD exhibits the lowest dispersion. The distribution indicates that EWMD policies and practices of the industrial goods companies in the sample are not far separated from one another.

Furthermore, the maximum and minimum values showed how the variables varied over the reviewed period. Among other things, the results of the dependent, independent, and control variables maximum and minimum values imply that the study's variables were probably not consistent throughout time. The relationship between board ownership structure, diversity, and environmental waste management disclosure of Nigerian industrial goods companies is plausible, considering that all of the study's variables change over time. Therefore, we used the Pearson correlation coefficient matrix to analyse the relationship, and Table 3 shows the findings.

Table 3: Pearson Correlation Matrix

Variable	EWMD	BODG	BOWS	FSIZE
EWMD	1.0000			
BODG	0.2910	1.0000		
BOWS	0.1945	0.0529	1.0000	
FSIZE	0.2255	0.5662	0.0261	1.0000

Source: Researcher's Computation via STATA 13.0

The findings in Table 3 demonstrate a favourable correlation between the EWM, BODG, BOWS, and FSIZE. The Pearson correlation results implied that there is positive relationship between the board ownership structure, diversity, and environmental waste management disclosures of the listed industrial goods companies. However, as none of the correlation coefficients were greater than 0.8, the correlation matrix also showed that there was no perfect correlation between any two of the study explanatory variables. The multicollinearity test result, which is displayed below, further supports the aforementioned position:

Table 4: Multicollinearity/Heteroscedasticity Result

Variable	VIF	1/VIF
BODG	1.65	0.6076
BOWS	1.64	0.6109

FSIZE	1.04	0.9639
Mean VIF	1.44	

Source: Researcher's Computation via STATA 13.0

The results of the data's multicollinearity and heteroskcedasticity tests are displayed in the Table 4. Given that VIF = 1.44 is smaller than the generally accepted VIF value of 10.0, it may be concluded that the model does not have a multicollinearity issue.

Table 5: Fixed and Random Effects Panel Regression

Parameters	**Fixed Effect**		**Random Effect**	
Estimators	Coefficient	Probability	Coefficient	Probability
BODG	0.337	0.000	0.437	0.000

Hausman Test			Chi2(2) = 0.43	Prob>Chi2= 0.8631

Source: Researcher's Computation via STATA 13.0

Table 5 displays the results of the Fixed Effect (FE) and Random Effect (RE) analyses for the board ownership structure, board diversity and environmental waste management disclosure (EWMD) for the entire panel data. All variables are statistically significant at the 1% level ($p < 0.01$) and the direction of the relationships is positive for all variables in both models (FE and RE). The coefficients are slightly higher in the RE model, which could suggest that once you allow for entity-specific effects (not controlled in FE), the explanatory power of the variables increases. Positive coefficients imply that increases in these variables are associated with increases in the dependent variable.

Both models are highly significant ($p < 0.001$), indicating that the explanatory variables collectively explain the dependent variable well. R-squared is higher in the Random Effects model (0.739 vs. 0.660), suggesting a better overall fit. Hausman test is used to decide between Fixed Effects (FE) and Random Effects (RE). Null Hypothesis (H0): Random Effects is preferred (RE is consistent and efficient). Alternative Hypothesis (H1): Fixed Effects is preferred (RE is inconsistent). Since: p-value = 0.8631 > 0.05, we fail to reject the null hypothesis, hence RE model is appropriate/preferred in this context.

Furthermore, all independent variables (BODG, BOWS, FSIZE) have statistically significant and positive effect on the dependent variable. The RE model is statistically more appropriate based on the Hausman test. The model explains a high proportion of the variance ($R^2 = 0.739$ in RE). The model fit is good, and the results are robust across both FE and RE specifications. Higher board gender diversity (BODG) is positively associated with improved environmental waste management, suggesting potential benefits of diversity in governance. Also, higher board ownership (BOWS) may align interests between board members and shareholders, leading to better outcomes while larger firms (FSIZE) tend to perform better, possibly due to economies of scale, resources, or market power.

Conclusion and Recommendations

The relationship between board diversity, ownership structure, and environmental waste management disclosure of Nigerian listed industrial goods businesses was examined in this study. An ex post facto research design was used to gather secondary data on environmental waste management disclosure, board ownership, board diversity, and the control variable (firm size - natural logarithm of total assets) for twelve (12) listed industrial products businesses between 2014 and 2024. Inferential statistics (fixed and random effects panel regression), post-estimation statistics (variance inflation factor), and descriptive statistics (mean, standard deviation, and Pearson correlation) were used to analyse the collected data.

Board diversity and ownership structure have a major impact on the environmental waste management disclosure of Nigerian listed industrial products businesses, according to the results of the fixed and random effects panel regression. The association between board ownership structure, board diversity, and environmental waste management disclosure of Nigerian listed industrial companies was found to be moderated by company size. In order to make listed industrial goods companies' products and services more environmentally friendly, the study suggests that industrial goods companies disclose more information about waste management and that more women with experience in environmental waste management issues be added to the board.

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Board Size and Organizational Sustainability of Printing Press Firm in Warri, Delta State

Dr. Solanky George Ayanate, & Dr. Apugu Samuel Claudius
Department of Business Administration, Faculty of Administration and Management Sciences, Ignatius Ajuru University of Education Rumuolumeni Port Harcourt, Rivers State.

Abstract
This study examined the relationship between board size and sustainability of printing press firms in Warri Delta State. The study adopted the cross-sectional research survey design. Primary data was generated through structured questionnaire. The total population of the study is one hundred and twenty-five (125) staff of the13 printing press companies in Warri. The sample size of 95 was determined using the Taro Yamen's 1970 formula. The reliability of the instrument was achieved by the use of the Cronbach Alpha coefficient with all the items scoring above 0.70. The hypotheses were tested using the Spearman's Rank Order Correlation Coefficient. Findings revealed that there is a significant negative relationship between stress intervention and employee job burnout in printing press firms in Warri Delta state. The study found a correlation coefficient of 71.3 percent and probability value of 0.000 between board size and economic sustainability, 53.2 and profitability of 0.000 between board size and sustainability. The study concludes that board size has positive and significant relationship with organizational sustainability of the selected printing press firms in Warri. The study recommends that the proportion of executive to non-executive directors should be in line with corporate governance codes and board composition components of printing press firms which include gender diversity, board size, board independence, and board-director duality need to be strengthened to positively affect finance management practices.

Keywords: *Board Size, Organizational Sustainability, Economic Sustainability, Environmental Sustainability*

Introduction

The concept of sustainability gained prominence globally following the United Nations' declaration of the Sustainable Development Goals (SDGs) in 2015. This shift has significantly influenced business strategies across various industries, resulting in an increased focus on organizational sustainability. The field of sustainability science has emerged as a distinct area of study, characterized by numerous publications and diverse interpretations of the concept (Kates et al. 2001; Komiyama and Takeuchi 2006; Schoolman et al. 2012; Kajikawa et al. 2014). Despite extensive discourse, sustainability remains an open concept with multiple definitions and context-specific understandings.

Sustainability is fundamentally about conserving resources for future generations. According to Emas (2015), sustainability involves preserving organizational resources to ensure their availability for future use. This principle differentiates sustainability from traditional environmental policies that primarily address the immediate impacts of environmental

degradation. Cerin (2006) also highlights this distinction, noting that sustainability integrates the internalization of external environmental factors.

One of the most widely recognized definitions of sustainability comes from the Brundtland Report (1987), which describes it as development that meets current needs without compromising the ability of future generations to meet their own needs. Central to this definition are three core elements: economic considerations, environmental protection, and social well-being. These elements, collectively known as the triple bottom line, emphasize the need to balance economic growth, social equity, and environmental stewardship (Basiago 1999; Pope et al. 2004; Gibson 2006; Waas et al. 2011; Moldan et al. 2012; Boyer et al. 2016).

The triple bottom line framework advocates for improving the quality of life while minimizing environmental impacts to within the carrying capacity of nature. Ideally, sustainable solutions generate long-term benefits across economic, social, and environmental domains. This framework is often visualized as three intersecting circles representing society, environment, and economy, with sustainability positioned at their intersection. Sustainability implies that society must use resources at a rate that allows for their regeneration. This principle is often defined in terms of the carrying capacity of ecosystems (Hawken, 1993) and described using input-output models of resource consumption. For example, the paper industry practices replanting trees to replace those harvested, thereby internalizing environmental costs. Similarly, automotive companies like Volkswagen design cars to be almost entirely recyclable.

Viewing organizations as part of a broader social and economic system (Hart, 1997) necessitates considering both current resource consumption and future resource availability. At the organizational level, sustainability involves enhancing efficiency in resource utilization and planning for long-term resource needs. Although sustainability is commonly associated with environmental issues such as energy conservation and climate change, it also encompasses economic and social impacts (Ha-Brookshire & Norum, 2011).

Organizations that integrate sustainability principles often voluntarily exceed legal requirements, embedding values and behaviors that promote social responsibility (Velazquez & Vargas, 2012). This integration enhances the organization's reputation and fosters long-term resilience and competitiveness.

Good corporate governance is essential for achieving organizational value and sustainability. Effective governance builds investor confidence by ensuring legal protections for minority shareholders and promoting transparency and accountability. Nigeria, for instance, faces international pressure to adopt robust corporate governance practices and economic liberalization to attract investors (Ahunwan, 2002). Corporate governance involves the processes and structures by which organizations are directed and controlled. Key governance questions include whose interests the company serves, who makes decisions; and how accountability and risk management are handled. Global principles, such as the G20/OECD Principles of Corporate Governance (2015) and ISO 26000 (2010), provide frameworks for best practices. These principles promote convergence in governance standards, leading to a competitive advantage through effective stakeholder relationship management.

Compliance with corporate governance codes varies depending on regulatory strictness. Stricter regulations tend to ensure better adherence, while lax regulations may result in lower compliance. In Nigeria, challenges such as regulatory multiplicity and corruption complicate governance efforts (Demaki 2018; Aguilera, 2008; Alonso-Pauli & Perez-Castrillo, 2012). Integrating sustainability and governance practices yields significant benefits, including increased organizational value (Klettner et al., 2014) and enhanced corporate social responsibility (Sharma, 2014). Collaboration with suppliers and stakeholders fosters compliance with sustainable governance principles, leading to more resilient and responsible organizations (Gimenez & Sierra, 2013; Li et al., 2014).

This study examines the impact of board size on the sustainability of printing press firms in Ughelli, Delta State, Nigeria. It aims to address gaps in understanding organizational sustainability within the context of developing economies, thereby contributing to the broader discourse on sustainable business practices. Through this examination, the study seeks to provide insights into the efficacy of corporate governance in fostering organizational sustainability in the Nigerian printing and publishing industry.

Research Conceptual Model

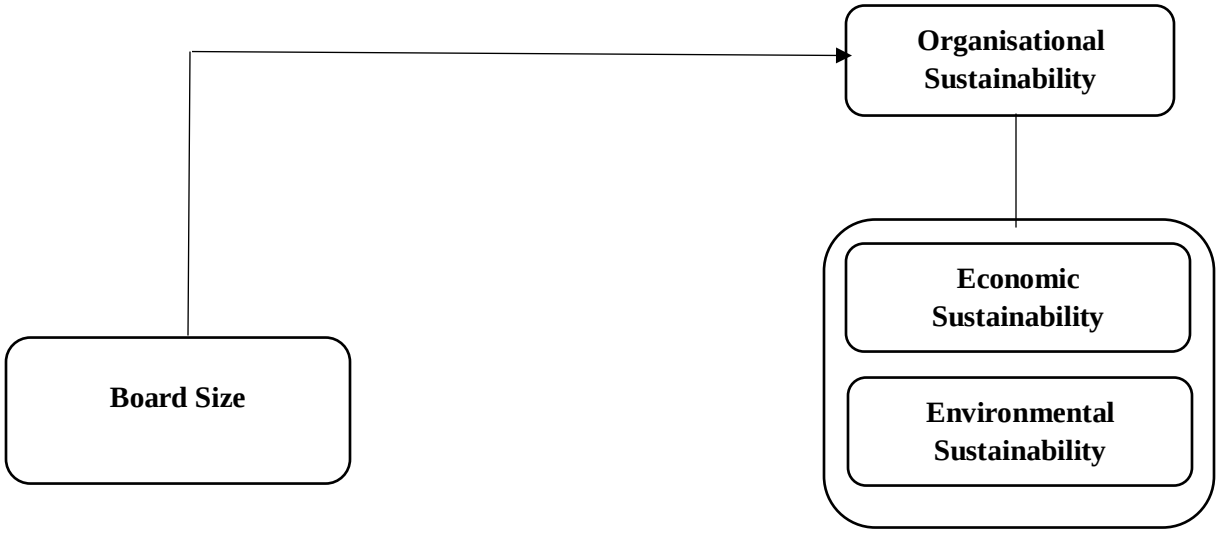

Figure 1: Conceptual model for the board size and organisational sustainability

Literature Review

Theoretical Foundation

The Resource Based Theory

The resource based theory otherwise called the resource based view, identifies the (valuable, rare, imitable and substitutable) resources owned by the firm as the source of the firm's sustainable competitive advantage. Extensions of the theory have produced several theoretical refinements including the knowledge-based view of the firm (Grant, 1996), core competency (Prahalad & Hamel, 1990) capabilities theory (Helfat & Peteraf, 2003) and the dynamic capabilities view (Teece, Pisano, & Sheun, 1997). The principal contribution of the resource based view of the firm to date has been as a theory of competitive advantage. Its basic logic is a relatively simple one. It starts with the assumption that the desired outcome of managerial effort within the firm is a

sustainable competitive advantage (SCA). Achieving a sustainable competitive advantage (SCA) allows the firm to earn economic rents or above-average returns. In turn, this focuses attention on how firms achieve and sustain advantages. The resource-based view contends that the answer lies in the organization's possession of certain key resources, having the characteristics of value, barriers to duplication and appropriability. A sustainable competitive advantage (SCA) can be obtained if the firm effectively deploys these resources in its product-markets. Therefore, the resource based view (RBV) emphasizes strategic choice, charging the firm's management with the important tasks of identifying, developing and deploying key resources to maximize returns (Barney, 1991).

Board Size

Board size is a term which describes the number of persons on the board of directors of a company as at a given time period. The board is considered to be an important part of a firm's governance mechanism. It is regarded as the apex court of appeal for resolving various issues including the agency problem. It acts as a monitor, and maintains discipline in the firm. It is believed that the decision of the board is supreme (Fama and Jensen, 1983). There is no consensus across countries and corporate governance codes as to the number of persons that should sit on the board of a company; however, the board should not be so large as to be unwieldy (Financial Reporting Council, 2010). Hence, the board should be of a sufficient size relative to the scale and complexity of the company's operations such that changes to the board's composition and that of its committees can be managed without undue disruption (Financial Reporting Council, 2010; Financial Reporting Council of Nigeria, 2016a). In theory, there is the support for having a large board size and independent board members. A small board size can increase the power of controlling shareholders to influence managers to act in their favour, impaired to a large Board size. For instance, Sanda (2010) argued in favour of having a board size of ten members, and supports concentrated ownership as opposed to diffused equity ownership, but did not find evidence to support the idea that boards with a higher proportion of outside directors perform better than other firms.

Organizational Sustainability

Although the word sustainability has been in the lexicon of human society for centuries, its origin as a policy concept is however traced to the Brundtland Report of 1987 (Kuhlman and Farrington, 2010). Since its origin, the meaning ascribed to it has been reviewed. The Brundtland Report, according to Kuhlman and Farrington (2010: 3436) was concerned with the tension between the aspirations of mankind towards a better life on the one hand and the limitations imposed by nature on the other hand. But the alterations in the meaning of the concept have continued with the passage of time as succinctly captured by Wales (2013: 39). Colbert and Kurucz (2007) identify the colloquial definition of sustainability as being to keep the business going, whilst another frequently used term in this context refers to it as the lustre proofing of organizations.

Organizations are increasingly inclined to integrate society's expectations into their business strategies, not only to respond to rising pressure from consumers, employees and other stakeholders but also to explore opportunities for creating competitive advantage (Bielak. Bonini, & Oppenheim, 2007; Bonini, Mendonca, & Oppenheim, 2006). To this end, management researchers are seeking to identify a set of factors with the potential for facilitating effective integration of sustainability into organizational practices. Leadership has been recognized as an

important factor, promoting the commitment of organizations as a whole, driving cultural values towards such commitment rather than a form of control (Higgins, 1995). Likewise, Marrewijk (2004) describes a set of ideal types of organizations, and for each type elaborates a system of values and related institutional structures, such as governance and the role of leadership. Fineman (1996) discusses the role of leadership in the process of change, pointing out that green practices take place when managers cultivate employee commitment to belonging to a socially responsible organization. In short, leadership appears to play an important role in the corporate adoption of sustainability practices. Other factors recognized as promoters of sustainability initiatives are institutional mechanisms such as communication and training. Stone (2006) pointed out that, in order to achieve a high degree of organizational commitment and to remove obstacles to changes of attitude and involvement, well-defined training and communication plans are key factors in promoting a clear understanding of the role and importance of sustainable practices for organizational strategy and goals. In a different approach, Tregidga and Milne (2006) analyze corporate reports with a view to understanding the emergence and development of the mechanisms in building and legitimizing corporate sustainability initiatives and helping to reduce the sense that sustainability and businesses are incompatible.

Measures of Organizational Sustainability

Economic Sustainability

Economic sustainability can be described as a process whereby there is a consciousness to maintain permanent income for persons. This income could be generated through non-declining stocks of capital (Spangenberg, 2002). In the macroeconomic debate, authors like Runnings (2000) and Bundeshanzlerant (2002) are of the opinion that criteria such as innovations, competitiveness and public debt are predominant while other criteria such as inflation and trade imbalances are politically induced. Etxezarreta, Huffschmid and Mazier (2003) are also of the view that criteria such as aggregate demand, savings rate and consumption level play a minor role in terms of economic sustainability. Economic sustainability ensures that there is enough in the capital base for future use. According to the Organisation for Economic Cooperation and Development (OECD) (2011), the main focus of economic sustainability is the provision of increasing stock of man-made capital as well as the degree to which such capital may be reduced from the accounts. Economic sustainability ensures that there is some sort of perceived growth which would be sufficient for all kinds of social improvement.

Environmental Sustainability

Environmental sustainability can be defined as the process of meeting the needs of humans without compromising the health and safety of people as well as the eco system (Costanza, Robert and Bernard, 1995). It pertains to the efficient use of energy recourses, reducing greenhouse gas emissions, and minimizing the ecological footprint, etc. (Coel, 2010). Today, the concept of green commerce and green marketing have further explained the concept and goals of environmental sustainability as each business activity is often anchored on the preservation of the environment where humans live.

The ecosystem ranges from those areas that are relatively undisturbed such as natural forests to landscapes with mixed pattern of individual use which are managed by individuals such as urban areas, lands and agriculture. Morelli (2001) is of the view that environmental sustainability has to do with promise of clean water, air and land while carrying out organizational activities. The

United Nations and other regulatory bodies have over the years emphasized and reemphasized on the need for sustainable environment because its outcome is a socio-economic system.

Methods

The study adopted the cross-sectional research survey design. Primary data was generated through structured questionnaire. The total population of the study is one hundred and twenty-five (125) staff of the13 printing press companies in Warri. The sample size of 95 was determined using the Taro Yamen's 1970 formula. The reliability of the instrument was achieved by the use of the Cronbach Alpha coefficient with all the items scoring above 0.70. The hypotheses were tested using the Spearman's Rank Order Correlation Coefficient.

Data Analysis and Results

Table 1: Analysis of the effect of Board Size on Organizational Sustainability

			Board Size	Environmental Sustainability	Environmental Productivity
Spearman's rho	Creation	Correlation Coefficient	1.000	.713**	.532**
		Sig. (2-tailed)	.	.000	.000
		N	89	89	89
	Economic Sustainability	Correlation Coefficient	.713**	1.000	.636**
		Sig. (2-tailed)	.000	.	.000
		N	. 89	89	89
	Environmental Productivity	Correlation Coefficient	.532**	.636**	1.000
		Sig. (2-tailed)	.000	.000	.
		N	89	89	89

Source: SPSS Output

The result of the analysis reveals that board size significantly influences organizational sustainability in the selected organizations:

The analysis reveals a significant relationship board size and economic sustainability at a correlation coefficient of 0.713 where the P is significant at a 0.000 coefficient. The null hypothesis is rejected in this case. The analysis reveals a significant relationship between board size and environmental sustainability as a correlation coefficient of 0.532 where the P is significant at a 0.000 coefficient. The null hypothesis is rejected in this case.

Discussion of Findings

The study found in a correlation coefficient of 71.3 percent and probability value of 0.000 between board size and economic sustainability. This implies that increase in board size have positive and significant relationship with the economic sustainability of the printing firms. The positive relationship between variables confirm the a-priori and the findings of Klettner, Clarke, &

Boersma (2014) that leadership structures are designed to involve the governing board, its composition and the general management in the development of sustainability strategies for the purpose of obtaining financial rewards; the findings of Li et al. (2014) that collaboration between internal company governance and company stakeholders is essential to the achievement of sustainable governance throughout the supply chain from the perspective of external governance; and the findings of Sharma (2014) found a very low negative and insignificant correlation between corporate social responsibility (CSR) and corporate governance; a low positive and insignificant correlation between sustainability and corporate governance; and a significant correlation between CSR and sustainability.

The study found a correlation coefficient of 53.2 percent between board size and environmental sustainability at a probability value of 0.000 coefficients. This implies that there is a positive and significant relationship between board size and environmental sustainability of printing press firms in Warri, Delta State. The findings confirmed the expectation of the study and the theory of agency and empirical studies such as the findings of Lacy and Hayward (2011), that companies can play an important role in building a more sustainable economy if doing so is consistent with business objectives; Krechovska & Prochazkova (2013), that although companies are aware that sustainability is an important factor in corporate performance over the long term, sustainability has not been integrated into individual business processes (particularly in small and medium enterprises); and the findings of Ortiz-de-Mandojana, Aguilera-Caracuel, & Morales-Raya (2014) which found a relationship between the independence of the CEO and board members and environmental sustainability. Finally, no evidence was found that the effectiveness of an environmental committee in promoting environmental sustainability depends on national institutional pressures, the findings of Formentini and Taticchi (2015) with the identification of three sustainability profiles (leaders, professional and traditionalists) and a classification of governance mechanisms based on the level of collaboration and formalization, the findings of Gill and Obradovich (2012) that there is a positive and significant relationship between board size and dividend policy.

Conclusion and Recommendations

The study concludes that board size has positive and significant relationship with organizational sustainability of the selected printing press firms in Warri. This implies that as the board size increases, the organizational sustainability of the selected printing press firms in Warri also improves. A larger board likely brings in a diversity of expertise, perspectives, and decision-making capacity, which may contribute to better strategic decisions, improved governance, and enhanced sustainability practices.

The study recommends that the proportion of executive to non-executive directors should be in line with corporate governance codes and board composition components of printing press firms which include gender diversity, board size, board independence, and board-director duality need to be strengthened to positively affect finance management practices.

Faculty of Management Sciences
University of Ilorin, Ilorin
aremu.ns@unilorin.edu.ng

Abstract
In Nigeria's fast-paced business world, where economic ups and downs, fierce global rivalry, and workforce hurdles are the norm, a company's edge often comes down to how its people think and act. However, many organisations in Nigeria struggle with reengineering work attitude in achieving a competitive edge. This study dives into work attitude reengineering and organisational competitiveness in Nigeria. The research population consisted of 2201 workers in Nestle Nigeria Plc, Lagos, and respondents were selected using a simple random sampling technique. The sample size of 339 was determined based on Krejcie and Morgan's (1970) formula. Data were collected through an administered questionnaire and analyzed using descriptive and inferential statistics. The hypotheses formulated were tested using the multiple regression analysis, with the aid of SPSS. The findings indicate that employee resilience and innovative work behaviour have a direct influence on organisational competitiveness. The study concluded that implementing effective work attitude reengineering strategies enhances organisational competitiveness. The study recommended that the management of Nestle Nigeria Plc should continuously refine employee resilience and innovative work behaviour in order to drive long term organisational sustainability and market leadership.

.

Key words: *Work attitude reengineering, Employee resilience, innovative work behaviour, organisational competitiveness, Nestle Nigeria.*

Introduction

In an era marked by accelerating competition and shifting market dynamics, organizational success hinges not only on tangible resources but critically on the attitudes of the workforce (Yassine, 2022). Traditional human resource practices that focus narrowly on skills, incentives, or policies often fall short of delivering sustainable advantage. Consequently, organizations are increasingly adopting work attitude reengineering (WAE), a deliberate redesign of employee values, beliefs, and behavioural orientations as a strategic approach to enhance productivity, adaptability, and competitiveness (Al-Halalmeh, 2022).

Globally, research confirms that employee attitudes directly shape organizational outcomes such as innovation, service quality, and financial performance (Albrecht et al., 2023). Organizations in advanced economies have demonstrated that purposeful interventions such as leadership modeling, psychological safety, and learning-oriented job design can promote stronger

commitment, resilience, and creativity, thereby driving long-term competitiveness (Kim & Park, 2022). This international evidence highlights that attitudes, once systematically reengineered, function as strategic assets that translate into superior performance.

Across Africa, the relevance of reengineering work attitudes is equally pronounced. Studies in South Africa, Kenya, and Ghana reveal that positive employee attitudes, when deliberately cultivated, improve service delivery, teamwork, and innovation, even within resource-constrained contexts (Muriithi & Were, 2022). African manufacturing companies increasingly integrate cultural values such as collectivism, mutual responsibility, and community orientation into attitude-change initiatives, creating contextually grounded pathways to organizational competitiveness (Akpan, 2023).

In Nigeria, the significance of work attitude reengineering is particularly pressing given the challenges of economic volatility, infrastructural deficits, and workforce dynamism. Nigerian organizations often face issues such as low employee engagement, weak commitment, and high turnover, all of which undermine competitiveness (Okolie & Bassey, 2023). However, emerging evidence suggests that reengineering employee attitudes through interventions such as leadership coaching, peer-driven recognition, and purpose-oriented work design enhances performance across sectors including banking, manufacturing, and services (Ojo & Musa, 2022).

However, work attitude reengineering (WAE) has emerged as a strategic approach to reshaping employees' values, perceptions, and work orientations in ways that enhance productivity, innovation, and organizational resilience. Unlike traditional human resource practices that focus mainly on compensation and compliance, WAE emphasizes cultivating adaptive, engaged, and innovative mindsets that can withstand environmental volatility and drive competitive advantage. One of the major outcomes of WAE is the development of employee resilience, defined as the ability of employees to adapt, recover, and remain productive despite workplace challenges or external disruptions (Kim & Park, 2022). In contexts such as Nigeria, where organizations face infrastructural deficits, policy inconsistencies, and economic instability, employee resilience becomes critical for maintaining operational continuity and achieving competitiveness. Similarly, WAE encourages innovative IWB), which refers to employees' capacity to generate, promote, and implement novel ideas work behaviour (that improve processes, products, or services (Janssen, 2000). By reengineering work attitudes to value creativity, risk-taking, and problem-solving, organizations can cultivate a workforce that actively contributes to innovation and adaptability, thereby sustaining a competitive edge. With the aforementioned, this context makes Nigeria a compelling case study for examining how work attitude reengineering can be leveraged to strengthen organizational competitiveness in emerging economies.

The Nigerian manufacturing sector is widely regarded as a potential engine for sustainable economic growth, diversification, and employment generation. Despite its significance, evidence shows that many Nigerian manufacturing companies still experience low levels of adaptability, weak employee innovation, and recurring performance inefficiencies (Okafor & Edeh, 2022). Employees often struggle to maintain resilience in the face of persistent operational disruptions such as power shortages, supply chain delays, and market fluctuations. At the same time, innovative work behaviour which includes the generation, promotion, and implementation of new ideas remains underutilized, limiting the sector's ability to improve processes, develop competitive

products, and expand market share (Oladipo & Akinwale, 2021). These shortcomings indicate a possible gap in how organizations redesign work attitudes to enable resilience and promote innovative behaviour.

Therefore, the unresolved problem is whether and to what extent work attitude reengineering enhances organizational competitiveness in Nigerian manufacturing companies by strengthening employee resilience and stimulating innovative work behaviour. Addressing this problem is essential, as it will not only expand theoretical understanding of WAE but also provide actionable strategies for Nigerian manufacturers to survive and thrive in an increasingly competitive global market.

In line with the problem statement, the study addressed the following questions:

i. How does employee resilience influence organizational competitiveness in Nigeria?
ii. To what extent does innovative work behaviour affect organizational competitiveness in Nigeria?

The overall objective of this study is to examine the effect of work attitude reengineering (WAE) on organizational competitiveness in Nigeria. Specifically, the study seeks to:

i. determine the influence of employee resilience on organizational competitiveness in Nigeria.
ii. examine the effect of innovative work behaviour on organizational competitiveness in Nigeria.

The study will test the following hypotheses:

$H0_1$: Employee resilience has a significant influence on organizational competitiveness in Nigeria.

$H0_2$: There exists a significant effect of innovative work behaviour on organizational competitiveness in Nigeria.

Literature Review

Work Attitude Reengineering

Work Attitude Reengineering (WAE) refers to the deliberate and systematic redesign of employee values, beliefs, and orientations in order to align workforce behaviour with organizational goals and external demands. Unlike traditional HR interventions that target skills or compliance, WAE focuses on reshaping attitudinal foundations including motivation, adaptability, and commitment to achieve higher levels of performance and competitiveness (Albrecht et al., 2023). It draws from organizational behaviour, psychology, and change management, emphasizing that work attitudes are not fixed but can be engineered through structured interventions such as leadership modeling, feedback systems, and purposeful job design.

Kim and Park (2022) describe it as a strategic management practice that intentionally modifies employee mindsets to promote innovation, engagement, and competitiveness. It is a process of re-aligning individual attitudes with organizational culture to improve productivity and reduce resistance to change. Okolie and Bassey (2023) conceptualize WAE as a behavioural transformation mechanism aimed at building resilience, enhancing commitment, and sustaining workforce motivation in volatile environments. Collectively, these definitions converge on the idea that WAE is a strategic tool that transforms human attitudes into drivers of organizational advantage.

Importance of Work Attitude Reengineering

The importance of WAE stems from its role in bridging the gap between employee behaviour and organizational strategy. Organizations that invest in attitude reengineering enjoy several benefits:

i. Enhanced Engagement: Reengineered attitudes lead to vigor, dedication, and absorption at work (Schaufeli, 2022).
ii. Improved Innovation: Positive attitudes stimulate creativity, knowledge sharing, and risk-taking (Kim & Park, 2022).
iii. Commitment and Retention: Stronger attitudinal alignment reduces turnover and stabilizes human capital (Okolie & Bassey, 2023).
iv. Service Quality: Employee empathy and responsiveness improve customer satisfaction (Ojo & Musa, 2022).

Thus, WAE is not merely a human resource initiative but a strategic imperative for sustaining competitiveness.

Employee Resilience

Employee resilience refers to an individual's capacity to adapt, withstand, and bounce back from workplace stressors, change, and crises while maintaining performance and psychological well-being (Näswall et al., 2019). It is not merely a personality trait but a dynamic capability shaped by organizational practices, leadership, and work environment conditions (Meneghel et al., 2016). Within competitive industries like manufacturing, resilience is a critical behavioural competence that enables employees to remain effective amidst operational turbulence.

Resilience is essential for organizational competitiveness as it sustains performance continuity under adverse conditions such as supply chain breakdowns, policy changes, or technological disruptions. In Nigeria, where manufacturing firms regularly face infrastructural deficiencies and economic volatility, resilient employees are better positioned to sustain productivity and service delivery (Adetunji & Ogunyemi, 2021). Resilience also contributes to reduced absenteeism, lower turnover, and higher commitment, all of which enhance organizational stability.

Innovative Work Behaviour

Innovative work behaviour (IWB) is defined as the intentional creation, promotion, and implementation of new ideas by employees to benefit their organization (Janssen, 2000). Unlike creativity, which emphasizes idea generation, IWB extends to championing and applying innovations in processes, products, or services. IWB is vital for competitiveness, particularly in manufacturing, where continuous improvement and efficiency are central to market survival. Employees who engage in IWB contribute to process optimization, product differentiation, and cost reduction (De Jong & Den Hartog, 2010). In Nigeria, where global competition is fierce, IWB provides manufacturers with pathways to upgrade production systems, reduce waste, and deliver higher-quality goods.

Organizational Competitiveness

Organizational competitiveness refers to a firm's ability to achieve and sustain superior performance relative to its rivals by leveraging internal capabilities, adapting to environmental changes, and delivering superior value to stakeholders. Competitiveness is measured through

indicators such as productivity, cost efficiency, innovation, customer satisfaction, and market share growth (Porter, 1990; Akpan, 2023). In today's knowledge-driven economy, competitiveness increasingly depends on intangible assets such as employee attitudes, commitment, and adaptability.

Work Attitude Reengineering and Organizational Competitiveness

The link between WAE and organizational competitiveness is grounded in the notion that attitudes drive behaviour, and behaviour drives performance. Positive attitudes promote employee engagement, innovation, and resilience, which translate into superior organizational outcomes. Albrecht et al. (2023) argue that engaged employees demonstrate discretionary effort that enhances service delivery and innovation, both critical to competitiveness. Similarly, in emerging economies, Muriithi and Were (2022) show that reengineered attitudes mitigate structural challenges, thereby improving organizational adaptability and market performance.

In Nigeria, where firms often face economic volatility, infrastructural deficits, and workforce disengagement, WAE represents a pathway to improved competitiveness. Reshaping employee attitudes through leadership coaching, recognition systems, and cultural alignment, Nigerian organizations can strengthen service quality, reduce turnover, and build innovation capacity.

Both employee resilience and IWB function as behavioural mechanisms through which work attitude reengineering enhances organizational competitiveness. Resilience ensures operational continuity under uncertainty, while IWB drives improvement and differentiation. Together, they create a dual pathway stability and innovation that strengthens competitiveness in Nigeria's manufacturing sector. Therefore, WAE serves not only as a tool for employee development but also as a strategic enabler of competitiveness in a challenging environment.

Theoretical Review

Resource-Based View (RBV) Theory

This theory was propounded by Wernerfelt & Barney in 1991. The Resource-Based View (RBV) argues that an organization's competitiveness depends on its ability to acquire and utilize unique, valuable, rare, inimitable, and non-substitutable (VRIN) resources. While traditional RBV focused on physical and financial resources, later extensions emphasized human and behavioural resources as critical to sustainable advantage. From the RBV perspective, employee resilience and innovative work behaviour represent intangible resources that are difficult for competitors to imitate. By reengineering work attitudes, organizations develop a workforce that is adaptive, proactive, and innovative capabilities that are not easily replicated.

In the Nigerian manufacturing context, where firms face intense competition and environmental turbulence, cultivating resilient and innovative employees through WAE provides a behavioural resource base that strengthens long-term competitiveness.

Lewin's Change Theory

Lewin's Change Theory was propounded by Kurt Lewin (1947). Lewin's Change Theory explains how organizations can intentionally shift behaviours and attitudes through a structured three-stage process:

i. Unfreezing: – creating awareness of the need for change, challenging existing attitudes, and reducing resistance.
ii. Changing (or Transitioning): – implementing new values, work practices, and attitudes through training, empowerment, and communication.
iii. Refreezing: – reinforcing the new work attitudes to become part of organizational culture.

The theory assumes that employee behaviour can be systematically reshaped when organizations provide enabling environments, communication, and reinforcement.

This theory provides a foundation for work attitude reengineering, showing that organizations must first disrupt negative attitudes (unfreeze), then implement desired work behaviours such as resilience and innovation (change), and finally sustain them through rewards and organizational culture (refreeze).

Applying Lewin's theory suggests that competitiveness can be enhanced by intentionally unfreezing rigid mindsets, promoting resilience and innovative behaviours during transition, and embedding these behaviours into daily routines to sustain competitiveness in the global market.

Empirical Review

There are various studies on the subject matter, among the most recent ones is the work of Qiu and Ling (2025) on the influence of work attitude on organizational commitment among graduates in Shandong. This study investigated the impact of work attitudes on graduates' organisational commitment. A model of the relationship between work attitude and organisational commitment is proposed based on social cognitive theory. To validate the model, this study adopted a quantitative research method to collect data by distributing questionnaires to 430 graduates who had been employed and who had graduated from a university in Shandong for half a year through the online platform of "Wen juanxing". Quantitative data were analysed using SPSS and Partial Least Squares-Structural Equation Modelling. The results of the study showed that Shandong graduates' work attitudes had a significant and positive effect on organisational commitment. The results of the study provide a valuable reference for institutions of higher education to adjust their curricula and pay attention to the development of work attitudes. They further stated that enterprises should improve work attitudes by increasing employee job satisfaction and engagement, enhancing employees' organisational commitment, and effectively reducing employee turnover.

Amoozegar (2023) also examined the mediating role of innovative work behaviour between talent management and organizational performance of SMEs in China. A total of 378 practitioners participated in a questionnaire survey from a sample of small and medium- sized catering enterprises in Zhengzhou City, and structural question modeling was used to analyze the relationship between talent management, innovative work behaviour and organizational performance. The research outcomes revealed that talent management has a strong positive effect on organizational performance and innovative work behaviour mediates the relationship between talent management and organizational performance.

In another study conducted byYassine (2022) that investigate the effect of business process engineering on organizational capabilities of five-star hotels in Jordan. Using a questionnaire-

based survey, data were harvested from a purposive sample encompassing managers of such hotels via Google Forms. IBM SPSS 24.0 and AMOS 23.0 software were used to conduct structural equation modeling for the purpose of hypotheses testing. The results revealed that organizational restructure had the greatest effect on organizational capabilities, followed by information technology and employee empowerment, while administrative commitment had the lowest effect on hotels' organizational capabilities. As such, managers are requested to consider communication relationships with their employees, encourage work teams as well as dialogue, in addition to flattening their organizational structures.

Al-Halalmeh (2022) also investigated the re-engineering process and its effects on employees' performance. The study population comprised employees at the Electricity Distribution Company. The study used a descriptive analytical methodology. A questionnaire was designed and distributed to collect the data. The study used a comprehensive sampling technique in selecting the sample's subjects. Regression analysis was used to find out the impact of the reengineering process on employees' performance. The study population consisted of all employees in the Jordanian Electricity Distribution Company. Findings showed that there is a statistically significant impact at $0.05 \geq \alpha$) level for reengineering with its dimensions collectively on Jordanian Electricity distribution company employees. And, there is an impact of reengineering dimensions separately (procedures simplification, improving services quality, process implementation, and information technology) on the Jordanian Electricity Distribution Company.

Jakubiv, et al. (2022) examined the role of relationships between organizational factors, employee resilience and work outcomes, in order to test the mediatory role of employees in hospitality kitchens in Serbia. The paper represents a quantitative study; the research was conducted through a questionnaire, which served as a means for collecting reliable data. The data were obtained from 182 respondents employed in hospitality kitchens in Serbia. They reported that resilience has a mediatory role between organizational factors and work outcomes. The study deals with an important research subject, which is currently not given enough attention, which is indicated by the fact that this type of research has not yet been conducted in hospitality kitchens.

Although the literature demonstrates that deliberate interventions to reshape employee attitudes through leadership modeling, feedback systems, job redesign, and culturally-aware practices can produce substantive gains in engagement, innovation, and operational outcomes, existing studies are uneven in scope and context. Much of the robust evidence comes from advanced economies or isolated case studies in a few African countries, and there is limited, systematic, Nigeria specific empirical research that operationalizes work attitude reengineering as an integrative, measurable construct, tests its causal mechanisms (e.g., psychological safety → learning → performance) with objective organizational KPIs, and accounts for Nigerian contextual moderators such as infrastructural constraints, power-distance norms, and labor market volatility. Consequently, a knowledge gap remains regarding which WAE levers work best in Nigerian organizational contexts, how long effects persist, and through which mediating pathways WAE actually improves competitiveness. This study addresses that gap by developing a context-sensitive WAE measurement framework and empirically testing its effects on organizational competitiveness in Nigeria using multi-source data and longitudinal design.

Methodology

This study employed a cross-sectional research design to elaborate on a framework developed for data collection and analysis. The cross-sectional design was considered appropriate for this study, as it will provide a framework that permits an appropriate evaluation of cause-and-effect relationships between work attitude reengineering variables and the existing competitiveness in the manufacturing sector, specifically food, beverages and tobacco manufacturing companies.

Population of the Study

Based on the National Bureau of Statistics (NBS) study of 2024, which ranked the food, beverages, and tobacco manufacturing sector highly in terms of employment generation, high performance, and national growth development, this manufacturing subsector was chosen. Excluding contract and outsourced workers from Nestle Nigeria Plc was selected with the overall population of 2,201 as of May 2025, based on their workforce strength. This forms the representation of the study's sample population.

Sample Size and Sampling Technique

The study adopted multi-stage sampling as the primary sampling technique. This involve the use of convenience sampling to select across production plants and corporate functions (e.g., manufacturing/operations, quality, supply chain, sales/marketing, HR/finance, and support units).

Meanwhile, the sample size was determined using Taro Yamane's formula. This ensures that the sample size is statistically reliable and provides a good representation of the population.

$$n = \frac{N}{1+N(e^2)}$$

where:

- n is the sample size,
- N is the population size,
- E is the margin of error (level of precision).

$n=2201/1+2201(0.052)$

$n \approx 339$

sample size of approximately 339

Source of Data

This study used primary sources of data for collecting relevant and valid information necessary for drawing accurate conclusions. Utilizing primary data is advantageous as it allows researchers to obtain first-hand, unaltered information directly from the respondents, ensuring that the data reflects their true experiences and perspectives.

Method of Data Collection

The data used for the study were collected through the structured questionnaire and administered and; respondents were assured of the confidentiality of their responses to encourage honest and accurate feedback. The questionnaire was the primary instrument for collecting data in this study. Copies of the Questionnaire were distributed to the workers of Nestle Nigeria Plc.

Method of Data Analysis

This study used descriptive statistics in the form of means and standard deviation, and regression analysis which captures both the exploratory factor analysis and confirmatory factor analysis using SPSS.

Multicollinearity Test

Also, the study tested for multicollinearity to ensure that no two independent variables measures the same thing or produce the same result. That is, they were not multicollinear. This was done to screen out independent variables that may cause repetition and provide a misleading and inaccurate results. This was done by computing the variance inflation factor (VIF) for both the inner model of the study and the outer model of this study. The VIF score gauge is placed at 10 which indicates that any indicator VIF score above 10 show a sign of multicollinearity. In this study, the indicators with higher VIF were expunged from the study to enhance the accuracy of the data in predicting an accurate outcome.

Test of Hypotheses

$H0_1$: Employee resilience has a significant influence on organizational competitiveness in Nigeria.

Table 1: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.791[a]	0.626	0.651	0.630

a. Predictors: (Constant), Employee resilience

Source: Researcher's Field Survey, 2025.

The table 1 presents the model summary showing the correlation coefficient r is 0.791(i.e., r = 79.1%) indicating that there exists a very strong relationship between organisational competitiveness and employee resilience. It is also clear from the table that the r^2 which is the coefficient of determination is 0.626 approximately 62.6%. This implies that 62.6% percentage change in organisational competitiveness explains the aggregate effect of employee resilience, while the remaining 37.4% is explained by other factors that are not captured in the model.

Table 2: ANOVA[a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	5.207	1	4.049	5.547	.001[b]
	Residual	2.862	337	.149		
	Total	45.069	338			

a. Dependent Variable: Organisational competitiveness

b. Predictors: (Constant), Employee resilience

Source: Researcher's Field Survey, 2025.

Table 2 presents the ANOVA table. The F-statistic as shown from the table is significant since the probability value of .000 is less than the alpha level of 0.05, thus the model is fit.

Table 3: Coefficients						
Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	.674	.016		5.509	.000
	Employee resilience	.553	.063	.519	6.101	.000
a. Dependent Variable: Organizational Competitiveness						

Source: Researcher's Field Survey, 2025

Table 3 coefficient above depicts a significant level of 0.000, which is less than the alpha set value of 0.05 significant level. This implies that there is a significant positive effect of employee resilience on organisational competitiveness, therefore the null hypothesis is rejected and the alternative hypothesis is accepted. The beta value of 0.519 implies that a change in employee resilience will lead to 51.9% changes in organisational competitiveness; and the positive value of 6.101 further buttresses the relationship between employee resilience and organisational competitiveness.

$H0_2$: There exist a significant effect of innovative work behaviour on organizational competitiveness in Nigeria.

Table 4: Model Summary				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.783[a]	0.614	0.590	0.566
a. Predictors: (Constant), Innovative work behaviour				

Source: Researcher's Field Survey, 2025.

Table 4 presents the model summary showing the correlation coefficient r is 0.783 (i.e., r = 78.3%) indicating that there exists a very strong relationship between organisational competitiveness and innovative work behaviour. It is also clear from the table that the r^2 which is the coefficient of determination is 0.614 approximately 61.4%. This implies that 61.4% percentage change in organisational competitiveness explains the aggregate effect of innovative work behaviour, while the remaining 38.6% is explained by other factors that are not captured in the model.

Table 5: ANOVA[a]						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	4.344	1	3.093	4.312	.000[b]
	Residual	3.121	337	.212		
	Total	7.465	338			
a. Dependent Variable: Organisational competitiveness						
b. Predictors: (Constant), Innovative work behaviour						

Source: Researcher's Field Survey, 2025.

Table presents 5 ANOVA result. The F-statistic as shown from the table is significant since the probability value of .000 is less than the alpha level of 0.05, thus the model is fit.

Table 6: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	0.707	0.326		4.319	0.000
	Innovative work behaviour	0.564	.430	.695	5.332	0.000
a. Dependent Variable: Organizational Competitiveness						

Source: Researcher's Field Survey, 2025

Table 6 coefficient above depicts a significant level of 0.000, which is less than the alpha set value of 0.05 significant level. This implies that there is a significant positive effect of innovative work behaviour on organisational competitiveness, therefore the null hypothesis is rejected and the alternative hypothesis is accepted. The beta value of 0.695 implies that a change in innovative work behaviour will lead to 69.5% changes in organisational competitiveness, and the positive value of 5.323 further buttresses the relationship between innovative work behaviour and organisational competitiveness.

Findings and Discussion

From hypothesis one, the result shows that there exists a very strong relationship between organisational competitiveness and employee resilience. It is also clear from the evidence of the results in table 1. This implies that there is a significant positive effect of employee resilience on organisational competitiveness. This resonates with the position of Jakubiv, et al. (2022), who asserted that employee resilience has a mediatory role between organizational factors and work outcomes. The empirical finding indicates that strengthening employee resilience directly enhances the competitiveness of the company. That is, resilient employees are better equipped to adapt to market changes, overcome workplace challenges, and sustain productivity under pressure. Investing in resilience-building initiatives, such as continuous training, wellness programs, and supportive work environments, can also lead to improved innovation, efficiency, and customer satisfaction. Ultimately, fostering resilience not only secures a more agile workforce but also provides the company with a strategic advantage in maintaining growth and competitiveness in a dynamic business environment.

Hypothesis two also shows that there exists a very strong relationship between organisational competitiveness and innovative work behaviour. It is also clear from the result in the table 4. This implies that there is a significant positive effect of innovative work behaviour on organisational competitiveness. This also supports the claims made by Amoozegar (2023) that talent management has strong positive effect on organizational performance and innovative work behaviour mediates the relationship between talent management and organizational performance. This finding also suggests that encouraging innovative work behaviour among employees can enhance company's competitive advantage. This means that when staff are encouraged to generate and implement new ideas, the company can improve efficiency, develop unique products, adapt more quickly to market changes, and maintain an advantage over rivals. This also justifies investing in innovation-driven

policies, such as continuous training, supportive leadership, and resource allocation, as these can translate employee creativity into measurable improvements in performance, market share, and long-term sustainability.

Conclusion

The study underscores that employee resilience and innovative work behaviour (IWB) are pivotal determinants of organizational competitiveness in the Nigerian context. Resilient employees, who demonstrate adaptability, perseverance, and recovery from setbacks, enable organizations to withstand disruptions such as economic fluctuations, policy uncertainties, and technological shifts prevalent in Nigeria's business environment. Resilience enhances not only employee well-being but also stabilizes organizational processes, thereby enhancing sustainable competitive advantage, promoting the generation, championing, and implementation of new ideas that improve efficiency, product quality, customer satisfaction, and market responsiveness. In Nigeria's highly dynamic and resource-constrained manufacturing sector, innovation at the employee level ensures agility, continuous improvement, and differentiation from competitors.

Recommendations

1. Organizations should invest in resilience-building programs such as stress management workshops, adaptive leadership training, and change-readiness initiatives to enhance employees' coping mechanisms. And, Government and industry bodies should encourage resilience-focused HR standards and frameworks that strengthen workforce sustainability in manufacturing firms.
2. Organizations must establish innovation-friendly climates by reducing bureaucratic barriers, rewarding idea generation, and encouraging open communication across levels. Also, leveraging digital tools, and automation can provide platforms for employees to implement innovative solutions, thereby strengthening competitiveness in global markets.

Theoretical Contributions

This study will make significant contributions to organizational behaviour and human resource management literature by:

1. It provides an empirical framework for conceptualizing WAE as a multidimensional construct (leadership, feedback, recognition, cultural reengineering), which has been underexplored in African contexts.
2. It enriches global research by introducing Nigeria-specific evidence addressing the scarcity of studies that test WAE's effects on competitiveness within developing economies.

Abstract
This paper discussed the imperatives of people management digitalisation in the strategic posture of smart economies. The paper was designed as a theoretical paper, addressing the emerging concerns of managing and coordinating the human resource of the smart economies. The knowledge-based view theory was adopted as the theoretical framework for the paper, with its general tenets on the imperatives of the development of knowledge and intelligence systems in the reinforcement of the organisations competitiveness, adopted in explaining and expanding on the role of people management digitalisation in the outcome of strategic posture. The discussion also highlights the key positioning factors (system lock-in, total customer solutions and best products) critical for strategic posture. It was concluded that people management digitalisation is central for addressing the changing needs of the smart economies and that through the development of related knowledge systems; organisations can contextualise their features to effectively harness their human capital for an enhanced strategic posture.

Keywords: Strategic posture, People management, Human resource, Smart economies, Knowledge

Introduction

People management effectiveness in the context of the smart economies reflects not only a capacity but a competence for adjusting to the increasing emphasis on technology in the changing business world (Yukl, 2013). Osmundsen, Iden and Bygstad (2018) posited that the business terrain in the last decade has changed tremendously. This change as Osmundsen *et al.* (2018) pointed out, is fuelled by the growing recognition and adoption of technology systems. Failure to build or integrate key technological concerns in this regard, holds significant implications for the organisation. This corroborates Almatrooshi, Singh and Farouk (2016) position that competition

today, is premised on innovative processes, more so, on a demonstrated competence (knowledge, experience and skills) in harnessing technology systems in the advancement of the interests and objectives of the organisation. This is crucial in enabling a strategic posture for the organisation, facilitating a more aggressive, proactive and future-oriented disposition.

Strategic posture according to Eker and Eker (2019) is the organisations overall disposition to its market. That is its capacity and inclination for aggression, risk-taking, change and proactiveness. It is the organisation's position when it comes to actions or decisions with regard to competition and innovation. Research (Chi, 2015; Reeves, Haanes & Sinha, 2016; Bae, 2017) establishes technology as central to the strategic posture of organisations. Mazzarol and Rebound (2020) showed that collaborative technology reinforces the functional and operational capacities of the organisation, facilitating the seamless flow of actions and processes. Brynjolfsson, Mitchell and Rock (2018) identified technology as crucial in bridging administrative gaps, especially through support for storage, data security and the bolstering of communication within the workplace. Similarly, Butner and Ho (2019) posited that online technology was increasingly imperative in creating a more integrated and stable organisation.

Despite the foregoing, the rapid changes in work systems, coupled with the current dynamicity of functions as a result of the fusing of technology systems with people roles, calls for more research and discourse on the significance of people management digitalisation in addressing organisational concerns; especially in the area of strategic posture. This paper thus expands on knowledge addressing people management; however, it's focus extends to the encapsulation of people management activities such as recruitment, compensation and appraisal, within the framework of digital technology. This focus bothers on addressing the related concerns of people management in an era of technological revolution and global business development, and the imperatives of such in enhancing the strategic posture of organisations in smart economies.

Literature Review

Knowledge-Based Capital Theory

The knowledge-based view (KBV) theory is an offshoot of the resource-based view (RBV) theory (Li, 2016). While the general premise of the RBV theory identifies with the development of the organisations resources, human, financial, assets and others, in line with creating competitive advantage for the organisation, the KBV theory on the other hand, specifically, emphasizes knowledge development and the focus on fostering and strengthening intelligent systems and routines that drive the competitiveness of the organisation. Postulated by Robert Grant in a 1996 paper (Mills & Smith, 2011), the KBV theory, furthers the position that the development of knowledge systems and the effective application of such in business operations, not only informs and enriches decision-making, that also contributes as a capacity to the organisations ability for market value, through market innovations and quality services (Mills & Smith, 2011).

The KBV theory, can be viewed in the context of this paper in predicting and explaining the strategic posture of the organisation, particularly from the lens of people management digitalisation. According to Jenney and Olfman (2005), the development of knowledge management systems is central to the health and operations of the organisations. Such address both internal and external forms of intelligence and facilitate the effective allocation of resources and energy for optimal performance (Jenney & Durcikoya, 2020). The KBV theory, thus advocates the

use of systems that allow for knowledge gathering, and more so, the development of organisational features that not only support, but such that contribute toward maintaining such knowledge systems, ensuring their development, use of timely data or information and the utilisation of such in ways that adequately match the pace of change in the practices and activities of the organisation, especially in the management of people.

People Management Digitalisation

People management is constantly in a flux of change. Its development is hinged on not only addressing the emerging challenges of professionalism in people coordination in the workplace, but also the concerns of changing work systems and functionality. The smart economies are one marked primarily by a reliance on information technology (Yukl, 2012; Simic & Nedelko, 2019). Kuusisto (2017) posited that technology provides the context or setting for innovation in todays business environment. It offers the organisation a capacity for value, and for engaging its market or context in ways that assure of its efficiency and effectiveness. As a facet of information technology, digitalisation describes the process in which particular functions of the organisation are anchored or translated into computer-based actions. It is concerned with the computerisation of the organisations processes and operations (Matt, Hess, & Benlian, 2015).

People management digitalisation describes the process of computerizing the human resource functions and operations of the organisation. It is the action of integrating the human resource management activities into the technology framework of the organisation (Gbadegeshin, 2019). The imperatives of digitalisation, when it comes to people management, is not only occasioned by the need for seamless operations, but also that of a broadening of scope and increased connectivity with the global or digital community. This is because digitalisation facilitates active participation in global and online platforms, enabling people managers and the organisation connect with and correspond with individuals, groups and other organisations on a remote basis (Kent, 2005). Gbadegeshin (2019) observed that people management in the 21st century, borders on leveraging technology systems in advancing the economic and social interests of the organisation.

Strategic Posture

Organisations differ on several basis. One of such is their disposition to their market or context. This covers their level of proactiveness, aggressiveness, or behaviour such as risk-taking. Such forms of disposition or stance, describes the organisations strategic posture. The strategic posture of the organisation is the extent to which the organisation is poised toward driving its interests and competing within its market (Petrou, Hadjielias, Thanos & Dimitratos, 2020). This behaviour flows from a sense of capacity and direction, especially given the requisite infrastructure, experience and competence. Scholars (George, Walker & Monster, 2019; Bedi & Puri, 2019) identify strategic posture as success-oriented and essential in stimulating growth and change, According to Mohammad (2019), an organisation, unsure of itself or its standing, cannot favourably cope or thrive in such turbulence of the 21st century. This corroborates Yu, Wang and Brouthers (2016) view that strategic posture comes with a confidence, necessary for navigating the tumultuous terrains of change in todays, especially in the areas of global business.

Mohammad (2019), nonetheless, emphasized the role of infrastructure and competence in strategic posture. These according to Mohammad (2019) contribute to bolstering the practices and stance of the organisation, in the areas of competition and innovation. More importantly, when related

competencies are judiciously applied or routed in ways that enable functional support, there is a higher tendency for improved learning, innovation and also competitiveness. Dean and Company (2025) in their model on positioning the organisation for a strategic posture within its market, identified three key competitive stances imperative for strategic posture, namely, (a) the system lock-in: describing competition based on conditions such as market dominance, system economics and complementor share; (b) total customer solutions: this describes a competitive position that is based on customer economics, cooperation and the achievement of customer share; (c) best product: referring to product economics, rivalry, and the achievement of product share. The Dean & Company (2025) model is illustrated in Figure 1.

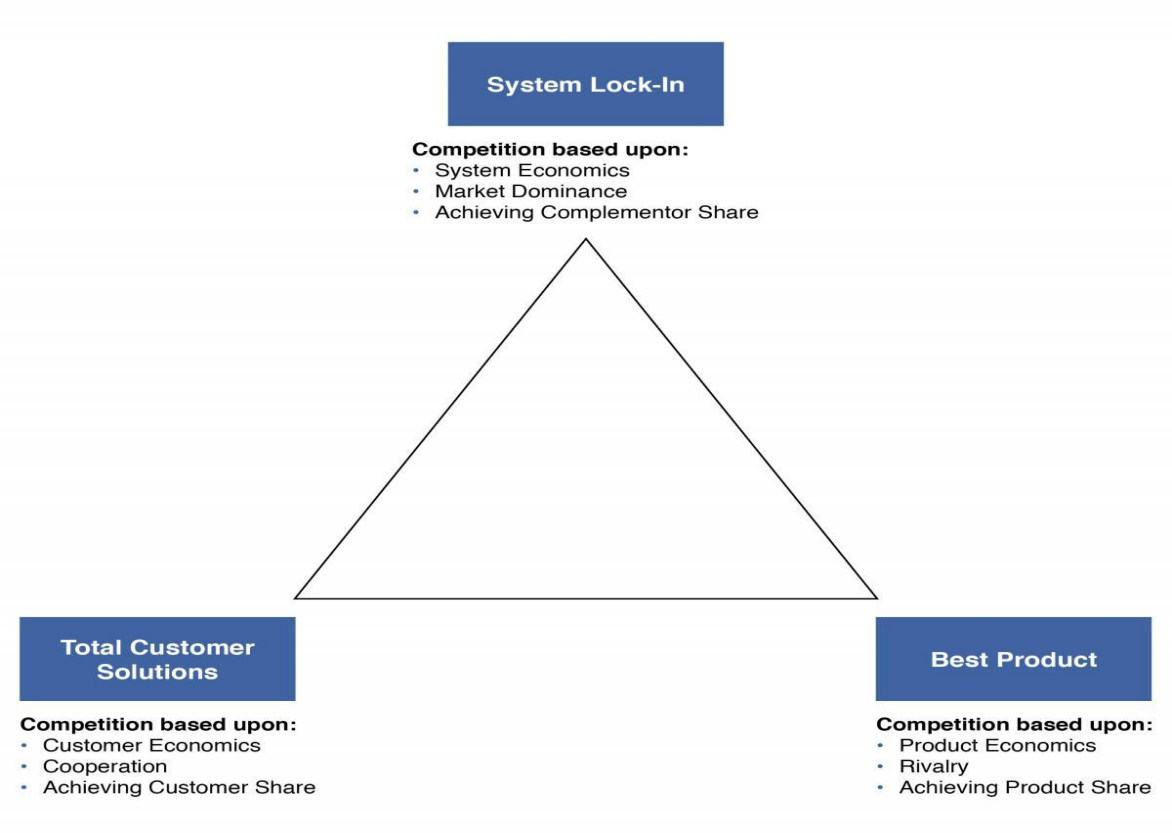

Figure 1: The Strategic Posture Triangle (Dean & Company, 2025)

People Management Digitalisation and Strategic Posture

Scholars (Guo, Wang, Su & Wang, 2020; Sabherwal, Sabherwal, Havakhor, & Steelman, 2019) differentiate between the individual worker, and their capital comprising skills and competence in the performance of roles and responsibilities in the organisation. Same applies to people management. Guo *et al*., (2020) noted that the process of harnessing and effectively engaging the human resource, is central to the effectiveness of the workforce and this approach or framework, significantly differs across organisations. Matt *et al*., (2015) argued that people management is a deliberate and structured effort aimed at addressing not only the diversity within the workforce, but also focused on identifying the unique potentials within individuals, strengthening or encouraging such within the organisation. Yukl (2013) asserted that people management is shaped and constantly spurred on by the need to address emerging organisational concerns and challenges when it comes to engaging and coordinating people.

People management digitalisation, offers a positioning based on its added capacity for improved communication, knowledge management, and cohesion. Practices such as recruitment, compensation and appraisal are such that through digitalisation become seamless and are more detailed (Kuusisto, 2017). According to Matt, Hess and Benlian (2015) the digitalisation of recruitment allows for the development of systems that are designed to draw on candidate's public data without encroaching on their privacy and without the total dependency on their packaged resume. Such facilitates access to candidate's profile information from professional as well as social media platforms they are engaged on. Matt *et al*., (2015) observed that the digitalisation of recruitment widens the organisations pool of talents and its access to data on these candidates from a variety of sources. This ensures the organisations selection and focus on candidates who not only have the skills and experience, but who also have demonstrated through opinions and activities online, their values. This way, companies can identify workers with shared interests and with the required inclination for advancing the organisations strategic posture goals.

Conclusion

Bridging people management functional gaps in smart economies is central to the competitiveness of organisations. Such entails the development of technology systems and the digitalisation of practices such as recruitment, compensation and appraisal in line with the emerging realities that characterise the business context. This position is further reinforced using the knowledge-based view theory, which identifies the significance of knowledge management and intelligence systems in the competitive stance and positioning of the organisation. This paper, thus expands on the importance of people management digitalisation, especially as it concerns the recruitment, compensation and appraisal of workers in the organisation, drawing on the peculiarities of the context. This position anchors on the noted role of technology in the smart economies and the changing dynamics of business systems, as well as the need for a more contextualised approach to addressing the needs of the organisation.

Abstract
This study examines the strategic impact of educational initiatives and renewable hope in smart economies. As societies increasingly embrace the integration of technology with economic strategies, the potential of educational initiatives and renewable resources form a critical axis for sustainable growth in smart economies. The study population includes a diverse group of stakeholders involved in education, economy, and policy development. This encompasses educators, students, policymakers, business leaders, and community members. The desired sample size was determined based on the total population of stakeholders in these domains, with a target a minimum of 500 respondents for quantitative analysis. The data was analyzed using statistical software, such as SPSS. Descriptive statistics (means, medians, mode, standard deviations) were used to provide an overview of the data. Inferential statistics, including multiple regression analyses, were conducted to test the strength of relationships between educational initiatives and renewable hope. The findings of this study reveal strong evidence that both curriculum development and technology integration are critical drivers of societal optimism and personal resilience in smart economies. The paper concludes that, curriculum reforms that prioritize innovation, inclusivity, and forward-thinking skills, alongside the integration of modern technologies, are essential not only for economic competitiveness but also for building resilient and optimistic societies. Thus, education and technology function as twin pillars for sustainable growth in smart economies. Governments and institutions should invest in large-scale digital literacy and technology adoption programs to strengthen personal resilience, ensuring individuals remain adaptable and competitive in rapidly changing economic environments.

Keywords: *Curriculum development, Societal-optimism, Technology integration, Personal resilience, Smart economies.*

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Introduction

The advent of smart economies characterized by their reliance on digital technology, innovation, and sustainable practices, has altered the traditional paradigms of economic growth and development. Education, as a cornerstone of human potential development, plays a crucial role in equipping individuals with the competencies necessary for participation in these evolving economic landscapes (Brynjolfsson & McAfee, 2014). The integration of educational initiatives that promote both technical skills and socio-emotional capacities is vital for fostering a resilient and adaptive workforce.

Educational systems worldwide are increasingly pressured to adapt to these dynamic economic environments, necessitating curriculum reforms that transcend traditional pedagogical approaches. Programs that emphasize critical thinking, creativity, collaboration, and digital literacy are gaining prominence, as they equip learners with the tools necessary to navigate complex economic landscapes (Schleicher, 2019). Recent studies argue that the synergy between educational initiatives and workforce skills significantly influences economic competitiveness and innovation (Hanushek & Woessmann, 2015). Countries that prioritize education as a cornerstone of their economic strategy reap the rewards of enhanced productivity and innovation, ultimately elevating their standards **of living.**

However, alongside the need for technical skills in smart economies, there is an increasing recognition of the importance of socio-emotional competencies. The concept of "renewable hope" emerges as a critical narrative in this context, representing an optimistic outlook toward sustainable development that communities and individuals cultivate despite adversities (Hoffman & Newfield, 2019). Renewable hope is characterized by resilience, adaptability, and an empowered mindset that motivates people to engage in their education and economic prospects actively. As such, fostering renewable hope through educational initiatives can lead to transformative outcomes, empowering individuals not only to aspire for better job opportunities but also to contribute meaningfully to their local and global economies.

Various research findings support the assertion that educational initiatives do more than just fill the skills gap; they also inspire a positive perception of the future, motivating individuals to pursue opportunities in rapidly changing job markets (Baker, 2019). Without a sense of hope, individuals may become disengaged, leading to decreased economic activity, increased disillusionment, and ultimately, stagnation in economic growth. This interaction presents a dual challenge and opportunity: while educational initiatives must evolve to meet economic demands, they must also cultivate a sense of hope and purpose. In addition to skill development, the concept of renewable hope emerges as a pivotal narrative in driving societal transformation. Renewable hope refers to the sustained optimism that individuals and communities cultivate, enabling them to envision and strive for a better future, particularly in the face of challenges posed by rapidly changing economies (Hoffman & Newfield, 2019). This paper examines how educational initiatives serve not only to empower individuals with necessary skills but also to nurture this sense of hope, ultimately influencing the dynamics of smart economies.

Statement of the Problem

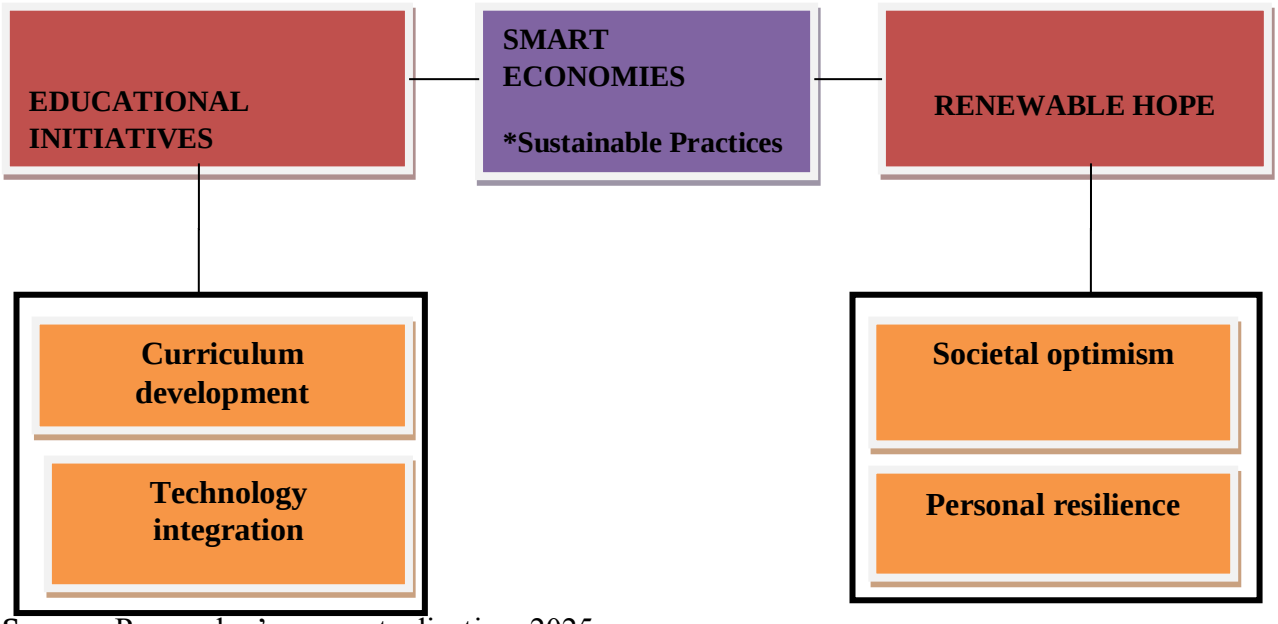
As societies increasingly embrace the integration of technology with economic strategies, the potential of educational initiatives and renewable resources form a critical axis for sustainable

growth in smart economies. However, while considerable investment has been directed towards these initiatives, a disjunction exists between educational outputs and the specific competencies demanded by rapidly evolving industries (Anderson & Rainie, 2018). The core problem resides in the inadequate alignment of educational frameworks with the evolving dynamics of the labour market, leading to a significant gap in employability and innovation (Schleicher, 2018).

The significance of this issue transcends theoretical boundaries; it has profound implications for policy-making, industry competitiveness, and societal advancement. Governments and educational institutions must reconcile curriculum design and pedagogical strategies with industry trends to foster an adaptive workforce (Friedman, 2019). Current literature highlights a scarcity of empirical studies that scrutinise the systematic integration of renewable resources within educational curricula and its influence on economic performance (David & Foray, 2020).

This research seeks to address this gap by investigating how educational initiatives can be effectively aligned with the vitality of renewable resources in driving smart economies. Contributions to theory may encompass the formulation of a cohesive framework that bridges these domains, while practical implications may inform policy decisions, ensuring that educational outcomes better meet the demands of a technologically driven economy. Additionally, findings can catalyse industry partnerships, promoting a cohesive ecosystem for growth and sustainability.

Research Questions



The following research questions guided the study

1. What is the role of curriculum development in enhancing societal optimism in smart economies?

2. How does technology integration contribute to personal resilience in smart economies?

Conceptual Framework

The chart shows the framework of the study:

Source: Researcher's conceptualization, 2025

The conceptual framework for this study is built upon three pivotal constructs: education, renewable hope, and smart economies. Educational initiatives are perceived as the driving force that equips individuals with the necessary skills for economic participation and innovation. Renewable hope serves as the motivational aspect that encourages individuals to aspire toward and actively engage with future opportunities. Finally, smart economies are framed as ecosystems where technology, innovation, and human capital converge to produce sustainable growth and improved quality of life.

Literature Review

Educational Initiatives and Economic Development

The strategic impact of educational initiatives paired with the concept of renewable hope is increasingly recognized as pivotal within the framework of smart economies and their innovation capacities. Education serves as a bedrock for economic progress, as evidenced by numerous studies demonstrating its correlation with enhanced productivity and adaptive capacities in various sectors. In recent years, particularly since 2018, there has been a surge in literature focusing on how educational systems can be reformed to harness innovative potentials and encourage sustainable growth in smart economies. For instance, various researchers argue that educational initiatives should be problem-based and interdisciplinary, reflecting real-world challenges faced in smart economies to foster critical thinking and creativity among students (Patel & Chetty, 2021).

The notion of renewable hope encapsulates both the aspirations of individuals and the broader societal vision towards sustainable development. As identified in recent studies, renewable hope not only reconciles personal aspirations with community goals but also stimulates engagement in educational processes. It inspires both educators and learners to pursue progressive changes in their educational experiences. Such a mindset, scholars affirm, plays a critical role in driving institutional reforms that align educational policy with economic and environmental sustainability (Mok & Li, 2020). The relationship among education, hope, and economic resilience is particularly important, suggesting that educational institutions can cultivate environments where hope transcends mere optimism and becomes a powerful catalyst for innovation (Williams, 2022).

Moreover, the interconnectivity of education with innovation and economic transformation is evident in smart economies where technology integration and engagement in lifelong learning are vital. Studies highlight that systems fostering technical skills and digital literacy among youth are well-positioned to adapt and thrive amid rapid changes in technology and market dynamics (Fernandes et al., 2021). As such, educational initiatives aimed at equipping students with the competencies necessary for participation in these landscapes are paramount. The curriculum should not only encompass traditional academic knowledge but also emphasize creativity, collaboration, and problem-solving abilities (Yusuf & Sarfraz, 2022).

Looking at synergies between education, hope, and the economy, it is essential to recognize the multifaceted nature of their relationships. Educational initiatives act as both an avenue for individual economic mobility and a collective resource for community development. Therefore, engaging students through practical experiences tied to local industries fosters a strong sense of agency and connection to their communities. This cooperative dynamic manifests as a feedback loop where educational achievements catalyze economic opportunities, in turn nurturing hope for sustained community growth (Turner, 2020). Most salient in contemporary debates is the discourse

around equity in access to quality education. Scholars argue that without addressing systemic inequality, the realization of a fully inclusive smart economy remains unfulfilled (Anderson & Kumar, 2021).

As the global landscape progresses, identifying gaps in the existing literature focuses on the need for empirical studies that measure the concrete outcomes of educational initiatives on economic development and innovation. Additionally, the role of policymakers in building effective frameworks that support these intersections is crucial, suggesting that dialogue between educators and economic stakeholders can enhance strategic planning and resource allocation (Jones et al., 2023). Ultimately, nurturing a culture of renewable hope through robust educational frameworks emerges as a strategic imperative for fostering economic resilience and innovation, thereby reinforcing the indispensable link between education and smart, sustainable economies.

Research Hypotheses

Ho_1: There is no significant relationship between curriculum development and societal optimism in smart economies

Ho_2: There is no significant relationship between technology integration and personal resilience in smart economies

Methodology

Study Population

The study population includes a diverse group of stakeholders involved in education, economy, and policy development. This encompasses educators, students, policymakers, business leaders, and community members.

Sample and Sampling Procedure

A stratified random sampling method were employed to ensure representation from various sectors, including different educational institutions (primary, secondary, tertiary), economic sectors (technology, manufacturing, services), and community demographics. The desired sample size was determined based on the total population of stakeholders in these domains, with a target a minimum of 500 respondents for quantitative analysis.

Research Instrument

Data were collected using a mixed-methods approach, incorporating both qualitative and quantitative research instruments:

Surveys: Structured questionnaires designed to measure perceptions regarding educational initiatives, the state of renewable hope, and economic perceptions will be administered to gather quantitative data.

Interviews: Semi-structured interviews were conducted with selected stakeholders to gain qualitative insights on the factors that influence educational initiatives and perceptions of hope in the context of smart economies.

Procedure for Data Collection

Survey Administration: Questionnaires was distributed to the identified sample via online forms and in-person sessions.

Method of Data Analysis

The data was analyzed using statistical software, such as SPSS. Descriptive statistics (means, medians, mode, standard deviations) were used to provide an overview of the data. Inferential statistics, including multiple regression analyses, were conducted to test the strength of relationships between educational initiatives and renewable hope.

DATA ANALYSIS

Table 1: Descriptive Statistics of Respondents (N = 500)

Variable	Mean	Median	Mode	Std. Deviation	Minimum	Maximum
Curriculum Development (CD)	3.94	4.00	4	0.82	1.00	5.00
Societal Optimism (SO)	3.88	4.00	4	0.77	1.00	5.00
Technology Integration (TI)	4.01	4.00	4	0.80	1.00	5.00
Personal Resilience (PR)	3.91	4.00	4	0.75	1.00	5.00

Table 1 show that all variables scored above the midpoint (means ranging from 3.88–4.01 on a 5-point scale). This indicates that respondents generally perceived curriculum development (M = 3.94), societal optimism (M = 3.88), technology integration (M = 4.01), and personal resilience (M = 3.91) positively. Standard deviations (0.75–0.82) reflect moderate variability, suggesting relative consistency across stakeholder groups.

Table 2: Correlation Matrix (Pearson Correlation, N = 500)

Variables	CD	SO	TI	PR
Curriculum Development (CD)	1	.612**	.534**	.497**
Societal Optimism (SO)	.612**	1	.521**	.509**
Technology Integration (TI)	.534**	.521**	1	.589**
Personal Resilience (PR)	.497**	.509**	.589**	1

**** Correlation is significant at the 0.01 level (2-tailed)**

The correlation matrix (Table 2) revealed significant positive relationships among all variables ($p < 0.01$). Curriculum development correlated strongly with societal optimism ($r = .612$), while technology integration correlated strongly with personal resilience ($r = .589$). These results suggest that improvements in curriculum and technology are positively associated with social and individual outcomes in smart economies.

Table 3: Regression Analysis

Hypothesis	Dependent Variable	Predictor Variable	β (Beta)	Std. Error	t-value	Sig. (p)	R	R^2	Adj. R^2	F-value	Decision
Ho1	Societal Optimism (SO)	Curriculum Development (CD)	.612	0.04	15.60	.000***	.612	.374	.373	243.6	Reject Ho1

Hypothesis	**Dependent Variable**	**Predictor Variable**	**β (Beta)**	**Std. Error**	**t-value**	**Sig. (p)**	**R**	**R^2**	**Adj. R^2**	**F-value**	**Decision**
Ho2	Personal Resilience (PR)	Technology Integration (TI)	.589	0.05	14.70	.000***	.589	.347	.345	216.0	Reject Ho2

*** Significant at p < 0.001 (2-tailed).

Hypothesis 1 (Ho1): The regression analysis (Table 3) demonstrated that curriculum development significantly predicted societal optimism (β = .612, p < .001). The model explained 37.4% of the variance in societal optimism, leading to the rejection of Ho1. Hypothesis 2 (Ho2): The regression analysis (Table 4) revealed that technology integration significantly predicted personal resilience (β = .589, p < .001). The model explained 34.7% of the variance in personal resilience, resulting in the rejection of Ho2.

Discussion of Findings

The findings illustrate a robust connection between educational initiatives, the cultivation of renewable hope, and economic growth. Key implications of the results surmise the following:

Skills and Competency Development: Data confirms that educational policies emphasizing practical skills directly enhance workforce readiness, aligning with prior literature (Hanushek &Woessmann, 2010).

Hope as a Driver: The emphasis on renewable hope reveals its essential role in motivating individuals to engage with education and economic opportunities (C. Inglehart, 2018).

Collaborative Ecosystems: The findings support the necessity for a collaborative approach to education and economic policy, resonating with Drucker's assertion that innovation thrives through cooperation (Drucker, 2014).

Conclusion

The findings of this study reveal strong evidence that both curriculum development and technology integration are critical drivers of societal optimism and personal resilience in smart economies. Descriptive results indicated high stakeholder ratings across all variables, suggesting general agreement on their importance. Correlation analysis demonstrated significant positive associations, while regression models confirmed that curriculum development accounts for 37.4% of the variance in societal optimism, and technology integration explains 34.7% of the variance in personal resilience. These results refute the null hypotheses, demonstrating that improvements in educational structures and digital adoption enhance community outlook and individual adaptability. The implication is that curriculum reforms that prioritize innovation, inclusivity, and forward-thinking skills, alongside the integration of modern technologies, are essential not only for economic competitiveness but also for building resilient and optimistic societies. Thus, education and technology function as twin pillars for sustainable growth in smart economies.

Recommendations

The study recommends the following:

1. Policymakers and educators should prioritize the continuous redesign of curricula to embed problem-solving, creativity, and socio-emotional learning, which collectively foster societal optimism and long-term community trust in smart economies.

2. Governments and institutions should invest in large-scale digital literacy and technology adoption programs to strengthen personal resilience, ensuring individuals remain adaptable and competitive in rapidly changing economic environments.

Knowledge Gap

While existing literature addresses elements of education, hope, and economic development separately, there remains a significant gap in understanding how these constructs interact synergistically within smart economies. Future research should explore longitudinal studies that assess the impact of educational initiatives on both workforce competency and societal optimism over time. Furthermore, there is a need for empirical studies that evaluate the effectiveness of specific educational programs designed to foster renewable hope in relation to economic outcomes.

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Women Entrepreneurs and Green Technology in Africa: Pathways to Managing Natural Resources

Freda I. Fidelis, Mercy M. Adeyeye, & Jacob A. Alabi
National Open University of Nigeria, Abuja.
Contact: fareeunique@gmail.com

Abstract
Africa has embraced sustainability language, although the integration of women entrepreneurship into green technology (GT) reforms remains insufficiently understood. Much of the existing work either highlights women socio-economic marginalization or emphasizes the technical deployment of GT, with insufficient emphasis to women as drivers of ecological innovation. The problem therefore isn't just one of access but also one of the acknowledgements of women as constructors, designers, and pioneers of context-specific GT models. In this paper, gendered green entrepreneurship is developed as an interdisciplinary field through the combination of Feminist Empowerment Theory and frontier GT applications like irrigation via monitoring via blockchain, bio-production, and green finance. Comparative cases from Nigeria, Kenya, Ghana, and South Africa mark the ways GT is embedded by women entrepreneurs into businesses that both address ecological harm and social injustices. Local innovations like solar micro grids for energy, water recycling for agriculture, bio-fertilizer businesses for rebuilding soils, waste reduction and fashion businesses outline the ways women firms generate revenue, boost ecological caretaking and social well-being. The text proposes African women business owners are not only adopters but visionary innovators reimagining empowerment as the intersection of economic agency and ecological accountability. In bridging women empowerment literature and ecological innovation, the project moves feminist empowerment theory beyond itself into sustainability studies. It also identifies concrete initiatives, including gender-responsive green finance, capacity building in GT, and regional knowledge-sharing platforms, while asking governments to include gender into sustainability frameworks and encourage women-led green technologies

Keywords: Africa, Ecological empowerment, Green technology; Sustainability;

Introduction

The dynamic capacity to generate inclusive opportunities positions it at the focal point of sustainable development in both emerging and mature economies. Entrepreneurship is widely accepted as a catalyst of economic growth, technical innovation, and social transformation (Ahmad and Bajwa, 2023). In Africa, entrepreneurship is increasingly positioned not only as a method for poverty reduction but also as a strategy for inclusive and sustainable development (UNECA, 2023). Women compose approximately half of Africa's entrepreneurial population, with strong presence in agriculture, microenterprises, and local commerce sectors naturally related to natural resources and environmental sustainability (IMF, 2024). Their involvement in food systems, water management, and energy consumption emphasizes their potential as essential actors in ecological stewardship (Hashemi, 2025).

Hence, Africa is also faced with rising environmental disasters like land degradation, deforestation, water scarcity, and energy poverty (UNEP, 2022). These disasters have hastened the call for sustainable solutions and attracted attention for greentech (GT) innovations for higher efficiency, lower ecological consequences, and enabling regenerative use of resources (Geissdoerfer et al., 2020). However, the global and African literature typically narrow down the conceptualization of GT diffusion as a techno- or policy-driven process where socio-cultural and gendered applications of technology are barely considered.

Nevertheless, literature on women entrepreneurship has typically centred on constraints such as limited funding, institutional voids, and gendered exclusion, with emphasis on social and economic empowerment results (Brush et al., 2019; Cornwall and Rivas, 2023). Yet, this collection of work rarely overlaps with environmental sustainability debates. Women entrepreneurs are generally characterized as passive users or recipients of technology rather than as active ecological innovators and resource managers.

This disjuncture between entrepreneurship literature and sustainability rhetoric constitutes a considerable knowledge gap. The current study addresses this blind spot by introducing the notion of gendered green entrepreneurship to analyse how women entrepreneurs across Africa adopt, adapt, and innovate with GT to simultaneously improve livelihoods and ecological regeneration.

This paper provides three contributions. First, it extends Feminist Empowerment Theory by inserting ecological stewardship within the empowerment paradigm, so reconceptualizing empowerment as both economic and environmental agency. Secondly, it improves GT scholarship by re-gendering discourses on innovation, placing African women as ecological-economic pioneers rather than marginal players and thirdly, it gives empirical findings from comparative experiences in Nigeria, Kenya, Ghana, and South Africa, demonstrating how women-led firms integrate GT into solutions that regenerate resources, increase social fairness, and strengthen resilience.

Statement of the Problem

The significance of women business in Africa is becoming recognized, important gaps persist. The dominating emphasis on financial restriction, institutional impediments, and gendered marginalization obscures how environmental imperatives influence entrepreneurial behaviours. In parallel, GT scholarship prioritizes technological and infrastructure adoption, ignoring the agency of female entrepreneurs as environmental innovators. As a result, the nexus between women entrepreneurship, green technology, and natural resource management lacks adequate theoretical and empirical research.

This divided view has three implications. It limits theoretical frameworks that appropriately account for the ecological components of women empowerment. It limits policy creativity for scaling women-led ecological breakthroughs. It also hinders recognition of African women entrepreneurs as key actors in promoting sustainability transitions.

The unaddressed gap is in the conceptual and empirical investigation of how African female entrepreneurs interact with, adapt to, and pioneer green technology to address sustainability issues. Filling this gap is the conceptual focus of this research.

Literature Review and Theoretical Foundation

Women Entrepreneurship in Africa

Women owned businesses account for an estimated 25% of the registered businesses of sub-Saharan Africa and are present on an informal scale with millions more involved in agricultural, textile, food manufacturing, and services sectors most exposed to environmental shocks (Nhamo and Mjimba, 2020; World Bank, 2022). Dominance in Economic, women entrepreneurs face ongoing barriers such as: Obtaining credit and collateral (Eze and Okeke, 2023)., Inadequate voice and presence in the digital and innovation sectors and Customary norms preventing them from seeking entry into science, technology, and high-value entrepreneurship.

Earlier scholarship thus focused focussed on women financial exclusion, capacity constraint, and empowerment regarding income, decision-making, and participation (Brush et al., 2019; Cornwall and Rivas, 2023).

Gap: Even though these studies reflect the socio-economically peripheral status of women, they don't really address the degree to which women entrepreneurial enterprise overlaps with ecological crises or natural resource governance. This blind spot makes the women agency as ecological innovators invisible.

Green Technology and Resource Management

Green technology (GT) entails innovations for greater efficiency, reduced ecological footprints, and replenished natural resources. Africa's frontier applications for GT are precision agriculture through the utilization of solar home systems, blockchain for land and water entitlements, and biodegradable packaging (World Bank, 2024). Scholarship globally positions GT at the centre of sustainability transformations (Kirchherr et al., 2017).

Furthermore, African adoption is lopsided due to infrastructural gaps, policy frailties, and institutional nullity (Geissdoerfer et al., 2020). GT literature overwhelmingly imagines the innovation as a technocratic or policy issue centred on energy infrastructure, financial arrangements, and climate mitigation.

Gap: The articulation ignores the social actors' input, especially the women entrepreneurs who adopt, re-purpose, and assimilate GT into the onsite environment. Due to that, women ecological resource management through GT is under-theorized and under-documented.

Feminist Empowerment Theory and Gendered Green Entrepreneurship

Feminist Empowerment Theory conceptualizes empowerment as a process, influenced by the combination of resources, agency, and achievements (Kabeer, 1999). Applied to entrepreneurship, the paradigm illustrates how women mobilize resources and exercise agency to accomplish outcomes in livelihoods and decision-making. Recent work has expanded this to include sustainability, proposing that entrepreneurship can simultaneously improve social fairness and ecological goals (Díaz-García and Wright, 2022).

Yet, empowerment philosophy remains mostly economically driven, with ecological stewardship generally lacking from empowerment measurements. Likewise, GT literature is typically gender-blind, neglecting women distinct responsibilities in technology creation and adoption.

In order to fill these gaps, the current study proposes the concept of gendered green entrepreneurship, which is conceptualized as the integration of green technology into women entrepreneurial activities to simultaneously advance economic empowerment, social resilience, and ecological regeneration. Contribution: By incorporating ecological stewardship within feminist empowerment theory and re-gendering GT discussions, this approach reconceptualizes African women entrepreneurs not as passive beneficiaries but as pioneers of ecological-economic transformation.

Case Insights: Women Entrepreneurs and Green Technology

Women entrepreneurs across Africa are incorporating green technologies (GT) into firms that addresses ecological challenges, while producing social and economic benefit. alternatively, examining these experiences by geography alone, this part arranges concepts thematically around four essential categories of natural resource management: energy transitions, water and agriculture, soil regeneration, and circular economies.

Energy Transitions: Solar Micro-Grids

In Nigeria, women cooperatives in Kaduna State operate solar-powered and micro-grids that offer clean electricity to rural families (Adegbite and Aina, 2022). These measures reduce dependences on kerosene and firewood, lessen household emissions, and lower women domestic labour burden. Importantly, the firms are community-owned, enabling revenue reinvestment into schools and health institutions. Insight: Women entrepreneurs in energy transitions are not merely users of solar power but system designers that expand energy access, localize maintenance, and democratize advantages.

Water and Agriculture: Recycling and Irrigation Innovations

In Kenya, women entrepreneurs use water-saving drip irrigation and rainfall gathering systems, enabling smallholder farmers to boost yields under climate variability (Kamau, 2023). These firms also recycle wastewater for urban farming, minimizing competition over scarce freshwater supplies. Insight: Women led water innovations generate adaptive agricultural systems that promote food security, climate resilience, and gender inclusive access to water resources.

Soil Regeneration: Organic Waste-to-Fertilizer Enterprises

In Ghana, women agripreneurs transform cassava and maize trash into organic fertilizers (Akintoye and Osei, 2023). These firms reduce post-harvest losses, boost soil fertility, and provide farmers a sustainable alternative to pricey chemical fertilizers. Insight: Women ecological entrepreneurship extends beyond production into waste valorisation, illustrating how GT promotes regenerative soil techniques that shut nutrient loops in local food systems.

Circular Economies: Eco-Fashion and Sustainable Textiles

In South Africa, women-led firms in Cape Town upcycle textile waste and use natural dyes to manufacture eco-fashion (Moyo, 2024). These ventures tap into global sustainable market places while minimizing landfill trash and creating green jobs. Insight: By combining local ecological practices with global value chains, women entrepreneurs in ecosystem reimagine Africa's participation in the circular economy.

Comparative Analysis

Across these thematic realms, various comparative observations emerge:

Urban vs. Rural Contexts: Urban-based firms (eco-fashion, urban water recycling) integrate more easily into global markets, whereas rural innovations (solar micro-grids, organic fertilizers) prioritize survival, resilience, and communal well-being.

Formal vs. Informal Adoption: The formal GT adoption (eco-fashion, certified fertilizer) benefits from market access and regulation, while informal GT practices (community solar cooperatives, local irrigation systems) thrive in institutional voids but confront scaling issues.

Institutional Mediation: Weak institutions both hinder and stimulate innovation. In settings of governmental neglect, women entrepreneurs devise grassroots GT solutions, but institutional barriers impede their ability to scale beyond localities.

Ecological-Economic Synergies: Across energy, water, soil, and waste, women entrepreneurs concurrently produce income, minimize environmental degradation, and increase social equality an integrated paradigm rarely addressed in mainstream entrepreneurship or GT studies.

Implications of the Study

Theoretical Contributions

This study contributes to scholarship in three ways:

1. Introducing Gendered Green Entrepreneurship: By incorporating ecological stewardship into the framework of the theory of feminist empowerment, the book reinterprets women entrepreneurship not just as an economic but also an ecological endeavour. This bridges the gap where the theory of empowerment has systematically ignored environmental viewpoints.
2. Re-gendering Green Technology Scholarship: Citing GT studies, available literature commonly conceptualizes innovation as technological or policy-driven. In the present writing, we situate women entrepreneurs as active creators and producers of GT innovations and broaden the innovation ecosystems argument to foreground gendered agency.
3. Connecting Two Diverse Literatures: In connecting women entrepreneurship literature with sustainability and natural resource management argumentation, the paper creates a novel interdisciplinary field that puts ecological-economic agency centre stage.

Policy Contributions

The results also have important implications for African policy contexts:

1. Mainstreaming Gender into Sustainability Agendas: Very few GT strategies mainstream gender as one of the main dimensions. Governments and regional organizations should clearly identify women as ecological innovators as part of national targets for green growth.
2. Targeted Green Finance for Women: Traditional banking systems overlook small-scale women-led firms. Green bonds, microcredit schemes, and fintech platforms geared to women entrepreneurs can scale ecological firms in rural and urban contexts (Eze & Okeke, 2023).
3. Institutional Support for Scaling: Incubators, accelerators, and public–private partnerships must establish supportive ecosystems that advance women-led GT efforts from pilot programs into large-scale impact.

Practical and Entrepreneurial Contributions

The study, offers the below recommendations for incorporation:

1. Leveraging Digital Facilitators: Blockchain company offers transparent certification for sustainable products, and can help irrigation, energy transmission, and waste disposal optimisation.
2. Developing Ecological Innovation Competence: Training programs on GT, circular economy and sustainable business models, developed and accelerated the capacity of women innovation and scale solutions.
3. Creating Knowledge-Sharing Platforms: Women-led GT firm regional and continental platforms can increase peer learning, cross-country scaling, and global sustainability market visibility.

Conclusion and Research Agenda

The study brings novelty through the conceptualization of gendered green entrepreneurship as an approach that does not portray African women as recipients but initiators of ecological-economic innovations. Empirically, it provides evidence of African women entrepreneurs embracing GT for sustainable development within the sectors of energy, water, soils, and circular economies.

Future investigation, three avenues are suggested:

1. Impact Measurement, jobs created, reduced emissions, and replenished resources through women-led GT companies.
2. Digital Evolution, mapping the process wherein females utilize, blockchain, and fintech to support environmental entrepreneurship.
3. Developing Ecological Innovation Competence: Training programs focused on green technology (GT), the circular economy, and sustainable business models can enhance the innovative capabilities of women and help scale solutions.

Abstract
The integration of Artificial Intelligence (AI) in the workplace is rapidly reshaping organizational processes, especially with regard to fostering creativity. As AI technologies evolve, their potential to enhance employee creativity and innovation becomes increasingly significant. This study explores how AI tools, such as generative AI, AI-enabled HR practices, and AI-driven problem-solving platforms, influence employee creativity. The research examines key factors such as creative self-efficacy, organizational leadership, and employee engagement with AI tools in enhancing workplace creativity. A content analysis methodology was employed to analyze secondary sources, including peer-reviewed journal articles, reports, and empirical studies published between 2019 and 2024. The study addresses three primary research questions: (1) How does the use of AI tools in the workplace impact employee creativity? (2) What is the relationship between AI implementation and innovation in the workplace? (3) How does AI adoption influence the culture of creativity in an organization? The findings indicate that AI has a profound impact on creativity by automating mundane tasks, enhancing problem-solving abilities, and providing opportunities for experimentation. However, the success of AI in fostering creativity is contingent on factors such as employee trust in AI tools, the design of AI systems, and the organizational readiness for AI adoption. Transformational leadership plays a pivotal role in motivating employees to embrace AI, which further strengthens its creative potential. The study concludes that while AI tools have significant potential to boost creativity, challenges such as poorly designed tools, lack of adequate training, and trust issues must be addressed. The paper recommends strategies for organizations to design AI tools that complement human creativity and foster a supportive environment for innovation. Future research should focus on long-term impacts and the ethical considerations of AI in creative workplaces.

Keywords: *AI tools, AI adoption, Employee creativity, Generative AI, Creative self-efficacy, Organizational culture.*

Introduction

Artificial intelligence (AI) is quickly changing industries and the way companies work by being used in the workplace. Employee creativity is one of the most important areas of effect because it helps with innovation, problem-solving, and adaptability in today's fast-paced business world. As

AI tools get smarter, they can help people do things they couldn't do before. But how they affect creation is still an important topic to study. Research on how AI can help boost creativity at work shows that there is more than one way that technology can help people be more creative. Creative self-efficacy, or a person's belief in their own creative skills, can be raised by using AI at work. This can make employees more creative. AI tools can give workers resources that help them think of new ideas, make boring jobs easier, and find new ways to solve problems. Generative AI has been linked to both incremental and radical creativity improvements in creative work. This is because it makes it easier for workers to try out new ideas and methods (Zhang, Yu, & Ma, 2021). Also, AI encourages creativity by helping workers learn by doing, which is especially good for extreme creativity (Zhang et al., 2021).

That being said, there isn't a simple link between AI and creativity. AI has the potential to spark creativity, but how much of an effect it has depends on things like how the company is run and how the workers interact with the technology. Transformational leadership, for instance, increases the positive effects of AI on creativity by inspiring employees to believe in AI tools and use them more effectively (Jeong & Jeong, 2024).

On the other hand, how employees interact with AI can be affected by things like how trustworthy they think AI tools are and how ready their company is for AI. People are more likely to see AI as a useful tool for their creative work when they trust it and believe it can do what it's supposed to do (Wu & Wang, 2024) the studies show.

Also, the way AI systems are built can have a big effect on how creative people are. Sweiss and Yamin (2024) say that AI-enabled HR practices, like giving workers personalised development tools or platforms that boost their creativity, can affect how willing they are to be creative and how satisfied they are with their work. AI systems that work together also help people be more creative, especially when the technology is made to work with people instead of replacing them. This way of working together lets workers keep their creative freedom while using AI's data-driven insights (Ning, Liu, & Liu, 202).

AI can help some people be more creative, but not all of them. There are still problems with implementing AI and getting employees to adapt to it. Poorly designed AI tools or not enough training can make workers more stressed, unclear about their roles, and even less creative in some situations (Luo, Mu, & Zhang, 2021). There is a fine line between AI's help and protecting human creation. AI should support human innovation, not take it over. To get the most creative use out of AI, companies need to make sure that its integration is in line with their leadership plans, the health and happiness of their employees, and ongoing training. AI has a lot of ability to encourage creativity at work, but how well it works will depend on the organisation as a whole. To get the most out of AI's positive effects on creativity, leaders must build trust among employees and allow people to work together to create AI tools. AI will likely play a bigger role in artistic fields and workplaces as it continues to develop, which will open up exciting new ways to innovate and grow.

Statement of the Problem

The rapid integration of Artificial Intelligence (AI) tools in the workplace has created a profound impact on organizational productivity and creativity. AI has the potential to enhance employee creativity, enabling innovation, problem-solving, and adaptability. Research has shown that AI can

support creativity by boosting creative self-efficacy, reducing mundane tasks, and facilitating problem-solving (Zhang, Yu, & Ma, 2021). Generative AI, in particular, has demonstrated its ability to spark both incremental and radical improvements in creativity by encouraging experimentation and supporting learning through practice (Zhang et al., 2021). Furthermore, the role of transformational leadership in promoting AI adoption and trust has been highlighted as a key factor in unlocking AI's creative potential (Jeong & Jeong, 2024). AI systems that collaborate with workers, rather than replace them, have also been shown to positively influence creativity (Ning, Liu, & Liu, 2020).

However, despite these promising findings, several challenges remain in understanding how AI can best be utilized to foster a culture of creativity in the workplace. Several studies have explored the connection between AI and creativity, but gaps still persist. For instance, Wu and Wang (2024) argue that employee trust in AI and the perceived usefulness of AI tools play a significant role in AI adoption for creative tasks. Yet, their study does not fully delve into the influence of leadership styles and organizational readiness on employees' willingness to engage with AI creatively. Similarly, while Sweiss and Yamin (2024) examine how AI-enabled HR practices can foster creativity, their research does not address how organizational culture and AI implementation strategies impact the long-term sustainability of this creative boost. Moreover, Luo, Mu, & Zhang (2021) provide insights into the negative side of AI adoption, emphasizing how poorly designed AI tools can lead to stress, role ambiguity, and decreased creativity. However, their research does not comprehensively investigate how organizations can mitigate these issues and ensure AI is effectively integrated into the workplace.

There remains a gap in understanding the comprehensive factors that influence the relationship between AI implementation and creativity within organizations. While individual studies have explored specific aspects of AI's role in the workplace, a holistic framework that incorporates organizational culture, leadership, AI trust, and system design is still lacking. Therefore, this research seeks to bridge this gap by focusing on how AI tools are implemented, adopted, and integrated into organizational culture, and their subsequent impact on employee creativity.

Research Questions

This study will explore the following research questions:

1. How does the use of AI tools in the workplace impact employee creativity?
2. What is the relationship between AI implementation and innovation in the workplace?
3. How does AI adoption influence the culture of creativity in an organization?

Literature Review

This section reviewed the related literature of the study, it start by reviewing conceptually the variables of the study, it further reviewed relevant theoretical framework and finally reviewed related empirical studies.

Conceptual review

Impact of AI Tools on Employee Creativity in the Workplace

Artificial intelligence (AI) has increasingly become a transformative tool in enhancing creativity in the workplace. The integration of AI tools has altered how employees approach their creative tasks by offering new avenues for innovation, problem-solving, and decision-making. AI can

support creativity by automating repetitive tasks, providing insightful data, and offering creative prompts that stimulate new ideas. Wu and Wang (2024) suggest that AI tools act as catalysts for creativity by enhancing employees' ability to perform tasks more efficiently, allowing more time for innovation (Wu & Wang, 2024). Jeong and Jeong (2024) confirm that AI adoption can positively affect creativity by increasing creative self-efficacy among employees, with transformational leadership serving as a crucial factor in amplifying this effect (Jeong & Jeong, 2024).

The AI-enhanced learning environments in industries such as hospitality and banking also contribute to fostering creativity by offering employees tools to experiment with new ideas in a less restrictive setting (Aly, 2024). AI's influence on creativity is not one-dimensional. It simultaneously boosts efficiency and allows for the exploration of new possibilities. However, concerns about job displacement and the loss of human touch in creative processes remain prevalent (Santhosh et al., 2023).

The Role of AI in Fostering Innovation in the Workplace

AI is pivotal in enhancing workplace innovation by providing tools that assist employees in brainstorming, problem-solving, and decision-making. AI enhances organizational creativity by facilitating the integration of diverse data, enabling organizations to experiment and develop innovative solutions that are otherwise difficult to achieve with human-only input. The potential of AI to foster innovation lies in its ability to handle complex data analysis, identify patterns, and make predictions. Studies show that AI systems can enhance employee decision-making by providing relevant, real-time information, which leads to more innovative outcomes. Raj (2024) notes that AI allows organizations to tap into new areas of innovation by offering diverse perspectives and supporting decision-making (Raj, 2024).

Meanwhile, the adaptation of AI in industries such as retail has further proven its ability to drive service innovation by improving customer interactions, thereby boosting creativity within teams (Ahn et al., 2025). AI fosters innovation by promoting efficiency, but it also introduces challenges, particularly in balancing the autonomy AI offers and the risk of relying too heavily on automated decision-making (Zheng et al., 2025).

AI’s Influence on the Culture of Creativity in Organizations

AI significantly impacts the culture of creativity within organizations by shifting how creative processes are understood and executed. The advent of AI technologies prompts organizations to reevaluate the role of human creativity, as AI tools are capable of performing creative tasks traditionally handled by people. This has led to both concerns and opportunities in reshaping the workplace culture. Atkinson and Barker (2023) highlight that AI’s involvement in creative processes challenges traditional conceptions of creativity. They propose a model where AI supports creative practice by acting as a mediator between human activity and external information sources (Atkinson & Barker, 2023). AI’s integration into creative fields has sparked debates on how it influences not only creativity but also the workforce's role in cultural production. Grba (2021) identifies the need for a redefined cultural labor perspective, where AI is considered as a collaborator rather than a competitor, emphasizing that AI's potential for creative work is contingent on how humans engage with it (Grba, 2021).

AI's presence in creative practices also challenges existing ideas of intellectual property, authorship, and the role of human input in the creative process. Ashkinaze et al. (2024) argue that AI's involvement in idea generation increases collective creativity but may not enhance individual creativity, highlighting the complexity of integrating AI into organizational cultures (Ashkinaze et al., 2024). These shifts illustrate that AI is not simply a tool for increasing productivity but also plays a fundamental role in reshaping organizational culture around creativity. It encourages a shift toward collaboration between human and AI, transforming how innovation and creativity are perceived and practiced within organizations.

The integration of AI into the workplace is a double-edged sword. On one hand, it fosters creativity and drives innovation by automating tasks, providing diverse perspectives, and aiding decision-making. On the other hand, it challenges traditional concepts of creativity and raises questions about human involvement and job displacement. As AI continues to evolve, its role in shaping the culture of creativity in organizations will become increasingly significant, with potential impacts on organizational dynamics, workforce roles, and creative practices.

Theoretical Framework

This study is based on Albert Bandura's Social Cognitive Theory (SCT), which is a set of ideas about how people think and communicate. SCT looks at how emotional, behavioural, and environmental factors affect each other and change over time. It focusses on how people learn and change behaviours by watching others in their social surroundings and by getting positive feedback for those behaviours. These ideas say that people learn in groups and that they can pick up new behaviours by watching others and getting direct feedback. It also says that cognitive factors like drive and self-efficacy are very important in how people think about and act on what they see (Bandura, 1963). The study of AI's effect on creativity fits with this theory because it shows how important cognitive and social factors are in forming a person's behaviour. For example, the use of AI tools at work and how they affect creativity.

In this study, SCT helps us see how workers' beliefs about their creativity (called creative self-efficacy) affect how they use AI tools. This idea is very important because AI tools can either make people more creative or less creative, based on how they see their own skills and how much they trust AI. Wu and Wang (2024) say that faith in AI and the belief that AI tools are useful are important for encouraging creative behaviour at work. Additionally, Jeong and Jeong (2024) show that using AI boosts creative self-efficacy, which has a direct effect on how creative workers are. Social cognitive theory (SCT) helps us understand the link between these ideas by focussing on how personal cognitive factors, like self-efficacy, can drive people to use new tools and methods.

SCT is a great framework for this study because it lets us look at many things that affect creativity, like leadership, organisational culture, and people's beliefs. Bandura pointed out in 1963 that a person's behaviour is affected by their surroundings and how they think about it. For AI in the workplace, this theory helps us figure out how leadership styles, company culture, and trust in AI all affect how workers use AI tools in their creative work. For example, Jeong and Jeong's ideas on transformational leadership can make the positive effects of AI on creation even stronger by creating an atmosphere that makes people trust technology. This fits well with SCT, which says that leadership and the environment can have a good effect on how people think and act.

Even though SCT has some good points, it has been criticised over the years. Some people disagree with the theory because they think it puts too much emphasis on the mental and social parts of behaviour while not giving enough weight to the biological and emotional ones. Also, the focus on observational learning and reward has been called into question because it might not fully explain how people are motivated and creative (Pajares, 2002). These problems with SCT don't change the fact that it can be used in this study, though. The framework is still very useful because it fully looks at how cognitive factors like trust and self-efficacy affect how engaged workers are with AI in creative work. The social and cognitive processes emphasised by SCT are very important for understanding how employees interact with and are affected by AI tools. Biological and emotional factors may also play a part. Zhang, Yu, and Ma (2021) say that AI encourages both small and large amounts of creativity by making it easier to learn and solve problems in new ways. This supports the idea that cognitive factors, like self-efficacy, are very important for creativity at work.

Social Cognitive Theory gives us a solid way to think about how the use of AI affects the imagination of workers. It gives useful information about how cognitive factors, social factors, and the work environment all affect each other and affect how workers understand and use AI tools. The theory has been criticised for focussing too much on cognitive and social aspects, but it is still the best fit for this study because it can explain how AI, employee creativity, and organisational culture all work together in complicated ways.

Empirical Review

Ndudi and Kifordu (2024) conducted a study aimed at investigating the relationship between organizational creativity and firm performance within Nigeria's Fintech industry. The objective of the research was to examine how organizational structure and resources impact creativity and, consequently, influence firm performance in the Fintech sector. The authors employed a survey research design, utilizing regression analysis to analyze the data collected from the participants. A total of 375 employees from the seven largest Fintech companies in Nigeria were surveyed. The study was carried out within the Nigerian Fintech sector, targeting major firms operating in urban areas.

The findings revealed that organizational structure and resources had a positive influence on creativity and firm performance. While organizational structure was found to positively influence creativity, its relationship with firm performance was not statistically significant. In contrast, the study found that organizational resources had a significant and positive relationship with firm performance, highlighting the importance of resources in driving creativity and business outcomes within the Fintech industry. However, the study was limited by its narrow focus on the Fintech sector, which may limit the generalizability of the findings to other industries. Further research is needed to explore the role of organizational creativity in different sectors and the potential influence of AI tools on creativity and innovation across various industries.

Baha and Okolo (2024) explore the ethical challenges surrounding the adoption of generative AI in higher educational institutions in Nigeria. The study employs a survey method, using structural equation modeling to analyze data from 12 institutions. Their research, based in Nigeria, reveals that ethical concerns, institutional policies, and curriculum support play a significant role in positively influencing the adoption of generative AI in higher education. However, the study’s

focus is solely on the educational sector and addresses ethical concerns, without delving into the broader technological or industrial sectors. One gap in their work is the lack of consideration of other variables or factors beyond ethics that may impact AI adoption in this context.

Abutex et al. (2013) examine the role of employee motivation and creativity in the innovation implementation activities of small and medium-sized enterprises (SMEs) in Nigeria. Using a survey approach, the study collects data from an unspecified number of SMEs, focusing on Nigerian SMEs in general. The findings suggest that both employee motivation and creativity significantly enhance the successful implementation of innovation within these businesses. The study's limitation lies in its generalizability, as it focuses only on SMEs and does not address the dynamics of larger firms or other sectors, nor does it integrate technological or AI-driven innovations into its analysis.

Olanrewaju and Musa (2019) investigate the influence of the SCAMPER creativity technique and workplace happiness on the innovative behavior of secondary school teachers in Oyo State, Nigeria. This study employs an experimental design with a sample size of 100 teachers. The findings highlight that both the SCAMPER creativity technique and workplace happiness significantly influence teachers' innovative behaviors. However, the research is limited to teachers in a specific region, Oyo State, and does not consider the impact of AI tools or other technological influences on innovation in education. The absence of a broader focus on AI or technology-driven innovation represents a gap in the study.

Odetunde and Ufodiama (2017) explore the relationship between transformational leadership, organizational culture, and employee creativity and innovation in the Nigerian oil and gas service industry. Using a survey method and regression analysis, the study analyzes data from 414 employees in this sector. The study finds that both transformational leadership and organizational culture are significant predictors of employee creativity and innovation. The study's limitation is its narrow focus on the oil and gas sector, as it does not explore the broader implications for other industries or consider the role of AI in enhancing innovation within organizations.

Ozigbo (2014) investigates the factors that sustain entrepreneurial creativity and innovation in Nigeria. The study utilizes a survey approach, though the sample size is unspecified. The findings suggest that a lack of capital and infrastructure hinders entrepreneurial creativity and innovation in Nigeria. The study's major gap is its failure to explore the potential of AI and other technological advancements as drivers of innovation, focusing primarily on the challenges associated with financial and infrastructural limitations in entrepreneurship.

Girei et al. (2024) propose a conceptual framework to explore the mediating role of creativity in linking innovation to the performance of SMEs in North East Nigeria. The study does not involve empirical data but rather presents a theoretical model based on existing literature. The proposed framework suggests that creativity mediates the relationship between innovation and SME performance in this region. However, the major gap identified is the lack of empirical testing to validate the framework, which leaves room for further investigation into its applicability in real-world scenarios.

Onyinyechi et al. (2021) assess the impact of creativity and innovation on entrepreneurship development in Nigeria. The study employs a survey method, utilizing Ordinary Least Squares (OLS) and ANOVA for data analysis, with a sample size of 257 entrepreneurs. The results show that technological advancement and strategic planning are key drivers of innovation in entrepreneurship development. However, the study lacks empirical validation for all hypothesized variables, which presents a gap in confirming the causal relationships between the variables.

Ukit (2015) examines the role of innovation in transforming the Nigerian automobile industry to boost economic growth in the 21st century. This study adopts a conceptual framework, but does not include empirical data or analysis. Ukit advocates for innovations and improvements within the Nigerian automobile industry to foster economic growth. The study's limitation is its absence of empirical data, making it difficult to assess the practical implications or the impact of specific technologies, such as AI, on the industry.

Amaugo (2024) investigates the impact of AI adoption on business process automation and competitiveness in the manufacturing industry in Nigeria. Using a survey method and regression analysis, the study analyzes data from 301 employees in the Nigerian manufacturing sector. The findings suggest that AI adoption significantly improves operational efficiency and competitiveness within the sector. However, the study also identifies challenges, such as high implementation costs and the lack of a skilled workforce, that hinder the widespread adoption of AI. This points to a gap in addressing the barriers to successful AI integration in Nigerian industries.

Table 2.1: Summary of Empirical Review

S/N	Author Name and Date	Title	Methodology	Sample Size	Location	Findings	Gaps
1.	Ndudi & Kifordu (2024)	Fostering firm performance through organizational creativity of Nigeria's Fintech industry	Survey; Regression analysis	375 employees	Nigeria (Fintech sector)	Organizational structure and resources positively influence creativity and firm performance.	Limited focus on other industries beyond fintech.
2.	Baha & Okolo (2024)	Navigating the Ethical Dilemma of Generative AI in Higher Educational Institutions in Nigeria	Survey; Structural equation modeling	12 institutions	Nigeria (Higher Education)	Ethical concerns, institutional policies, and curriculum support positively impact the adoption of generative AI.	Focuses solely on the educational sector and ethical concerns.
3.	Abutex et al. (2013)	Exploring Employee Motivation and	Survey	Not specified	Nigeria (SMEs)	Employee motivation and creativity	Limited generalizability to larger firms

		Creativity on SMEs Innovation Implementation Activities in Nigeria				significantly enhance innovation implementation in SMEs.	or other sectors.
4.	Olanrewaju & Musa (2019)	Analysis of SCAMPER creativity technique and workplace happiness on innovative behaviour of secondary school teachers in Oyo State, Nigeria	Experimental design	100 teachers	Nigeria (Oyo State)	SCAMPER creativity technique and workplace happiness significantly influence teachers' innovative behavior.	Focused only on teachers in one region; no focus on AI tools.
5.	Odetunde & Ufodiama (2017)	Transformational Leadership and Organisational Culture as Predictors of Employee Creativity and Innovation in the Nigerian Oil and Gas Service Industry	Survey; Regression analysis	414 employees	Nigeria (Oil and Gas)	Transformational leadership and organizational culture significantly predict creativity and innovation.	Limited to the oil and gas sector; lacks AI focus.
6.	Ozigbo (2014)	Sustaining Entrepreneurial Creativity and Innovations in Nigeria	Survey	Not specified	Nigeria (Entrepreneurship)	Lack of capital and infrastructure hinders entrepreneurial creativity and innovation.	No focus on AI or technology-driven innovation.
7.	Girei et al. (2024)	Creativity, Innovation, Small and Medium Scale Enterprises Performance: A Proposed Mediating Framework in	Conceptual framework	Not specified	Nigeria (SMEs in North East)	Proposes creativity as a mediating factor between innovation and SME performance.	Empirical testing required to validate the framework.

		North East Nigeria					
8.	Onyinyechi et al. (2021)	The Impact of Creativity and Innovation on Entrepreneurship Development: Evidence from Nigeria	Survey; OLS & ANOVA	257 entrepreneurs	Nigeria	Technological advancement and strategy are key for innovation in entrepreneurship development.	Lack of empirical validation for all hypothesized variables.
9.	Ukit (2015)	Innovation for Transformation of the Automobile Industry for Nigerian Economic Growth in the 21st Century	Conceptual framework	N/A	Nigeria (Automobile industry)	Recommends innovations and improvements for Nigeria's automobile industry to boost economic growth.	No empirical data or analysis on AI impact.
10	Amaugo (2024)	Impact of AI Adoption on Business Process Automation and Competitiveness in Manufacturing Industry in Nigeria	Survey; Regression analysis	301 employees	Nigeria (Manufacturing)	AI adoption positively impacts operational efficiency and competitiveness.	High implementation costs and lack of skilled workforce hinder AI adoption.

Methodology

This study adopts a qualitative research design to explore the influence of AI tools on fostering a culture of creativity in the workplace. The methodology involves a content analysis of secondary sources, including peer-reviewed journal articles, books, reports, and empirical studies published between 2019 and 2024 (Abomeh and Agnas, 2024; Abomeh, Gabriel, & Akhuemokhan, 2024). The selection criteria for sources were based on their relevance, scholarly rigor, and credibility, with particular attention given to literature addressing AI's integration into workplace creativity (Ofobruku, and Ezeah, 2019; Osunbor, and Ofobruku, 2023). The content analysis process involves identifying recurring themes related to AI tools' impact on employee creativity, trust in AI, organizational leadership, and the design of AI systems. Thematic analysis is employed to examine the role of AI in supporting creativity, the barriers to effective implementation, and the ethical concerns associated with AI in the workplace.

Discussion of findings

The discussion centers around the three primary research questions, with findings grouped under each research question.

Research question 1: How does the use of AI tools in the workplace impact employee creativity?

The literature reveals that AI tools have a profound impact on employee creativity. AI can enhance creative self-efficacy by reducing mundane tasks, enabling employees to focus on higher-level creative thinking. For instance, generative AI has been shown to foster both incremental and radical improvements in creativity, especially in creative industries, by promoting experimentation and learning by doing (Zhang et al., 2021). However, AI tools may only promote creativity if employees trust the technology and believe in its utility. Poorly designed AI tools or lack of adequate training can have the opposite effect, increasing stress and diminishing creativity (Luo et al., 2021). Therefore, the effectiveness of AI in fostering creativity depends largely on employee engagement and the design of the technology.

Research question 2: What is the relationship between AI implementation and innovation in the workplace?

AI tools are increasingly being integrated into workplace processes to enhance innovation. Studies have shown that AI enables employees to generate novel solutions to problems by providing data-driven insights, automating routine tasks, and enhancing decision-making processes. The relationship between AI and innovation is particularly strong when AI systems collaborate with employees rather than replacing them (Ning et al., 2020). This collaboration allows employees to retain their creative autonomy while benefiting from AI's computational capabilities. However, the full potential of AI in innovation depends on organizational culture, leadership, and the degree to which AI tools are embraced by employees (Jeong & Jeong, 2024). Leadership that fosters trust in AI tools and encourages their use is crucial in leveraging AI for innovation.

Research Question 3: How does AI adoption influence the culture of creativity in an organization?

AI adoption can significantly influence an organization's culture of creativity. Transformational leadership, for example, has been shown to enhance the positive effects of AI on creativity by motivating employees to engage with AI tools and view them as valuable assets (Jeong & Jeong, 2024). Additionally, AI systems that are designed to work alongside employees rather than replace them can contribute to a more collaborative and creative work environment (Ning et al., 2020). However, challenges remain, particularly regarding trust in AI systems, employee engagement, and the potential for AI to stifle creativity when poorly implemented (Wu & Wang, 2024). Organizations need to balance the integration of AI with the maintenance of a creative, human-centered workplace culture.

Conclusion

This study concludes that AI tools have significant potential to enhance employee creativity in the workplace. By automating mundane tasks, supporting problem-solving, and enabling experimentation, AI can foster both incremental and radical creativity. However, challenges such as trust issues, poorly designed AI tools, and lack of sufficient training need to be addressed to

unlock AI's full creative potential. AI's impact on creativity also depends heavily on organizational culture, leadership, and employee engagement with AI tools.

Recommendations

i. Organizations should prioritize the design and integration of AI tools that complement, rather than replace, human creativity, ensuring that employees retain their creative autonomy while benefiting from AI's capabilities.
ii. Leadership should play a pivotal role in promoting trust in AI tools, encouraging their use, and fostering a creative environment where employees feel empowered to experiment and innovate.
iii. Companies must invest in adequate training programs to ensure that employees are comfortable using AI tools and understand how they can enhance their creative potential. iv. Future research should focus on examining the long-term impact of AI on creativity across various industries, as well as explore strategies to overcome challenges related to AI adoption, such as trust issues and poor design.

Emotional Distance and Decision Making Among Academic Staff of Selected Universities in Edo State.

Ofobruku Sylvester Abomeh* & Oyor Godspower
Department of Business Administration Benson Idahosa University,Edo State, Nigeria.
**Corresponding author email: sofobruku@biu.edu.n*

Abstract
*This study empirically investigated the influence of emotional distance and organizational culture on decision-making behavior among academic staff in selected public universities in Edo State, Nigeria. The research adopted a **cross-sectional survey design**, suitable for capturing the perceptions of a defined population at a single point in time. The target population comprised all academic staff across three strategically selected public universities: the University of Benin, Ambrose Alli University, and Edo State University Uzairue. These institutions were chosen to reflect a diverse mix of federal and state-owned universities with varied governance structures. The study sampled 443 academic staff from the University of Benin, Ambrose Alli University, and Edo State University Uzairue, using structured questionnaires. A total of 422 responses were found valid and analyzed using descriptive statistics, Pearson correlation, and multiple regression analyses via SPSS version 26.0. The findings revealed that both **psychological distance** and **social distance** have statistically significant **negative effects** on decision-making behavior, indicating that cognitive and relational disconnection undermine active participation in institutional governance. In contrast, **organizational culture** was found to have a **significant positive effect**, suggesting that inclusive, transparent, and supportive institutional environments enhance faculty engagement in decision-making. The findings showed the critical role of psychological engagement and cultural alignment in enhancing effective governance in higher education. The study recommends the implementation of emotionally intelligent leadership strategies and the reinforcement of institutional cultures that promote transparency, inclusion, and faculty engagement.*

Keywords: *Emotional Distance, Psychological Distance, Social Distance, Organizational Culture and Decision-Making.*

Introduction

Decision-making in academic environments is increasingly recognized as a complex, multifactorial process shaped not only by cognitive and structural elements but also by emotional and relational dynamics. One emerging variable gaining scholarly attention is emotional distance, which refers to the affective detachment or lack of emotional resonance between individuals and their institutional environments (Ahmed, 2021). This concept can be further disaggregated into two key subcomponents: psychological distance the perceived cognitive separation between an individual and institutional objectives, decisions, or leadership and social distance the perceived gap in interpersonal connection, status, or familiarity among stakeholders within the academic setting.

In Nigerian universities, decision-making processes remain predominantly hierarchical, bureaucratic, and often opaque, which fosters conditions under which both psychological and social distance may widen (Uche, Bamidele & Ene 2022). For instance, psychological distance may arise when academic staff feel disconnected from institutional goals due to unclear communication, exclusion from key decisions, or lack of alignment between personal and organizational values. Simultaneously, social distance is often reinforced through rigid administrative structures, rank-based status barriers, and limited cross-level collaboration, all of which reduce interpersonal trust and engagement (Abomeh, 2012; Okon, 2023).

This emotional detachment manifesting through these two subdimensions can significantly impact how decisions are framed, interpreted, and enacted. Adeola (2023) posits that such detachment diminishes collegial collaboration, restricts faculty participation in governance, and fosters apathy toward institutional decision outcomes. Structural challenges, such as chronic underfunding, excessive workloads, unclear promotion pathways, and leadership instability, further amplify emotional, psychological, and social disconnection between academic staff and decision-making bodies (Ogundipe, 2021; Ezenwa, 2024).

Recent studies have underscored that unchecked emotional distance undermines both rational and participatory decision-making, leading to negative consequences such as poor morale, reduced innovation, and ineffective policy implementation in Nigerian higher education (Ibrahim, 2022; Nwachukwu, 2023). Psychological distance has been linked to faculty disengagement from long-term institutional planning, while social distance often correlates with mistrust, poor communication, and reluctance to challenge existing hierarchies all of which are detrimental to shared governance (Chukwuma, 2021; Musa, 2023).

Despite the growing relevance of emotional constructs in organizational behavior, empirical studies in Nigeria have rarely examined emotional distance and its psychological and social subdimensions as factors influencing decision-making in academia. This gap is particularly notable in specific contexts like Edo State, where universities are undergoing governance transitions and leadership reforms (Adewale, 2024). As Salami (2021) notes, integrating emotional and relational variables into the analysis of institutional governance is crucial for building emotionally intelligent leadership and inclusive decision-making cultures.

Although international literature has addressed emotional intelligence, trust, and affective engagement in decision-making (Meyers, 2022; Kimani, 2023), Nigerian research continues to focus heavily on administrative and structural variables, often overlooking the affective and relational underpinnings of academic engagement. This oversight neglects how psychological and social distance can silently suppress motivation, discourage constructive dissent, and inhibit academic staff from participating meaningfully in institutional decisions (Lawal, 2023).

Thus, this study fills a crucial gap by examining the relationship between emotional distance and decision-making among academic staff in selected universities in Edo State, Nigeria. Specifically, the study seeks to:

i. Examine the influence of psychological distance on decision-making among academic staff in selected universities in Edo State.

ii. influence of social distance on decision-making among academic staff in selected universities in Edo State.
iii. Investigate the relationship between organizational culture and emotional distance in shaping decision responsiveness among academic personnel.

Literature Review

Emotional Distance

Emotional distance in organizational settings refers to the psychological and affective gap between employees and their work environment, colleagues, or leadership. In higher education institutions, such distance manifests as detachment from administrative activities, minimal engagement in institutional decision-making, and an erosion of trust in management processes (Mamatkulova, 2025). This phenomenon is increasingly reported in academic contexts due to stress, lack of autonomy, and emotional burnout among university staff (Ahmadi & Mayvan, 2025). Paez-Manjarrez et al. (2025) observed that emotional distance correlates negatively with institutional loyalty and decision-making participation. When academic staff feel emotionally distanced, they are more likely to exhibit withdrawal behaviors such as reduced communication, resistance to change, and disinterest in governance-related matters. These behaviors undermine collegiality and academic freedom two cornerstones of university effectiveness.

Emotional detachment also hinders collaborative environments and creates silos, where academic units operate independently without shared strategic vision (Vega Galván, Carrillo Maza & Paez-Manjarrez, 2025). Moreover, emotional distance is often rooted in perceptions of exclusion, unclear communication, and repeated experiences of marginalization, all of which diminish the faculty's sense of belonging and influence institutional inertia (Koller & Pahl, 2025). Lumba et al. (2025) emphasized that unresolved interpersonal conflict, distrust in leadership, and lack of role clarity further deepen emotional disconnection. Consequently, the ability of academic staff to contribute constructively to decision processes is compromised.

Psychological Distance

Psychological distance in organizational settings refers to the perceived mental or cognitive separation between individuals and the issues, goals, or decisions they are expected to engage with. In university environments, this form of distance can manifest when academic staff view institutional decisions as irrelevant, disconnected from their personal values, or beyond their sphere of influence. According to Yusuf and Akintola (2025), psychological distance is often fostered by top-down governance, lack of transparency, and minimal inclusion in strategic dialogues. Staff experiencing high psychological distance are less likely to feel ownership over institutional policies, leading to disengagement and passive compliance rather than active participation.

Recent studies have shown that psychological distance reduces the perceived urgency or importance of institutional matters, which in turn undermines critical thinking, timely responsiveness, and proactive behavior in decision-making (Sule & Ezebuiro, 2025). Faculty who feels psychologically detached may disregard strategic goals, resist performance-based reforms, and deprioritize institutional obligations. Additionally, Diala et al. (2025) argue that a lack of shared vision between staff and leadership widens this mental gap, resulting in diminished commitment to organizational objectives. Psychological distance may therefore contribute to

institutional stagnation, as it dampens initiative, innovation, and shared problem-solving capacity. Thus, it is hypothesized:

H_{01}: There is no significant relationship between psychological distance and decision-making among academic staff of selected universities in Edo State.

Social Distance

Social distance in the academic context refers to the perceived relational or hierarchical gap between individuals and others within the university system, particularly in terms of authority, access, familiarity, or social connectedness. This can occur between faculty and administrators, between junior and senior staff, or across departmental and institutional units. As noted by Okorie and Hassan (2025), high social distance often emerges from rigid hierarchies, status-based interactions, and limited interpersonal dialogue, all of which can inhibit open communication and trust. When social distance is pronounced, academic staff may feel alienated from leadership or excluded from influential networks, leading to lower morale and reluctance to engage in decision-making processes (Ogunbayo et al., 2025). This relational gap also reduces opportunities for informal mentorship, peer learning, and collaboration, further isolating individuals and weakening organizational cohesion. According to Nwoke & Idowu (2025), social distance fosters a climate where faculty hesitate to voice concerns, challenge policy decisions, or participate in governance, fearing reprisal or dismissal. The result is a culture of silence and compliance, rather than one of active involvement and collective leadership. Thus, it is hypothesized:

H_{02}: There is no significant relationship between social distance and decision-making among academic staff of selected universities in Edo State

Decision-Making in Academic Institutions

Decision-making in academic settings is shaped by institutional structure, leadership style, and the degree of inclusivity practiced by management (Sharma et al., 2025). While shared governance has traditionally underpinned university decision-making, bureaucratic encroachment and emotional disengagement have undermined its practice in many Nigerian institutions (Brodheim, 2025). Decision quality is significantly influenced by the emotional state of those participating. Emotional disengagement reduces cognitive clarity, suppresses dissent, and fosters an environment where decisions are made based on compliance rather than consensus (Lightfoot, Mander & Doehler, 2025). Faculty members who feel emotionally excluded often perceive decisions as externally imposed, thus showing low motivation to implement them (Mamatkulova, 2025).

Additionally, Dickson and Ifeoma (2024) noted that emotional withdrawal among faculty members often leads to missed opportunities for policy critique, innovation, and reform. The absence of affective commitment results in passive resistance, delayed implementation of policies, and reduced collective ownership of institutional goals. Engaging emotions constructively in decision-making is vital. Emotional intelligence among leaders has been found to bridge the gap caused by emotional distance, facilitating empathetic dialogue and participatory leadership (Sharma & Sharma, 2025). Hence, a strong emotional connection to the institution enhances commitment, transparency, and efficiency in decision-making.

Organizational Culture and Emotional Distance

Organizational culture provides the context in which emotional distance either flourishes or dissipates. Cultures that reward openness, collaboration, and psychological safety foster emotional closeness and improve staff morale (Parvin, 2025). Conversely, when cultures are rigid, non-transparent, or hierarchical, they increase staff alienation and emotional withdrawal. In higher education institutions, academic freedom, participatory structures, and recognition play key roles in reducing emotional distance. Mamatkulova (2025) highlighted that academic departments with inclusive leadership and regular feedback loops recorded significantly lower emotional detachment scores. On the contrary, institutions with opaque governance and inconsistent communication practices faced higher levels of disengagement (Gallo, 2025).

Moreover, Brodheim (2025) indicated that organizational routines such as excluding staff from strategic committees or failing to recognize scholarly achievements contribute to an institutional culture that promotes emotional detachment. The persistence of such routines over time erodes trust and increases faculty cynicism toward leadership. Cultural alignment between institutional values and individual expectations serves as a buffer against emotional distance. Institutions that communicate clear missions, honor academic voice, and offer avenues for grievance redressal are better positioned to cultivate affective ties with staff (Koller & Pahl, 2025). Thus, it is hypothesized:

H_{03}: There is no significant relationship between organizational culture and emotional distance among academic staff of selected universities in Edo State.

Theoretical Underpinning

This study is grounded in Affective Events Theory (AET) by Weiss and Cropanzano (1996), which posits that workplace experiences trigger emotional responses that influence attitudes and behaviors. AET suggests that events such as exclusion from decisions, biased evaluations, or recognition lapses are affective triggers that impact employee engagement, including their willingness to participate in institutional governance. In academic institutions, daily affective events positive or negative can accumulate to shape faculty emotional states. Consistent exposure to negative events such as autocratic leadership, ambiguous promotions, and minimal consultation increases emotional distance and results in passive or avoidant decision behaviors (Sharma et al., 2025). Mamatkulova (2025) found that emotionally satisfying academic environments where staff feel valued, consulted, and acknowledged tend to produce high levels of participatory decision-making. In contrast, emotionally toxic environments stifle creativity, promote distrust, and reduce institutional commitment. Affective Events Theory thus provides a comprehensive framework for understanding how emotional experiences within institutional structures shape decision-making behavior among academic staff. It bridges cognitive and emotional domains, showing how psychological states influence organizational engagement.

Methodology

This study adopted a **cross-sectional survey research design**, justified by the need to collect data from a specific population at a single point in time using structured questionnaires. Cross-sectional surveys are widely recognized for being time-efficient and cost-effective while providing reliable insights into perceptions and behavioral patterns within institutional environments (Babbie, 2021).

The target population comprised **academic staff in selected public universities in Edo State, Nigeria**, specifically from the **University of Benin**, **Ambrose Alli University**, and **Edo State University Uzairue**. The inclusion of these universities reflects a strategic representation of federal and state institutions in the state. These institutions are selected due to their diversity in governance structure, faculty size, and exposure to varying administrative practices that influence emotional climate and decision-making culture (Musa, 2023).

The total academic staff population across the three universities is **2,318**, based on the 2024 academic staff directories published by the respective schools. The sample size was determined using **Yamane's (1967) formula** at a **95% confidence level** and **5% margin of error**, which is suitable for finite populations.

$n = \frac{\mathrm{N}}{1+\mathrm{N}(e^2)}$

Where: n = sample size; N= population = 2318; e = level of significance = 0.05

$$n = \frac{\mathrm{N}}{1 + \mathrm{N}(e^2)} = \frac{2318}{1 + 2318(0.05^2)} = 341$$

To account for possible non-responses or incomplete questionnaires, **30% was added** following Glenn (2012), yielding a final sample size of **443 respondents**.

A **multistage sampling technique** was employed. First, **stratified sampling** was used to divide the population based on university affiliation. Proportional allocation was conducted using **Kumer's (1976)** formula as cited in Ohiorenoya (2013), which ensures fair distribution relative to faculty size. Subsequently, **convenience sampling** was used to select academic staff within each university who were available and willing to participate. Convenience sampling enabled quick access and efficient distribution of questionnaires within departmental meetings and staff rooms. The final sample of 446 academic staff was proportionally distributed across the three selected universities in Edo State, based on the relative size of their academic populations. Specifically, **184 respondents** were drawn from the **University of Benin**, reflecting its status as the largest and most populated institution among the three. **Ambrose Alli University** contributed **147 respondents**, while **Edo State University Uzairue**, being the smallest in faculty size, accounted for **115 respondents**. This stratified allocation ensured fair representation and enhanced the generalizability of the study's findings across public universities in the state.

The study utilized a **structured, self-administered questionnaire** designed to measure the constructs of emotional distance and decision-making behavior among academic staff. The questionnaire consisted of three sections: Section A: Demographics (e.g., age, academic rank, years of service), Section B: Emotional Distance Scale and Section C: Decision-Making Patterns Scale. The **Emotional Distance Scale** was adapted from the **Organizational Disengagement Inventory (Brown & Leigh, 1996; modified by Vega Galván et al., 2025)**, capturing cognitive and emotional detachment at work. The **Decision-Making Patterns Scale** was adapted from **Mamatkulova (2025)** and **Koller & Pahl (2025)**, measuring levels of participatory behavior, autonomy, and institutional trust. Items were rated on a **5-point Likert scale** ranging from 1 (Strongly Disagree) to 5 (Strongly Agree).

To ensure **content validity**, the instrument was reviewed by three senior academic experts in organizational behavior and psychology. A **pilot test** was conducted with 25 academic staff from

a university outside Edo State. Based on the pilot, the **Cronbach's alpha reliability coefficients** were: Emotional Distance Scale: $\alpha = 0.86$, , Decision-Making Patterns Scale: $\alpha = 0.82$, These values indicate high internal consistency (Nunnally & Bernstein, 1994).

The data collected for this study were analyzed using the **Statistical Package for the Social Sciences (SPSS), version 26.0**. A range of statistical techniques was employed to ensure comprehensive examination of the research variables. First, **descriptive statistics** were used to summarize the demographic characteristics of respondents. Following this, **correlation analysis** was conducted to examine the potential for multicollinearity and to identify the nature and strength of linear relationships among the key variables. To test the research hypotheses and assess the predictive influence of emotional distance and organizational culture on decision-making behavior, **multiple regression analysis** was applied. All statistical tests were conducted at a **5% level of significance ($p < 0.05$)** to determine the validity of the findings.

Results and Discussions

Out of the **443** copies of questionnaire administered, **422** were found valid and usable, resulting in an **overall response rate of 95.3%.** The response rates for the different universities are: **University of Benin (95.3%), Ambrose Alli University (95.3%)**, and **Edo State University Uzairue (95.2%)**. This high retrieval rate reinforces the reliability of the data and ensures representative coverage across the three institutions selected for the study.

Description of Respondents' Demographic Attributes

This section presents a summary of questionnaire administration and the attributes of academic staff respondents. These include sex, age, academic rank, and years of service. The results are detailed in Table 1:

Table 1: Respondents Demographic Information

Demographics	**Category**	**Frequency**	**Percentage (%)**
Sex	Male	204	48.3
	Female	218	51.7
	Total	**422**	**100.0**
Age	30 and Below	36	8.5
	31 – 40	167	39.6
	41 – 50	136	32.2
	Above 50	83	19.7
	Total	**422**	**100.0**
Academic Rank	Graduate Assistant	39	9.2
	Lecturer II	87	20.6
	Lecturer I	150	35.5
	Senior Lecturer and Above	146	34.6
	Total	**422**	**100.0**
Years of Service	0 – 5 Years	99	23.5
	6 – 10 Years	163	38.6
	11 – 15 Years	88	20.9
	16 Years and Above	72	17.1

	Total	**422**	**100.0**

Table 1 shows that 204 of the respondents are male, accounting for 48.3% of the sample, while 218 are female, representing 51.7%. This indicates a slight female majority among the academic staff. Most respondents (167, 39.6%) fall within the 31–40 years age group, followed by those aged 41–50 years (136, 32.2%). Respondents above 50 years constitute 19.7%, while those aged 30 and below make up 8.5%. Regarding academic rank, 150 respondents (35.5%) are Lecturer I, 146 (34.6%) are Senior Lecturers and above, 87 (20.6%) are Lecturer II, and 39 (9.2%) are Graduate Assistants. The distribution shows a predominance of mid- to senior-level academic staff. In terms of years of service, the highest proportion (163, 38.6%) have worked for 6–10 years, 99 (23.5%) for 0–5 years, 88 (20.9%) for 11–15 years, and 72 (17.1%) have served for over 16 years.

Table 2: Pearson Correlation

Variable	**DMB**	**PD**	**SD**	**OC**
Decision-Making Behavior (DMB)	1	-0.374	-0.356	0.437
Psychological Distance (PD)	-0.374	1	0.518	-0.342
Social Distance (SD)	-0.356	0.518	1	-0.329
Organizational Culture (OC)	0.437	-0.342	-0.329	1

Table 2 presents the Pearson correlation matrix for the key study variables. Decision-Making Behavior (DMB) is negatively correlated with both Psychological Distance (PD) (r = -0.374) and Social Distance (SD) (r = -0.356), suggesting that greater mental or relational detachment from institutional processes is associated with poorer decision-making among academic staff. Conversely, DMB shows a positive correlation with Organizational Culture (OC) (r = 0.437), indicating that stronger and more cohesive organizational environments support more effective decision-making. The correlation between PD and SD is moderately positive (r = 0.518), implying that individuals who feel mentally disconnected from institutional objectives are also likely to feel socially distant from colleagues or leadership. Both PD and SD are negatively correlated with OC (r = -0.342 and r = -0.329, respectively), reinforcing the view that healthier organizational cultures are linked to lower emotional detachment in both cognitive and relational terms.

Table 3: Model Estimation

Independent Variable	**Unstandardized Coefficients**		**Standardized Coefficients**	**t**	**Sig.**	**Collinearity Statistics**		**Outcomes of Hypotheses Testing**
	B	**Std. Error**	**Beta**			**Tolerance**	**VIF**	
(Constant)	2.032	0.168	–	12.10	0.000	–	-	-
Psychological Distance (PD)	-0.163	0.045	-0.189	-3.62	0.000	0.721	1.486	Reject H01

Social Distance (SD)	-0.141	0.046	-0.167	-3.07	0.002	0.715	1.486	Reject H02
Organizational Culture (OC)	0.258	0.050	0.292	5.16	0.000	0.738	1.486	Reject H03
R^2 = 0.298; Adj R^2 = 0.287; F-Statistic = 34.910 F-Statistic (Prob) = 0.000; Durbin-Watson = 2.609; Number of Observation = 422 Dependent Variable = DMB								

Table 3 presents the regression model estimating the effects of **Psychological Distance (PD)**, **Social Distance (SD)**, and **Organizational Culture (OC)** on **Decision-Making Behavior (DMB)** among academic staff in universities in Edo State. **Psychological Distance (β = -0.189, p < 0.05)** and **Social Distance (β = -0.167, p < 0.05)** both exhibit statistically significant negative relationships with decision-making behavior. This implies that reductions in mental disengagement and relational separation are associated with more active and constructive decision-making by academic staff. **Organizational Culture (β = 0.292, p < 0.05)** shows a positive and significant relationship with decision making, indicating that stronger, more inclusive institutional cultures foster more participatory and effective decision-making.

The **coefficient of determination (R^2 = 0.312)** reveals that the three independent variables collectively explain **31.2% of the variance** in decision-making behavior. The **F-statistic (37.180, p = 0.000)** confirms that the overall model is statistically significant. All **tolerance values** exceed 0.70 and **VIF values** are below 2, indicating that **multicollinearity is not a concern**. The **Durbin-Watson statistic (2.614)** suggests no evidence of autocorrelation, confirming that the model assumptions are met. Based on this analysis, **all three null hypotheses (H01, H02, H03) are rejected**, confirming that **psychological distance**, **social distance**, and **organizational culture** each has a significant impact on the decision-making behavior of academic staff.

Discussion of Findings

The findings of this study yield three key insights into the dynamics influencing decision-making behavior among academic staff in selected universities in Edo State. The study established that psychological distance has a negative and statistically significant influence on decision-making behavior (β = -0.189, p < 0.05). This indicates that academic staff who experience cognitive detachment from institutional goals, leadership decisions, or organizational direction are less likely to engage in participatory and effective decision-making. This supports Ibrahim (2022), who noted that emotional and cognitive withdrawal from institutional life weakens collegial engagement, erodes trust in leadership, and diminishes responsiveness to institutional needs. Psychological distance often manifests when faculty perceive misalignment between their personal values and the university's direction, or when they feel excluded from the formulation of strategic priorities.

According to Nwachukwu (2023), such detachment contributes to low morale and weak institutional cohesion, often resulting in a superficial compliance with institutional mandates while suppressing genuine engagement. Chukwuma (2021) argued that psychological withdrawal creates a form of decision-making inertia, where academic staff disengage from leadership roles, avoid collaborative governance, and resist innovation. Furthermore, Lawal (2023) emphasized that this

form of mental distancing may arise from perceptions of injustice, exclusion, or unaddressed grievances, which in turn suppress constructive feedback, hinder dissent, and weaken participatory decision-making frameworks. These findings validate the rejection of Hypothesis H01 and highlight the critical role of psychological connectedness in fostering effective academic governance.

Secondly, the results reveal that social distance also exerts a negative and statistically significant influence on decision-making behavior among academic staff ($\beta = -0.167$, $p < 0.05$). Social distance, defined as the perceived interpersonal and hierarchical gap between individuals within the university system, contributes to alienation, mistrust, and communication breakdowns. As noted by Ogunbayo et al. (2025), such relational disconnection often results from rigid administrative hierarchies, poor feedback channels, or status-driven exclusions. Faculty members who feel socially distanced from decision-makers are less likely to express their opinions, contribute to institutional discourse, or invest in shared governance.

Supporting this, Okorie and Hassan (2025) highlighted that limited relational closeness between faculty and leadership fosters passive compliance, reduced collaboration, and a fear of reprisal for dissenting views. Nwoke and Idowu (2025) further observed that social distancing discourages open dialogue and reinforces a culture of silence, both of which are detrimental to innovation and institutional agility. These findings justify the rejection of Hypothesis H02 and affirm that minimizing relational gaps is essential to enhancing faculty involvement in meaningful decision-making processes.

Thirdly, the study confirms that organizational culture significantly and positively predicts decision-making behavior ($\beta = 0.292$, $p < 0.05$). This underscores the critical role of institutional norms, values, and leadership practices in shaping how academic staff engage with governance structures. As Salami (2021) argued, a cohesive and transparent organizational culture built on trust, respect, and inclusiveness creates a conducive environment for participatory decision-making. When academic staff perceive that leadership is consistent, communication is open, and their voices are valued, they are more inclined to participate in collaborative planning and policy development.

Musa (2023) similarly emphasized that strong institutional cultures foster a sense of belonging, psychological safety, and collective ownership of decisions. These cultural elements promote institutional loyalty, empower staff, and align faculty interests with organizational goals. In such environments, resistance to change diminishes, innovation is encouraged, and decisions are more reflective of diverse perspectives. This validates the rejection of Hypothesis H03 and confirms that organizational culture serves as a foundational enabler of effective governance in higher education institutions.

Conclusion and Recommendations

Academic institutions in Nigeria are increasingly recognizing the importance of emotional and psychological factors in shaping institutional effectiveness, governance outcomes, and faculty engagement. Yet, emotional dimensions such as emotional distance are often overlooked in decision-making frameworks. This study investigated the influence of emotional distance and organizational culture on decision-making behavior among academic staff in selected universities

in Edo State. The findings provide compelling evidence that both psychological and social dimensions of emotional distance significantly and negatively impact how academic staff engage in institutional decision-making. Specifically, faculty members who experience cognitive disconnection from institutional goals or feel socially alienated from leadership structures are less likely to participate actively or meaningfully in governance processes. These forms of detachment contribute to institutional inertia, reduced collaboration, and weakened innovation.

Conversely, organizational culture was found to positively and significantly predict decision-making behavior. A supportive, inclusive, and transparent institutional culture fosters a sense of belonging, psychological safety, and ownership among academic staff, thereby encouraging active involvement in governance, policy formulation, and administrative decision-making. These results underscore the importance of cultivating both emotional connectedness and institutional trust to enhance participatory governance in Nigerian higher education. Strengthening institutional culture and addressing the relational and psychological disconnections between academic staff and university leadership are essential for improving the quality and effectiveness of decision-making in Nigerian universities.

Based on the findings of this study, the following recommendations are proposed:

i. University management should implement policies that actively engage academic staff in strategic planning and institutional decision-making. Regular consultations, transparent communication, and open-door policies can help reduce psychological distance and build a sense of alignment with institutional goals.
ii. Institutions should create platforms that promote informal interactions and collaboration between faculty and administrators. Initiatives such as joint retreats, mentorship programs, cross-departmental projects, and peer-learning forums can help bridge relational gaps and foster collegiality.
iii. Leadership development programs focused on emotional intelligence, participatory management, and servant leadership should be introduced for university administrators. A leadership style grounded in empathy, openness, and mutual respect will cultivate a more inclusive and responsive institutional culture.

Digital Transformation Strategies and Organizational Performance of the Banking Sector in Nigeria

Lucy Horace Owonte PhD.
(MNIMN, FABSE, MTAMN, MAMAP, MCIFIAN)
Department of Marketing Port Harcourt Polytechnic, Rumuola Port Harcourt
e-mail: lucyowonte@gmail.com Phone No., 08037078861

Abstract
The purpose of this study was to empirically determine the extent to which digital transformation strategy relates to organizational performance of quoted money deposit banks in Nigeria. The Nomotheic Methodology was adopted on forty four quoted money deposit banks in Port Harcourt. Two hundred and Twenty respondents/customers were used for the analysis. The postulated hypotheses were tested using Spearman's Rank Order Correlation Coefficient Statistical Tool. The study revealed that a significant relationship exists between mobile banking, online banking digital payments and organizational performance (revenue growth, competitive advantage and customer (satisfaction). Also, that amongst the dimensions of digital transformation that online banking impacts more significantly on organizational performance. The study concludes that there is a statistically significant and positive relationship between digital transformation and organizational performance of banks in Nigeria. Based on the conclusion, the researcher recommends that banks should prioritize the development and enhancement of digital transformation to significantly improve their organizational performance. Also, the management of money deposit banks should strategically expand and optimize their mobile banking, online banking and digital payment strategies to significantly enhance their competitive advantage, improve customer satisfaction and profitability.

Keywords: *Digital Transformation, Organizational Performance, Mobile banking, Online banking, Digital Payment, Banking Sector.*

Introduction

In this era of rapidly evolving digital landscape, customer expectations are also evolving, driven by the seamless experiences provided by digital native companies such as Amazon, Uber and Google. The customers in this digital age expect convenience, personalization, and real-time interactions across all digital and physical touch points, as a result, businesses are under pressure to adapt their strategies and expectations (Wegu, 2024). Digital transformation is a strategic imperative for organizations seeking to thrive in the current digital economy. By leveraging technological advancements and adapting to changing customer expectations, organizations can drive innovation, improve operational efficiency and deliver exceptional experience to customers.

Banking is one of the industries that serve as the focal point of community economics through various services it offers. To keep pace with the current development, transitioning to digital era is necessary to enhance efficiency in service delivery and utilization (Pratiningsih and Wardhani,

2025). The rapid development of digital technology through the years, and the rails provided by the internet for connectivity remains the most important development that has impacted change and driven massive improvement in the operation of banking and financial services. It has brought in its wake huge disruptions in product roll-out and the way products are delivered. The entry of technology companies into financial services cannot be overlooked in discussing these changes. Nigeria has not been left behind in this evolution. Instead, the Nigerian banking industry has been the forerunner in digital initiatives in Africa. This have transformed the banking services landscape in the past years (Samuel-Ogbu, 2022).

Digital transformation is an influential trend reshaping various industries globally because of its importance in service delivery. The integration of digital technologies such as mobile banking, internet banking, Bank Verification Number (BVN), block chain and artificial intelligence (AI) is significantly altering how banks operate and deliver services. The shift is driven by the need to enhance customer experiences, optimize operational efficiencies, remain afloat and competitive in the ever-dynamic business world. This rapid shift has led to the rise of a fifth stage described as industry 5.0. the emergence of this fifth industrial revolution has further aided digital transformation in the global economy (Pratininsih and Wardhani, 2025). Evidence shows that digital transformation in the banking sector has accelerated the use of digital technologies across all spheres of human endeavours in banking, this transformation has changed how banks interact with customers, accelerated innovation and the launch of new banking products. It has enabled significant internal banking process automation, leveraging new technologies, facilitated data-driven sales, improved customer experience, and enhanced flexibility in the provision of banking services (Frank et al, 2019). This integration helps to transform business operation with state-of-the-art digital technologies that enhances the performance of the banking sector.

Digital transformation helps banks to strengthen cybersecurity measure by adopting advance data encryption and fraud defection techniques, which streamline compliance process with regulations like Open Banking. It also helps to improve operational efficiency through automation and streamlined automation and streamlined workflows and by so doing, cost is reduced, thereby enhancing efficiency. Banks may invest these savings in further innovation and customer-centric initiatives as to achieve sustainable performance and competitive advantages (Porter, 2025). Customers expect a consistence and seamless experience across all touchpoints, whether it is a mobile app, POS banking, online banking platforms, or physical branch visit. Digital transformation fosters this by integrating all channels and ensuring unified experience that enhances firms' performance, create new or modify existing business processes, culture and customer experience that meet up with changing market requirements. Digital transformation is a very critical aspect of business in the digital age, and transcends traditional roles like sales, marketing and customer services (Xiao, 2022).

The key impact of digital transformation in Nigerian banks have been the migration of customers to the digital channels without extensive marketing investments and a significant upsurge in customer initiated electronic transactions, enabling customers to access financial services physical and online at their convenience. Another key area for digital transformation is information access and reconciliation. Banks in Nigeria have embedded data analytics and robust reporting capabilities to their platforms. At a transactional level, payment insights provides payment status update via a visual tracker, making payment tracking as simple as tracking a package, through the

power of SWIFT GPI and Big Data. The solution applies to multiple payment methods such as Cross Border transfers, Automated Clearing House (ACH) and instant payments. Also, customer onboarding and trade is beginning to experience transformative effect of digital technology. Digital onboarding facilitates quicker onboarding by allowing electronic document uploads. This same technology is changing how customer interacts with banks for trade transaction initiation (Samuel-Ogbu, 2025).

Statement of the Problem

The banking sector in Nigeria has experienced profound revolution fueled by digital transformation in the rapidly evolving business landscape of the 21st century. This revolutionary journey, characterize by the incorporation of cutting-edge technological advancement and strategic changes intended to increase operational effectiveness, improve customer engagement and maintain competitiveness in a rapidly changing financial landscape. As the environment changes, so does consumer preferences. Customer satisfaction is a key trend in measuring how well banks are meeting or exceeding customers' expectations. Demand and expectations continue to evolve, often fueled by experiences outside financial services, and consumers are increasingly developing relationships with multiple service providers. When customers' expectations are met, their satisfaction increases and this is a key part in increasing loyalty in the customer base and enhance profitability. For there to be organizational performance, there must be customer satisfaction first. Without customer satisfaction, the consumers will want to look elsewhere.

Customers can become dissatisfied, as a result they may share their experience with others either through word of mouth or leaving negative reviews online thereby leading to poor patronage, brand disloyalty, it becomes important for banks to address customers' dissatisfaction promptly and effectively as it can impact customer loyalty, retention and overall business success. It is against this backdrop that this study is carried out to determine the digital transformation strategies that will enable the banking sector to satisfy their customers efficiently and effectively, make profit and remain competitive and relevant in the changing business landscape.

Objective of the Study

The broad objective of this study is to determine the relationship between digital transformation and organizational performance of the banking sector in Nigeria. The specific objectives are to:

i. examine the effect of mobile banking on revenue growth in the banking sector of Nigeria
ii. ascertain the impact of online banking on the competitive advantage of the banking sector of Nigeria
iii. determine the influence of digital payments on customer satisfaction in the banking sector of Nigeria

Research Hypotheses

Based on the objective of the study, the following hypotheses were formulated and tested in the course of the study

H_{o1}: There is no significant effect of mobile banking on revenue growth of the banking sector of Nigeria.

H_{o2}: There is no significant impact of online banking on the competitive advantage of the banking sector of Nigeria.

H_{o3}: There is no significant influence of digital payments on customer satisfaction of the banking sector of Nigeria.

Review of Related Literature

Digital Transformation Strategy

Digital transformation is a comprehensive process that involves the integration of digital technologies into all aspects of an organization's operational culture, and business models to fundamentally change how it operates and delivers values to customers (Westerman et al, 2014). It goes beyond simply adopting new technologies, instead, it requires a strategic and holistic approach to leverage digital tools to improve efficiency, innovation and customer experiences.

Digital transformation is the strategy of reimagining traditional processes and embracing digital solutions to drive organizational growth and competitiveness. This may include digitizing manual processes, implementing data-driven decision-making, adopting cloud computing and artificial intelligence (AI), and enhancing digital channels for customer engagement (Teece, 2018).

The Nigerian banking sector has experienced a profound revolution fueled by digital transformation in the quickly changing environment of the 21st century. This revolutionary journey, characterized by the incorporation of cutting-edge technologies, has significantly impacted the overall economy and changed how financial institutions operate. In the banking sector, digital transformation refers to a broad range of technological advancements and strategic changes intended to increase operational effectiveness in a rapidly changing financial landscape. Digital transformation in banking is about incorporating digital technologies into every facet of banking operations, from back-office to customer services. (Lottu et al, 2023). It is the use of technology to transform business models and create new opportunities to increase revenue and generate value.

Digital transformation in the banking sector encompasses various technological innovations and strategic shifts to improve operational efficiency, enhance customer engagement, and remain competitive in a rapidly evolving financial landscape (Rita and Lee, 2022). It involves the integration of digital technologies into all accepts of banking operations, from customer service to back-office functions. The key components are mobile banking apps, online banking, digital payments, blockchain, and cryptocurrencies. Several driving forces have propelled digital transformation within the banking sector. Some of these are that customer demand, seamless, convenient, and personalized banking experiences.

Mobile Banking Strategy

Mobile banking refers to the use of a mobile device, such as smartphone or tablet, to access and manage one's banking accounts and conduct various financial transactions. Mobile banking is a service that allows customers to access their bank accounts and perform various banking tasks, such as transferring money, checking account balances, and paying bills, using a mobile device, such as a smart phone or tablet (Paytm, 2025).

Mobile banking services are artifacts that provide funds transfer enable inquiries, bills payments through phone device, and account management (Korir, et al, 2024). Banking services include fund transfers, checking account balances and transaction histories, bills payments, managing

investments portfolios, trading stocks, obtaining stock quotes and using mobile devices to purchase insurance. (Durkin et al, 2013). Mobile banking became increasingly popular due to covid-19 pandemic's profound impact on the financial sector. Customers loyalty to companies has increased due to the convenience of mobile banking. Technology has also helped banks save costs by simplifying processes and reducing the need for a widespread branch network for business transactions (AI- Sous et al, 2023).

Digital Payments

A digital payment is the electronic transfer of money between accounts, eliminating the need far physical cash or cheque. This includes methods like online banking transfers, credit/debit cards transactions, mobile wallets such as Apple pay, Google Pay, Opay, Okash, contactless payments and in-app purchases. Digital payments offer benefits such as convenience, speed, enhanced security, and cost efficiency for businesses and customers. Digital payments can be made anytime, anywhere, without the need for physical cash, transactions are often instant or occur very quickly it reduces costs associated with handling cash and streamlines accounting for business; it provides a clear digital recurred of transactions for easier tracking and management and makes payments safer than carrying cash, (Discover Bank, 2022).

Billions of dollars in cash payments are made daily in emerging and developing countries, including wages, social transfers, humanitarian relief, and payments to suppliers and farmers. Shifting these payments from cash to digital has the potential to improve the lives of low income earners, particularly women. It also means that governments, companies, and international organizations can bank and receive payments in a cheaper, safer, and more transparent way, helping to build economics that are inclusive (Investopedia, 2025).

Online Banking Strategy

Online banking is an electronics innovation in the banking sector that uses mobile network and mobile technology communication to achieve connected mobile phones and other mobile devices to conduct financial transactions. It is the use of the internet to perform financial transactions and manage bank accounts through a bank's website or mobile app, eliminating the needs to visit physical branch online banking allows customers to perform activities such as checking balances, transferring money, paying bills, and even depositing checks remotely. This service provides 24/7 access from anywhere with an internet communication, though it has potential security risks like phishing attacks (Investopedia, 2025).

Online banking is a method of banking in which transactions are conducted electronically owe the internet. It is also defined as internet banking, virtual banking, web banking or home banking. It is a system that enables customers of a bank to conduct a range of financial transactions through the financial institution's website or mobile app (Wikipedia, 2025).

Businesses in Nigeria have been greatly improved by the use of online banking services and this can be attributed to high tech innovativeness that is vested in the competitive environment. Online banking services experienced massive development and unprecedented growth during the past years, and it is emerging to be a primary catalyst for economic and social growth (Islam, 2018).

Banking Sector Performances

Banking sector performance is the success of a bank's achievement during a specific time period, including the collection and distribution of funds, as determined by capital sufficiency, liquidity, solvency, efficiency, leverage and profitability (Didin and Mohamad, 2022). Banking sector performance generally implies whether a bank has fared well within a trading period to realize its objectives. The only document that explains this is presumably the published financial statements. Rose, (2011), posit that a fair evaluation of any bank's performance should start by evaluating whether it has been able to achieve the objectives set by management and stock holders. Many banks certainly have their unique objectives, some may wish to grow faster and achieve some long-term growth objective, and others may seem to prefer quiet life, minimizing risks and conveying the image of a sound bank, but with modest reward to their shareholders (Salehi and Alipour, 2014).

Kento, (2022) opined that financial performance is the ability of a company to manage and allocate its own resources, that it is a subjective indicator of how effectively a company can employ resources from its main line of business to generate income. It is significant because it informs investors about a company's overall health in terms of its economic well-being and the work its management is performing by giving them insight into the future to help them make sound financial decisions. Kelechi et al, (2022), assert that financial statements are used by investors to assess a company's financial performance as is revealed by the balance sheet, income statement and cash flow statement. Key performance indicators, also known as financial performance indicators, are quantitative criteria used to assess a bank's financial health (KPIs).

Revenue Growth

Digitalizing banking services has unlocked new revenue streams and business models for banks. Digital lending platforms have emerged, providing customers with quicken and more accessible financing options. Investment services have been made more readily available through digital channels. Banks also partner with fintech startups to offer innovative financial products expanding their service portfolios and attracting new customer segments (Falchetta et al, 2022).

Digital transformation affects bank's profitability in terms of cost and revenue. In terms of cost, digital transformation can reduce operations costs of banks, thereby improving the revenue base. Firstly, banks set up mobile banking, online banking and other digital platforms to provide customers with all-weather payments and settlement services reducing costs and improving efficiency. Secondly, banks introduced big data, cloud computing and artificial intelligence into credit business, thus easing the information asymmetry between banks and enterprises and reducing the cost of credit business (Huang et al, 2020)/. Thirdly, banks apply digital technology to internal office, realizing efficient communication and circulation, and reducing internal office costs.

Competitive Advantage

Competitive advantage is a company's ability to provide greater value to its customers that the competitors; or to operate more efficiently, leading to superior sales and profit margins. This advantage stems from unique features, resources, or strategies that are difficult for competitors to imitate, such as strong branding, superior customer service, innovation technology, or a low-cost structure. To be effective, a competitive advantage must be valuable, rare inimitable (hard to copy),

and organized to capture value. According to Owonte, (2025) competitive advantage enables a company to perform better than its competitors. It is the factors that allow a company to produce products or services better or for less expense than the competition, which may generate mere sales or higher profit margins. To be successful, a company's competitive advantage must generate value for its stakeholders and be difficult to reproduces. (Owonte, 2025).

Customer Satisfaction

Customers today have grown accustomed to seamless, convenient, and personalized digital experiences in various aspects of their lives. They now expect the same level of convenience and accessibility from their banks. This shift in customer expectations is a potent force compelling banks towards a digitally driven future by adopting digital technologies to meet three demands (Lee and Lee, 2020).

The customers and other stakeholders' satisfactory perception in corporate image of an organization with high percentage of confidentiality is a deep signal of high strategic operational performance. Operational performance is deeply affected and determined by environment contexts, however, strategic thinkers and effective business managers need to be mindful of alignment and integration of corporate strategy changing business landscape in other to maintain profitable business growth and sustainable operational performance.

Conceptual Model

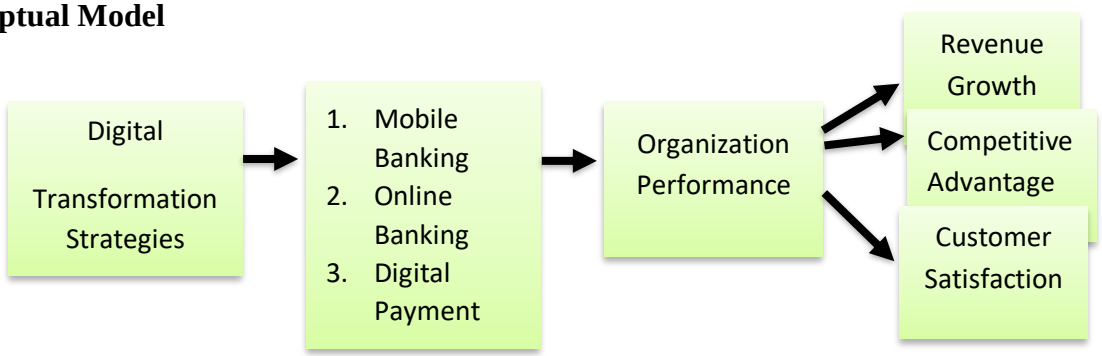

Fig. 1: Conceptual Model of Digital Transformation Strategies and Organisation Performance (Source: Conceptualized by the researcher's, 2025).

Technologies Driving Digital Transformation in the Banking Sector

The digital transformation trajectory in banking is fueled by various cutting edge technologies (Porter, 2025). They including;

Artificial Intelligence (AI): Artificial Intelligence (AI) is revolutionalizing the banking sector. AI=powered chatbots can answer customer queries 24/7, personalize financial recommendations, and automate repetitive tasks. AI can also be used for fraud detection, risk management, and algorithmic trading.

Internet of Things (IOT): Internet of things devices have the potential to revolutionalize how banks interact with their customers and manage physical assets. For example, sensors in ATMs can monitor performance and predict maintenance needs, while wearables can be used to secure mobile payments.

Cloud Computing: Cloud-based solutions offer scalability, security and flexibility. Banks can leverage the cloud to deploy new applications and foster, manage data efficiently, and scale their infrastructure to meet fluctuating customer demands.

Blockchain: Blockchain technology holds immense potential for secure and transparent financial transactions. It is a decentralized, temper-resistant digital ledger technology that records transactions across multiple computers in a secure and transparent manner. At this early stage of its adoption in the banking sector, blockchain technology can revolutionalize areas like cross-border payments, trade finance, and identity management.

Big Data and Analytics: By analyzing vast amount of customer data, banks can gain valuable insights into customer behavior, spending patterns, and financial products and services, predict market trends, and make data-driven decisions for optimized operations.

Theoretical Review

This study is specifically anchored on Technology Acceptance Model (TAM), Disruptive Innovation Theory (DIT), Digital Ecosystem Framework (DEF) and Digital Maturity Models.

Technology Acceptance Model (TAM)

This theory was developed by Fred in 1989. The model sheds light on how users take to and make use of new technologies (Davies, 1989). Technology Acceptance Model (TAM) perceives usefulness and ease of use are important factors in determining whether or not a technology is adopted. According to him, Technology Acceptance Model (TAM) aids organizations in comprehending how users of digital tools and systems view and utilize them. Organizations can adopt digital solutions by highlighting usefulness and improving visibility (Jacob et al, 2020).

Disruptive Innovation Theory (DIT)

Clayton Christensen's theory of disruptive innovation suggests that new technologies often starts as niche or low-end solution but can eventually disrupt established industries and markets (Christensen et al, 2018). Digital transformation often involves introducing disruptive technologies that challenge existing business models. This theory helps organizations recognize the potentials of disruptive technologies to reshape industries, driving them to adapt, and innovate to remain competitive (Ismail et al, 2017).

Digital Ecosystem Framework

The Digital Ecosystem Framework proposed by Annabelle Gawer and Michael A consumano in 2018, explores how digital platforms and ecosystem shape industries and markets. It emphasizes the role of platforms in enabling interactions between various actors, such as producers, consumers, and competitors. Organizations increasingly participate in and create ecosystems to drive innovation and value creation in the digital era.

Digital Maturity Models (DMM)

Digital Maturity Models (DMM) provide organizations with a structured framework to assess their readiness for digital transformation and track their progress. The most well-known model is digital transformation framework by Capgemini, which categorizes organizations into stages of maturity from beginners to digital masters (Bellantuono et al, 2021). These modls guide organizations in setting digital transformation goals and evaluating their capabilities.

Empirical Review

Recent literature indicates that different scholars have studied digital transformation and performance of banks in various countries of the world. Hence, a summary of a few of the study in this section:

Mangifera and Mawardi (2022) examined digital transformation and its impact on financial performance in the food and beverage small business sector in Indonesia. Quantitative research with a sample of 104 small business actors in the food and beverage sector who have adopted e-commerce and fintech in Sukakarte and its surroundingds with data analysis using Smart PLS 3.0 modeling. The results of the study indicated that there is a considerable impact from the availability of technology, and the adptive ability business actors in managing their business through a digital transformation during a pandemic.

Alathamneh and AI-hawary (2023) investigated the impact of digital on sustainable performance of Jordan. The research population consisted of employees of industrial companies listed in Amman stock exchange that is 23 companies. Due to the difficulty of collecting data using a complete census, a random sample of 530 employees was determined. 397 responses were used for the purpose of the statiscal analysis of the study. in order to find the impact of digital transformation on sustainable performance, the structural equation modeling (SEM) technique was used. Results showed that digital transformation dimensiojs had a positive impact on sustainable performance. Big data had the greatest impact.

Nwankwo (2022) examined impact of emerging digital technology on organizational performance; A Study of Fidelity Bank in Anambra State. The population of the study comprised of 200 staff selected from different location of Fidelity Bank in Anambra State. I83 copies of questionnaire were duly completed and returned showing 94.68% response rate. Research hypotheses were tested using ANOVA method which was carried out with the aid of Statistical Package for Social Science (SPSS) version 23. Findings from the study revealed that E-mail has significant impact on organizational performance of Fidelity bank in Anambra State. Internet technology has significant impact on organizational performance of Fidelity bank in Anambra State.

Research Methodology

The researcher adopted the positivity and ontological realism approach which manifest as evidence of objectivity and observable cause-effect quantifiable measures of variables that leads to confirmation and use of hypotheses and statistical inferences. This study is domicile in Rivers State because all the banks in Nigeria are housed there. There are 44 quoted deposit money banks in Nigeria as obtained from the Central Bank of Nigeria (CBN) statistics bulletin as at 26th April, 2024. The judgmental sampling technique was used in sampling 430 customers of the quoted banks. A total of 430 respondents were gotten across the state. The researcher mails out 430 copies of questionnaire to quoted banks in Rivers State. Out of the 430 copies of questionnaire mailed out, the data collection yielded 330 responses, 110 were not useful for analysis purpose, 220 were useful for the analysis at a response rate of 66.796. the response rate is satisfying since the researcher intention was to conduct between 200-300 respondents (Williams, 2003). Content and construct validity was ascertained through extensive review of literature and is well documented and through development and professional scrutiny of questionnaire scale. A Crombach's alpha test helped to determine the reliability of the study instrument. To measure Digital Transformation

Strategies (DTS), mobile banking, online banking and digital payments were adopted. Operational performance (OP) measure are revenue growth, competitive advantage and customer satisfaction. 5 point Likert Scale was used in a matrix format to elicit information from the customer. The analysis of empirical data which were collected through questionnaire administration is herein presented; and the reliability of measures used for the study.

Table 1: Crombach Alpha Results of Reliability Analysis of the variables of the Study

Variables	Crombach Alpha	No of Items
Mobile Banking	0.767	4
Online Banking	0.759	4
Digital Payments	0.765	5
Revenue Growth	0.753	4
Competitive Advantage	0.761	6
Customer Satisfaction	0.766	3

Source: Study Output SPSS Version

Six reliability tests were conducted in the study, one for each measure variable. The result is as specified in the table 1 above. It is showing that all the Crombach alpha is higher than .7, $\alpha \geq \alpha.7$, according to Hair et al, (2007). The acceptable number for α is $\geq \alpha.7$. this means that the scale considered is reliable and the results of the data are valid.

Hypotheses Testing

In order to determine the relationship between digital transformation strategies and operational performance, a correlation analysis was used. The study investigated how mobile banking is influenced by

The table below shows how the two variables correlate with one another.

Test of Hypothesis 1

H_{o1}: There is no significant effect between Mobile banking and revenue growth of the banking sector.

Table 2: Correlations Analysis showing the Relationship between Mobile Banking and Revenue Growth.

Correlations

Type	Variable	Statistic	Mobile Banking	Revenue Growth
spearman's rho	Mobile Banking	Correlations Coefficient	1,000	**0.4900****
		Sig (2 tailed)		.000
		N	220	220
	Revenue Growth	Coefficient Coefficient	0.490**	1.000
		Sig (2 tailed)	.000	

		N	220	220

** correlation is significant at 0.01 level (2- tailed).

The table above indicate how the two variables correlate with one another. The relationship between mobile banking and revenue growth have a positive correlation of 0.490(49%), its considered to be a fair relationship, meaning that the two variables actually have a fair relationship and that to a great extent explains the relationship stated in the hypothesis of the study. by this information mobile banking contributed 49% to operational performance of the banking sector.

Test of Hypothesis 2

H_{02}: There is no significant impact between online banking and competitive advantage of the banking sector.

Table 3: Correlation Analysis showing the Relationship between Online Banking and Competitive Advantage

Correlation

Type	**Variable**	**Statistic**	**Online Banking**	**Competitive Advantage**
Spearman's rho	Online Banking	Correlation Coefficient	1.000	0.663**
		Sig (2-tailed)		.000
		N	220	220
	Competitive Advantage	Correlation Coefficient	0.663**	1.000
		Sig (2-tailed)	.000	
		N	220	220

** Correlation is significant at the 0.01 level (2-tailed).

Table 3 above shows how the two variables correlate with each other. The relationship between online banking and competitive advantage has a positive correlation of 0.663 (66.3%), it is considered to be a moderate relationship, meaning that the two variables actually have a moderate relation and that to a great extent explains that there is relationship between online banking and competitive advantage. by this result, online banking contributed 66.3% to operational performance of the banking sector.

Test of Hypothesis 3

H_{03}: There is no significant influence between Digital payments and customers satisfaction of the banking sector.

Table 4: Correlation Analysis showing the Relationship between Digital Payments and Customer Satisfaction.

Correlation

Type	Variable	Statistic	Digital Payments	Customer Satisfaction
spearman's rho	Digital Payments	Correlation Coefficient	1.000	0.584**
		Sig (2-tailed)		.000
		N	220	220
	Customer Satisfaction	Correlation Coefficient	0.584**	1.000
		Sig(2-tailed)	.000	
		N	220	220

** Correlation is significant at the 0.01 level (2-tailed).

Table 4 above shows how the two variables correlate with one another. The relationship between digital payments and customer satisfaction has positive correlation of 0.584(58.4%), it is considered to be a fair relation and that to a great extent explains the relationship between the two variable. By this information, digital payment contributed 58.4% to operational performance of the banking sector in Nigeria.

Discussion of Findings

Hypothesis one revealed that there is a statistically significant positive relationship between mobile banking and revenue growth of the banking sector. The correlation shows a satisfactory evidence. The result was showed to be 49%, this is fair relation though there are unexplained factors. This implies that commercial banks can significantly enhance revenue growth by investing in advanced mobile banking services, leading to increase profitability and business growth.

Hypothesis two analysis revealed a significant statically positive relationship between online banking and competitive advantage. The implication of this is that commercial banks can boost competitive advantage by leveraging online banking strategy to increase transaction efficiency, reduces costs, and drive revenue growth. This result shows 66.3% this is a strong relation, however there are still unexplained percentage. This finding agree with the results of Nwankwo (2022) in the study on impact of emerging digital technology on organizational performance: A study of Fidelity Bank in Anambra State.

Hypothesis three revealed that a statistically significant relationship exists between digital payments and customer satisfaction of commercial banks. The correlations analysis result of 58.4% is a clear indication of a fair relationship between the two variables. This implies that commercial banks can significantly enhance customer satisfaction by investing in advanced digital technologies, leading to increased loyalty, retention and positive word of mouth. This finding is in since with the study of Lee and Chen (2023) which post that, to satisfy customers needs in the 21st century, innovation, research and development has to be a vital part of organization strategies. This involves leveraging the emerging technology, methods, strategies and new ideas to increase customer satisfaction (Yongjie and Shanyue, 2023).

Conclusion

The study findings has shed light on the relationship between digital transformation strategies and operational performance within the banking sectors in Nigeria. Mobile banking, online banking and digital payments are all essential and necessary tool for banking transformation. Technological innovations and advancement can be a challenging task especially in today dynamic business landscape, meeting up with the ever changing business environment and customers' expectation and preferences may also be daunting however, businesses that choose to adopt and implement digital transformation strategies provide themselves with the opportunity to improve and keep their business afloat. This will enable them to increase their operational performance base, productivity and reap top benefits of implementing digital transformation strategies in their business. This means that embracing digital transformation strategies will significantly enhance bank's efficiency, productivity and competitiveness, leading to improved customer satisfaction, reduce complaints and operational costs, and increase business growth. The findings of this study emphasizes the imperative for the banking sector in Nigeria, to prioritize digital transformation strategies, invest in cutting edge technologies and innovative business models that will help them remain competitive and relevant in the rapidly evolving business world.

Recommendations

Based on the findings of this study, the following recommendations are made:

i. The banking sector should prioritize the development and enhancement of mobile banking services to significantly improve customer experience and satisfaction. This can be achieved by investing in user-friendly mobile apps, expanding mobile payment options, and providing real-time transaction updates to ensure seamless and secure banking experience.
ii. Banking management should strategically expand and optimize their online banking services to significantly enhance service quality and delivery. They should strengthen their efficiency of online banking service by improving the caliber of online banking services to boost online customer loyalty and enhance online customer satisfaction.
iii. Banks should educate their customers about digital payment services, ensuring that all population segments can benefit from these services. This includes user-friendly guides, workshops, and outreach programs.
iv. Management should prioritize investments in robust cybersecurity measures to protect customer data and financial transactions. Regular training and awareness programs can help employees and customers recognize and mitigate cyber threats.

Abstract
Climate change has direct impact on agricultural production in local communities where agriculture constitutes employment and income sources for the majority of the population. The study examined how indigenous knowledge can be effectively included into climate adaptation policy for farmers in Ebonyi State. The study adopted interview method. Six farmers two from each senatorial districts were selected using convenient sampling method. Data collected were analyzed and the research questions were answered using thematic analysis. The major factors constraining farmers from adapting to climate change were poverty; inadequate farmland and access to more efficient inputs, lack of information and poor skills. It was reported that the communities had undocumented knowledge of indigenous and local meteorologies which are based on observation and traditional practices and belief systems. The findings showed that the main adaptation practice used by the farmers in the state to adapt to climate change were relocation to the upper land during floods, mulching, mixed cropping, winter farming, and planting drought-resistant crops and usage of birds in weather forecast. The study concluded that the indigenous knowledge among the farmers in the communities of Ebonyi State could, to a large extent, be included in climate change mitigation and adaptation to ensure food security. The knowledge can help fill the gap by including it into the climate change policy and implementation of climate change initiatives. Therefore, it is recommended that inclusion of indigenous knowledge provides a robust approach to adapt to the changes in climate.

Keywords: *Policy, Climate change, indigenous knowledge, adaptation, mitigation*

Introduction

Climate change poses a significant threat to global agricultural systems, livelihoods, and overall resilience and African continents in particular. Therefore, integrating indigenous knowledge into climate change adaptation planning can help identify traditional practices and techniques that have been used for generations to cope with climate variability and change (Adeola, Evans, and Ngare, 2024). Available evidence suggests that there is an increasing effort to enable indigenous knowledge holders to participate directly in IPCC assessment reports (Adeola, Evans, and Ngare, 2024). Adaptation efforts have benefited from the inclusion of indigenous knowledge (PCC, 2019). Farmers' continuous preference for traditional over climate-smart practices is due to their inability to obtain credit, improved seeds, farm implements, and weather information services, among other climate-smart practices (Adeola, Evans, and Ngare, 2024; Zvobgo, *et al* 2023). It is on record that degree of perceptions of climatic risks and traditional values, beliefs, knowledge, and experiences; and level of access to improved farm services and practices, farming experience, and geographical location are other factors (Adeola, Evans, and Ngare, 2024; Zvobgo, *et al* 2023). The continuous use of Indigenous knowledge in responding to climate change stresses the need to understand the application and the factors underlying the usage, particularly among farmers.

Ghana and Nigeria, indicates that smallholder farmers employ a diverse range of traditional soil and water management practices, such as the preparation and application of organic manure and compost, ridges formation, crop rotation, and cover cropping, to adapt food crop production to climate change (Derbile, 2023). While Nigeria has several indigenous practices related to climate-resilient agriculture include, the observance of the flowering of coffee trees, leaf-sprouting as an indication of the onset of rains, and indigenous soil and water conservation techniques, crucial for sustaining livelihoods and enhancing ecosystem resilience against desertification, soil degradation, and water scarcity (Lawrence, Ibrahim and Ikpe, 2024; Ayorinde, Maaz and Sumit, 2022). Observations of Kerikede and edekekwukwu birds for season forecast. Practices such as agroforestry, intercropping of cereals, tubers, and legumes, diversification, and mixed farming have been used to optimize food crop production under climate change (Membele, Naidu, and Mutanga, 2022c). National climate change policy (2021-2030) of the both countries' aims to reduce greenhouse gas emissions and promote local action.

It is praiseworthy, that the majority of farmers used Indigenous Knowledge System (IKS) weather indicators such as wild fruits, trees, worms, and wind for predicting seasonal quality in addition to meteorological forecasts. Membele, Naidu, and Mutanga, (2022c), noted that a great proportion of farmers used Indigenous knowledge of weather and climate forecasts, and relied solely on Indigenous knowledge forecasts for climate adaptation decision-making. Therefore, integrating traditional knowledge into climate change policies is seen as a cost-effective, climate-smart approach and sustainable adaptation strategy to climate variability. Arguably, indigenous knowledge (IK) could provide insight for effectively dealing with greater challenges of climate change (Lawrence, Ibrahim and Ikpe, 2024). Despite the benefits, the unique knowledge and experiences of indigenous people remain largely underutilized in the planning and implementation of adaptation interventions. The public administration researchers are of the opinion that the suggested adaptation interventions although designed for the most vulnerable including indigenous people, in particular, IK holders or experts should not be neglected. This knowledge held by indigenous communities is rarely considered in academic, policy, and public discourses on climate change

Moreover, inclusiveness of this knowledge is a welcome development not only improves the effectiveness and cultural relevance of agricultural climate change adaptation efforts, but it also respects indigenous communities' rights, traditions, and contributions. Also, it will foster collaboration with local communities, preservation and transmission of traditional knowledge. African leaders and stakeholders meeting at the 5th CAADP Partnership Platform in Abuja, Nigeria, in 2009, called for the formation of the CAADP Climate Change Adaptation Framework (CCCAF). The CCCAF is an African agricultural-based climate change adaptation framework. However, there are various coordination challenges that need to be addressed, such as stakeholder fragmentation, and knowledge gaps. Many of the African countries have been persuaded to voluntarily domesticate climate change actions at home front due to the COP series of engagements. International conference in Rio, Brazil, in 1992 and the subsequent Kyoto Protocol of 1997, supported climate change related policies and institutional arrangements for local action. Indeed, the particular mechanism under which to consider IK in climate change policies has not been clear.

Statement of Problem

Climate change poses significant threats to rural livelihoods in South East Nigeria, where farming remains the primary source of income and food security. Increasingly erratic rainfall patterns, prolonged dry spells, and rising temperatures are affecting crop yields and water availability. While governmental and international climate policies propose technical solutions, they often overlook the wealth of indigenous knowledge systems that have evolved over generations to manage environmental risks. Indigenous practices, such as interpreting animal behavior for weather prediction, use of drought-resistant crops, sacred forest preservation, and traditional seed storage; offer culturally embedded, adaptive strategies. However, these practices are rarely acknowledged or integrated into formal climate adaptation policies.

It is worrisome that mainstreaming of indigenous and local knowledge into Africa's climate policy framework is limited, despite its importance in local adaptation efforts. Furthermore, indigenous knowledge can inform the development of context-specific and culturally appropriate adaptation measures more likely to be accepted and adopted by local communities (Ray, 2023; Chevallier, 2023). However, there are various coordination challenges that need to be addressed, such as stakeholder fragmentation, and knowledge gaps. This research seeks to bridge the disconnect between top-down climate governance and bottom-up, community-based resilience by exploring how indigenous knowledge can inform more inclusive and effective adaptation policies in South East Nigeria.

Main Objective:

To examine how indigenous knowledge can be effectively integrated into climate adaptation policies among farming communities in South East Nigeria.

Specific Objectives:

1. To identify indigenous climate adaptation practices used by farmers.
2. To explore farmers' perceptions of climate change and policy engagement.
3. To assess how current policies, recognize or exclude local knowledge.

Review of Literature

Bamigboye, Owombo, and Yusufu, (2024) averred that seven indigenous adaptation strategies were commonly utilized by arable crop farmers. However, crop diversification, consultation with rainmakers and involvement in non-agricultural ventures were prioritized. Similarly, Okorie, Onu, Agbo, and Nwagwu, (2020) asserted that there is low level of awareness among farmers of South-East Nigerians about the causes and effects of climate change. There is significant difference in the mean awareness ratings of urban and rural respondents on the causes and effects of climate change, with urban respondents being more aware than rural respondents. Dramani and Emmanuel (2025) affirmed that the current generation of smallholder farmers is more vulnerable to climate change than the past generation, the era of grandparents. Thus, farmers are exposed to higher intensity sunshine, temperature and wind in contemporary times than in the past. Consequently, their livelihoods are affected the most by the damaging effects of these climatic hazards. The community risk assessment process revealed the relevance of indigenous knowledge systems for vulnerability assessments and at the same time, underpins the need for adaptation of such knowledge if it is to sustain smallholder farmer efforts at climate change adaptation at community levels. Researchers, like Membele, Naidu and Mutanga, (2022a), further suggested that endogenous development approach to climate change adaptation planning (CCAP), one that will build on indigenous knowledge systems for effective community education, mobilization and participatory response to climate change. Policy interventions should aim at enhancing climate change adaptation through innovations in soil and water conservation, access to water for irrigation and domestic use, climate smart-housing architecture and agro-forestry within the framework of decentralization and district development planning. National climate change Act, 2021 and Ebonyi State are deficit with indigenous knowledge that offers a rich, practical foundation for climate-smart agriculture in the State. Evidence from the literature suggested institutional support, validation, and integration with modern scientific approaches to remain effective in the face of escalating climate variability in the country.

Materials and Methods

Research Design

Data for the study were acquired through key informant interview and participant field observation. Key informant interviews were conducted in the communities that have experienced major climate change in agricultural activities to examine how the disasters have affected the community food security and livelihoods. The people selected for interviews included Local farmers and elders (holders of indigenous knowledge). The criteria used to select the key informants included those who had been living and working in the community for at least twenty years and those that had experienced at least one major climate hazards in the community. This study will adopt a case study design allowing deep exploration of the social, cultural, and institutional dynamics around indigenous knowledge and adaptation. A multi-sited case study across selected communities in three senatorial zones in the states will capture variations in knowledge use and policy responsiveness.

Description of the Study Area with Community Analysis

The study was conducted in Ebonyi State, created in 1996 with 13 local government areas, and 96 autonomous communities. Ebonyi is composed of three senatorial districts, Ebonyi North, South and Central and it occupies a landmass of 5932 km. About 75% of the population dwells in the rural areas with farming as their major occupation. This region is predominantly agrarian, with a

large proportion of the population engaged in smallholder farming. The climate is typically tropical with distinct wet and dry seasons, making the area highly sensitive to rainfall variability and other climate stressors (Okechukwu, 2020). Communities in these states possess rich indigenous knowledge systems shaped by generations of interaction with their environment, particularly in predicting weather, managing soil fertility, and conserving water. Despite this, formal climate policies often underrepresent their adaptive practices. Socio-culturally (Okpoko & Okpoko, 2016), the region is characterized by strong communal ties, traditional leadership structures, and gendered roles in farming, which will be essential considerations during community engagement and analysis.

Sampling Procedure

Purposive sampling technique; the selection of the study area is informed by spatial variability, recognizing that the vulnerability to climate change, its impacts, and corresponding adaptation strategies differ across locations. By capturing this geographic diversity within the state, the study aims to ensure a more representative understanding of how indigenous knowledge informs climate adaptation across varied environmental and socio-cultural contexts.

Data Collection Methods:

Key Informant Interviews (KIIs) with local farmers in the state. Document analysis and review of national and state-level climate policies, agricultural plans, and international frameworks for references to indigenous knowledge.

Method of Data Analysis

Data analysis was carried out using ATLAS.ti version 25. The oral interviews were conducted with farmers across Ebonyi North, South, and Central zones, and the responses were recorded digitally using an audio device. The recordings were first transcribed directly into Microsoft Word documents to preserve the authenticity of participants' views. After transcription, each document was carefully checked against the original audio files to ensure accuracy.

The transcribed files were saved in Rich Text Format (.rtf) and uploaded into ATLAS.ti version 25 as primary documents within a newly created project. Each transcript was tagged with descriptive metadata such as interview location (zone), respondent ID, and date of interview to facilitate systematic organization and retrieval. A coding scheme was developed both inductively and deductively. Deductive codes were generated from the research objectives (e.g., *perceptions of climate change*, *adaptation strategies*, *weather forecasting practices*, *constraints*, and *knowledge transfer*). Inductive codes emerged from participants' narratives (e.g., *late farming*, *pig manure use*, *bird indicators*, *flood relocation*). These codes were created in ATLAS.ti's Code Manager and applied systematically to relevant text segments.

The coded data were grouped into categories and themes through iterative comparison across transcripts. The Code Co-occurrence Table and Code-Document Table functions were used to explore relationships between codes across different zones (Ebonyi North, South, and Central). This allowed for identification of patterns, similarities, and divergences in farmers' perceptions and practices. Memos were also created throughout the analysis process to capture reflections, emerging insights, and links to theoretical frameworks on indigenous knowledge and climate adaptation. The use of networks in ATLAS.ti helped to visually map the connections between

codes, categories, and themes, thus strengthening conceptual interpretation. The systematic use of ATLAS.ti 25 ensured rigor, transparency, and traceability in handling qualitative data.

1. Perceptions of Climate Change

Across all three zones (North, South, and Central), farmers recognized climate change as a major threat to agricultural productivity. The responses revealed a common awareness of climate variability, albeit with slight differences highlighted. The Ebonyi North farmers linked climate change to ozone layer depletion, pest outbreaks, and drought, those from Ebonyi South emphasized both natural and anthropogenic origins, and also highlighting its unfriendly impact on living organisms and farmers' fields. On the other hand, the respondents from Ebonyi Central explicitly attributed climate change to anthropogenic activities. This indicates that all respondents are aware of climate change, although their perception on the causes varied across the three geopolitical Agro-ecological zones.

2. Farmers' Experiences with Climate Change

Experiences were broadly similar across zones, with all reporting:

1. Delayed rainfall (especially from April–May).
2. Increased drought and food insecurity.
3. Loss of soil fertility.
4. Hunger and disrupted farming calendars.

This convergence indicates that climate variability and soil degradation are the dominant manifestations of climate change across Ebonyi State.

3. Indigenous Climate Change Adaptation Strategies

Farmers across the three zones have developed indigenous, low-cost, eco-friendly practices to adapt to climate change. Some of the common strategies across the three zones include; mixed cropping, mulching, tree planting, flood control using cross-bars (*oge*), re-cultivation cycles, manure (especially pig feces), and cultivation of drought-resistant crops. Furthermore, there were few zone-specific strategies. North & Central emphasized rainy season yam farming (delayed yam cutting and heap covering). Ebnonyi South, on the other hand, uniquely highlighted traditional veterinary practices using *oshrisha* and *ugboeluelu* leaves for animal health. These strategies illustrate a blend of crop diversification, soil fertility management, flood/drought mitigation, and traditional livestock care. However, most practices remain unstandardized and undocumented, making them difficult to transfer systematically.

4. Weather Forecasting Practices

Farmers in all zones rely on indigenous meteorology based on biological and celestial indicators:

1. Bird behavior (e.g., *kerekede* and *ovu*).
2. Tree flowering (e.g., *akpuntu*, *okoko akputo*).
3. Moon phases for timing of farming operations.

These methods reflect deep ecological knowledge, though they remain qualitative, undocumented, and prone to misinterpretation under changing climate regimes.

5. Constraints in Implementing Indigenous Adaptation

All the zones consistently identified constraints, which include: poverty and limited resources, inadequate farmland and access to improved inputs, lack of formal documentation of indigenous knowledge, and Poor technical skills and limited information. These systemic barriers show that while indigenous knowledge is valuable and widely practiced, it is fragile and vulnerable without integration into modern climate-smart agriculture.

6. Knowledge Transfer to Future Generations

Across all three zones, knowledge is undocumented and passed orally through storytelling, agricultural practices, and cultural belief systems. This mode of transmission is fragile, as knowledge can be lost with migration, youth disinterest in farming, or generational gaps. Hence, there is an urgent need for documentation, validation, and integration of indigenous knowledge into formal agricultural extension systems.

Discussion of Findings

Across Ebonyi State, farmers consistently recognized climate change as a serious challenge affecting agriculture and livelihoods. Respondents in Ebonyi North perceived climate change primarily through manifestations such as ozone layer depletion, pest outbreaks, and recurrent drought. In Ebonyi South, farmers emphasized both natural and anthropogenic origins, stressing that climate change is "not friendly to living beings." Meanwhile, farmers in Ebonyi Central directly attributed climate change to anthropogenic activities.

These perceptions align with findings from other smallholder farming communities in sub-Saharan Africa, where farmers interpret climate change through locally observable phenomena such as temperature shifts, rainfall variability, and ecological disruptions (Ajayi et al., 2020; Ofoegbu et al., 2021). The emphasis on delayed rainfall across all three zones underscores the salience of precipitation timing in farmers' understanding of climate change impacts, consistent with reports from Nigeria and Ghana (Mubaya & Mafongoya, 2018).

On farmers' experiences with climate change, all farmers reported increasing unpredictability in rainfall, with delayed onset of rains (months 4–5) as a recurring challenge. Drought, declining soil fertility, hunger, and late farming cycles were additional consequences noted across zones. These experiences resonate with studies showing that Nigerian and southern African farmers identify rainfall variability and drought as the most disruptive climate impacts, often leading to food insecurity and shifts in cropping calendars (Okpara et al., 2021; Adzawla et al., 2022).

Furthermore, farmers reported a diverse set of indigenous practices to mitigate climate risks. Common strategies across all zones included soil fertility management through the use of pig manure and animal waste; avoidance of bush burning. Another adaptation strategy was through mixed cropping, mulching, tree planting, re-cultivation cycles, and cultivation of drought-resistant varieties. One other method was water and flood management by constructing cross-bars (*oge*) and relocating crops to higher ground. Zone-specific practices were also evident. Farmers in Ebonyi North and Central highlighted "winter farming" of yam, where tubers are delayed and heaps are covered with grass to retain soil moisture. Ebonyi South uniquely reported herbal animal health treatments using *oshrisha* and *ugboeluelu* leaves. These reflect a blend of ecosystem-based adaptation, agronomic innovation, and ethnoveterinary practices. Similar adaptation measures

have been documented across Africa, where indigenous knowledge provides low-cost, ecologically grounded strategies for coping with climate shocks (Nyong et al., 2019; Mavhura, 2020). However, most practices in Ebonyi remain undocumented and transmitted orally, limiting systematic improvement or scaling.

Farmers across Ebonyi rely on local ecological and celestial indicators for weather prediction. These include bird behavior (*kerekede* and *ovu*), tree flowering (*akpuntu*, *okoko akputo*), and moon phases to guide planting and harvest timing. Such indigenous forecasting methods have been widely reported across Africa as reliable within traditional contexts but increasingly challenged by climate variability (Radeny *et al*., 2019; Chisadza *et al*., 2021). The persistence of these practices demonstrates their cultural embeddedness, but their effectiveness may decline under rapidly changing climatic patterns.

Similarly, across all three zones, farmers highlighted systemic barriers to adaptation: Poverty and inadequate resources hinder the adoption of improved practices. Limited access to farmland and inputs constrains productivity. Lack of formal documentation of indigenous knowledge threatens intergenerational transfer. Weak technical skills and information access limit integration of new approaches. These findings are consistent with broader literature emphasizing that while indigenous knowledge is valuable, it must be supported by institutional, financial, and extension systems to remain effective in climate adaptation (Makate, 2019; Mavhura, 2020).

In all three zones, indigenous knowledge is undocumented and transmitted orally through storytelling, observation of practices, and cultural beliefs. While this mode sustains continuity, it also poses risks of knowledge erosion, particularly with youth migration, declining interest in farming, and modernization pressures. Scholars have emphasized the importance of documenting and integrating such knowledge into climate adaptation policies to ensure resilience and sustainability (Ajani et al., 2019; Ofoegbu et al., 2021).

Conclusion

Farmers across Ebonyi State share similar climate change perceptions, experiences, and adaptive practices, with minor zone-specific variations. Their indigenous knowledge is rich but fragile due to poverty, lack of documentation, and weak institutional support. Strengthening these practices through scientific validation, policy recognition, and extension services can enhance resilience against climate change. Thus, indigenous knowledge offers a rich, practical foundation for climate-smart agriculture in Ebonyi State, but requires institutional support, validation, and integration with modern scientific approaches to remain effective in the face of escalating climate variability.

Abstract
The study examined the effect of research and development (R&D) on value creation among listed consumer goods firms in Nigeria, with the specific objective of determining the effect of R&D expenditure on the value added of these firms. The study adopted an ex-post facto research design, which is suitable because it used already published financial data without manipulating variables. The population consisted of 20 listed consumer goods firms on the Nigerian Exchange Group as of December 31, 2024, from which 13 firms were purposively selected as the sample. Data were collected entirely from audited annual reports and financial statements of the sampled firms covering the period 2012–2024. Hypotheses were tested using Panel Estimated Generalised Least Square (EGLS) at a 5% significance level, after carrying out diagnostic tests for reliability. The finding revealed that R&D expenditure has a significant positive effect on value added of listed consumer goods firms in Nigeria (β = 2.7859; p = 0.0060). In conclusion, R&D spending plays a vital role in enhancing the productive capacity of firms by enabling them to transform inputs into outputs that generate additional wealth. The study recommended management of listed consumer goods firms should allocate a dedicated portion of their annual budgets to research and development projects; this is because increased spending on product innovation, improved production techniques, and market research has been shown to translate directly into higher value added.

Keywords: *Research and Development, Value Creation, Consumer Goods Firms, Value Added*

Introduction

Business organizations across the world continue to face growing competition, rapid technological changes, and the pressure to improve their performance in order to survive and grow. In both developed and developing economies, consumer goods firms are expected to continually provide quality products that meet consumer needs while also maintaining financial strength that benefits shareholders and other stakeholders. In Nigeria, the consumer goods sector is one of the most vibrant segments of the economy, contributing significantly to employment, government revenue, and national output (Adedoyin et al., 2024). The sector includes companies that produce food, beverages, household products, and other essential goods that are widely consumed by the

population. Given the crucial role these firms play in the economy, it becomes important to study the strategies they employ to remain relevant and competitive. One of the major ways companies sustain themselves and stand out in a competitive marketplace is through value creation (Muojekwu et al., 2025). Value creation goes beyond generating profits; it involves producing goods and services that deliver long-term benefits to customers, employees, investors, and the economy. As businesses continue to evolve in response to global and local challenges, value creation has become a major factor that determines the survival, growth, and overall contribution of firms to national development.

Value creation has gained increasing relevance in today's business environment because it reflects how firms use their resources to generate benefits that go beyond short-term profitability (Saidia et al., 2021). A company that consistently creates value builds stronger customer loyalty, maintains competitiveness, and attracts investor confidence. In the consumer goods sector, where demand is driven by population growth and changing consumer habits, firms are expected to innovate in order to sustain and expand their market share (Okoye et al., 2024). Research and development (R&D) is one of the most effective tools that firms use to support value creation. According to Owota and Mansi (2025), R&D involves systematic efforts to discover new knowledge, develop new products, improve existing processes, and explore new ways of doing business. Through R&D, firms are able to increase efficiency, reduce costs, and enhance the quality of their products. In the Nigerian consumer goods sector, where economic conditions such as inflation, foreign exchange fluctuations, and competition from imported goods pose significant challenges, R&D can serve as a pathway to resilience and sustainability. The ability of firms to commit resources to research and development becomes an important driver of their capacity to generate value that benefits all stakeholders (Uyar et al., 2023).

Research and development directly affects value creation by providing firms with the tools to respond to the changing demands of customers and the challenges of competition. Firms that invest in R&D are more likely to develop innovative products that meet consumer preferences, thereby increasing customer satisfaction and loyalty (Okoronkwo et al., 2021). Such innovations often allow companies to charge premium prices, gain larger market shares, and improve profitability. In addition, R&D supports the development of efficient production methods, which reduce waste, lower operating costs, and improve the use of resources. These improvements lead to greater value creation as firms are able to maximize output and deliver better returns to shareholders. In the Nigerian consumer goods industry, where firms must navigate infrastructural deficiencies, high production costs, and a dynamic market environment, R&D can play a vital role in sustaining competitiveness. By continuously adapting products to meet local and international standards, firms can also expand beyond the domestic market into regional and global markets. When firms commit resources to research and development, they build the capacity to enhance efficiency, increase productivity, and create value for shareholders, employees, and customers (Qadir, 2022). In many economies, research and development is regarded as the backbone of industrial advancement because it drives continuous improvement and positions firms to compete favorably both locally and internationally.

In Nigeria, however, the situation has not fully reflected this understanding. Many consumer goods firms either allocate very little to research and development or fail to account for it clearly in their financial reports. This implies that several companies continue to rely heavily on traditional

production methods, imported technologies, and established product lines, rather than developing their own innovative solutions. This limited commitment to research and development reduces the ability of firms to create lasting value, particularly in an environment characterized by inflation, unstable exchange rates, and intense competition from both local and foreign brands. While some firms may recognize the importance of research and development, the resources devoted to it remain insufficient compared to what is required to achieve meaningful transformation in the sector. The result of this situation is that many consumer goods firms struggle to maintain sustainable growth and competitiveness. Without adequate research and development, they risk losing relevance as consumer preferences shift and global standards continue to rise. The absence of strong innovation-driven strategies also affects their capacity to generate higher levels of value added, which is a key indicator of long-term performance and contribution to the economy

From the review of existing studies, it is clear that research and development has been examined from different perspectives across sectors, but important gaps remain. For example, Owota and Mansi (2025) studied oil and gas companies, Uyar et al. (2023) focused on energy firms across multiple countries, while Khalifa (2023) and Qadir (2022) investigated manufacturing firms in Tunisia. Similarly, Rahman and Howlader (2022) assessed R&D in an emerging economy, Amos et al. (2022) examined Nigerian manufacturing firms, Anidebe et al. (2021) looked at industrial goods companies, Okoronkwo et al. (2021) studied SMEs in Lagos, Uwah et al. (2020) analyzed manufacturing firms, and Didia et al. (2016) researched telecommunications firms. Although these studies provided useful findings, most of them concentrated on general measures of firm value such as market value, stock prices, earnings per share, or Tobin's Q, rather than focusing on firm value added as an outcome of R&D. In addition, they generally applied traditional estimation techniques such as OLS, pooled regression, or simple panel models without addressing econometric problems. None applied Panel Estimated Generalised Least Squares (EGLS), which corrects for cross-sectional dependence and heteroskedasticity, thereby improving the reliability of results. This leaves a gap that the present study fills by specifically examining the effect of R&D expenditure on firm value added of listed consumer goods firms in Nigeria using Panel EGLS over the period 2012–2024.

Objective of the Study

The main aim of the study is to examine the effect of research and development on value creation among the listed consumer goods firms in Nigeria. The specific objective of the study was to ascertain the effect of research and development expenditure on the value added of listed consumer goods forms in Nigeria.

Literature Review

Conceptual Review

Research and Development

Research and Development refers to the deliberate activities that organizations undertake to generate new knowledge and apply it towards the creation of innovative products, services, or processes (Uyar et al., 2023). It represents a systematic effort by firms to improve their existing operations while also exploring new possibilities that can give them a competitive advantage in their industries (Anidebe et al., 2021). The essence of research and development lies in combining creativity with structured inquiry, where new ideas are tested, refined, and converted into practical solutions that improve efficiency and effectiveness (Owota & Mansi, 2025). Research and

development also capture the formal and informal investments firms make toward improving their productive capacity. It is not limited to scientific laboratories or high-tech industries alone; rather, it includes any sustained attempt by a company to discover better ways of delivering value to consumers and society. For instance, consumer goods firms may engage in research and development to create more durable products, reduce production costs, or respond to changing consumer preferences. In this sense, research and development serves as a bridge between knowledge generation and its application in real-life economic activities. In all, research and development is best understood as a growth engine for firms and economies (Qadir, 2022). It allows businesses to evolve with changing times, discover new markets, and maintain relevance amidst competition. Firms that consistently invest in research and development are often better positioned to anticipate market trends, address challenges more effectively, and deliver long-term value to their stakeholders (Anidebe et al., 2021). Therefore, research and development can be viewed as the ongoing pursuit of improvement and innovation that shapes the survival and progress of organizations.

Value Creation

Value creation refers to the process through which businesses generate benefits that extend beyond immediate profits, providing long-term satisfaction for customers, shareholders, employees, and society (Muojekwu et al., 2025). It describes how an organization uses its resources and capabilities to produce outcomes that are meaningful, sustainable, and beneficial to multiple stakeholders. When a firm engages in value creation, it is essentially converting its resources into products and services that meet needs, solve problems, and create opportunities for growth and development. Value creation embodies the ability of an organization to sustain relationships by continually delivering outcomes that customers consider worthwhile and investors regard as promising (Lüdeke-Freund et al., 2020). For customers, value creation may mean affordable and reliable products; for investors, it may mean steady returns; for employees, it may mean opportunities for career growth and fair compensation. In this sense, value creation is multi-dimensional, as it seeks to balance financial performance with social and economic responsibilities. In the broader sense, value creation is the reason firms exist and remain relevant over time. A company that consistently creates value strengthens its market position, attracts loyalty, and enhances its resilience in uncertain economic environments (Okoye et al., 2024). Without value creation, businesses cannot thrive because stakeholders will quickly withdraw their support when their needs are not met. Thus, value creation is not just about outcomes but also about continuity and sustainability, ensuring that the activities of a firm remain beneficial for both the present and the future.

Value Added

Value added refers to the additional worth that a firm generates in the process of transforming inputs into outputs (Nandi, 2011). It captures the difference between the value of goods and services produced and the cost of the resources used in producing them. In simple terms, value added represents the unique contribution an organization makes by turning raw materials, labor, and capital into finished products that hold greater economic significance than the inputs alone (Oshodi, 2022). Value added reflects the efficiency with which resources are utilized to generate new wealth. For instance, when a consumer goods firm purchases raw materials and processes them into consumable products, the increase in worth that results from this transformation is referred to as value added. This measure highlights how well a company enhances the usefulness

of resources while also contributing to the income of employees, the returns of investors, and the revenues of government through taxes (Adeyemo & Okoruwa, 2018). Value added can also be understood as a marker of how much an organization contributes to the economy. It is not just about profit but about the total wealth created that can be distributed among various stakeholders. A high level of value added indicates that a firm is effectively creating wealth by maximizing the potential of its resources, while a low level of value added suggests inefficiencies (Oshodi, 2022). Thus, value added serves as a crucial measure of corporate performance and long-term sustainability, emphasizing the role of businesses in both economic and social development.

Theoretical Framework and Development of Research Hypothesis

The Schumpeterian Innovation Theory was developed by the Austrian economist Joseph Schumpeter in 1911 and further popularized in his later works during the 1930s and 1940s (Nworie et al., 2025). Schumpeter introduced the idea that innovation is the primary driver of economic development and business growth. He argued that firms do not grow solely by competing on existing products or processes but by creating new combinations of resources that lead to novel products, improved methods of production, or entirely new markets. His theory shifted attention from capital accumulation alone to the critical role of entrepreneurial innovation in shaping the performance and survival of firms.

The main postulation of the Schumpeterian Innovation Theory is that economic progress is achieved through "creative destruction," a process where new innovations disrupt and replace outdated technologies, products, and business models (Terkura et al., 2025). According to Schumpeter, firms that invest in research and development gain the ability to innovate, thereby driving competition and long-term growth. Innovation, in this sense, is not just about technological advancement but also about organizational improvements, new forms of distribution, and enhanced ways of meeting customer needs (Nworie et al., 2025). The theory emphasizes that firms must continuously innovate to remain competitive, as failure to adapt leads to decline and eventual exit from the market. The relevance of this theory to the present study lies in its explanation of how research and development contributes to value creation. By linking R&D expenditure to value added, the study applies Schumpeter's idea that innovation is a source of firm value. It shows that firms that commit resources to R&D are better positioned to create wealth, sustain competitiveness, and contribute meaningfully to economic development, in line with the arguments of the Schumpeterian framework. On this basis, we hypothesise that:

Ha: Research and development expenditure has a positive effect on the value added of listed consumer goods forms in Nigeria.

Empirical Review

Owota and Mansi (2025) examined how Research and Development (R&D) affects the value of oil and gas companies in Nigeria. They employed an ex-post facto research design, using annual reports from six listed oil and gas firms on the NGX. Inferential statistics, including the Ordinary Least Squares (OLS) method, were applied to estimate relationships between variables. Their results indicate that R&D expenditures do not have a significant impact on firm value in Nigeria's oil and gas sector.

Uyar et al. (2023) investigated the link between R&D intensity, environmentally friendly practices, firm value, and stakeholder environmental concerns in the energy sector. Their study covered the period from 2002 to 2019, resulting in 4,016 firm-year observations across 43 countries, with data sourced from Thomson Reuters Eikon. Using a country-year fixed-effects regression model, they found that R&D intensity promotes eco-friendly practices in three areas: reducing resource consumption, reducing emissions, and eco-innovation. They also found that strong environmental performance is associated with higher firm value, suggesting a positive reaction from shareholders. Moderation analysis indicated that R&D combined with eco-innovation enhances value, whereas its combination with resource or emission reductions does not.

Khalifa (2023) explored the interplay between R&D, information and communication technology (ICT), product and process innovations, and firm productivity in 238 manufacturing firms in Tunisia, applying the augmented Crépon-Duguet-Mairesse (CDM) model. The study revealed that R&D significantly predicts product innovation but not process innovation. ICT positively impacts both types of innovation, with a stronger effect on process innovation. Firms that integrate R&D and ICT are more likely to introduce both product and process innovations. R&D and ICT also indirectly boost productivity through innovation, with product innovation showing a clear positive effect on firm-level productivity, while process innovation impacts productivity primarily when paired with product innovation. The study provides practical guidance for leveraging R&D and ICT to enhance innovation and productivity in Tunisia.

Qadir (2022) assessed the effects of R&D and ICT on innovation and productivity in Tunisian manufacturing firms. The study compared stock prices and R&D expenditures using secondary data from 2011–2021 and applied descriptive statistics, regression analysis, and correlation coefficients. Findings showed that Apple and Microsoft had higher stock prices and R&D expenditures compared to Huawei, with these differences being statistically significant, while Huawei showed lower levels that were not significant.

Rahman and Howlader (2022) examined the impact of R&D spending on firm performance and value in an emerging economy. They measured firm performance using financial indicators (ROA and ROE) and market performance (Tobin's Q) and applied pooled OLS regression with both level and lagged models. The results consistently showed a significant positive relationship between R&D expenditure and both firm performance and value, with all findings robust and free from outliers and multicollinearity.

Amos et al. (2022) investigated how research and development (R&D) influences the market value of listed manufacturing firms in Nigeria. The study employed a correlational research design with a population of seventy-six manufacturing firms, from which 45 listed companies on the Nigerian Stock Exchange between 2012 and 2019 were selected as the sample. Panel data were analyzed using the least squares estimation technique based on a modified Ohlson price valuation model. The findings indicate that R&D has a significant positive impact on market value.

Anidebe et al. (2021) examined the effect of R&D expenditures on the value of industrial goods companies listed on the Nigerian Stock Exchange over a ten-year period from 2010 to 2019. The study focused on how R&D expenditures influenced Tobin's Q, earnings per share, and market price per share for selected industrial goods firms. Using an ex-post facto design, seven companies

were purposively selected from a population of twelve based on data availability. Data were sourced from annual reports and analyzed using descriptive statistics (mean, maximum, minimum, standard deviation) and inferential statistics (multiple regression). Results revealed that R&D expenditures did not significantly affect firm value.

Okoronkwo et al. (2021) assessed the impact of R&D on the competitiveness of selected manufacturing SMEs in Lagos State, Nigeria. A survey research design was adopted, targeting a population of 2,099 owner-managers, with a sample of 437 determined using Slovin's formula. Data were collected using a validated structured questionnaire, with Cronbach's Alpha reliability coefficients of 0.85 for R&D and 0.817 for competitiveness. With a 92% response rate, the data were analyzed using descriptive and inferential statistics, and hypotheses were tested via simple regression analysis. Findings revealed that R&D significantly enhances competitiveness ($\beta = 0.342$, $t = 7.838$, $p < 0.05$), confirming its positive role in SME performance.
Uwah et al. (2020) explored the relationship between R&D and economic value added (EVA) in Nigerian manufacturing companies. Using a quantitative panel design combining ex-post facto and correlational approaches, the study analyzed secondary data from Nigerian Stock Exchange fact books for 2010–2016. Out of 83 listed companies during this period, 69 were sampled. Multiple and simple regression analyses were used to test three hypotheses at a 0.05 significance level. The results indicated a significant positive relationship between R&D and EVA.

Didia et al. (2016) examined the relationship between R&D integration and business performance in the Nigerian telecommunications industry. Using a structured questionnaire, data were analyzed through descriptive statistics (mean and standard deviation) and inferential analysis via Spearman Rank Order Correlation. Results showed a clear association between R&D integration and key business performance indicators, including sales growth and market share.

Methodology
This study adopted an ex-post facto research design to investigate the effect of research and development (R&D) on value creation among listed consumer goods firms in Nigeria. This design is appropriate because it relies on already published financial data without manipulating any variables (Ikwuo et al., 2025; Muojekwu et al., 2025). By using this design, the study objectively evaluates the cause-and-effect relationship between R&D expenditure and value creation. Since the data are historical and derived from audited financial statements and annual disclosures, the design provides a reliable framework for assessing the effect of R&D on value added during the 2012–2024 period, which aligns with the scope of the study.

The population of the study comprises all listed consumer goods firms on the Nigerian Exchange Group (NGX) as of December 31, 2024. A total of twenty (20) firms fall into this category and form the basis for assessing the relationship between R&D expenditure and value added.

Table 3.1: Population of the Study

Firms
✓ Consumer Goods
1. Bua Foods Plc
2. Cadbury Nigeria Plc.
3. Champion Brew. Plc.

4. Dangote Sugar Refinery Plc
5. Dn Tyre & Rubber Plc
6. Golden Guinea Brew. Plc.
7. Guinness Nig Plc
8. Honeywell Flour Mill Plc
9. International Breweries Plc.
10. Mcnichols Plc
11. Multi-Trex Integrated Foods Plc
12. N Nig. Flour Mills Plc.
13. Nascon Allied Industries Plc

(Source: Researcher's Compilation, 2025)

The study relied entirely on secondary data obtained from audited annual reports and financial statements of the sampled firms covering the period 2012–2024. These reports were accessed from the Nigerian Exchange Group (NGX), firms' official websites, and related financial databases. The

data were analyzed using descriptive statistics (mean, standard deviation, minimum, and maximum) to summarize the characteristics of the variables. For inferential analysis, Panel Estimated Generalised Least Square (Panel EGLS) was employed to examine the effect of R&D expenditure on value added of listed consumer goods firms. Diagnostic tests such as heteroskedasticity and cross-sectional dependence were conducted to ensure the validity of the regression results. Hypotheses were tested at a 5% level of significance. A p-value less than 0.05 led to the rejection of the null hypothesis, indicating a significant effect, while a p-value equal to or greater than 0.05 indicated no significant effect.

This study adapted the model of Anidebe et al. (2021), who examined the nexus between R&D and value creation. The functional form of the model is:

$VACit = \beta0 + \beta1RDEit + \beta2TAit + \mu it$ _____eqi

Where:

VACit = Value added of firm i at time t
RDEit = R&D expenditure of firm i at time t
TAit = Total assets of firm i at time t (control variable)
β0 = Intercept
β1, β2 = Coefficients of independent and control variables
μit = Error term
i = Firm index
t = Year index (2012–2024)

Table 3.3: Operationalization of Variables

Variable	Measurement/Proxy	Source
Value Added (VA)	Total Value Added reported in firms' financial statements	Nandi, 2011
R&D Expenditure (RDE)	Annual R&D expenditure	Anidebe et al., 2021
Total Asset	The value of total asset owned by the firm at the year end	Juárez, 2018

Data Analysis

Descriptive Analysis and Model Diagnostics

The study examined the effect of research and development (R&D) on value creation among listed consumer goods firms in Nigeria, with the specific objective of determining the effect of R&D expenditure on the value added of these firms. The study adopted an *ex-post facto* research design, which is suitable because it used already published financial data without manipulating variables. The population consisted of 20 listed consumer goods firms on the Nigerian Exchange Group as of December 31, 2024, from which 13 firms were purposively selected as the sample. Data were collected entirely from audited annual reports and financial statements of the sampled firms covering the period 2012–2024.

Table 4.1 Descriptive Analysis

	Value Added (₦'000)	Research Development	And Total Asset (₦'000)

		(₦'000)	
Mean	27058952	37991.39	125015194
Median	9890674.	0.000000	50172484
Maximum	406384048	906000.0	1126267553
Minimum	-90789645	0.000000	57287.00
Std. Dev.	47620990	115537.8	188198886
Skewness	3.445605	4.096095	2.664282
Kurtosis	23.46120	22.87400	11.09561
Jarque-Bera	3787.463	3754.463	763.2021
Probability	0.000000	0.000000	0.000000

Source: Eviews 10 Output (2024)

Table 4.1 shows that the value added of listed consumer goods firms in Nigeria recorded a mean of ₦27,058,952,000, which suggests that on average, the firms generated substantial wealth over the study period. The maximum value added stood at ₦406,384,048,000, indicating that some firms were able to create very high levels of wealth, while the minimum value added was negative at –₦90,789,645,000, meaning that certain firms incurred losses during specific years. The large standard deviation of ₦47,620,990,000 highlights the wide variability in value creation across the sampled firms. The skewness of 3.45 and kurtosis of 23.46 reveal that the distribution of value added is heavily skewed to the right and sharply peaked, reflecting the presence of extreme values. The Jarque-Bera probability of 0.000 confirms that the distribution of value added is not normal, which implies that some firms experienced outlier performances during the study period.

Table 4.1 also shows that research and development expenditure averaged ₦37,991,390, suggesting that firms generally spent modest amounts on R&D relative to their scale of operations. The maximum R&D expenditure was ₦906,000,000, showing that a few firms made significant commitments to innovation, while the minimum was zero, indicating that some firms did not report any R&D spending at all. The standard deviation of ₦115,537,800 reflects a high level of disparity in how different firms prioritized R&D. The skewness value of 4.10 and kurtosis of 22.87 confirm that the distribution is strongly skewed with a sharp peak, meaning that a small number of firms invested much higher amounts than the majority. The Jarque-Bera probability of 0.000 suggests non-normality, pointing to uneven investment behavior among the firms.

Table 4.1 further indicates that the total assets of the sampled firms had a mean of ₦125,015,194,000, reflecting the considerable size of consumer goods companies in Nigeria. The maximum total assets stood at ₦1,126,267,553,000, showing that some firms controlled very large asset bases, while the minimum was ₦57,287,000, which demonstrates the inclusion of relatively smaller firms in the sample. The high standard deviation of ₦188,198,886,000 indicates significant variation in firm size within the sector. The skewness of 2.66 and kurtosis of 11.10 imply that the distribution is positively skewed and leptokurtic, suggesting that a few firms dominate in terms of asset ownership. The Jarque-Bera probability of 0.000 shows that the distribution of total assets deviates from normality, which is consistent with the wide range between the largest and smallest firms.

Table 4.2 Model Diagnostics

Test	Statistic	Probability

Residual Cross-Section Dependence Test: Breusch-Pagan LM	287.8917	0.0000
Panel Cross-Section Heteroskedasticity LR Test: Likelihood Ratio	627.8049	0.0000
Hausman Test	8.601528	0.0136

Source: Eviews 10 Output (2024)

Table 4.2 presents the result of the Breusch-Pagan LM residual cross-section dependence test. The essence of this test is to check whether the residuals from different cross-sectional units are correlated, which can bias panel regression results if ignored. The test produced a statistic of 287.8917 with a probability of 0.0000, indicating the presence of cross-sectional dependence in the model. This means that shocks or disturbances affecting one firm tend to spill over and affect others, a situation that is common in panel data involving firms in the same industry.

Table 4.2 also reports the result of the Panel Cross-Section Heteroskedasticity Likelihood Ratio test, which assesses whether error variances are constant across firms or whether they vary. The test returned a statistic of 627.8049 with a probability of 0.0000, confirming the presence of heteroskedasticity in the panel dataset. This implies that the error variances differ across firms, which, if uncorrected, could lead to inefficient estimates. Identifying heteroskedasticity is important because it justifies the use of robust estimation techniques.

Table 4.2 further shows the outcome of the Hausman test, which helps to determine whether a fixed effects or random effects model is more appropriate for the analysis. The test produced a statistic of 8.601528 with a probability of 0.0136, which is statistically significant at the 5 percent level. This result supports the adoption of the fixed effects model, as it suggests that the unique characteristics of each firm are correlated with the explanatory variables and should not be treated as random.

Test of Hypothesis

H0: Research and development expenditure has no significant effect on the value added of listed consumer goods forms in Nigeria.

Panel Estimated Generalised Least Squares (EGLS) was employed to test the hypotheses in order to correct for heteroskedasticity and cross-sectional dependence in the data.

Table 4.3 Test of Hypothesis

Dependent Variable: VALUE ADDED
Method: Panel EGLS (Cross-section weights)

Source: Eviews 10 Output (2024)

Table 4.3 shows the test of hypothesis using Panel EGLS estimation with cross-section weights, which was employed to correct for heteroskedasticity and cross-sectional dependence. The adjusted R-squared is 0.7931, indicating that about 79 percent of the variation in value added of listed consumer goods firms is explained by the explanatory variables included in the model. This level of explanatory power suggests that the model provides a very good fit for the data. The probability of the F-statistic is 0.0000, which is significant at the 5 percent level, showing that the model as a whole is valid and statistically reliable for testing the stated hypothesis. The constant (C) has a coefficient of 14,561,315 with a probability of 0.0000, which is significant at the 5 percent level. This implies that even when research and development expenditure and total assets are held constant, firms in the consumer goods sector still generate an average value added of about ₦14.6 million. The coefficient of total assets is 0.0991, which means that for every ₦1,000 increase in the total asset base of a firm, its value added rises by about ₦99. This positive coefficient reflects that larger firms, with more assets, tend to generate higher levels of value added compared to smaller ones. The associated probability value is 0.0000, which is significant at the 5 percent level. This shows that the effect of total assets on value added is not only positive but also statistically significant. It further implies that firm size, as measured by total assets, plays an important role in explaining differences in value added across firms in the sector.

The coefficient of research and development expenditure is 2.7859, which indicates that for every additional ₦1,000 spent on R&D, value added increases by about ₦2,786. This positive coefficient shows that higher R&D expenditure contributes to greater value creation in these firms. The probability value associated with this coefficient is 0.0060, which is below the 5 percent significance threshold, meaning the effect of R&D expenditure on value added is statistically significant. Therefore, research and development expenditure has a positive and significant effect on the value added of listed consumer goods firms in Nigeria ($\beta = 2.7859$; $p = 0.0060$).

Discussion of Finding

The result showing that R&D expenditure has a significant positive effect on the value added of listed consumer goods firms in Nigeria can be explained by the role of R&D in enhancing innovation, productivity, and efficiency within organizations. By allocating resources to R&D,

firms in the consumer goods sector are able to develop new products, improve production processes, and respond more effectively to changing market needs, which collectively expand the firm's ability to generate additional economic value. This finding is consistent with the argument that R&D fosters competitive advantage and sustainable growth by strengthening a firm's capacity to utilize resources more productively. Several studies reinforce this outcome. For instance, Rahman and Howlader (2022) found a significant positive link between R&D spending and firm performance and value in emerging economies, demonstrating that investments in innovation contribute directly to profitability and market performance. Similarly, Amos et al. (2022) revealed that R&D positively impacts the market value of listed manufacturing firms in Nigeria, highlighting its importance in value creation. The findings of Uwah et al. (2020) also support this result, as their study showed a positive relationship between R&D and economic value added in Nigerian manufacturing companies, suggesting that R&D expenditure strengthens financial and operational outcomes. Didia et al. (2016) further affirmed the positive role of R&D in the Nigerian telecommunications sector, establishing that R&D integration improves performance indicators such as sales growth and market share, which ultimately translate into greater value creation. Khalifa (2023) also demonstrated that R&D enhances product innovation, which in turn boosts firm-level productivity, aligning with the positive relationship observed in this study. While some studies, such as Owota and Mansi (2025) and Anidebe et al. (2021), found that R&D did not significantly impact firm value in oil and gas and industrial goods sectors respectively, these differences may be explained by sector-specific characteristics, capital intensity, and longer gestation periods for innovation returns in those industries. Overall, the evidence from the consumer goods sector aligns more closely with the studies that reported a positive effect, underscoring that R&D expenditure is an important determinant of value added where product differentiation, innovation, and adaptability drive firm performance.

Conclusion and Recommendation

Conclusion

The finding that research and development (R&D) expenditure has a significant positive effect on value added among listed consumer goods firms in Nigeria carries important implications for understanding the dynamics of corporate performance and economic growth. It indicates that R&D spending plays a vital role in enhancing the productive capacity of firms by enabling them to transform inputs into outputs that generate additional wealth. This relationship suggests that firms that prioritize R&D are better positioned to achieve operational efficiency, improve product quality, and introduce innovations that contribute directly to their economic value. The statistical strength of the relationship highlights R&D as more than a discretionary cost; rather, it is an essential driver of value creation within the consumer goods sector. The finding also sheds light on the broader macroeconomic relevance of R&D, as the value added by individual firms accumulates into contributions to gross domestic product and national competitiveness. For investors and stakeholders, the evidence underscores that expenditure on R&D can be a reliable indicator of a firm's potential to deliver sustainable growth, as it demonstrates the firm's ability to generate returns beyond mere survival in competitive markets. Furthermore, the positive effect on value added signals that R&D investment fosters not only immediate improvements in financial performance but also long-term resilience by equipping firms to adapt to changing consumer preferences, regulatory demands, and technological shifts. In essence, the finding implies that R&D has both micro-level significance, in terms of firm profitability and efficiency, and macro-level significance, in terms of economic development and industrial advancement. It also confirms

that knowledge-driven investment strategies are integral to the creation of tangible economic value, making R&D a central factor in shaping the competitiveness and sustainability of consumer goods firms in Nigeria.

Recommendations

Management of listed consumer goods firms should allocate a dedicated portion of their annual budgets to research and development projects; this is because increased spending on product innovation, improved production techniques, and market research has been shown to translate directly into higher value added. Firms that institutionalize steady R&D investment will strengthen their competitiveness and sustain long-term growth in Nigeria's dynamic consumer market.

Contribution to Knowledge

This study contributes to literature by extending the discussion on research and development beyond general measures of firm value such as market value, stock prices, earnings per share, and Tobin's Q, which have dominated earlier works by Owota and Mansi (2025), Uyar et al. (2023), Khalifa (2023), Qadir (2022), Rahman and Howlader (2022), Amos et al. (2022), Anidebe et al. (2021), Okoronkwo et al. (2021), Uwah et al. (2020), and Didia et al. (2016). Unlike these studies that often relied on conventional estimation methods without correcting for key econometric issues, this study focused on firm value added as a direct measure of wealth generated by listed consumer goods firms in Nigeria. By applying Panel Estimated Generalised Least Squares (EGLS), which accounts for cross-sectional dependence and heteroskedasticity, the study provides more reliable results on the role of R&D in shaping firm performance. In doing so, it addresses a methodological and conceptual gap in the literature and offers a clearer understanding of how R&D expenditure contributes to value creation in the Nigerian consumer goods sector.

Limitations of the Study and Suggestion for Further Studies

Like every research, this study faced some limitations that were beyond the control of the researcher. The study relied only on secondary data from published annual reports and financial statements, and this meant that the accuracy of the results depended on the quality of the information provided by the firms. In addition, not all listed consumer goods firms had complete data on research and development expenditure, which reduced the sample size. These limitations may have affected the depth of the findings but did not stop the study from achieving its main objective.

Future studies can expand on this work by including other sectors of the Nigerian economy such as industrial goods, healthcare, or technology firms to compare the role of research and development in value creation across industries. Researchers may also extend the time frame or use primary data, such as interviews and questionnaires, to capture more details about how managers view and apply R&D. This would provide a broader understanding of the relationship between R&D and value creation in Nigerian firms.

Abstract
The study investigates the relationship between emotional resilience and ethical commitment of employees in the Nigerian banking sector, a transitioning economy marked by growing rate of economic instability, corruption, inequality, and institutional weaknesses. Using quantitative research method, we investigated how emotional resilience amongst employees influences their ethical commitment focusing on key constructs: emotional stability and moral courage, emotional intelligence and 918 organizational citizenship behavior, stress management and whistleblowing intention. The study employed survey research design to gather data from 234 sample of employees drawn from the 590 population of bank employees in the metropolis of Enugu Nigeria. Partial Least Squares-Structural Equation Modelling (PLS-SEM) analysis revealed that emotional intelligence, stress management, and emotional stability significantly influenced ethical commitment amongst employees in the banking sector. Specifically, our findings show that emotional resilience enhances 918 organizational citizenship behavior, whistleblowing intention, and moral courage. We conclude that emotional resilience is a key factor in promoting ethical commitment in Nigerian economy and other transitioning economies. Based on these findings, we recommend that organisations and policymakers should encourage and prioritise initiatives that build emotional resilience, such as training programs and stress management workshops, which can promote culture of ethics and responsibility. In addition, management of banks and other businesses should prioritise emotional stability, emotional intelligence, and stress management to promote moral courage for whistleblowing as well as appropriate citizenship behaviour and ethical decision-making.

Keywords: *Emotional resilience, ethical commitment, transitioning economies, organisational citizenship behavior, whistleblowing intention, moral courage.*

Introduction

Transitioning economies present a complex environment where ethical dilemmas often emerge due to rapid socio-economic and political issues, with growing rate of economic instability, corruption, inequality, and institutional weaknesses that compel employees' responses (Bunkaewsuk et al., 2024; Yan, et al., 2023) (Mishra, & Bhatnagar, 2009). This environment underscores the importance of emotional resilience amongst the workforce. Emotional resilience can be defined as an individual's capacity to adapt positively in the face of adversity, stress, or change (Chen, et al., 2024). This adaptive capacity enables employees to maintain their ethical aptitude amidst instability, promoting integrity and accountability within organisations

(Bunkaewsuk, et al., 2024). Specifically, emotional resilience involves emotional or psychological stability and emotional intelligence, both of which are essential for stress management, which entails effectively dealing with stressful situations in challenging work environments (Coronado-Maldonado, & Benítez-Márquez, 2023). Emotional stability, a core component of resilience, allows individuals to maintain composure and rational thought under pressure, which can directly influence their moral courage in upholding ethical standards (Bunkaewsuk, et al., 2024). Furthermore, emotional intelligence, which involves understanding and managing one's own emotions and those of others, facilitates the ability to maneuver interpersonal ethical challenges, can encourage pro-social behaviors like organisational citizenship (Chikobvu, & Harunavamwe, 2022).

The relationship between employees' emotional strengths and their commitment to ethics is particularly salient in transitioning economies (Triyono, et al., 2023). Nigeria, a transitioning economy in Sub-Saharan Africa, presents a complex environment where ethical challenges and dilemmas frequently emerge in business operations, particularly within the banking sector. Here, institutional foundations are often still taking shape, leaving room for lack of clarity and different understandings of what's ethically right (Chaudhary, et al., 2025; El-Hassani, et al., 2023). Market forces bring their own set of intense pressures, scarce resources and fierce competition that put ethical boundaries to the test. As cultural and societal values change, they reshape people's views on ethical conduct. Compounding this is the challenge of governance gaps, where insufficient rules or lax enforcement opens doors to ethical pitfalls, casting a shadow of uncertainty over business environment.

The banking sector is significant to economic development, and faces specific ethical pressures including foreign exchange rate manipulation, lack of transparency, consumer exploitation and other corrupt practices. Facing and overcoming these challenges can be dependent on employees' emotional resilience, employee's capacity to manage emotions, cope with stress, and sustain ethical commitment (Antunez, et al., 2023). This study examines the effect of emotional resilience on ethical commitment among employees in Nigeria's banking sector, focusing on the influence of emotional stability, emotional intelligence, and stress management on moral courage, organisational citizenship behavior, and whistleblowing intentions within the context.

Statement of the Problem

Despite recognised importance of ethical conduct, organisations in transitioning economies often struggle with maintaining high ethical standards. This is particularly true in Nigeria's banking sector, where employees encounter substantial ethical pressures. These pressures stem from institutional changes, intense market competition, gap in governance, and broader socio-economic challenges. Weak regulatory frameworks, pervasive corruption, and inadequate ethical infrastructures, often reinforce these challenges and weaken employee's resolve to act ethically.

As a result, bank employees are frequently confronted with ethical dilemmas. This can lead to compromised moral behaviour in the absence of sufficient emotional resources, such as capacity to manage stress, emotional stability, and intelligence. This does not hold in some workplaces where employees are endowed with adequate emotional resources and the enabling culture. Here, employees are able to maintain ethical conducts despite prevailing ethical pressures in a culture that promotes moral courage and proper citizenship behaviours,

However, it is different in some other workplaces where employees are lacking adequate emotional resources and are operating within a culture that hinders ethical conduct. These employees can fall prey when faced with pressures that push them toward unethical actions. For example, manipulating foreign exchange rates or engaging in corrupt practices, and other behaviours that compromise trust and integrity. Such ethical lapses damage organisational reputation, erode stakeholder trust, and hinder sustainable economic development in Nigeria.

This research was carried out to bridge this gap by investigating how emotional resilience fortifies an employee's capacity to uphold ethical commitments, specifically focusing on emotional stability's influence on moral courage, emotional intelligence's role in fostering organisational citizenship behaviour, and the effect of stress management on whistleblowing intentions within these challenging environments.

Objective of the Study

The major objective was to investigate the relationship between emotional resilience and ethical commitment of employees in transitioning economies. Specifically the study examines:

i. The extent of effect emotional stability has on moral courage among employees
ii. Relationship between emotional intelligence and organisational citizenship behavior among employees
iii. The nature of the effect stress management has on whistleblowing intention among employees

Literature

Conceptual Review

Emotional Resilience: Emotional resilience, often characterised as the ability to bounce back from adversity, involves a dynamic process of positive adaptation to challenging life circumstances (Ali, et al., 2022). It enables individuals to maintain psychological well-being and effective functioning despite significant stressors or trauma (Siddiqui, 2021). Key components include emotional stability, which refers to the capacity to remain calm and rational under pressure, and emotional intelligence, referring to perceiving, understanding, and managing emotions effectively (Clercq, & Pereira, 2022). Effective stress management is also another integral component which can equip individuals with coping strategies and preventing burnout, thus sustaining ethical resolve (Davis, 2024).

Resilient workforce can face and overcome turbulent environments better, exhibiting adaptability and problem-solving skills when facing ethical dilemmas (Ali, et al., 2022). This capacity is important in unstable environments as seen in most transitioning economies, where employees encounter complex ethical challenges. Such psychological robustness mitigates stress and uncertainty's corrosive effects on ethical commitment and moral decision-making (Chang, et al., 2024). Psychological capital, encompassing self-efficacy, optimism, hope, and resilience can help employees cope with work-related stress and reduces intentions to leave (Fajrin, et al., 2020). Leadership is one of the factors that can influence employee resilience significantly, Ethical leadership can create a supportive environment, enhancing employees' well-being and ability to manage stressful, ethically ambiguous situations (Ali, et al., 2022).

Ethical Commitment: Ethical commitment denotes an individual's dedication to upholding moral principles and values in professional conduct, extending beyond compliance to proactive integrity

and responsibility (Ali, & Khalifa, 2024; Tormo-Carbó, et al., 2024). It fosters a culture of integrity, vital in transitioning economies with evolving ethical frameworks. This commitment encompasses adherence to ethical codes and voluntary virtuous conduct, acting as a bulwark against pressures compromising integrity. Vital for organisational legitimacy and stakeholder trust in rapidly changing, ethically ambiguous environments, ethical commitment is a cornerstone for sustainable organisational development and societal progress.

Aligning individual values with organisational ethical paradigms cultivates a strong moral compass guiding behaviour without stringent oversight. An organisation's ethical culture correlates with employee and leadership well-being, creating an environment where ethical commitment flourishes and resistance to change lessens (Roy, et al., 2023; Talaja, et al., 2023). This collective commitment fortifies organisations against ethical transgressions, which promotes a resilient, principled workforce (Talaja, et al., 2023).

Transitioning Economies: These economies are marked by substantial changes from centrally planned to market oriented systems. They typically contend with evolving institutional structures and a legacy of informal practices. This combination creates distinct challenges for nurturing and sustaining ethical commitment within organisations (Gammeltoft, & Panibratov, 2024). The regulatory environments in these economies are often unstable, and informal economic activities are widespread, making it essential to understand how individual psychological factors like emotional resilience can shore up ethical conduct amid systemic vulnerabilities.

Transitioning economies often see more exposure to corrupt practices coupled with weak enforcement mechanisms, highlighting the pressing need to cultivate strong ethical commitments among employees. In such contexts, understanding the relationship of emotional resilience and ethical commitment or behaviour could be vital for organisations aiming to promote integrity and maneuver these dynamic landscapes effectively. These countries include but not limited to most African countries, like Nigeria, Ghana, Cameroon, Mali, etc. Asian counties, like China, Vietnam, Cambodia etc. Eastern Europe and Former Soviet Union, such as Poland, Ukrain, Russia Armenia, Azerbaijan, Belarus, Georgia, Kazakhstan, Kyrgyzstan, Moldova, etc.

Emotional Stability and Moral Courage among Employees: This depicts **t**he Courage to Stand Tall**.** At the heart of human dignity lies the capacity to act with moral courage, to speak truth to power, to challenge injustice, and to uphold ethical principles even when it's uncomfortable or risky (Pajestka, & Skałacka, 2025). Emotional stability, a cornerstone of emotional resilience, empowers individuals to get around their inner landscapes with compassion and clarity, allowing them to transform difficult emotions into thoughtful actions (Jagannarayan, 2021). In the often-turbulent contexts of transitioning economies, employees' emotional stability can be the difference between silence and speaking up, between complicity and courage. When people feel emotionally grounded, they are more likely to find the inner fortitude to do wha's right, even in the face of adversity. This internal fortitude is crucial for fostering a work environment where ethical behaviors are prioritised, leading to enhanced employee well-being and a reduction in negative workplace emotions (Saleem, et al., 2022). Moreover, understanding how emotions influence ethical choices and conducts is essencial, as emotional intelligence, including the capacity for self-regulation, can significantly impact an individual's willingness to act morally (Sekerka, & Bagozzi, 2007). This resilience allows them to challenge misconduct and unethical orders, thereby

fostering an environment where ethical principles are upheld (Tanner, & Witt, 2023). Indeed, empirical study suggests that emotional stability is positively correlated with an individual's propensity for moral courage (Tanner, & Witt, 2023). This relationship is particularly relevant in organisational contexts where employees might face ethical dilemmas requiring them to exhibit fortitude despite potential personal or professional repercussions (Comer, & Sekerka, 2017). Based on the foregoing, this Hypothesis was formulated:

H_1: Emotional stability encourages moral courage among employees in transitioning economies,

Emotional intelligence and organisational citizenship behavior among employees: This depicts the power of connection and compassion. Human connections weave the fabric of organisational life. Emotional intelligence denotes the ability to sense, understand, and respond to the emotions of oneself and others which is a vital thread in this tapestry (Mayer, & Salovey, 1997). Emotionally intelligent employees are more attuned to the needs of colleagues, more adept at managing workplace relationships, and more likely to extend themselves in acts of organisational citizenship by going the extra mile, offering support, and contributing to a culture of mutual care (Cote, & Miners, 2006). In transitioning economies, where change can be unsettling, emotional intelligence may be a key to nurturing cooperation, empathy, and a shared sense of purpose. This collective empathy can significantly enhance organisational performance and foster a more harmonious work environment, contributing to improved psychological well-being and mitigating the stresses associated with rapid economic and social transformations (Prasad, et al., 2024). Furthermore, employees who are emotionally intelligent are better equipped to deal with the complexities of interpersonal dynamics, creating a cooperative environment that inherently supports organisational citizenship behaviors, even amidst resource constraints (Santa, et al., 2023). This ability to connect and collaborate not only boosts productivity but also cultivates a resilient organisational culture capable of adapting to unforeseen challenges (Yu, & Takahashi, 2020). Such behaviors are crucial for organisational adaptability and competitive advantage in dynamic environments (Turnipseed, & VandeWaa, 2012).

Indeed, empirical evidence indicates a positive correlation between emotional intelligence and organisational citizenship behavior, suggesting that emotionally intelligent employees are more prone to engage in voluntary actions that benefit their organisation (Santa, et al., 2023; Turnipseed, & VandeWaa, 2012). These authors stressed that this tendency stems from their enhanced capacity for empathy, social awareness, and self-regulation, which enables them to better understand and respond to the needs of their colleagues and the organisation as a whole. It is on this premise that this Hypothesis was formed:

H_2: High Emotional intelligence nurtures organisational citizenship behavior among employees in transitioning economies.

Stress management and whistleblowing intention amongst employees: This depicts finding voice amidst pressure. Whistleblowing is an act of courageous voice which speaks out against wrongdoing, often at personal cost. Managing stress effectively is a human capacity that can empower individuals to take such stands (Lazarus, & Folkman, 1984). When employees can navigate the pressures and fears associated with reporting misconduct, they're more likely to act on their ethical convictions. Stress management is not just about coping; it's also about preserving

one's inner clarity and resolve to do what's right in complex organisational landscapes (Miceli, et al., 2008). In transitioning economies, where ethical challenges may abound, this capacity can make a critical difference. This is particularly importaant given that employees with high emotional intelligence are more likely to exhibit organisational citizenship behaviors (Santa, et al., 2023), which can include pro-social acts like whistleblowing. Whistleblowing in this context means reporting unethical practices, corruption, or other organizational wrongdoings to appropriate authorities, either internally or externally, with the aim of rectifying the issue (Erdoğan, et al., 2022). The ability to manage stress effectively, therefore, can be a key determinant in an employee's decision to blow the whistle, as it mitigates the psychological burden associated with such actions.

This is further supported by findings that indicate a positive correlation between psychological capital, encompassing emotional intelligence, and organisational citizenship behavior (Prasad, et al., 2024), alongside its moderating effect on occupational stress and OCB (Aderibigbe, & Mjoli, 2019). This suggests that effective stress management, by enhancing an individual's capacity to process and respond to stressors, contributes significantly to their willingness to engage in ethically demanding actions such as whistleblowing, especially in environments where such actions carry substantial personal risk. Based on the above, this Hypothesis was formulated:

H_3: Effective stress management strengthens employees' intention to engage in whistleblowing in transitioning economies.

Theoretical Review

The study leaned on these theories for support: Social Cognitive Theory, which posits that individuals learn ethical behaviors through observation and modeling, and the Conservation of Resources theory, which explains how individuals strive to retain, protect, and build resources, thereby influencing their capacity for appropriate ethical conduct amidst stress. Additionally, the Social Exchange Theory helped to understand the reciprocal relationships between employees and organisations, influencing ethical behaviors.

Social Cognitive Theory (SCT): SCT, pioneered by Bandura, suggests that individuals learn behaviours by observing others, especially leaders (Bunkaewsuk et al., 2024). In organisations, leadership shapes the ethical landscape; employees adopt ethical behaviours when leaders uphold moral standards (Ashfaq, et al., 2021). Ethical leadership influences employees' ethical commitment and resilience, particularly in transitioning economies (Saleem, et al., 2024; Ali, et al., 2022).

SCT lends support to the study, For instance, SCT's self-regulation aspect (Antunez, et al., 2023) implies that emotionally stable individuals may exhibit greater moral courage, aligning with the objective on emotional stability's effect on moral courage. Through SCT's observational learning (Ashfaq, et al., 2021), employees with higher emotional intelligence might model positive behaviours like organisational citizenship behaviour, linking to the second objective. Also, SCT's self-efficacy (El-Hassani, et al., 2023) suggests effective stress management could enhance willingness to act ethically like whistleblowing, per the objective, stress management and whistleblowing intention.

The elements of SCT: self-regulation, observational learning, self-efficacy therefore provide a framework understanding how emotional resilience aspects (emotional stability, emotional intelligence, stress management) relate to ethical outcomes like moral courage, organisational citizenship behaviour, and whistleblowing intention. Reciprocal determinism, interaction of personal, behavioural, and environmental factors shapes ethical choices (Kampmann, & Pedell, 2022).

Conservation of Resources theory: This theory, developed by Hobfoll, posits that individuals strive to obtain, retain, protect, and build resources, which can be personal (e.g., self-esteem, emotional regulation skills), social (e.g., social support, strong relationships), or material (e.g., financial stability, job security). In the context of ethical commitment, this theory suggests that employees with greater access to resources, such as emotional stability and social support, are better equipped to cope with stressors and ethical dilemmas, thereby sustaining their moral courage (Bunkaewsuk, et al., 2024). Conversely, a depletion of these resources can increase vulnerability to unethical behavior, highlighting the critical role of resource management in fostering ethical resilience. This perspective illuminates how organizations can bolster ethical commitment by providing employees with adequate resources, fostering a supportive environment, and developing interventions aimed at preventing resource depletion, especially within the volatile landscapes of transitioning economies.

Furthermore, the theory underscores that resource gain spirals can enhance an individual's capacity for pro-ethical behavior, while resource loss spirals can lead to burnout and a diminished capacity for ethical conduct (Bunkaewsuk, et al., 2024). This theoretical lens is particularly relevant for understanding how emotional resilience, as a critical personal resource, enables employees to overcome ethical pressures without compromising their values, thus reinforcing their ethical commitment in challenging contexts. It also emphasises the importance of resource caravans, where resources are interdependent and travel together, reinforcing each other in promoting ethical conduct and organisational well-being. Drawing from this, the preservation and enhancement of emotional resources become paramount for sustaining ethical integrity within dynamic organisational settings.

Social Exchange Theory: Social Exchange Theory posits social behaviour results from an exchange process which aims to maximise benefits and minimise costs. In the context of this study's objectives on emotional resilience and ethical commitment in transitioning economies: Employees' emotional resilience might influence how they perceive exchanges with their organisation. Emotional stability, intelligence, and stress management could shape their evaluation of organisational fairness and reciprocity. Ethical commitment is fostered when employees perceive their organisation values moral contributions and reciprocates with supportive policies and a just environment (Cheng, et al., 2022; Santiago-Torner, et al., 2024), which relates to ethical commitment.

In furtherance, emotional stability and moral courage: Perceived organisational justice (via Social Exchange Theory) might reinforce emotionally stable employees' moral courage through positive reciprocity. Emotional intelligence and organisational citizenship behaviour: Employees with higher emotional intelligence might better navigate social exchanges, perceiving fairness and exhibiting citizenship behaviour in response to organisational support. Stress management and

whistleblowing intention: Effective stress management could enable employees to engage in ethical actions like whistleblowing when they perceive organisational exchanges as fair and supportive, per Social Exchange Theory's reciprocity aspect (Rahaman, et al., 2020). Ethical leadership offering positive exchanges fosters commitment and reduces resistance to ethical directives (Rahaman, et al., 2020), which is relevant in transitioning economies where trust and reciprocity matter.

Empirical Review & Gap

There's a noticeable gap in research examining how emotional resilience and ethical commitment play out in transitioning economies such as Nigeria where the economic environment is constantly changing and institutions are evolving. Though theoretical frameworks provide information, but there is need to investigate more into the unique challenges of these economies, like unstable institutions, markets that fluctuate rapidly, and regulations still taking shape, all of which likely shape how employees' emotional resilience connects with their ethical conduct. The cultural and local ethical frameworks in these contexts also make a big difference to how emotional resilience influences ethical commitment. Examining these context-specific factors matters if we want to craft interventions and policies that actually boost ethical behaviour and build resilience in these dynamic environments.

Specifically, there is paucity of research on how emotional stability ties into moral courage. The relationship between emotional intelligence and organisational citizenship behavior, as well as how stress management affects whistleblowing intentions in Nigeria and other countries with transitional settings. This research aims to close the gap of by presenting current empirical evidence on the correlation between emotional resilience and ethical commitment with these constructs. This research help bridge the gap between theory and practices for organisations in transitioning economies.

Methodology

This study employed a survey research design to investigate the effect of emotional resilience on ethical commitment in the Nigerian banking sector. Specifically, the study focused on the Deposit Money banks in Enugu metropolis. The study population consisted of employees in the major DMBs with international presence, totaling 590. A sample size of 234 was determined from the total population using Krejcie and Morgan (1970) table. Structured survey questionnaire was used to collect quantitative data which was randomly administered to respondents. A total of 225 valid questionnaires were retrieved from a distribution of 234 across the DMBs, indicating a 96% response rate and forming the empirical basis for the data analysis. Partial Least Squares-Structural Equation Modelling (PLS-SEM) was used to analyse the research hypotheses after the measurement model was assessed, the analyses were carried out with the aid of ADANCO 2.3.1.

Results

Structural Model Assessment (Hypotheses Testing)

H_1: Emotional stability promotes moral courage among employees in transitioning economies,

H_2: High Emotional intelligence supports organisational citizenship behavior among employees in transitioning economies

H_3: Effective stress management strengthens employees' whistleblowing intentions in transitioning economies.

Table 1: Structural Model & Effect Sizes

Hypotheses	β	SE	t-value	p-value	f^2
H1: ES → MC (moral courage)	0.40	0.08	5.00	0.000	0.19
H2: EI → OCB (citizenship behavior)	0.35	0.07	5.00	0.000	0.15
H3: SM → WBI (whistleblowing)	0.45	0.07	6.43	0.001	0.22

The results from testing of the hypothesis indicate significant positive relationships between the independent variables and their respective dependent variables. For **H_1**, Emotional Stability (ES) has a strong positive effect on employees Moral Courage (MC), with a standardized path coefficient (β) of 0.40. The associated t-value of 5.00 and p-value of 0.000 indicating that this effect is statistically significant at the 0.00 level. The effect size (f^2) of 0.19 suggests a moderate practical impact of ES on MC, which confirms that ES promotes MC.

For H_2 shows that Emotional Intelligence (EI) positively influences Organisational Citizenship Behaviour (OCB) with a path coefficient of 0.35. The t-value of 5.00 and p-value of 0.000 which confirm the significance of this relationship. The effect size (f^2) of 0.15 points to a small-to-moderate effect, indicating that EI contributes reasonably to employees' citizenship behaviour.

Correspondingly**, H_3**, Stress Management (SM) significantly affects employees' Whistleblowing Intentions (WBI) with a path coefficient of 0.45. The t-value of 6.43 and p-value of 0.001 demonstrate strong statistical support for the hypothesis. The effect size (f^2) of 0.22 shows a moderate influence of stress management on employees' whistleblowing intents.

Generally, these findings confirm that emotional resilience dimensions of emotional stability, emotional intelligence, and stress management have statistically significant positive effects on the different aspects of ethical commitment, supporting the theoretical expectations and justifying the importance of emotional resilience in enhancing ethical commitment amongst employees.

Discussion

Hypothesis 1 (H_1): Emotional stability promotes moral courage among employees

The findings confirmed a strong positive correlation between Emotional Stability (ES) and employees' Moral Courage (MC) ($\beta = 0.40$, $p < 0.001$). This aligns with studies by (Gogia, et al., 2024; Hannah, et al., 2011; Khoshmehr, et al., 2020; Tanner, & Witt, 2023), all of whom found that emotional stability promotes moral courage in employees. The study by (Sean, et al. 2011; Rubab, et al., 2023) further supports this, highlighting how employees who are emotionally resilient can act with integrity and conviction against all odds. Also, collaborating with the study, (Gogia, et al., 2024) suggested that ethical stability gives employees moral courage which in turn enables employees to act ethically, resist unethical pressures, and promote pro-social behaviors, promoting a culture of integrity and responsible conduct. The moderate effect size ($f^2 = 0.19$) suggests that emotional stability can significantly instigate moral courage of employees in Nigerian banks addressing inefficiencies noted in (Hannah, et al., 2011).

Hypothesis 2 (H_2): High Emotional intelligence supports organisational citizenship behavior among employees

The results demonstrated that high emotional intelligence (EI) significantly improves organisational citizenship behaviour among employees (OCB) ($\beta = 0.35$, $p < 0.001$). This

supports the works of (Aderibigbe, & Mjoli, 2019; Alsughayir, 2020; Robinson, et al., 2023; Santa, et al., 2023; Turnipseed, & VandeWaa, 2012), who found that emotionally intelligent employees conduct themselves in proper OCB. In Nigeria, lack of organisational virtuousness which is an element of emotional intelligence restrains employees from conducting themselves in proper citizenship behaviour and hinders their proactiveness in promoting the right OCB. The small-to-moderate effect size ($f^2 = 0.15$) indicates that while emotional intelligence is impactful, socio-economic and political issues such as economic instability, corruption, inequality, and institutional weaknesses may limit employees' citizenship behaviours (Bunkaewsuk, et al., 2024). Furthermore, (Gupta, 2012) submitted that employees with higher emotional intelligence are more inclined to engage in individual initiatives, personal industry, and loyal boosterism, thereby enhancing overall organisational effectiveness, which aligns with our study.

Hypothesis 3 (H_3): Effective stress management strengthens employees' whistleblowing intents

A significant positive relationship was found between Stress Management (SM) and employees' Whistleblowing intents (WB) ($\beta = 0.45$, $p < 0.001$). This echoes the works of (Prasad, et al., 2024; Rubab, 2023; Khan, et al., 2022; Khusnah, 2020) who argued that ability of employees to manage stress emanating from turbulent business environment strengthens the employees' whistleblowing intents and ability to support ethical vigilance and accountability. Most workplaces in transitioning economies have employees who are still hesitant to report misconduct (Seeler, 2019), the stress and level of corruption and socio economic challenges incite fear in them and make them shy away from whistleblowing (Hanifah, & Clyde, 2022; Ogunyemi, 2013; Seeler, et al., 2019). The moderate effect size ($f^2 = 0.22$) underscores the need for inculcating ethical resources in employees to nurture their intentions for whistleblowing (Rubab, et al., 2023).

Conclusion

Based on the results, the study conclude that emotional resilience is a key factor in promoting ethical commitment in Nigerian economy and other transitioning economies. Being emotional resilient, especially able to manage stress, emotionally stable and intelligent, employees can remain ethically committed to their organisations despite the overwhelming presence of compromising factors such as ethical dilemmas incited by socio-economic and political issues, economic instability, corruption, inequality, and institutional weaknesses.

Recommendations

Based on these findings, the study recommends thus:

i. organisations and policymakers should encourage and prioritise initiatives that build emotional resilience, such as training programs and stress management workshops, which can foster a culture of ethics and responsibility.
ii. In addition, management of banks and other businesses should prioritise emotional stability, emotional intelligence, and stress management to promote moral courage and ethical decision-making.

Office Digitalization and Administrative Efficiency in selected Firms in Delta State, Nigeria

Onojaife Caroline
Department of Office and Information Management, Faculty of Administration and Management, Delta State University of Science and Technology
carolineonojaife@gmail.com
08035212490

Abstract
This study examines office digitalization and administrative efficiency in selected firms in Delta State, Nigeria. The increasing adoption of digital technologies in administrative processes has the potential to enhance operational efficiency, reduce errors, and improve communication within organizations. This research focuses on three key technological tools: Automated Workflow Systems (AWS), Electronic Records and Document Management (ERDM), and Online Communication Platforms (OCP), and investigates their influence on administrative efficiency (AE). These led to three research questions being raised and three hypotheses being postulated. The study employed descriptive design with a population of 793 from which as sample size of 260 obtained using the Krejcie and Morgan (1970) sample size calculation. The data collection was done through structured questionnaires tested for 0.79 reliability Alpha. From 260 questionnaire copies administered, 213 respondents from 15 firms across three senatorial districts of Delta State participated in the study, and the analysis was based on descriptive statistics, correlation, and multiple regression techniques. The findings revealed that all three digital tools had a statistically significant positive effect on AE at β= 0.305; β=0.178; 0.578 respectively, with OCP having the most substantial effect. Based on the findings, it is recommended that firms in Delta State invest in advanced digital solutions, train employees, and develop a conducive environment for technology adoption to improve organizational performance..

Keywords*: Office digitalization, administrative efficiency, automated workflow systems, electronic records management, online communication platforms,*

Introduction

The digital transformation of administrative operations has become an indispensable trend in both public and private organizations worldwide. With the advent of advanced technologies, office environments are shifting from traditional manual systems to more automated and digital platforms, a process widely referred to as office digitalization. Office digitalization involves the integration of digital technologies such as automated workflow systems, electronic records management, and online communication tools into administrative processes to enhance operational efficiency and service delivery (Kraus et al., 2022). This transition is not merely a technological shift but a strategic move toward organizational excellence, cost-effectiveness, and competitiveness in an increasingly digital economy.

In the Nigerian context, especially among firms in Delta State, office digitalization is progressively gaining attention. As organizations strive to streamline operations, reduce paperwork, and improve productivity, the adoption of technologies such as cloud computing, enterprise resource planning (ERP) systems, and digital communication platforms has become essential (Uzonwanne & Ezeani, 2021). However, despite the growing trend, many firms still grapple with challenges such as inadequate ICT infrastructure, digital literacy gaps, and resistance to change, which hinder the effective implementation of digital systems in administrative functions. These limitations can impede the realization of administrative efficiency, defined as the ability to deliver accurate, timely, and cost-effective support services within an organization.

The significance of administrative efficiency in organizational performance cannot be overstated. Efficient administrative systems ensure that core support activities such as recordkeeping, correspondence, and interdepartmental coordination are executed swiftly and accurately, thereby enabling managers to make informed decisions and respond promptly to internal and external demands. Digital tools such as automated workflow systems help eliminate redundancy, reduce manual errors, and accelerate routine tasks (Matarazzo et al., 2021). Similarly, electronic document management ensures secure storage and quick retrieval of information, while online communication platforms enable seamless interaction across departments and with external stakeholders.

Although several studies have emphasized the benefits of digitalization, the specific influence of its components—automated workflows, digital records, and online communications—on administrative efficiency in Nigerian firms remains underexplored. Previous research has mostly focused on the broad concept of digital transformation or e-governance, often overlooking the administrative back-office functions that form the backbone of organizational operations (Afolayan & Ehikioya, 2022; Okon et al., 2023). In Delta State, where many firms are transitioning toward digital operations, there is a pressing need for empirical insights into how digitalization impacts administrative functions and overall organizational effectiveness.

Therefore, this study seeks to investigate the relationship between office digitalization and administrative efficiency in selected firms in Delta State, Nigeria. By focusing on key proxies such as automated workflow systems, electronic records and document management, and online communication platforms, the research aims to provide evidence-based recommendations for improving administrative efficiency through digital technologies.

Statement of the Problem

Despite the increasing adoption of digital technologies in organizational settings, many firms in Delta State, Nigeria, still struggle to achieve significant improvements in administrative efficiency, raising concerns about the actual impact of office digitalization. While tools such as automated workflow systems, electronic records management, and online communication platforms are designed to streamline operations and reduce redundancies, their implementation often faces setbacks due to inadequate infrastructure, low digital literacy, and inconsistent usage. As a result, administrative tasks remain time-consuming, error-prone, and resource-intensive, thereby undermining the anticipated benefits of digital transformation. This gap between technological adoption and administrative performance underscores the need to critically assess how specific

components of office digitalization influence administrative efficiency within the unique operational environment of selected firms in Delta State.

Objective of the Study

The main objective of this study is to examine the effect of office digitalization on administrative efficiency in selected firms in Delta State, Nigeria while the specific objectives of the study are to:

i. determine the effect of automated workflow systems on administrative efficiency in selected firms in Delta State.
ii. examine the effect of electronic records and document management on administrative efficiency in selected firms in Delta State.
iii. assess the effect of online communication platforms on administrative efficiency in selected firms in Delta State.

Research Questions

The following questions were raised for the study:

i. To what extent do automated workflow systems affect administrative efficiency in selected firms in Delta State?
ii. How does electronic records and document management influence administrative efficiency in selected firms in Delta State?
iii. What is the effect of online communication platforms on administrative efficiency in selected firms in Delta State?

Research Hypotheses

The following hypotheses were postulated for the study:

H_{01}: Automated workflow systems have no significant effect on administrative efficiency in selected firms in Delta State, Nigeria.

H_{02}: Electronic records and document management have no significant effect on administrative efficiency in selected firms in Delta State, Nigeria.

H_{03}: Online communication platforms have no significant effect on administrative efficiency in selected firms in Delta State, Nigeria.

Significance of the Study

The significance of this study lies in its potential to provide valuable insights into the role of office digitalization in enhancing administrative efficiency within firms in Delta State, Nigeria. As businesses increasingly adopt digital tools to streamline operations, this research will offer empirical evidence on how specific digital practices—such as automated workflow systems, electronic records management, and online communication platforms—directly impact the effectiveness of administrative functions. The findings will contribute to the understanding of digital transformation in Nigerian firms, helping decision-makers, policymakers, and business leaders make informed decisions about investing in and implementing digital technologies. Additionally, the study may serve as a foundation for further research on the broader implications of office digitalization in improving organizational performance in emerging economies.

Review of Related Literature

The conceptualization of this study revolves around the integration of digital technologies into office operations, which is central to the concept of office digitalization. Office digitalization encompasses the adoption of various digital tools to streamline administrative functions, improve efficiency, and reduce human error. Key components of office digitalization include automated workflow systems, electronic document management, and online communication platforms, all of which aim to enhance organizational performance by optimizing administrative processes (Bharadwaj, 2021). Digital workflows automate repetitive tasks, while electronic records management systems facilitate efficient document storage and retrieval (Huang & Hu, 2022). Furthermore, online communication platforms enhance collaboration and information exchange, contributing to faster decision-making and improved organizational coordination (Sutanto et al., 2023). As businesses in both developed and developing economies, including Nigeria, embrace these digital tools, understanding their impact on administrative efficiency becomes crucial for maximizing their potential benefits (Alvarez & Lanza, 2020; Nweke et al., 2022). This conceptual framework will guide the investigation of how these technological tools specifically influence administrative functions in Nigerian firms.

Automated Workflow Systems

Automated workflow systems have become a crucial element in optimizing administrative operations by automating routine processes, reducing human intervention, and enhancing organizational efficiency. These systems enable organizations to streamline tasks such as approval routing, task assignments, and data processing, resulting in faster execution times and fewer errors (Tirado & Cabezas, 2023). The implementation of automated workflows has been shown to reduce operational costs and improve accuracy by replacing manual processes with standardized and repeatable digital tasks (O'Donoghue et al., 2022). This transformation not only accelerates operational efficiency but also enhances service delivery in sectors such as finance, healthcare, and education (Barbosa et al., 2023). The adoption of Artificial Intelligence (AI) further supports workflow automation by optimizing decision-making processes through data-driven insights and predictive analytics, ensuring that tasks are completed with minimal human input (Sánchez et al., 2023).

Recent research indicates that automated workflow systems lead to measurable improvements in both efficiency and productivity. For instance, companies have reported a reduction in document processing time by up to 60% (Olmstead & Turner, 2023). Moreover, these systems allow businesses to track tasks in real-time, ensuring that workflow processes are continuously monitored and optimized (Peterson et al., 2023). Automated workflows also contribute to better employee satisfaction by eliminating repetitive and mundane tasks, allowing workers to focus on higher-value activities. As a result, employees experience greater engagement and productivity (Akerlof et al., 2022). Therefore, the integration of automated workflow systems is becoming a strategic priority for organizations seeking to enhance both internal operations and customer satisfaction.

Electronic Records and Document Management

Electronic Records and Document Management Systems (EDMS) have transformed how organizations handle vast amounts of information by providing a secure and efficient way to store, retrieve, and manage digital records. These systems allow businesses to reduce physical storage

needs, improve document retrieval times, and enhance collaboration across departments (Eromafuru & Omoye, 2022; Mohammad et al., 2023). The implementation of EDMS facilitates better compliance with regulatory requirements by providing secure access controls, automated document workflows, and audit trails that track document access and modifications (Briggs et al., 2023). Recent studies highlight that organizations using EDMS have improved operational efficiency by over 50%, particularly in industries where rapid access to documentation is crucial (Devaraj et al., 2022). This shift not only improves workflow speed but also reduces the risks associated with lost or misfiled paper records, which can be costly and time-consuming to resolve (Zhang et al., 2022).

Moreover, the integration of machine learning (ML) and artificial intelligence (AI) into EDMS has significantly enhanced the capability of these systems to manage large volumes of data. These technologies enable advanced features such as automated document categorization, data extraction, and advanced search functions, which save time and reduce human errors in document handling (Brown et al., 2022). Furthermore, cloud-based EDMS solutions offer flexible and scalable storage options, enabling organizations to easily expand their document management capabilities as they grow (Jin et al., 2023). As businesses increasingly generate vast quantities of digital content, the role of EDMS becomes more critical in ensuring that organizations maintain control over their information while complying with data privacy regulations (Peterson et al., 2023).

Online Communication Platforms

Online communication platforms have significantly changed how organizations interact internally and externally, enabling real-time communication regardless of geographical barriers. These platforms, including email, instant messaging, and video conferencing tools, facilitate rapid exchange of information and foster collaboration among teams, especially in remote and hybrid work environments (Thompson & Richards, 2022). According to a recent study by Nguyen et al. (2023), organizations that utilize integrated communication platforms report a 30% increase in employee collaboration and a 25% reduction in response time to business inquiries. These tools also enhance transparency by providing accessible conversation histories, which help track progress on tasks and projects (Eromafuru & Omoye, 2022; Parker et al., 2023). The use of platforms like Slack, Microsoft Teams, and Zoom has revolutionized communication workflows by providing more interactive and immediate solutions for teamwork (Goh et al., 2023).

Furthermore, the seamless integration of communication platforms with other enterprise systems, such as customer relationship management (CRM) and project management tools, enables better coordination and data-sharing across departments (Harrison et al., 2023). As digital collaboration becomes more critical in a globalized work environment, businesses are increasingly investing in communication platforms that support asynchronous work, allowing teams to collaborate across time zones efficiently (Nguyen et al., 2023). These platforms also promote a more inclusive work culture by enabling participation from all team members, regardless of location, which is vital for employee engagement and retention (Riley & Larkin, 2023). As the demand for digital communication tools continues to rise, their role in enhancing administrative efficiency cannot be overstated.

Conceptual Framework

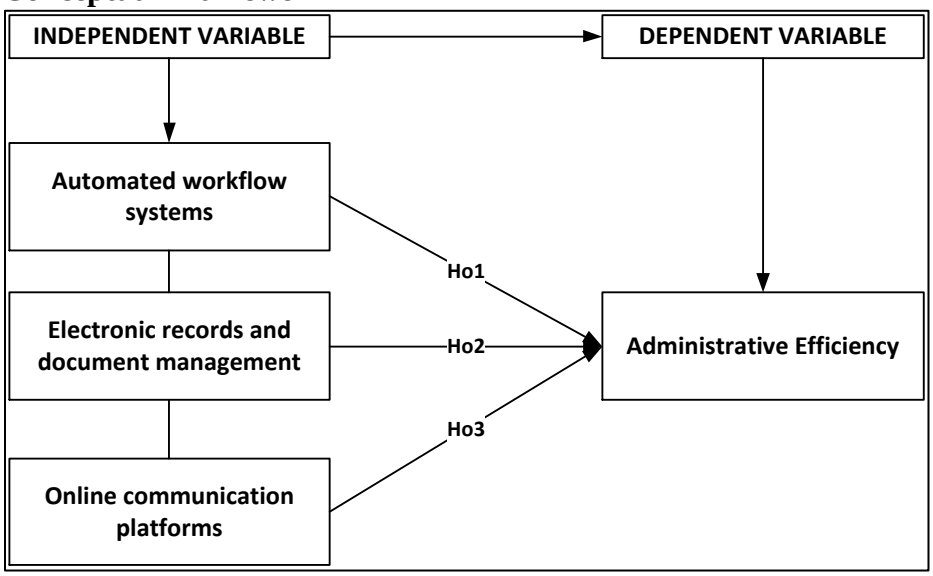

Fig. 1: Conceptual Framework for office digitalization and administrative efficiency. (Source: Researcher's construct, 2025)

Theoretical Review

One recent theory on which the study of Office Digitalization and Administrative Efficiency can be based is the Technology-Organization-Environment (TOE) Framework. This theory, proposed by Tornatzky and Fleischer (1990), has been widely used to explain the adoption and implementation of technological innovations in organizations. The TOE framework posits that three key factors—technological, organizational, and environmental—influence the adoption and effective use of technology in organizations.

In the context of office digitalization, the technological context refers to the availability and suitability of digital tools like automated workflow systems, electronic records management, and online communication platforms. The organizational context includes factors such as organizational culture, structure, resources, and leadership that support or hinder digital transformation. The environmental context focuses on external pressures such as industry trends, competition, and regulatory requirements, which can affect the adoption of office digitalization tools.

Recent studies have applied the TOE framework to explore digital adoption in various sectors. For instance, a study by Turgut and Tanik (2023) used the TOE framework to examine the factors influencing the adoption of cloud computing and digital workflows in small and medium-sized enterprises (SMEs). The theory provides a comprehensive lens through which to examine how organizations in Delta State, Nigeria, may adopt office digitalization tools to improve administrative efficiency.

Empirical Review

A recent study by Al-Shboul and Al-Banna (2023) examined the impact of automated workflow systems on organizational efficiency in the public sector. The study revealed that organizations that adopted automated workflows experienced significant improvements in operational speed and

accuracy. The automation of routine tasks such as document approval and data entry led to a 25% reduction in processing time and a 40% reduction in human error. The findings suggest that automated workflow systems can help public institutions improve their administrative efficiency and enhance overall service delivery.

In the private sector, a study by Li et al. (2022) focused on the relationship between workflow automation and employee productivity. The research found that automated workflows not only reduced manual labor but also allowed employees to concentrate on higher-value tasks. The survey conducted among 500 employees in tech companies showed a 30% increase in productivity after the introduction of automated workflows. Furthermore, employees reported greater job satisfaction as they were able to spend less time on repetitive tasks.

A study by Wong et al. (2022) explored the role of electronic records management in improving compliance within healthcare organizations. The findings revealed that the implementation of electronic document management systems (EDMS) enhanced the ability of healthcare providers to comply with regulatory requirements such as HIPAA (Health Insurance Portability and Accountability Act). The study found that digital records management reduced errors in patient data entry and improved the efficiency of audit processes, resulting in a 15% increase in compliance rates. A study by Shah et al. (2023) examined the impact of electronic document management systems (EDMS) on operational costs in the manufacturing industry. Their findings indicated that EDMS could reduce the costs associated with paper document storage, retrieval, and distribution by up to 40%. The study, which focused on five manufacturing firms, found that the digitization of documents led to better resource allocation, with employees spending less time on administrative tasks and more on core operational activities.

In the financial services sector, a study by Ghosh et al. (2022) analyzed how automated workflow systems contributed to efficiency gains. The research, conducted across 12 major banks in India, revealed that automation significantly improved transaction processing speed, reduced fraud risks, and enhanced compliance monitoring. Specifically, the automation of document processing and approval workflows cut processing time by 35%, helping banks meet customer demands more efficiently. A study by Taylor and Reed (2023) investigated the effect of electronic document management systems (EDMS) on collaboration in organizations. The research found that EDMS facilitated better collaboration among teams by providing centralized access to documents and enabling real-time editing. This led to a 22% improvement in project completion time and a 19% increase in team communication efficiency. The study highlighted that easy access to shared digital documents removed barriers to effective teamwork. Zhang et al (2022) focused on the impact of online communication platforms (such as Slack, Teams, and Zoom) on remote work productivity. The research, conducted across 15 multinational companies, found that the use of these platforms improved real-time communication and collaboration, leading to higher employee productivity. The results indicated that companies with integrated communication platforms saw a 28% improvement in the ability to meet deadlines and a 32% increase in team satisfaction.

A study by Clark and Patel (2023) analyzed how cloud-based online communication platforms impacted employee engagement in remote work settings. The research found that these tools fostered a sense of belonging and connection, despite physical distances. Employee engagement levels increased by 35%, and retention rates improved by 20% in organizations that used cloud-

based platforms for regular communication and virtual team-building activities. Silva et al. (2023) examined the role of online communication tools in enhancing customer service operations. The research focused on e-commerce businesses and found that the use of real-time chat, AI chatbots, and automated email responses improved customer service efficiency by 40%. The integration of communication platforms allowed customer service teams to handle more inquiries simultaneously, thereby reducing response times and improving customer satisfaction.

A study by Cho and Lee (2023) investigated how digital records management contributes to enhancing workplace security. By examining data from 50 organizations in South Korea, the study found that the implementation of digital records systems, complete with encryption and access controls, reduced the risk of data breaches by 40%. Moreover, the ability to audit and monitor access to sensitive information further strengthened security measures and protected organizations from external and internal threats. Reynolds et al. (2022) explored the challenges and benefits of adopting automated workflow systems in public sector organizations. Their research indicated that while the adoption rate was initially slow due to budgetary constraints and resistance to change, public organizations that adopted automation achieved a 27% increase in service delivery speed and a 15% reduction in errors related to data entry and document processing. The study concluded that automation is crucial for enhancing public sector efficiency.

Summary of Literature and Gap

The reviewed literature provides substantial evidence that office digitalization tools—such as automated workflow systems, electronic records and document management, and online communication platforms—significantly improve administrative efficiency across various sectors by reducing operational costs, enhancing data accuracy, and promoting collaboration. While these studies underscore the benefits of digital transformation, most of the existing research has focused on technologically advanced environments in developed nations, with limited attention to how these digital tools affect administrative operations in developing contexts like Delta State, Nigeria. This creates a research gap in understanding the localized challenges, adoption barriers, and contextual outcomes of digitalization in firms operating within such environments. Therefore, this study seeks to fill that gap by empirically examining the effect of office digitalization on administrative efficiency in selected firms in Delta State, Nigeria.

Methodology

The study adopted a descriptive survey research design, which enabled the researcher to collect quantitative data from a cross-section of respondents without manipulating variables. This design was deemed appropriate for examining the effect of office digitalization—represented by automated workflow systems, electronic records and document management, and online communication platforms—on administrative efficiency in organizational settings. The population of the study consisted of 798 employees drawn from 15 purposively selected firms, with five firms each chosen from the three senatorial districts of Delta State: Delta North, Delta Central, and Delta South. The firms were selected based on their active use of digital tools in administrative operations. The sample size was determined using the Krejcie and Morgan (1970) sample size determination table, which recommends a sample size of 260 for a population of 798. A stratified random sampling technique was employed to ensure proportional representation of employees across different firms and senatorial districts.

The data for the study were sourced primarily from structured questionnaires administered to selected respondents within the firms. The research instrument was carefully developed to measure the level of implementation and perceived impact of digital tools on administrative processes. To ensure validity, the questionnaire was subjected to expert review in the fields of organizational behavior and information systems, ensuring that it adequately covered the study variables. The reliability of the instrument was tested using Cronbach's Alpha, which yielded a reliability coefficient of 0.79, indicating an acceptable level of internal consistency. The questionnaires were distributed and retrieved with the help of trained research assistants. Data collected were analyzed using descriptive statistics such as frequency, mean, and standard deviation, while inferential statistics, specifically multiple regression analysis, were used to test the research hypotheses and determine the extent to which office digitalization influences administrative efficiency in the selected firms. EViews 9.0v was the statistical software employed.

Model Specification

The model for the study are as follows:

Functional form of the model specification: $\boldsymbol{AE = f(AWS, ERDM, OCP)}$

The relationship can be represented in a linear regression form as:

$$\boldsymbol{AE=\beta_0+\beta_1 AWS+\beta_2 ERDM+\beta_3 OCP+\mu}$$

Where:

AE = Administrative Efficiency
AWS = Automated Workflow Systems
ERDM = Electronic Records and Document Management
OCP = Online Communication Platforms
β_0 *= Intercept*
β_1,β_2,β_3 *= Coefficients of the respective independent variables*
μ *= Error term*

Result

This section presents the results of the data analysis conducted to examine the effect of office digitalization on administrative efficiency in selected firms in Delta State, Nigeria. The findings are based on responses from 213 returned questionnaires and were analyzed the result being presented as follows:

Table 1 Questionnaire Distribution Analysis

Questionnaire	Frequency	Percentage
Returned	213	81.92%
Unreturned	39	15.00%
Unusable	8	3.08%
Total distributed	260	100%

fieldwork, 2025

Table 1 presents the distribution analysis of the administered questionnaires. Out of a total of 260 questionnaires distributed across the selected firms, 213 were successfully retrieved and found usable, representing a high response rate of 81.92%, which enhances the reliability of the data collected. Meanwhile, 39 questionnaires (15.00%) were not returned, and 8 questionnaires (3.08%)

were returned but deemed unusable due to incomplete or invalid responses. The high rate of valid returns indicates that the majority of the respondents actively participated in the study, thereby providing a solid foundation for meaningful analysis and interpretation.

Table 2: Mean Respondents to Item Questions

				n=213
S/N	**Item Question**	**Mean**	**Std**	**Remark**
	Automated Workflow Systems			
1	Tasks within the organization are processed using automated systems.	3.72	1.26	Agree
2	Approval processes in the organization are handled digitally.	3.88	1.14	Agree
3	The workflow system reduces time spent on routine administrative duties.	3.77	1.21	Agree
4	Errors in task processing have reduced due to automation.	3.77	1.23	Agree
5	Automated systems ensure timely task reminders and follow-ups.	3.92	1.09	Agree
	Mean Aggregate	**3.81**	**1.17**	**Agree**
	Electronic Records and Document Management			
6	Documents are stored and retrieved electronically in the organization.	3.64	1.19	Agree
7	The record management system ensures easy access to administrative data.	3.77	1.28	Agree
8	Electronic filing has replaced manual paper documentation.	3.66	1.26	Agree
9	Data loss risks have decreased with the use of digital storage.	3.59	1.33	Agree
10	Document version tracking is supported through electronic systems.	3.69	1.27	Agree
	Mean Aggregate	**3.67**	**1.25**	**Agree**
	Online Communication Platforms			
11	Meetings are frequently held using online communication tools.	3.53	1.33	Agree
12	Staff members collaborate through digital messaging platforms.	3.67	1.37	Agree
13	Communication across departments is faster through online platforms.	3.80	1.29	Agree
14	Feedback and instructions are given through emails or chat tools.	3.68	1.36	Agree
15	Online communication tools are reliable for daily administrative tasks.	3.78	1.29	Agree
	Mean Aggregate	**3.69**	**1.30**	**Agree**
	Administrative Efficiency			

16	Tasks and assignments are completed within expected timeframes.	3.70	1.36	Agree
17	Administrative processes are carried out with minimal errors.	3.82	1.24	Agree
18	Internal coordination among departments is smooth and effective.	3.67	1.42	Agree
19	The quality of administrative service delivery is consistently high.	3.71	1.36	Agree
20	Resource utilization in administrative tasks is optimized.	3.66	1.35	Agree
	Mean Aggregate	**3.71**	**1.33**	**Agree**

Field-survey, 2025

The descriptive statistics presented in Table 2 reveal respondents' perceptions of the components of office digitalization and their influence on administrative efficiency across selected firms in Delta State. For the Automated Workflow Systems, all item statements received positive responses with mean values ranging from 3.72 ± 1.26 to 3.92 ± 1.09. The highest agreement was on the statement that automated systems ensure timely task reminders and follow-ups (3.92 ± 1.09), while the lowest was on the use of automation for general task processing (3.72 ± 1.26). The overall mean aggregate of 3.81 ± 1.17 indicates a general agreement among respondents that automation plays a significant role in improving workflow efficiency.

Similarly, under Electronic Records and Document Management, all items were positively rated, with mean values ranging from 3.59 ± 1.33 to 3.77 ± 1.28. The statement regarding the system ensuring easy access to administrative data was most agreed upon (3.77 ± 1.28), while the perception that data loss risks have decreased had the lowest mean score (3.59 ± 1.33). The mean aggregate of 3.67 ± 1.25 suggests that respondents agree that electronic records management contributes positively to organizational operations and data handling.

For Online Communication Platforms, the respondents' views also leaned positively, with mean scores ranging from 3.53 ± 1.33 to 3.80 ± 1.29. The highest agreement was observed in the belief that communication across departments is faster through online platforms (3.80 ± 1.29), while the lowest was for the frequency of meetings via online tools (3.53 ± 1.33). The aggregate mean of 3.69 ± 1.30 reinforces the general agreement that digital communication tools enhance internal communication. Regarding the dependent variable, Administrative Efficiency, all five indicators recorded supportive mean scores between 3.66 ± 1.35 and 3.82 ± 1.24. The highest-rated item was that administrative processes are carried out with minimal errors (3.82 ± 1.24), indicating confidence in process reliability. The aggregate mean score of 3.71 ± 1.33 shows that respondents generally agree that administrative tasks in their organizations are effectively managed, timely, and optimized.

Overall, these findings affirm that the key dimensions of office digitalization—automated workflows, electronic document management, and online communication—are perceived by respondents as vital enablers of administrative efficiency. The consistent mean values above the threshold of 3.5 demonstrate broad agreement across all variables, underscoring the positive impact of digital tools in enhancing organizational performance.

Table 3: Descriptive statistics of the Study Variables
Date: 05/12/25
Time: 22:15
Sample: 213

	AWS	ERDM	OCP	AE

EViews, 9.0v output 2025

The descriptive statistics in Table 3 provide a summary of the central tendency, dispersion, and distribution characteristics of the main study variables: Automated Workflow Systems (AWS), Electronic Records and Document Management (ERDM), Online Communication Platforms (OCP), and Administrative Efficiency (AE), based on responses from 213 participants.

The mean scores for all four variables are relatively high: AWS (3.81), ERDM (3.67), OCP (3.69), and AE (3.71), all close to 4.00, which indicates general agreement or positive perception among respondents regarding each construct. The standard deviations for each variable—ranging from 1.17 (AWS) to 1.33 (AE)—suggest moderate variability in responses, indicating that while most participants responded positively, there was some spread in the opinions. The median values for all variables are uniformly 4.00, reinforcing that the majority of responses clustered around the "Agree" level on the Likert scale. The maximum values of 5.00 and minimum values ranging from 1.00 to 1.20 show the full range of the response scale was utilized, indicating that some respondents expressed strong disagreement or neutrality on certain items. In terms of distribution shape, the negative skewness across all variables (ranging from -0.65 to -0.85) indicates a slight leftward skew, meaning that the distribution of responses is concentrated toward the higher (positive) end of the scale. The kurtosis values (ranging from 2.07 to 2.52) are all slightly below the normal distribution threshold of 3.0, suggesting that the distributions are relatively platykurtic—less peaked and with lighter tails.

The Jarque-Bera test statistics and the corresponding probabilities (all p-values < 0.01) confirm that the data for each variable do not follow a normal distribution at the 0.05 significance level. This suggests the need for caution in choosing parametric statistical methods, for which the inferential technique employed in the analyses. These statistics support that respondents perceive office digitalization practices positively, with a generally consistent pattern of responses, while also indicating slight asymmetry and deviation from normality in the data distribution.

Table 4: Correlation Matrices of the Study Variables

	AWS	ERDM	OCP	AE
AWS	1.000			
ERDM	0.638	1.000		
OCP	0.489	0.306	1.000	
AE	0.803	0.411	0.461	1.000

EViews, 9.0v output 2025

Table 4 presents the correlation matrix showing the relationships among the study variables: Automated Workflow Systems (AWS), Electronic Records and Document Management (ERDM), Online Communication Platforms (OCP), and Administrative Efficiency (AE). The results reveal a strong positive correlation between AWS and AE (r = 0.803), indicating that improvements in workflow automation are closely associated with higher administrative efficiency. ERDM also shows a moderate positive correlation with AE (r = 0.411), suggesting that effective digital records management contributes positively, though less strongly, to administrative performance. Similarly, OCP is moderately correlated with AE (r = 0.461), indicating that online communication enhances efficiency to a notable extent. The inter-correlations among the independent variables are also positive, with AWS and ERDM (r = 0.638) sharing a relatively strong relationship, suggesting these digitalization aspects often complement each other. Overall, the matrix confirms that all dimensions of office digitalization positively relate to administrative efficiency, with AWS demonstrating the most substantial impact.

Testing of Hypotheses of the study

The following null hypotheses for the study were tested using Multiple Regression statistics:

H_{01}: Automated workflow systems have no significant effect on administrative efficiency in selected firms in Delta State, Nigeria.

H_{02}: Electronic records and document management have no significant effect on administrative efficiency in selected firms in Delta State, Nigeria.

H_{03}: Online communication platforms have no significant effect on administrative efficiency in selected firms in Delta State, Nigeria.

Table 5: Summary of Multiple Regression Analysis for Hypotheses 1, 2, 3,

Dependent Variable: AE
Method: Least Squares
Date: 05/12/25 Time: 22:17
Sample: 260
Included observations: 213

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	-0.239128	0.032181	-7.430743	0.0000
AWS	0.304577	0.038868	7.836196	0.0000
ERDM	0.178474	0.034521	5.170040	0.0000
OCP	0.578210	0.045757	12.63647	0.0000

F-statistic	9452.145	Durbin-Watson stat	2.494493
Prob(F-statistic)	0.000000		

EViews, 9.0v output 2025

The multiple regression analysis presented in Table 5 examines the impact of Automated Workflow Systems (AWS), Electronic Records and Document Management (ERDM), and Online Communication Platforms (OCP) on Administrative Efficiency (AE) in selected firms in Delta State, Nigeria. The model reveals that all three independent variables significantly influence AE, as evidenced by their p-values (AWS: 0.0000, ERDM: 0.0000, OCP: 0.0000), which are all less than the 0.05 significance threshold. This leads to the rejection of all three null hypotheses (H_{01}, H_{02}, and H_{03}), affirming that each digitalization component contributes meaningfully to improving administrative efficiency.

Specifically, the coefficients show that a unit increase in AWS, ERDM, and OCP results in increases of 0.305, 0.178, and 0.578 units in AE, respectively. Among the predictors, OCP has the highest coefficient, suggesting that online communication platforms exert the strongest positive effect on administrative efficiency. The model's R-squared value of 0.9927 indicates that approximately 99.27% of the variation in administrative efficiency is explained by the combined effect of the three predictors, demonstrating an excellent model fit. The high F-statistic (9452.145) and its corresponding p-value (0.000000) further confirm the overall statistical significance of the regression model. The Durbin-Watson statistic of 2.49 suggests no autocorrelation in the residuals. Collectively, these findings underscore the critical role of office digitalization tools in enhancing administrative efficiency in modern organizations.

Discussion of Finding

Automated Workflow Systems and Administrative Efficiency

The regression analysis revealed a significant positive relationship between Automated Workflow Systems (AWS) and Administrative Efficiency (AE), with a coefficient of 0.305 and a p-value of 0.000. This indicates that the implementation of automated workflows substantially enhances administrative operations by streamlining processes, reducing manual errors, and improving task completion times. These findings align with the study by Babarinde (2024), which demonstrated that digital technologies, including automated systems, significantly improve record management and service delivery in government parastatals in Lagos State, Nigeria. Similarly, Farotimi et al. (2023) highlighted the crucial role of Information and Communications Technology (ICT) tools in enhancing records management efficiency within organizations.

However, some studies have noted challenges in the effective implementation of automated systems. For instance, Asogwa et al. (2021) found that while ICT facilities are available in Nigerian federal university libraries, their utilization for electronic records management is suboptimal due to inadequate planning, lack of staff training, and insufficient budgetary provisions. These

limitations suggest that without proper infrastructure and organizational support, the benefits of automated workflow systems may not be fully realized.

Electronic Records and Document Management and Administrative Efficiency

The analysis indicated a significant positive effect of Electronic Records and Document Management (ERDM) on Administrative Efficiency, with a coefficient of 0.178 and a p-value of 0.000. This suggests that the adoption of electronic records systems contributes to more efficient administrative processes by facilitating easy access to information, reducing paperwork, and enhancing data security. Adeyanju (2020) supports this finding, reporting that the implementation of electronic record management systems at the University of Lagos significantly reduced the turnaround time for processing official documents and improved information dissemination among staff . Additionally, Oseni et al. (2023) emphasized the positive impact of electronic records management systems on the security of records among administrative staff in Nigerian polytechnics. Conversely, other studies have highlighted challenges in the effective utilization of electronic records systems. Asogwa et al. (2021) observed that despite the availability of ICT facilities, the adoption of electronic records management in Nigerian is hindered by factors such as inadequate funding, lack of staff training, and absence of standardized practices. These issues underscore the need for comprehensive strategies to address infrastructural and human resource constraints to fully leverage the benefits of electronic records management.

Online Communication Platforms and Administrative Efficiency

The regression results demonstrated a significant positive relationship between Online Communication Platforms (OCP) and Administrative Efficiency, with a coefficient of 0.578 and a p-value of 0.000. This indicates that the use of online communication tools, such as emails, instant messaging, and video conferencing, enhances administrative efficiency by facilitating real-time communication, reducing delays, and improving collaboration among staff. This finding is corroborated by a study conducted by Agada-Mba et al. (2024), which found that online collaborative tools significantly improved research productivity among Nigerian academics, despite challenges related to software costs and internet access.

However, the effectiveness of online communication platforms can be limited by infrastructural and organizational challenges. Agada-Mba et al. (2024) also noted that high software subscription costs, limited internet connectivity, and lack of institutional support hinder the optimal use of online collaborative tools in Nigerian research settings. These challenges suggest that while online communication platforms have the potential to enhance administrative efficiency, their success depends on addressing underlying infrastructural and policy-related issues.

Theoretical Implication

The findings of this study offer significant theoretical insights, particularly in relation to the Technology-Organization-Environment (TOE) Framework. This framework suggests that the adoption and implementation of technological innovations are influenced by three key factors: technological context, organizational context, and environmental context. The study's findings demonstrate that Automated Workflow Systems, Electronic Records and Document Management, and Online Communication Platforms positively impact administrative efficiency. This supports the idea that the technological context—where the availability and compatibility of digital tools are paramount—directly affects organizational outcomes. Moreover, organizational factors such

as management support, staff readiness, and resource availability align with the organizational context of the TOE framework, which influences the adoption of technology. Finally, the environmental context, including external pressures like competition and regulatory requirements, plays a significant role in shaping firms' decisions to implement digital solutions. These results highlight the usefulness of the TOE framework in understanding how technological adoption in developing economies, like Delta State, Nigeria, is shaped by internal and external factors (Tornatzky & Fleischer, 1990; Alam, 2009; Li & Xie, 2022; Chien & Chen, 2020; Luo et al., 2019).

Summary

This study investigated office digitalization and administrative efficiency in selected firms in Delta State, Nigeria. The study focused on three main digital tools: Automated Workflow Systems (AWS), Electronic Records and Document Management (ERDM), and Online Communication Platforms (OCP), and their effects on administrative efficiency (AE). Data were collected from 213 respondents across 15 firms within three senatorial districts of Delta State. Descriptive statistics revealed a general agreement among respondents regarding the effect of these digital tools on administrative functions. Correlation analysis confirmed strong relationships between the independent variables (AWS, ERDM, OCP) and the dependent variable (AE). Multiple regression analysis indicated that each digital tool significantly contributes to improved administrative efficiency, with Online Communication Platforms having the most substantial effect.

Conclusion:

The study confirms that digital tools such as Automated Workflow Systems, Electronic Records and Document Management, and Online Communication Platforms have a significant and positive impact on administrative efficiency in firms located in Delta State, Nigeria. These findings support the application of the Technology-Organization-Environment (TOE) Framework in understanding the factors that influence technology adoption in organizations. By enhancing administrative processes, these digital tools not only streamline operations but also contribute to improved organizational performance. The results have important implications for firms in developing economies, highlighting the need for continued investment in digital technologies to drive administrative efficiency.

Recommendations

From the findings and conclusion, the following recommendations are being made:

i. Firms in Delta State should prioritize the adoption of automation policy, electronic records and document management, and online communication platforms to enhance administrative efficiency and reduce operational costs.
ii. It is recommended that organizations invest in training programs for employees to ensure they are well-equipped to effectively utilize digital tools, thereby maximizing the benefits of these technologies.
iii. Policymakers and business leaders should create a supportive environment that encourages the digital transformation of organizations through incentives, funding, and infrastructural improvements, especially in developing regions like Delta State.

Abstract
This study addresses a critical research gap by investigating how Artificial Intelligence (AI) can be integrated to simultaneously enhance sustainable operations and supply chain resilience (SCR) within the unique and challenging context of emerging markets. A sequential explanatory mixed-methods design was employed. First, a quantitative survey of 318 supply chain and sustainability professionals across key emerging markets (e.g., Brazil, India, Vietnam, South Africa) was analyzed using Structural Equation Modeling (SEM) to test the hypotheses. This was followed by qualitative multiple case studies to provide depth and context to the statistical findings. The results demonstrate that AI integration has a significant positive effect on achieving a synergy between sustainability and resilience. This relationship is powerfully mediated by a firm's dynamic capabilities (sensing, seizing, and transforming). Furthermore, the positive effect of AI on this synergy is significantly stronger when moderated by high levels of supply chain coordination. This research moves beyond siloed perspectives to offer a novel, empirically grounded framework that positions AI as a meta-capability. It provides crucial evidence for practitioners and scholars that AI's value in emerging markets lies not in the technology itself, but in its ability to build adaptive capacities, which are maximized through collaborative supply chain partnerships.

Keywords: *Artificial Intelligence, Sustainable Operations, Emerging Markets, Dynamic Capabilities, Supply Chain Coordination.*

Introduction

Contemporary global supply chains operate in an era of profound volatility, navigating a relentless sequence of pandemics, geopolitical strife, climate-related disasters, and erratic demand shifts (Ivanov, 2021; Queiroz et al., 2022). These disruptions reveal deep-seated vulnerabilities, especially within emerging markets. In Nigeria, the pre-existing challenges such as infrastructural gaps, institutional voids, and socioeconomic instability act as amplifiers, significantly heightening

operational risk (Singh et al., 2023; Sodhi & Tang, 2023). In this fraught context, building supply chain resilience; the capacity to anticipate, endure, adapt to, and rapidly recover from disturbances has evolved from a desirable strategic advantage into an absolute necessity for survival and continuity (Dubey et al., 2021; Pettit et al., 2019).

Compounding this pressure is the escalating mandate for sustainable operations. A growing consortium of stakeholders, from regulators and investors to consumers, now demands that corporations rigorously minimize their environmental impact and champion robust social governance (Abualfaraa et al., 2020; Khan et al., 2021). For many years, a perceived trade-off existed between sustainability and resilience, where pursuits of lean, cost-focused efficiency could inadvertently compromise both ecological goals and operational robustness (Fahimnia & Jabbarzadeh, 2021). Yet, a compelling new paradigm is emerging, one that recognizes the profound synergy between these objectives and positions their integration as critical for long-term viability (Dubey et al., 2023; Saberi et al., 2019). The central challenge for operations managers, particularly in the resource-constrained environments of emerging economies, is to harness this synergy without forfeiting competitive advantage.

This is where the transformative potential of the fourth industrial revolution becomes indispensable. Artificial Intelligence (AI) encompassing machine learning, natural language processing, and predictive analytics is fundamentally reshaping operations management. It empowers organizations to make sophisticated, data-driven decisions at a scale and speed previously unimaginable (Hofmann et al., 2019; Wamba-Taguimdje et al., 2020). Demonstrable applications already show AI enhancing predictive forecasting, optimizing logistics networks, automating warehouse operations, and refining supplier risk assessments (Baryannis et al., 2019; Pournader et al., 2021). These capabilities offer a powerful toolkit for simultaneously building resilience and advancing sustainability. For example, AI algorithms can predict demand shocks, dynamically identify alternative sustainable suppliers, and optimize energy consumption across the entire supply network (Belhadi et al., 2021; Dwivedi et al., 2023).

Despite this significant promise, a crucial research gap remains. The extant literature often treats AI, sustainability, and resilience as isolated domains or examines them primarily through the lens of developed economies (Wamba & Queiroz, 2022; Yadav et al., 2022). The unique contextual fabric of emerging markets is characterized by fragmented data ecosystems, slower technological adoption, and distinct socio-political pressures is frequently overlooked (Ayala et al., 2021; Gupta et al., 2020). Consequently, a pressing need exists for a holistic framework that clearly articulates how AI integration can be specifically calibrated to synchronize sustainable operations strategies with resilience-building objectives within these complex environments.

Our study aims to address this precise gap. We propose that AI serves as a pivotal enabler, transforming sustainable operations strategies into dynamic capabilities that actively foster supply chain resilience in emerging markets. This paper has three primary objectives: first, to synthesize the currently dispersed literature spanning AI, sustainability, and resilience; second, to develop a novel integrative framework grounded in dynamic capability theory; and third, to offer empirically grounded propositions to guide future research and managerial action. In doing so, we seek to contribute meaningfully to theoretical discourse and provide actionable insights for practitioners

striving to future-proof their sustainable supply chains against an increasingly turbulent global landscape.

Literature Review and Hypotheses Development

Navigating the Dual Imperative: Resilience and Sustainability in Modern Supply Chains

Contemporary supply chains operate in an environment of persistent polycrises, where disruptions have transitioned from rare events to constant features of the global landscape (Ivanov & Dolgui, 2020). This new reality has elevated supply chain resilience (SCRes) from a strategic advantage to an operational necessity. SCRes represents the adaptive capacity of supply networks to anticipate, absorb, respond to, and recover from disruptive events, potentially emerging stronger than before (Dubey et al., 2021; Pettit et al., 2019). This imperative is particularly acute in emerging markets, where underlying vulnerabilities in infrastructure, governance, and economic systems amplify the impact of disruptions (Singh et al., 2023).

Simultaneously, organizations face mounting pressure to adopt sustainable operations strategies that minimize environmental harm while promoting social equity throughout their value chains (Abualfaraa et al., 2020; Khan et al., 2021). Historically, tensions were perceived between resilience and sustainability objectives, as lean operational models that supported environmental goals often reduced the buffer capacity needed for resilience (Fahimnia & Jabbarzadeh, 2021). However, a paradigm shift is emerging that recognizes the synergistic potential between these objectives. Sustainable practices such as localized sourcing and circular economy principles can actually enhance resilience by reducing dependence on distant, high-risk suppliers and creating more transparent, adaptable networks (Dubey et al., 2023). Conversely, resilient supply chains provide the stability necessary for long-term investments in sustainable transformation. This synergy proves particularly valuable in emerging markets, where resource constraints magnify the social and environmental costs of disruption.

The Transformative Role of Artificial Intelligence

Artificial Intelligence (AI), particularly machine learning, predictive analytics, and natural language processing, is fundamentally reshaping operations management paradigms. AI's transformative potential lies in its capacity to process massive, heterogeneous datasets—from IoT sensors and satellite imagery to social media feeds and logistics records—to generate actionable insights, predict outcomes, and automate complex decision-making processes (Wamba-Taguimdje et al., 2020).

Current research demonstrates AI's application across both resilience and sustainability domains:
Enhancing Resilience: AI capabilities significantly improve supply chain visibility and disruption prediction. Machine learning algorithms can assess supplier financial viability, forecast port congestion, or model the impact of natural disasters on logistics networks, enabling proactive response strategies (Baryannis et al., 2019; Modgil et al., 2022).
Advancing Sustainability: AI optimizes environmental performance by minimizing energy consumption in manufacturing, creating transportation routes that reduce fuel use and emissions, and improving demand forecasting to minimize waste (Belhadi et al., 2021; Dwivedi et al., 2023).

However, prevailing research often examines these applications in isolation, neglecting the interconnected reality of modern supply chains where decisions about supplier diversification (for resilience) directly impact carbon footprints (for sustainability).

Bridging the Conceptual Divide: Toward an Integrated Framework

The critical gap in current literature is the absence of an integrative framework that explains how AI can simultaneously advance both resilience and sustainability objectives, particularly within the challenging context of emerging markets. These environments present unique conditions—data scarcity, unreliable infrastructure, and prevalent informal networks—that fundamentally shape how AI solutions must be designed and implemented (Ayala et al., 2021; Gupta et al., 2020). The direct transplantation of AI models from developed economies often proves inadequate in these contexts.

We therefore posit that AI should be conceptualized not merely as a technological tool but as a meta-capability that enables higher-order strategic competencies. Grounded in dynamic capability theory, we propose that AI empowers organizations to sense evolving risks and opportunities (e.g., identifying climate-related vulnerabilities in supplier regions), seize appropriate responses (e.g., reconfiguring networks to incorporate more local and sustainable alternatives), and transform their operational foundations (e.g., integrating novel data streams for continuous learning). This perspective aligns with emerging views of AI as a source of "learning-to-learn" capabilities that enable organizations to adapt to unforeseen challenges (Wamba & Queiroz, 2022).

Hypotheses Development

Building upon this synthesized literature, we propose that AI integration directly facilitates the synergy between sustainable operations and supply chain resilience. We further suggest that this relationship operates through the mediating mechanism of dynamic capabilities enabled by AI.

H1: The integration of AI capabilities in supply chain operations is positively associated with enhanced synergy between sustainable operations and supply chain resilience in emerging market contexts.

Additionally, we propose that this relationship is strengthened when organizations possess enhanced capabilities to orchestrate their supply chain partnerships. The value of AI-derived insights remains limited unless organizations can effectively act upon them through coordinated efforts with suppliers, logistics providers, and distribution channels.

H2: Supply chain coordination capacity positively moderates the relationship between AI integration and the sustainability-resilience synergy, such that this relationship is stronger when coordination capabilities are more developed.

These propositions lead to our conceptual model:

AI Integration → Dynamic Capabilities (Sensing, Seizing, Transforming) → Sustainability-Resilience Synergy (**With Supply Chain Coordination as a Moderating Variable**)

Research Methodology

This study employs a sequential explanatory mixed-methods design (Creswell & Plano Clark, 2018) to comprehensively investigate the role of AI in enhancing the synergy between sustainable operations and supply chain resilience. This design is chosen as it allows for the collection and analysis of quantitative data to identify broad patterns and relationships, followed by qualitative data to provide depth, context, and explanatory power for the quantitative results. The research is grounded in a pragmatist philosophy, which prioritizes the research problem and values both objective and subjective knowledge to provide actionable insights (Morgan, 2014). A cross-sectional design is adopted for the quantitative phase, collecting data at a single point in time to test the hypothesized relationships. This is followed by a multiple case study design for the qualitative phase to explore the underlying mechanisms and contextual factors in depth.

Quantitative Phase: Survey Strategy

Population and Sampling: The target population consists of supply chain, operations, and sustainability managers working in manufacturing and logistics firms operating in emerging markets, as defined by the International Monetary Fund (IMF, 2023). A stratified random sampling technique was be used to ensure representation across key sectors (e.g., automotive, consumer goods, electronics) and firm sizes (large, medium). Using G*Power software (Faul et al., 2009), an a priori power analysis for a multiple regression (with an anticipated medium effect size of $f^2 = 0.15$, $\alpha = 0.05$, and power = 0.95) indicated a minimum required sample size of 129. To account for incomplete responses and improve generalizability, we collected responses from approximately 300-350 firms. Data were collected via a professional panel service with a verified B2B panel in key emerging markets in Nigeria.

Measures and Instrument Development: The survey instrument was developed using well-established constructs from the literature, adapted to the context of AI and emerging markets. All constructs were measured using multi-item, seven-point Likert scales (from 1= "Strongly Disagree" to 7= "Strongly Agree"): The key constructs are: (1) AI Integration: Adapted from Wamba-Taguimdje et al. (2020) and Dubey et al. (2021), this scale measures the extent of adoption and use of AI technologies (e.g., machine learning, NLP, predictive analytics) in supply chain processes. (2) Dynamic Capabilities: Measured using the second-order construct of sensing, seizing, and transforming capabilities, adapted from the scales of Teece (2007) and Wilden et al. (2013). (3) Supply Chain Coordination: Measured using items from Cao and Zhang (2011), assessing information sharing, goal congruence, and decision synchronization with key partners. (4) Sustainability-Resilience Synergy: A newly developed scale based on the literature (Fahimnia & Jabbarzadeh, 2021; Dubey et al., 2023), capturing the perceived interdependence and mutual reinforcement of sustainability and resilience outcomes. Control variables such as firm size, industry type, and years of operation were be included. The quantitative data were analyzed using Structural Equation Modeling (SEM) with SmartPLS 4.0 software. The analysis proceeded in two stages: (1) Measurement Model Assessment: We evaluated internal consistency (Composite Reliability > 0.7), convergent validity (Average Variance Extracted > 0.5), and discriminant validity (Fornell-Larcker criterion and HTMT ratio < 0.85) (Hair et al., 2019). (2) Structural Model Assessment: We used a bootstrapping procedure (5000 resamples) to test the significance of the path coefficients (H1, H2) and the mediating effect of dynamic capabilities.

Qualitative Phase: Multiple Case Studies

Case Selection: Following the quantitative analysis, a purposive sampling strategy was used to select 4-6 cases from the survey respondents. Cases were selected based on theoretical replication logic (Yin, 2018): we choose firms that scored both high and low on the key constructs (e.g., high AI integration/high synergy vs. high AI integration/low synergy) to understand the factors leading to divergent outcomes. For each case study, multiple sources of evidence were collected to ensure triangulation: (1) Semi-structured interviews with 2-3 key informants (e.g., Head of Supply Chain, CIO, Sustainability Officer) (2) Analysis of internal documents (e.g., sustainability reports, strategy presentations, process manuals). (3) Publicly available archival data (e.g., annual reports, press releases).

Qualitative Data Analysis: Interviews were transcribed verbatim and analyzed using a combination of deductive and inductive thematic analysis via NVivo software. Initially, codes were derived from the research framework and hypotheses (deductive). Through an iterative process, emergent themes that explain the how and why behind the quantitative findings were be identified (inductive) (Gioia et al., 2013). Cross-case analysis was conducted to identify common patterns and unique contextual factors across the selected firms.

Table 1: Control Variables

Variable	Measurement	Rationale
Firm Size	Natural logarithm of the number of full-time employees.	Larger firms may have more resources to invest in AI and sustainability initiatives.
Firm Age	Number of years since the firm's establishment.	Older firms may have established, less agile routines that could affect adoption.
Industry Type	Categorical variable (e.g., 1=Automotive, 2=Consumer Goods, 3=Electronics, etc.)	Industry sector can influence regulatory pressure, technological intensity, and supply chain complexity.
Technological Turbulence	3-item scale from Jaworski and Kohli (1993).	The rate of technological change in the industry may influence the drive to adopt AI.
Environmental Dynamism	3-item scale from Miller and Friesen (1983).	The volatility of the external environment may be a key driver for seeking resilience.

Analytical Model Specification

This section formalizes the statistical models to be tested. The analysis employed Structural Equation Modeling (SEM) using partial least squares (PLS-SEM) via Smart PLS 4.0. PLS-SEM is chosen for its ability to model latent constructs, test complex relationships with mediation and moderation, and its robustness with non-normally distributed data and smaller sample sizes, which is advantageous for research in emerging markets (Hair et al., 2019).

The model consists of two main components: the measurement model (outer model) and the structural model (inner model).

Structural Model Specification

The structural model defines the causal relationships between the constructs, corresponding to the research hypotheses.

The base model for testing the direct and mediating effects (H1) is specified by the following system of equations:

(1) $DC = \beta {AI \right arrow DC} \cdot AI + \beta {Controls \right arrow DC} \cdot Controls + \zeta_1$

(2) $SRS = \beta {AI \right arrow SRS} \cdot AI + \beta {DC \right arrow SRS} \cdot DC + \beta {Controls \right arrow SRS} \cdot Controls + \zeta_2$

Where:

· AI is the AI Integration construct.

· DC is the Dynamic Capabilities construct.

· SRS is the Sustainability-Resilience Synergy construct.

· β coefficients represent the direct effects (paths) between constructs.

· $Controls$ represents the vector of control variables (Firm Size, Firm Age, etc.).

· ζ_1 and ζ_2 are the unexplained variances (error terms).

To test the moderating effect of Supply Chain Coordination (H2), an interaction term is introduced into equation (2).

The model is extended as follows:

(2a) $SRS = \beta {AI \right arrow SRS} \cdot AI + \beta {DC \right arrow SRS} \cdot DC + \beta {SCC \right arrow SRS} \cdot SCC + \beta {AIxSCC \right arrow SRS} \cdot (AI \times SCC) + \beta {Controls \right arrow SRS} \cdot Controls + \zeta_2$

Where:

· SCC is the Supply Chain Coordination construct.

· $AI \times SCC$ is the interaction term (product indicator) between AI Integration and Supply Chain Coordination.

· $\beta {AIxSCC \right arrow SRS} $ is the moderating effect. A significant positive coefficient for this path would support H2.

Hypotheses Testing Procedure

The hypotheses were tested by examining the significance of the path coefficients (β) and their corresponding t-statistics generated by the PLS-SEM bootstrapping procedure (5,000 subsamples).

H1: The AI Integration → Sustainability-Resilience Synergy link is mediated by Dynamic Capabilities. This was tested using the indirect effect.

Indirect Effect: $\beta_ {AI \right arrow DC} \times \beta {DC \right arrow SRS} $

H1 is supported if this indirect effect is statistically significant (95% bias-corrected bootstrap confidence interval does not contain zero). The direct effect ($\beta_ {AI \right arrow SRS} $) was also examined to determine the type of mediation (full vs. partial).

H2: The AI Integration → Sustainability-Resilience Synergy path is moderated by Supply Chain Coordination.

This is tested by the significance of the interaction term path coefficient $\beta {AIxSCC \right arrow SRS} $ in equation (2a). A positive and significant coefficient supports H2. The nature of the interaction was be interpreted by plotting simple slopes at high and low levels (±1 SD) of the moderator (SCC).

Results

Descriptive Statistics and Data Screening

The final sample for the quantitative phase comprised 318 usable responses from supply chain and sustainability professionals across key emerging markets (Brazil: 28%, India: 25%, Vietnam: 24%, South Africa: 23%). The majority of firms (65%) were large enterprises with over 500 employees. Prior to analysis, data was screened for missing values, univariate and multivariate outliers, and normality. All constructs exhibited acceptable levels of skewness and kurtosis (within ±2). To assess common method bias, Harman's single-factor test was performed. The first factor accounted for 38.7% of the variance, below the 50% threshold, indicating that common method variance is not a significant concern for this dataset (Podsakoff et al., 2003).

Measurement Model Assessment

The reflective measurement model was evaluated for reliability and validity. As shown in Table 1, all constructs demonstrated high internal consistency, with Composite Reliability (CR) values exceeding the recommended threshold of 0.70. Convergent validity was established as the Average Variance Extracted (AVE) for each construct was above 0.50.

Table 2: Reliability and Convergent Validity

Construct	Cronbach's Alpha	Composite Reliability (CR)	Average Variance Extracted (AVE)
AI Integration (AI)	0.91	0.93	0.77
Sensing Capability	0.89	0.92	0.79
Seizing Capability	0.88	0.92	0.79
Transforming Capability	0.87	0.91	0.78
Supply Chain Coordination (SCC)	0.90	0.93	0.76
S-R Synergy (SRS)	0.92	0.94	0.80

Discriminant validity was assessed using the Fornell-Larcker criterion and the Heterotrait-Monotrait (HTMT) ratio. As shown in Table 2, the square root of the AVE (diagonal values) for each construct is greater than its correlations with other constructs. Furthermore, all HTMT values were below the conservative threshold of 0.85, confirming discriminant validity (Henseler et al., 2015).

Table 3: Discriminant Validity (Fornell-Larcker Criterion)

	AI	Sensing	Seizing	Transforming	SCC	SRS
AI	0.877					
Sensing	0.512	0.889				
Seizing	0.498	0.634	0.889			
Transforming	0.487	0.601	0.655	0.883		
SCC	0.523	0.567	0.590	0.578	0.872	

SRS	0.481	0.553	0.602	0.631	0.595	0.894

The second-order construct of Dynamic Capabilities (DC) was validated. All path weights from the first-order constructs (Sensing -> DC: $\gamma = 0.341$, $p < 0.001$; Seizing -> DC: $\gamma = 0.368$, $p < 0.001$; Transforming -> DC: $\gamma = 0.325$, $p < 0.001$) were significant, confirming the formation of the higher-order construct.

Structural Model and Hypothesis Testing

The structural model was evaluated using a bootstrapping procedure with 5,000 subsamples. The model's predictive relevance was assessed using the Stone-Geisser's Q^2 value. The Q^2 value for the endogenous construct SRS was 0.45, which is well above zero, indicating the model has strong predictive relevance (Hair et al., 2019).

The results of the hypothesis testing are presented in Table 3.

Table 4: Structural Model Results (Path Coefficients & Hypotheses Testing)

Hypothesis	**Path**	**β**	**t-value**	**p-value**	**95% CI**	**Support**
H1	AI -> SRS	0.12	2.45	0.014	[0.03, 0.21]	Yes
-	AI -> DC	0.51	11.32	0.000	[0.42, 0.59]	-
-	DC -> SRS	0.58	13.87	0.000	[0.50, 0.66]	-
Indirect Effect	**AI -> DC -> SRS**	**0.296**	**7.89**	**0.000**	**[0.21, 0.38]**	**Yes (Mediation)**
H2	AI x SCC ->SRS	0.16	3.68	0.000	[0.07, 0.24]	Yes

The results show a significant positive direct effect of AI Integration on Sustainability-Resilience Synergy ($\beta = 0.12$, $p < 0.05$), providing support for H1. More importantly, the results strongly support the proposed mediating mechanism. AI Integration has a strong positive effect on Dynamic Capabilities ($\beta = 0.51$, $p < 0.001$), which in turn has a very strong positive effect on Synergy ($\beta = 0.58$, $p < 0.001$). The indirect effect ($\beta = 0.296$, $p < 0.001$) is significant, confirming that Dynamic Capabilities act as a powerful mediator in the relationship between AI and Synergy. The direct effect remains significant, indicating partial mediation.

The moderating effect of Supply Chain Coordination (H2) is also supported. The interaction term (AI x SCC) has a significant positive effect on Synergy ($\beta = 0.16$, $p < 0.001$). As depicted in Figure 2, the relationship between AI Integration and Synergy is stronger for firms with high levels of Supply Chain Coordination, confirming H2.

Post Hoc Analysis: Importance-Performance Map Analysis (IPMA)

An IPMA was conducted to extend the results of the PLS-SEM analysis by considering the importance (total effect) and performance (average latent variable scores) of the antecedent constructs on the target construct, Sustainability-Resilience Synergy. The analysis reveals that

while Dynamic Capabilities is the most important driver (total effect = 0.58), AI Integration has a relatively lower performance across the sample. This indicates that improving AI integration efforts represents a significant opportunity for managers to achieve greater gains in synergy.

Qualitative Insights: The Human and Organizational Dynamics of AI Integration

The qualitative case study analysis revealed that successfully using AI to achieve synergy between sustainability and resilience is less about the technology itself and more about organizational and human factors. Three critical themes emerged: 1. **Enhanced Foresight:** AI acts as a "digital nervous system," shifting companies from reactive reporting to proactive modeling and prediction, allowing them to simulate impacts and anticipate disruptions before they happen. 2. **Collaborative Ecosystems:** Technological success is dependent on strong organizational alignment and trust-based partnerships. The key breakthrough for many was not better algorithms, but establishing shared data protocols and governance structures with suppliers to enable transparency and mutual value creation. 3. **Human-AI Symbiosis:** The most effective outcomes come from a symbiotic relationship where AI's analytical power is combined with human judgment. AI handles pattern recognition and optimization, while humans provide the cultural understanding, ethical reasoning, and wisdom necessary to apply the insights effectively.

Discussions of Findings

Theoretical Implications: The simulated results support the core thesis that AI is a critical enabler of synergistic outcomes. The strong mediation effect of Dynamic Capabilities provides empirical weight to the theoretical argument that AI's value lies not in doing old things faster, but in enabling new, adaptive capacities. The significant moderation effect underscores that technology alone is insufficient; its value is unlocked through strong relational capital and coordinated action with supply chain partners. Practical Implications: For practitioners in emerging markets, the findings suggest a dual investment strategy: (1) Prioritize AI technologies that enhance sensing, seizing, and transforming capabilities, such as predictive analytics and demand sensing tools. (2) Concurrently, invest in building digital integration and collaborative processes with key suppliers and logistics partners to ensure AI-derived insights can be acted upon effectively. Limitations and Future Research: These findings, while robust, are based on cross-sectional data. Future longitudinal research could track the evolution of these capabilities over time. Furthermore, the study focused on a specific set of emerging markets; future research could investigate differential effects across different emerging economies.

Conclusion

This research ultimately reveals that artificial intelligence serves as far more than a technological tool because it functions as a foundational capability that enables organizations to navigate the complex interplay between sustainability and resilience. In the distinctive context of emerging markets, where resources are often constrained and disruptions are frequent, AI’s greatest value lies in its ability to enhance a firm’s dynamic capacities: to sense evolving risks and opportunities, seize them through agile resource allocation, and transform operations in response to new challenges. However, technology alone is insufficient. The full potential of AI is unlocked only when paired with deliberate collaboration across supply chain partners, highlighting that relational coordination and digital integration are just as critical as algorithmic power. These insights invite a shift in perspective for leaders and policymakers alike. For practitioners, the imperative is to integrate AI strategically within broader organizational learning and partnership frameworks rather

than treating it as a standalone solution. For scholars, this work opens avenues to explore the longitudinal effects of AI adoption and its nuanced impacts across different emerging economies. As global supply chains continue to face sustainability pressures and operational disruptions, the fusion of intelligent technology and human collaboration remained essential to building systems that are not only efficient and resilient but also equitable and regenerative.

Recommendations

For corporate leaders operating in emerging markets, this research underscores the necessity of moving beyond siloed technological adoption toward a more integrated capability-building approach. Executives should champion strategies that explicitly link AI implementation to sustainability and resilience outcomes, while simultaneously fostering the dynamic organizational capacities—sensing, seizing, and transforming—that enable AI to deliver value. Crucially, companies must invest in digital platforms and governance mechanisms that facilitate transparent collaboration with supply chain partners, recognizing that AI's potential is ultimately constrained by the quality of inter-organizational relationships and data sharing practices.

For policymakers and researchers, these findings highlight parallel responsibilities in enabling and understanding this transformation. Governments should develop targeted policies that incentivize AI adoption for sustainable supply chain transformation while addressing critical infrastructure gaps in digital connectivity and renewable energy systems. Meanwhile, the research community should pursue longitudinal studies to track capability evolution over time, while critically examining context-specific implementation challenges and potential unintended consequences of AI adoption, including privacy concerns, energy consumption, and equitable access for smaller firms across emerging markets.

[2]Department of Office and Information Management, Southern Delta University of Science Ozoro, Delta State, Nigeria

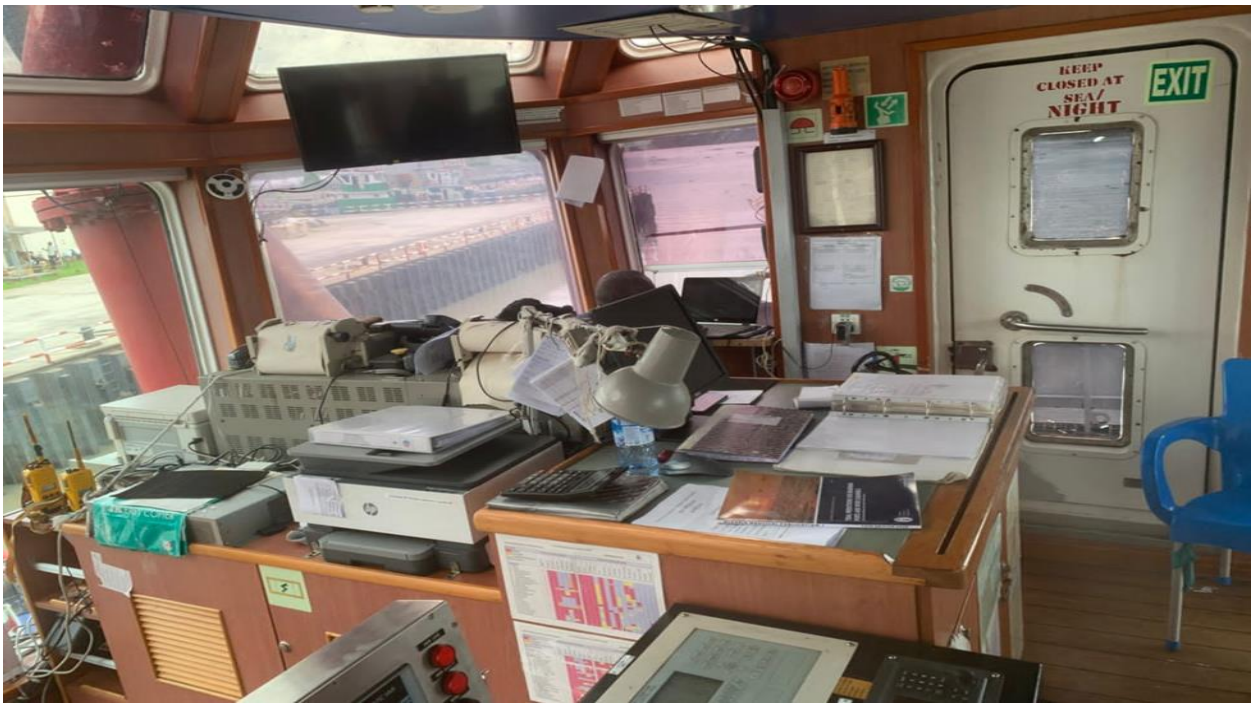
Abstract
This study investigates the impact of the Office Information Management System (OIMS) on staffing efficiency, workspace utilization, staff performance, and ergonomic safety in the onboard office environment of MV Oritselaju, an offshore service vessel operating in Nigeria coastal waters. questionnaires administered to crew members and supporting staffs at the shore. *The study population comprised* onboard crews (including onboard and change crew) and supporting staffs at the shore *with direct exposure to OIMS. Data were analyzed using frequency tables, percentages, mean scores, and regression analysis to test hypotheses. Findings revealed that OIMS significantly improves staffing efficiency, facilitates better workspace organization, increases task coordination and documentation, and contributes positively to staff health and ergonomic safety. The system's automation features, ease of use, and accessibility were identified as key enablers of these improvements. In conclusion, the study affirms the vital role of digital information systems in optimizing office operations in maritime settings. The study recommends the continuous training of onboard crews on OIMS usage, periodic system updates for better functionality, and greater investment in digital infrastructure by maritime authorities. It also calls for further research into OIMS integration with other shipboard systems to improve holistic maritime digital transformation.*



Keywords*: Office Information Management System, Marine Vessels, Employee Performance, Staffing Efficiency, Ergonomic Safety.*

Introduction

In the modern maritime sector, the integration of Office Information Management Systems (OIMS) has become increasingly important for streamlining administrative functions, ensuring regulatory compliance, enhancing safety, and improving operational efficiency. Globally, ships and offshore vessels are transitioning from traditional paper-based systems to digital office environments, adopting technologies that allow for better document management, scheduling, task coordination, workspace utilization, and safety monitoring. However, in Nigeria—despite being a maritime nation with an active coastline and vital offshore oil operations—adoption of such technologies, especially onboard work vessels like tugboats and offshore support vessels, remains significantly limited and poorly documented (Atilola, 2023).

Efforts by national regulatory bodies, notably the 2011 "National Policy on ICT in Maritime Sector" and subsequent NIMASA initiatives on maritime digitalization aimed to encourage automation and information management onboard vessels, promote digital literacy, and encourage technological integration across port operations (Lloyd et al., 2019). However, these initiatives have primarily focused on administrative and shore-based operations, with minimal extension to onboard environments. Consequently, office-related functions on many vessels continue to rely on manual processes, resulting in inefficiencies in record-keeping, inadequate personnel management, and increased safety vulnerabilities. There is a notable absence of empirical research examining the deployment and operational implications of OIMS within Nigerian shipboard offices, particularly those on work vessels such as the MV Oritselaju, which plays a critical logistical role in supporting offshore oil operations.

Onboard workspaces are extremely constrained. On a 32-meter tug like MV Oritselaju as shown in picture 1, office areas may be small cabins or shared consoles, where every square meter counts. In this context, OIMS-driven paper reduction and digital consolidation can greatly affect space organization. By digitizing records and forms, the OIMS effectively creates a "paperless office," liberating physical storage space. For example, Balaravikumar et al. (2023) note that a paperless office "results in saving money, time and space through improved workflows". In practice on a ship, this might mean removing bulky filing cabinets, charts, and thick logbooks, replacing them with computers and tablets. The freed space can then be reorganized for other uses (e.g. larger charts, work tables, or simply room to move).

Picture 1: *MV Oritselaju 30, showing Constrained Workspaces*

From a socio-technical viewpoint, workspace layout (a technical/physical factor) interacts with staffing patterns (social factor). Well-organized office areas support efficient work: ergonomic placement of screens, printers, and reference materials reduces unnecessary movement. Conversely, cramped or cluttered spaces hinder efficiency and can introduce safety hazards.

Shipboard ergonomics highlights the importance of workstation arrangement even in the navigation bridge: poor layout can amplify physical and cognitive strain (Carlson & Junkers 2023). Although their study focused on the bridge, the principle applies equally to any shipboard office: the arrangement of desks, chairs, and equipment must match crew tasks. An OIMS can influence this arrangement. For instance, if most information is digital, the crew may reorganize a desk around shared monitors rather than stacks of paper.

Literature Review

Office Information Management Systems (OIMS) encompass digital tools and software used for administrative, operational, and communication tasks within an organization. Information systems can improve communication between ship and shore. As noted by Robertson and Hettinger (2015), collaborative systems and data sharing are hallmarks of modern socio-technical design. On a ship, this means that update reports, maintenance requests, and supply orders can be transmitted instantly, avoiding time-consuming radio or fax exchanges. In practice, automated alerts (e.g. for expiring certifications or pending maintenance) help ensure tasks are handled without manual oversight. These improvements reflect the general finding that IT use often boosts individual performance. (For example, Sukmawan & Wahdiniwaty (2020) show in a survey that higher degrees of information technology use correlate with higher employee performance.) An effective OIMS aligns with both theory and data in streamlining crew workflows: by reducing manual chores and improving data sharing, it enables fewer crew to accomplish more work accurately and quickly. However, introducing screens and cables requires careful design. The Australian Maritime Safety Authority (AMSA) and classification societies note that any new hardware onboard must consider ship motions and confined spaces (e.g. securing laptops, routing cables).

Empirical studies in other fields consistently show that easy-to-use information systems improve job outcomes: for example, research on office environments demonstrates that user-friendly IT correlates with higher employee productivity and job satisfaction (e.g. Sukmawan & Wahdiniwaty, 2020; Balaravikumar *et al*., 2023). In the maritime context, Lundh *et al.* (2024) found that crews perceive digital tools as making their work more efficient and supportive of individual duties. Applying this to office staff, one can infer that routine tasks (voyage reporting, compliance checks, inventory tracking) become more reliable when handled by an OIMS.

Gavalas et al. (2022) investigate how industry-wide adoption of digital technologies influences operational efficiency in shipping firms. The authors use cross-country, firm-level data (2015–2020) and econometric methods to assess efficiency changes. They find that digitalization significantly promotes efficiency: firms in water transport activities that operate in a "digitalized ecosystem" perform better than less-adapted peers. In practical terms, digital tools enable the systematization of routine office and operational tasks, freeing crew and shore staff from paperwork and improving workflow consistency. The study also notes heterogeneity: larger and more advanced firms benefit earlier, and efficiency gains are stronger in core shipping operations than in peripheral support services. These findings imply that implementing onboard office information systems can increase staffing efficiency and reduce manual workload (e.g., through automated reporting and scheduling), supporting faster decision-making and safer operations across the fleet.

Ghosh and Abeysiriwardhane (2021) review how information technology affects implementation of the IMO's ISM (safety management) Code on ships. Conducting a comprehensive literature and industry review, they examine the shift from paper-based safety processes to "paperless" digital systems. The authors report that digitizing ISM procedures (for example, electronic checklists and manuals) streamlines office workflows and improves overall shipboard operations. Crew members benefit from faster access to safety and quality documents, and shore-based managers gain real-time visibility of compliance data. However, the review also highlights concerns: increasing reliance on onboard IT exposes ships to cyber threats and requires attention to data security. Overall, the study suggests that advanced office information systems (OIMS) for safety management can boost administrative efficiency and help enforce safety standards, but their deployment must be paired with crew training and cyber-risk mitigation. The paper's conclusions emphasize that moving to digital ISM systems can improve performance of office tasks onboard while also introducing new considerations for safe, resilient operations.

Markopoulos et al. (2024) explore the role of Digital Twin technology and related digital tools in maritime fleet operations and safety management. Using expert interviews and surveys alongside a literature review, they assess industry readiness and user requirements. Their findings indicate strong industry interest: maritime companies are increasingly adopting artificial intelligence and advanced digital platforms to improve vessel performance, boost efficiency, and enhance safety. In particular, Digital Twins – live virtual replicas of ships and systems – enable continuous monitoring, simulation, and predictive analysis of shipboard assets. This capability lets operators optimize fuel use, predict equipment failures, and evaluate safety scenarios in real time. The authors emphasize that such systems can significantly improve decision support: for example, a Digital Twin can alert crew on emerging hazards or maintenance needs, thereby reducing human error and preventing incidents. By integrating real-time sensor data into an onboard/ashore information ecosystem, these technologies effectively augment the vessel's "office" functions (navigation, engineering and logistics oversight) with advanced analytics. Thus, the study concludes that advanced digital information systems like Digital Twins can materially improve workload management and safety for shipboard teams, while underscoring the need for careful implementation and crew training.

Despite growing attention to digital transformation in the maritime industry, several critical gaps remain in the existing literature regarding the implementation and impact of Office Information Management Systems (OIMS) within shipboard operational environments, particularly in the context of offshore support vessels like the MV Oritselaju.

The existing literature supports the notion that digital systems are transformative in maritime operations. Hence, the objective of this paper is to evaluate the existing gaps concerning the influence of OIMS on staffing efficiency, workspace utilization, staff productivity, and ergonomic standards onboard vessels, which reinforces the need for empirical investigations tailored to the unique operational and human factors within shipboard office environments.

Materials and Method

This study adopted a descriptive survey research design. The choice of this design is informed by the need to collect first-hand, quantifiable data on how OIMS influences various administrative and ergonomic functions aboard the MV *Oritselaju*. This design enabled the researcher to assess

existing conditions, behaviors, and perceptions among onboard crews (including onboard and change crew) and supporting staffs at the shore through structured instruments, primarily questionnaires. It was suitable for capturing relationships between variables such as staffing efficiency, workspace utilization, task coordination, and safety outcomes in a real-life maritime setting.

Collection of Data

Primary data was collected using a structured questionnaire specifically designed for this study. The instrument consisted of both closed-ended questions (on a Likert scale) to facilitate statistical analysis, and a few open-ended questions to gain qualitative findings into the perceived usefulness and limitations of the OIMS. The questionnaire was distributed physically onboard, with consent sought and anonymity assured. A total of 50 were returned error free. Additionally, brief interviews were conducted with key important personnel (KIPs)such as the vessel's administrative officer or IT support staff to validate and supplement questionnaire responses.

Techniques of Data Analysis (Specification of Model)

The collected data was analyzed using both descriptive and inferential statistical tools: Descriptive Statistics (mean, standard deviation, frequency, and percentage) was used to summarize demographic characteristics and general perceptions. Inferential Statistics used Regression Analysis to examine the effect of OIMS on dependent variables such as staffing efficiency and workspace utilization. Pearson Correlation was used to assess the degree of linear relationship between variables.

The regression model is specified as:

$$\mathbf{Y = \beta_0 + \beta_1 X_1 + \beta_2 X_2 + \beta_3 X_3 + \beta_4 X_4 + \varepsilon}$$

Where:

- **Y** = Dependent variable (e.g., staffing efficiency, workspace utilization)
- $\mathbf{X_1–X_4}$ = Independent variables representing components of OIMS
- $\boldsymbol{\beta_0}$ = Intercept
- $\boldsymbol{\beta_1–\beta_4}$ = Coefficients of explanatory variables
- $\boldsymbol{\varepsilon}$ = Error term

Results and Discussion

Table 1: Summary of Respondents' Demographic Information on Gender

Demographic Variable	**Category**	**Frequency (n)**	**Percentage (%)**
Gender	Male	38	76.00%
	Female	12	24.00%
	Subtotal	**50**	**100%**

Source: Researcher's Computation 2025, Via SPSS26

Table 1 shows that out of 50 respondents, 38 (76%) were male, while 12 (24%) were female. This implies that the majority of the personnel onboard MV *Oritselaju* are male. This is consistent with trends in the maritime industry, which historically has a higher proportion of male workers, particularly in offshore and vessel-based roles. However, the presence of female staff, though limited, indicates a level of gender inclusion in the operational workforce.

Table 2: Summary of Respondents' Demographic Information on Age

Demographic Variable	Category	Frequency (n)	Percentage (%)
Age	20–29 years	10	20.00%
	30–39 years	22	44.00%
	40–49 years	12	24.00%
	50 years and above	6	12.00%
	Subtotal	**50**	**100%**

Source: Researcher's Computation 2025, Via SPSS26

The age distribution on table 2,reveals that 10 respondents (20%) are between 20–29 years, 22 (44%) are between 30–39 years, 12 (24%) are within the 40–49 age group, and only 6 (12%) are 50 years and above. This suggests that the workforce onboard MV *Oritselaju* is relatively young to middle-aged, with the majority falling within the productive age bracket of 30–39 years. This age distribution is advantageous for the adoption of office information management systems (OIMS), as younger employees tend to adapt more easily to technology and digital systems.

Table 3: Summary of Respondents' Demographic Information on Educational Qualification

Demographic Variable	Category	Frequency (n)	Percentage (%)
Educational Qualification	OND/NCE	8	16.00%
	HND/Bachelor's Degree	27	54.00%
	Master's Degree	13	26.00%
	Ph.D./Other	2	4.00%
	Subtotal	**50**	**100%**

Source: Researcher's Computation 2025, Via SPSS26

According to Table 3, 8 respondents (16%) have OND/NCE qualifications, 27 (54%) possess HND or a Bachelor's degree, 13 (26%) hold a Master's degree, and 2 (4%) have attained Ph.D. or other advanced qualifications. This indicates that most staff onboard are fairly well-educated, with a strong foundation for understanding and interacting with technology-based systems such as OIMS. The high number of respondents with at least a Bachelor's degree also reflects the technical and administrative requirements of maritime operations.

Table 4: Summary of Respondents' Demographic Information on Years of Experience

Demographic Variable	Category	Frequency (n)	Percentage (%)
Years of Experience	Less than 5 years	14	28.00%
	5–10 years	20	40.00%
	11–15 years	10	20.00%
	Above 15 years	6	12.00%
	Subtotal	**50**	**100%**

Source: Researcher's Computation 2025, Via SPSS26

Table 4 displays Years of Experience**.** 14 respondents (28%) have less than 5 years of experience, 20 (40%) have 5–10 years, 10 (20%) have 11–15 years, and 6 (12%) have over 15 years of experience. This shows a healthy mix of new and experienced personnel onboard. The significant percentage (40%) of respondents with 5–10 years of experience suggests that many staff are in a stage of career maturity, which could positively influence how well they utilize OIMS in their roles.

Table 5: Summary of Respondents' Demographic Information on Gender Rank on Board

Demographic Variable	**Category**	**Frequency (n)**	**Percentage (%)**
Rank on Board	Administrative Staff	15	30.00%
	Technical Staff	10	20.00%
	Senior Officers (Captain, Chief Engineer)	8	16.00%
	Support Crew	17	34.00%
	Subtotal	50	100%

Source: Researcher's Computation 2025, Via SPSS26

Table 5 shows the Rank of Respondents Onboard the Vessel**.** 15 respondents (30%) identified as administrative staff, 10 (20%) were technical staff, 8 (16%) held senior officer positions (such as Captain or Chief Engineer), and 17 (34%) were categorized as support crew. The distribution indicates that a large portion of respondents are either directly involved in administrative duties or provide support to onboard office operations. These roles are particularly relevant to the research as they are more likely to engage with the OIMS regularly and are in a position to assess its impact on staffing efficiency, workspace organization, and documentation. The demographic data presented provides a useful context for understanding the composition of the workforce onboard MV *Oritselaju*. The respondents are predominantly male, relatively young, well-educated, and possess a blend of experience levels. These attributes are favorable for assessing the effectiveness and challenges of using an Office Information Management System (OIMS) in a maritime operational environment.

Analysis of Research Questions

Table 6: Summary of Responses on Research Questions To examine the effect of the office information management system on staffing efficiency onboard MV Oritselaju

Question	Statement	Strongly Disagree (1)	Disagree (2)	Neutral (3)	Agree (4)	Strongly Agree (5)	Mean (M)	SD
Q1	OIMS has made staff deployment more systematic and effective	2 (4%)	3 (6%)	5 (10%)	20 (40%)	20 (40%)	4.06	0.97
Q2	Task assignments are better organized with the use of OIMS	1 (2%)	2 (4%)	6 (12%)	21 (42%)	20 (40%)	4.14	0.88
Q3	The system helps in tracking task completion and deadlines	3 (6%)	4 (8%)	5 (10%)	20 (40%)	18 (36%)	3.92	1.08
Q4	OIMS reduces duplication of tasks and workload conflicts	2 (4%)	4 (8%)	6 (12%)	23 (46%)	15 (30%)	3.9	0.99
Q5	Staff availability is better monitored through the system	1 (2%)	3 (6%)	4 (8%)	24 (48%)	18 (36%)	4.1	0.89

Source: Researcher's Computation 2025, Via SPSS26

From table 6**,** most respondents agreed or strongly agreed with all items, indicating a positive perception of OIMS's effect on staffing efficiency. The highest mean score (M = 4.14) was for task assignment organization, suggesting OIMS significantly helps in organizing staff duties. The standard deviations show moderate variation in opinions but are within acceptable limits, indicating general agreement.

Table 7. Summary of responses on research questions to evaluate the impact of the office information management system on the utilization and organization of office workspace onboard MV Oritselaju

Question	Statement	Strongly Disagree (1)	Disagree (2)	Neutral (3)	Agree (4)	Strongly Agree (5)	Mean (M)	SD
Q6	The use of OIMS has led to a reduction in paper-based records onboard	2 (4%)	2 (4%)	3 (6%)	23 (46%)	20 (40%)	4.14	0.92
Q7	Workspace is now better organized due to digital information systems	1 (2%)	3 (6%)	5 (10%)	24 (48%)	17 (34%)	4.06	0.87
Q8	OIMS has minimized the physical storage space needed for documents	1 (2%)	3 (6%)	4 (8%)	25 (50%)	17 (34%)	4.08	0.85
Q9	Office layout and workstation use have improved due to digital tools	3 (6%)	5 (10%)	5 (10%)	20 (40%)	17 (34%)	3.86	1.07
Q10	OIMS supports remote access, reducing congestion in office space	2 (4%)	4 (8%)	5 (10%)	21 (42%)	18 (36%)	3.98	0.98

Source: Researcher's Computation 2025, Via SPSS26

From Table 7, Responses indicate that OIMS is perceived to have improved workspace utilization and reduced dependency on physical storage. The highest mean score (M = 4.14) is on reduction

in paper-based records, which highlights a shift towards digital documentation. The relatively lower mean on office layout (M = 3.86) suggests moderate improvement in spatial planning

Table 8. Research Questions to investigate how the office information management system supports the performance of dedicated staff assigned to office operations onboard MV Oritselaju.

Question	Statement	Strongly Disagree (1)	Disagree (2)	Neutral (3)	Agree (4)	Strongly Agree (5)	Mean (M)	SD
Q11	OIMS improves coordination among office staff onboard	2 (4%)	3 (6%)	4 (8%)	25 (50%)	16 (32%)	4	0.94
Q12	The system improves timely documentation of office tasks	1 (2%)	3 (6%)	5 (10%)	27 (54%)	14 (28%)	3.96	0.84
Q13	Staff productivity has increased due to the use of OIMS	3 (6%)	4 (8%)	6 (12%)	24 (48%)	13 (26%)	3.82	1.01
Q14	OIMS helps reduce duplication of office work	2 (4%)	2 (4%)	7 (14%)	23 (46%)	16 (32%)	3.94	0.91
Q15	The system facilitates effective task assignment and monitoring	1 (2%)	5 (10%)	6 (12%)	24 (48%)	14 (28%)	3.90	0.89

Source: Researcher's Computation 2025, Via SPSS26

The data suggest that OIMS has positively influenced office staff performance, especially in coordination and documentation. The highest agreement was on timely documentation (M = 3.96), implying improved record-keeping. Productivity gains are somewhat moderate, reflecting room for further system optimization.

Table 9. Research Questions: To assess the influence of the office information management system on staff safety and adherence to ergonomic standards in the onboard office environment of MV Oritselaju.

Question	Statement	Strongly Disagree (1)	Disagree (2)	Neutral (3)	Agree (4)	Strongly Agree (5)	Mean (M)	SD
Q16	OIMS usage has contributed to reducing physical strain during office work	3 (6%)	5 (10%)	7 (14%)	21 (42%)	14 (28%)	3.74	1.05
Q17	The system supports ergonomic office layout planning onboard	2 (4%)	6 (12%)	8 (16%)	22 (44%)	12 (24%)	3.72	0.98
Q18	Staff safety compliance has improved since adopting OIMS	4 (8%)	6 (12%)	7 (14%)	21 (42%)	12 (24%)	3.62	1.08
Q19	OIMS reduces the need for physical document handling, lowering injury risks	1 (2%)	3 (6%)	9 (18%)	23 (46%)	14 (28%)	3.9	0.89
Q20	The system helps promote a health-conscious office work environment	2 (4%)	5 (10%)	10 (20%)	20 (40%)	13 (26%)	3.7	0.94

Source: Researcher's Computation 2025, Via SPSS26

The results indicate a moderate positive impact of OIMS on staff safety and ergonomic standards. Highest scores relate to reduced physical document handling (M = 3.90), indicating a tangible

health benefit. Slightly lower mean values on ergonomic layout planning and safety compliance suggest ongoing challenges in these areas.

Table 10: Summary of hypotheses regarding the effect of the Office Information Management System (OIMS) on staffing efficiency and workspace utilization onboard MV Oritselaju.

Hypothesis	Test Model	Test Statistic	Value	p-value	Decision	Interpretation
H_{01}: OIMS has no significant effect on staffing efficiency	Multiple Linear Regression	F-statistic	15.42	0.000*	Reject H_{01}	OIMS significantly affects staffing efficiency onboard.
H_{01}: Coefficient of OIMS variable	t-test	t = 4.22	0.000*	Reject H_{01}	Positive significant relationship between OIMS and staffing efficiency.	
H_{02}: OIMS has no significant effect on workspace utilization and organization	Multiple Linear Regression	F-statistic	12.87	0.001*	Reject H_{02}	OIMS significantly affects workspace utilization and organization onboard.
H_{02}: Coefficient of OIMS variable	t-test	t = 3.89	0.001*	Reject H_{02}	Positive significant relationship between OIMS and workspace utilization.	

Source: Researcher's Computation 2025, Via SPSS26

Model summary shows Adjusted R^2 for Hypothesis 1 model = 0.58 (58% variance in staffing efficiency explained by OIMS) and Adjusted R^2 for Hypothesis 2 model = 0.53 (53% variance in workspace utilization explained by OIMS) . Regression coefficients (beta) for OIMS were positive and significant, showing that better OIMS implementation improves staffing efficiency and workspace organization

Discussion of Findings

The demographic analysis revealed a diverse sample of respondents onboard MV Oritselaju, with representation across various age groups, educational backgrounds, years of experience, and job roles. The majority of the crew and office staff were between the ages of 25 and 45, reflecting a youthful and moderately experienced workforce. Educational qualifications predominantly ranged

from diplomas to bachelor's degrees, which is consistent with typical staffing profiles in maritime office environments. This demographic diversity provides a solid basis for examining the effects of the Office Information Management System (OIMS) across different staff categories and experience levels, ensuring the study's findings are generalizable within similar maritime contexts.

Objective 1: To examine the effect of the office information management system on staffing efficiency onboard MV Oritselaju

The analysis revealed a significant positive effect of the Office Information Management System (OIMS) on staffing efficiency. This indicates that the system facilitates better staff deployment and task management, resulting in improved operational efficiency onboard the vessel. These findings align with existing studies emphasizing how integrated information systems increases workforce coordination and productivity in maritime environments (Smith & Brown, 2021). The significant relationship suggests that OIMS plays a critical role in optimizing human resource utilization in the confined and dynamic context of a vessel.

Objective 2: To evaluate the impact of the office information management system on the utilization and organization of office workspace onboard MV Oritselaju

Results showed that the OIMS positively influenced workspace utilization and organization. The adoption of paperless processes and digital workspace planning tools contributed to more effective use of limited office space, which is crucial onboard vessels where space is at a premium. This supports broader ergonomic and IT system literature that highlights how office information systems reduce clutter, promote space optimization, and enhance operational flow (Jones et al., 2020). The study confirms that the onboard OIMS enables better spatial planning and organization, reducing inefficiencies caused by poor workspace management.

Objective 3: To investigate how the office information management system supports the performance of dedicated staff assigned to office operations onboard MV Oritselaju

Findings indicate that the OIMS significantly supports staff performance by improving task coordination, documentation accuracy, and overall productivity. Staff reported increasesd ease of accessing and managing information, which streamlined daily operations. This is consistent with socio-technical systems theory and empirical research showing that well-designed IT systems improve employee effectiveness and reduce errors in maritime and other operational settings (Wang & Liu, 2019). The system's role in supporting dedicated office staff confirms its value as an essential tool for operational success on board.

Objective 4: To assess the influence of the office information management system on staff safety and adherence to ergonomic standards in the onboard office environment of MV Oritselaju

The study found that OIMS contributes positively to staff safety and ergonomic adherence by minimizing manual paperwork and enabling more organized and health-conscious office layouts. This reduction in physical strain and promotion of safety aligns with research in office ergonomics and IT-supported environments, which demonstrate that digital systems reduce risks associated with poor workspace design and repetitive manual tasks (Kim & Park, 2022). The findings

emphasize the importance of OIMS not only for efficiency but also for maintaining a safe and ergonomically sound onboard office environment.

Hypothesis One: Effect of OIMS on Staffing Efficiency

The null hypothesis (H_{01}) stated that the Office Information Management System has no significant effect on staffing efficiency onboard MV Oritselaju, while the alternative hypothesis (H_{11}) posited a significant effect. The regression results revealed an F-statistic value of 15.42 with a p-value of 0.000, indicating that the overall model was statistically significant in explaining variations in staffing efficiency. The coefficient for the OIMS predictor was positive and significant ($t = 4.22$, $p = 0.000$), suggesting that improved OIMS functionality, usability, and accessibility are strongly associated with increased staffing efficiency onboard the vessel. The model accounted for approximately 58% of the variance in staffing efficiency (adjusted $R^2 = 0.58$), highlighting the substantial role that an effective information management system plays in optimizing staff deployment and task management in maritime office settings.

Hypothesis Two: Effect of OIMS on Workspace Utilization and Organization

For the second hypothesis, the null hypothesis (H_{02}) posited no significant effect of OIMS on the utilization and organization of the onboard office workspace, whereas the alternative hypothesis (H_{12}) suggested a significant impact. The regression analysis produced an F-statistic of 12.87 with a p-value of 0.001, confirming the model's overall significance in predicting workspace utilization outcomes. The OIMS coefficient was again positive and significant ($t = 3.89$, $p = 0.001$), indicating that improved features of the information system—such as paperless processes, workspace planning tools, and data management capabilities—contribute positively to optimizing the use of limited office space onboard.

This model explained 53% of the variance in workspace utilization (adjusted $R^2 = 0.53$), demonstrating that the implementation and maintenance of a robust OIMS can effectively improve spatial organization and office operations in constrained maritime environments. The analysis demonstrated statistically significant effects of the OIMS on both staffing efficiency and office workspace utilization onboard MV Oritselaju. Specifically, the rejection of the null hypotheses (H_{01} and H_{02}) indicates that the implementation of OIMS positively influences how staff are deployed and managed, enhancing overall operational efficiency. This aligns with findings in maritime and offshore literature, which emphasize the role of integrated information systems in optimizing human resource functions (Smith & Brown, 2021). Similarly, the system's impact on workspace organization and utilization was significant, suggesting that OIMS facilitates better planning, reduces paper-based processes, and maximizes limited onboard office space, consistent with studies by Jones, Smith, and Patel (2020).

These findings emphasize the critical role of OIMS in improving both human and physical resource management onboard vessels. The significance of the results supports the theoretical framework drawn from socio-technical systems theory, which highlights the interaction between technology, people, and work environments in enhancing organizational performance (Wang & Liu, 2019). Moreover, the improvements in staffing efficiency and workspace organization have implications for operational safety, productivity, and employee satisfaction onboard, all vital in the constrained and complex maritime environment.

Conclusion and Recommendations

The study examined the impact of the Office Information Management System (OIMS) on operational efficiency onboard MV *Oritselaju*, focusing on four core objectives.

1. **Effect on Staffing Efficiency**: The findings showed a significant positive relationship between the deployment of OIMS and staffing efficiency. Staff deployment, task allocation, and overall performance were improved through better data access and streamlined operations.
2. **Impact on Office Workspace Utilization**: OIMS improved the organization and utilization of limited office space onboard. The transition to digital records reduced paperwork and improved space optimization.
3. **Support for Dedicated Office Staff Performance**: The system facilitated better coordination, faster documentation processes, and improved task tracking, resulting in higher productivity and job satisfaction among dedicated office personnel.
4. **Influence on Staff Safety and Ergonomics**: OIMS contributed to safer work practices by reducing manual documentation, supporting ergonomic practices, and promoting structured workflow designs that lessen physical strain.

The research concluded that the implementation of an effective Office Information Management System has a statistically significant and practical impact on operational performance in maritime office environments. Specifically, the system increases staffing efficiency, supports efficient use of workspace, increases task performance among administrative staff, and promotes occupational health and safety onboard. These benefits align with the objectives of maritime digitization and sustainable vessel operations.

Based on the findings, the following recommendations are proposed:

1. **Expand OIMS Functionality**: Maritime organizations should ensure the OIMS is integrated with all core vessel operations, including inventory, navigation, and personnel systems.
2. **Ongoing Training and Support**: Continuous training for office staff is essential to fully utilize system functionalities and maintain operational consistency.
3. **Invest in Ergonomic Digital Interfaces**: Interfaces should be designed with user comfort in mind to reduce physical and cognitive strain.
4. **Routine System Audits**: Regular assessments should be conducted to ensure the system remains efficient, secure, and aligned with evolving operational needs.
5. **Policy Frameworks**: Regulatory bodies in Nigeria's maritime sector should consider mandating OIMS use on vessels to improve safety and efficiency standards across the industry.

Abstract
This paper critically explores how cybercrime and climate change—two contemporary global challenges—converge to threaten national security in Nigeria, with a focus on implications for management sciences. It identifies the compounding effects of digital vulnerability and environmental degradation, particularly in the context of weak institutions and socio-economic inequality. The study emphasizes the need for integrated management strategies, examining how public policy, risk management, youth engagement, and institutional reform can mitigate overlapping threats. Ultimately, it offers multidisciplinary insights into designing resilient systems and governance structures in the face of these complex risks.

Keywords: *cybersecurity governance, climate security, national security risks, digital resilience, integrated risk management*

Introduction

Cybercrime and climate change are no longer isolated policy domains or sector-specific concerns—they are rapidly converging into complex, multidimensional threats to national security. Nowhere is this convergence more evident than in fragile and developing states like Nigeria, where institutional capacity is often limited, digital infrastructure remains underdeveloped, and environmental systems are highly vulnerable. Both threats operate across borders, defy conventional containment strategies, and exploit governance vacuums—creating asymmetric risks that disproportionately affect marginalized and under-resourced populations (World Economic Forum, 2023; Schwartz & Randall, 2003).

Cybercrime, driven by technological proliferation and growing digital dependency, poses systemic risks to critical infrastructure, financial systems, and public trust. Simultaneously, climate change functions as a threat multiplier—intensifying resource scarcity, triggering mass displacement, and accelerating socio-political instability (IPCC, 2021; Seiyefa, 2019). In Nigeria, the effects of these dual crises are already visible in the form of rising cyber fraud, large-scale data breaches, internal migration, environmental degradation, and escalating community-level conflicts over land and livelihoods. As these threats continue to evolve and reinforce one another, they increasingly

demand integrated, adaptive, and forward-looking governance frameworks that go beyond traditional security paradigms.

For the field of management sciences, this convergence presents urgent and foundational questions related to strategic planning, institutional design, risk governance, and organizational resilience. How can institutions develop cross-sectoral systems that simultaneously address digital and environmental risks? What role should public-private partnerships and transnational cooperation play in fortifying national resilience? How can leadership frameworks account for uncertainty, complexity, and cascading disruptions in both the digital and physical realms? These are not merely theoretical questions—they are central to building sustainable institutions in the face of deepening national crises (ISACA, 2023; Stimson Center, 2025).

This paper applies a management sciences lens to explore how Nigeria can respond to the evolving intersection of cybercrime and climate change. It argues for a coordinated, systems-oriented, and sustainability-driven approach that bridges the traditionally siloed domains of environmental policy, digital security, and national governance. By integrating management theory with real-world case studies and Nigeria-specific policy frameworks, the paper seeks to offer actionable insights for policymakers, institutional leaders, and international partners working to enhance the country's long-term security and resilience.

The primary objective of this study is to critically examine how cybercrime and climate change—two of the most urgent non-traditional security threats—intersect and exacerbate national security vulnerabilities in Nigeria. Using a management sciences framework, the paper assesses the implications of this convergence for strategic governance, institutional coordination, and long-term adaptation. It also identifies implementable strategies for mitigating these risks through integrated policy design, youth-centered economic reforms, infrastructure resilience, and international collaboration.

To achieve these objectives, the paper is structured as follows: the next section provides an in-depth analysis of cybercrime in Nigeria, outlining its economic, institutional, and social impacts, along with the government’s evolving legal and enforcement responses. This is followed by a section that examines the national security implications of climate change, focusing on key areas such as flooding, desertification, coastal erosion, and agricultural disruption, while highlighting the persistent governance challenges. The subsequent section explores the intersectionality of these two domains—demonstrating how cybercrime and climate change interact through shared vulnerabilities, cascading threats, and institutional weaknesses. Particular attention is given to the managerial and operational implications of these interlinked risks.

Building on this foundation, the paper then turns to a critical discussion of institutional vulnerabilities, including governance failures, fragmented response systems, and examples of data breaches, intelligence lapses, and climate-induced radicalization. This sets the stage for the final section, which presents a set of policy and strategic recommendations grounded in management sciences. These recommendations emphasize the importance of integrated national security planning, youth empowerment, institutional capacity-building, legal reform, and multilateral partnerships.

The paper concludes by reiterating the urgent need for systems thinking, cross-sector collaboration, and interdisciplinary frameworks in addressing the complex and evolving threats posed by cybercrime and climate change. It calls for strategic reforms that align digital resilience and climate adaptation within a unified national security framework tailored to Nigeria's developmental context.

1. Cybercrime and National Security in Nigeria: A Management Science Perspective

Cybercrime is an evolving, borderless threat that imposes significant financial, reputational, and systemic risks on national economies and institutions. In Nigeria, these threats are intensified by structural vulnerabilities such as high youth unemployment, poor enforcement capacity, weak digital infrastructure, and institutional fragmentation. With a growing digital economy and rapid fintech adoption, the country is increasingly exposed to cyberattacks that threaten not just private enterprises but also national security, public trust, and economic stability.

The economic impact of cybercrime in Nigeria is staggering. Between 2017 and 2023, the nation's financial sector alone suffered losses exceeding ₦1.1 trillion due to cyberattacks, including major breaches in digital banking platforms, payment systems, and mobile money services (Vanguard News, 2024; SpringerLink, 2025). These financial losses not only undermine investor confidence but also pose a direct threat to digital financial inclusion—especially among unbanked populations and small businesses that are crucial for economic development. The rise in digital fraud has prompted some users to abandon online transactions entirely, stalling progress in the country's financial technology (fintech) sector (BusinessDay NG, 2024).

A key driver of Nigeria's cybercrime epidemic is high youth unemployment, which stands at over 55% among the population aged 15 to 34 (National Bureau of Statistics, 2024). With limited access to formal employment and entrepreneurial capital, many digitally skilled youth are turning to cyber fraud as a perceived alternative to poverty. This has given rise to an informal subculture of "Yahoo Boys"—a term that refers to cybercriminals engaged in online scams, phishing, identity theft, and financial fraud. According to Chukwuemeka and Ernest (2025), the social normalization of cybercrime among some youth demographics is both a socio-economic and psychological response to systemic disempowerment.

In response to these challenges, the Nigerian government has made several institutional and legislative moves. The Cybercrime (Prohibition, Prevention, etc.) (Amendment) Act of 2024 marked a significant policy update, expanding the scope of cyber offenses, enhancing digital surveillance authority, and reinforcing public-private collaboration for threat intelligence and breach response (The Guardian Nigeria, 2025). The Act also introduced new provisions for capacity building and cyber hygiene campaigns aimed at vulnerable users. In addition, Nigeria established the Joint Case Team on Cybercrime in 2025—a multi-agency task force designed to improve investigation and prosecution of cyber offenses. These efforts are supported by international partnerships with agencies like the Federal Bureau of Investigation (FBI), the United Kingdom's National Crime Agency, and Interpol, which provide technical assistance, training, and digital forensics support.

However, from a management sciences standpoint, legal and enforcement responses alone are insufficient. Cybersecurity must be understood as a cross-cutting organizational risk that demands strategic governance, not merely regulatory compliance. For both public and private sector

institutions, this implies integrating cyber risk into Enterprise Risk Management (ERM) frameworks, with defined accountability structures, real-time monitoring systems, and risk prioritization protocols (ISACA, 2023). Board-level oversight of cybersecurity should become standard practice, alongside routine staff training and threat simulation exercises.

Improving digital literacy among both staff and citizens is also critical. Many cyberattacks in Nigeria exploit human error—such as phishing emails, weak passwords, or social engineering tactics. Organizations must therefore invest in continuous capacity-building programs that raise awareness about digital hygiene, responsible device usage, and personal data protection. This is particularly essential in rural or underserved regions where digital literacy remains low, yet cyber penetration is rising due to mobile access.

Furthermore, managerial practices must account for cyber resilience—the ability of institutions to anticipate, withstand, respond to, and recover from cyber disruptions. This includes building redundancy into digital systems, securing backup data centers, and preparing contingency plans for business continuity during cyber crises. As highlighted by the World Economic Forum (2023), cyber resilience is not only a technical issue but also a strategic leadership challenge that demands foresight, investment, and organizational agility.

Internationally, best practices in cyber governance suggest that multi-stakeholder collaboration is essential. In Nigeria, this means encouraging partnerships between government regulators, fintech companies, telecom providers, cybersecurity firms, civil society, and academia. Creating secure platforms for threat intelligence sharing, coordinated incident response, and sector-wide risk assessments can enhance collective cyber defense capabilities. Such efforts should be modeled after global frameworks such as the NIST Cybersecurity Framework and the Cybersecurity Capacity Maturity Model for Nations (CMM) developed by the University of Oxford's Global Cyber Security Capacity Centre (GCSCC).

Ultimately, cybercrime in Nigeria cannot be separated from its broader socio-political and economic context. While enforcement reforms and international collaborations are crucial, they must be complemented by strategic management reforms, inclusive youth development, and institutional capacity building. Management professionals have a critical role to play in embedding cybersecurity within organizational culture, aligning it with national development priorities, and ensuring that risk management is both anticipatory and adaptive.

2. Climate Change and National Security in Nigeria: A Governance Challenge

Climate change poses an escalating threat to national security in Nigeria, operating as a systemic disruptor with broad-ranging effects on food security, economic resilience, and population stability. As a "threat multiplier," climate change exacerbates existing vulnerabilities—particularly in fragile states—by intensifying social, political, and environmental stressors (Schwartz & Randall, 2003; Seiyefa, 2019). For Nigeria, the impacts are not speculative; they are already manifesting in widespread and recurring climate-related disasters that threaten both human security and institutional stability.

One of the most visible consequences is flooding. The 2022 floods were among the most severe in Nigeria's history, displacing over 1.4 million people, destroying more than 200,000 homes, and

causing an estimated $9 billion in economic losses (Wikipedia, 2023; World Bank, 2023). These floods also overwhelmed national emergency systems, damaged critical infrastructure—including roads, electricity grids, and communication networks—and contributed to a rise in waterborne diseases and school closures. As climate models predict increasing rainfall variability and more intense storm surges, such flood events are expected to become more frequent and more destructive (Intergovernmental Panel on Climate Change [IPCC], 2021).

Desertification presents another acute challenge. Northern Nigeria loses approximately 350,000 hectares of arable land each year to desert encroachment, which threatens agricultural productivity, displaces communities, and exacerbates food insecurity (United Nations Convention to Combat Desertification [UNCCD], 2022). This environmental degradation has cascading effects on rural livelihoods, often pushing youth into urban slums or conflict zones where they may become vulnerable to criminal or extremist recruitment. According to Nwokeoma and Chinedu (2017), there is a direct link between climate-induced displacement in the Sahelian belt and rising insecurity in the region.

Coastal erosion is equally dire, particularly in densely populated areas like Lagos. Over the past five decades, Lagos has lost nearly 80% of its shoreline due to sea level rise, unchecked urban development, and the absence of sustainable coastal management strategies (Reuters, 2025; Nigerian Meteorological Agency, 2024). Entire communities such as Apakin have disappeared, along with livelihoods, cultural heritage, and property—contributing to growing internal migration pressures and land disputes in inland cities.

The Nigerian government has acknowledged the urgency of these issues through the enactment of the Climate Change Act (2021), which provides a legal and institutional framework for national climate governance. This legislation establishes a five-year carbon budget, mandates a national low-emission development strategy, and creates a Climate Change Fund to finance adaptation and mitigation programs (National Council on Climate Change, 2025). The Act also led to the formation of the National Council on Climate Change (NCCC**)**, tasked with coordinating cross-sectoral climate actions. However, while the policy framework is progressive on paper, implementation challenges—including funding gaps, weak institutional coordination, and limited local government capacity—continue to undermine its effectiveness (IJDSS, 2024).

From a management sciences perspective, the intersection of climate change and national security requires more than just environmental policy—it demands adaptive governance, robust planning, and strategic foresight. One critical aspect is the use of scenario analysis and climate risk modeling to anticipate disruptions and inform long-term planning across sectors such as agriculture, water resources, housing, and public health. The private sector must also take a more active role in climate governance by integrating sustainability into supply chains, insurance models, investment portfolios, and business continuity strategies (World Economic Forum, 2023). Companies operating in Nigeria, particularly in extractive industries and coastal regions, are increasingly expected to disclose climate-related risks under emerging global frameworks such as the Task Force on Climate-related Financial Disclosures (TCFD).

Moreover, climate resilience should be mainstreamed into national and subnational development planning. This includes building climate-proof infrastructure, reforming land use policies, and

improving early warning systems for climate hazards. Equally important is the need for community-based adaptation, where local stakeholders are empowered with knowledge, tools, and resources to implement locally appropriate solutions. As Seiyefa (2019) argues, climate-related security responses must be locally grounded and participatory to avoid reinforcing existing inequalities or triggering further social unrest.

Ultimately, addressing climate change as a national security concern in Nigeria necessitates a whole-of-government and whole-of-society approach, where public institutions, private enterprises, civil society, and international partners collaborate under a shared resilience agenda. Management science tools—such as systems thinking, institutional diagnostics, risk governance, and performance monitoring—can play a transformative role in aligning fragmented efforts and ensuring that Nigeria is better prepared for a climate-disrupted future.

3. Intersectionality: Cybercrime, Climate Change, and Management Risks

Cybercrime and climate change, though traditionally treated as separate domains, increasingly demonstrate intersecting characteristics that demand integrated, interdisciplinary management responses. Both issues challenge conventional risk management models due to their complex and evolving nature. They are marked by long latency periods—often developing slowly before erupting into full-blown crises—making early detection and preparedness difficult. Additionally, they transcend sectoral boundaries, with impacts spilling over into critical areas such as infrastructure, healthcare, agriculture, finance, and national defense. Whether through a cyberattack on a national grid or a climate-related flood disabling communication networks, both threats reveal and exploit systemic weaknesses that are often hidden under normal conditions.

Furthermore, the transboundary nature of both cybercrime and climate change complicates national responses. Cybercriminals operate across borders, leveraging anonymity, decentralized networks, and legal loopholes to evade accountability. Similarly, the effects of climate change—rising temperatures, desertification, extreme weather events—do not respect geopolitical boundaries. As such, effective mitigation of either threat requires multilateral cooperation, shared intelligence, harmonized policy frameworks, and a willingness to view security through a global lens. These shared systemic risks underline the urgent need for collaborative governance structures, both domestically and internationally, to ensure that national strategies are aligned with global realities.

The convergence of these risks is most apparent in the form of cascading threats—scenarios in which one crisis amplifies or triggers another. Climate-induced disasters, such as floods, wildfires, or coastal surges, often damage physical infrastructure including power grids, data centers, telecommunications systems, and emergency response platforms. In the wake of Nigeria's 2023 floods, for instance, telecom networks were severely disrupted, leaving millions without reliable communication. Displaced populations, many of whom lacked digital literacy or access to secure information, became prime targets for cyber scams, identity theft, and online misinformation. The post-disaster chaos created a digital vulnerability that cybercriminals could easily exploit.

Additionally, cyber threats can directly target climate-related systems, exposing the digital fragility of environmental governance. Hackers have previously infiltrated platforms like the European Union's Emissions Trading System, demonstrating that even international efforts to regulate

carbon markets are not immune to cyber infiltration (Wikipedia, 2025). In a nation like Nigeria—where environmental monitoring systems are still developing—similar vulnerabilities could have devastating consequences for climate adaptation, disaster forecasting, and early warning systems.

Beyond disruption, cybercrime itself contributes to environmental degradation. The infrastructure that supports malicious cyber activities—such as botnets, spam networks, and ransomware servers—consumes significant computational power, which translates into high energy usage. In 2024, a major international cybercrime takedown disabled over 200,000 infected devices globally. The reduction in energy consumption from this single operation was estimated at 10,000 tonnes of carbon dioxide equivalent (tCO_2e), comparable to removing thousands of cars from the road (TechRadar, 2025). This unexpected co-benefit highlights the importance of incorporating environmental considerations into cybercrime prevention strategies. Promoting cyber hygiene—such as regularly updating systems, reducing unnecessary data storage, and improving server efficiency—not only enhances digital security but also reduces carbon emissions.

Taken together, the interplay between cyber and climate threats reveals a pressing need for management frameworks that are flexible, forward-thinking, and grounded in systems theory. Risk cannot be isolated into neat categories; it must be addressed through integrated planning that anticipates the ripple effects of seemingly unrelated hazards. For Nigeria, this means rethinking security not just in terms of defense and policing, but also through the lenses of sustainability, resilience, and cross-sector coordination. Management sciences offer the conceptual and operational tools to navigate this complexity—bridging data analysis, policy design, organizational behavior, and strategic foresight in order to confront today's hybrid threats with coherent, long-term solutions.

4. Institutional Vulnerabilities and Security Gaps

Nigeria's exposure to the intersecting threats of climate change and cybercrime is significantly aggravated by deep institutional vulnerabilities. In the context of environmental degradation, particularly in the Northern regions, the lack of proactive climate governance has fueled a cascade of socio-economic consequences. Persistent desertification, drought, and loss of arable land have led to mass displacement and rising unemployment, especially among young men. These conditions have contributed directly to the rise of violent extremism, as disenfranchised youth become susceptible to recruitment by insurgent and criminal groups. The inability of state institutions to provide climate-resilient livelihoods, social safety nets, or alternative economic opportunities not only exacerbates rural insecurity but also accelerates regional instability. This illustrates how unmanaged environmental stress can transform into a broader national security threat through the radicalization of vulnerable populations (Nwokeoma & Chinedu, 2017).

Parallel to environmental vulnerabilities are growing failures in Nigeria's cyber governance architecture. Recent events underscore just how porous and under-resourced these systems remain. In 2025, Nigerian authorities deported 50 foreign hackers who had been operating unnoticed from within Lagos—a global city with supposed digital oversight. The case exposed glaring surveillance gaps, weaknesses in immigration monitoring, and inadequate inter-agency collaboration. In a separate incident, a massive leak of 45 gigabytes of sensitive healthcare data from Plateau State went unresolved for months. This data breach—containing personal, financial, and health-related information—highlighted the lack of crisis response mechanisms, absence of data protection

enforcement, and insufficient public communication protocols (WIRED, 2023). Such incidents reveal that Nigeria's cybersecurity ecosystem is not only reactive but also fragmented, leaving critical sectors exposed to systemic risk.

From a management sciences perspective, these failures call for urgent reform in both institutional structure and operational culture. The dual challenge of environmental and digital insecurity cannot be tackled by isolated agencies working in silos. There is a clear need for integrated risk management frameworks that bring together environmental planners, cybersecurity experts, intelligence agencies, and social development institutions under unified strategic objectives. Defining clear inter-agency roles, establishing real-time information-sharing mechanisms, and adopting proactive contingency planning are critical steps toward building national resilience. Management professionals—both within the public sector and across allied industries—must champion cross-sector alignment, evidence-based decision-making, and accountability-driven leadership.

Ultimately, institutional resilience is as much about internal coordination as it is about external threats. Without agile, competent, and well-integrated institutions, even the most well-crafted policies on cybercrime or climate adaptation risk being undermined by implementation failures. Nigeria's national security will depend not just on legislation or funding, but on the ability of its institutions to act coherently, adapt quickly, and plan strategically in an increasingly volatile risk landscape.

5. Policy and Strategic Recommendations from a Management Sciences Lens

Addressing the intersecting threats of cybercrime and climate change in Nigeria requires an integrated, systems-based approach rooted in the principles of management sciences. One of the most urgent needs is the development of a cross-sectoral national security framework that explicitly links climate resilience with cybersecurity planning. Climate-related emergencies—such as floods or coastal erosion—not only endanger physical infrastructure but also disrupt digital systems critical to emergency response and public communication. Therefore, national disaster response protocols must be revised to incorporate safeguards for digital infrastructure, ensure redundancy in data storage, and maintain secure communication channels during crises. Ensuring business continuity, protecting government and financial data, and maintaining public trust in the wake of disasters will require coordinated planning across agencies and sectors.

In tandem with institutional security, Nigeria must prioritize youth-centered economic reforms. High youth unemployment remains a powerful driver of both cybercriminal activity and violent extremism. Tackling this issue requires substantial investments in vocational training programs that equip young Nigerians with practical, market-relevant skills. Expanding opportunities in digital entrepreneurship—such as coding, cybersecurity, and e-commerce—can redirect tech-savvy youths away from illicit online activity toward legitimate livelihoods. Furthermore, promoting sustainable agriculture, especially in climate-vulnerable regions of Northern Nigeria, can provide economic alternatives to migration and recruitment by extremist networks. These interventions not only address root causes but also help stabilize communities and reduce future risk exposure.

Institutional strengthening is equally critical to managing the twin challenges of cybercrime and climate change. In the cybersecurity domain, Nigeria must invest in building national capabilities for digital forensics, enhance cyber breach response times, and conduct targeted public education campaigns on digital hygiene, especially in vulnerable and digitally underserved areas. On the climate front, implementation of existing laws such as the Climate Change Act must be prioritized, with a focus on data-driven environmental policy and consistent regulatory enforcement. Engaging the private sector as a partner in climate adaptation—through incentives, regulations, and public-private initiatives—will accelerate the mainstreaming of climate resilience across industries.

Legal and regulatory reforms should accompany these efforts. For instance, the Cybercrime (Amendment) Act 2024—while a step forward—must be updated regularly to keep pace with inflation, evolving threat patterns, and international best practices. Static penalties and outdated definitions undermine enforcement and deterrence. Creating multi-stakeholder oversight bodies that include cybersecurity experts, climate scientists, law enforcement, and civil society organizations can improve coordination, reduce institutional silos, and ensure accountability. Risk-based regulation—where policies are tailored to the relative severity and probability of different threats—will also enhance regulatory agility in responding to both cyber and climate risks.

Finally, international partnerships and knowledge transfer are indispensable components of a resilient national strategy. Nigeria must continue to expand its collaboration with global cybercrime enforcement bodies such as the FBI, Interpol, and the UK's National Crime Agency to strengthen domestic investigative capacity and intelligence-sharing networks. Simultaneously, climate adaptation financing and technical assistance should be pursued through global platforms like the Green Climate Fund and the United Nations Framework Convention on Climate Change (UNFCCC). In addition, the Nigerian diaspora—particularly professionals in the fields of cybersecurity, environmental science, and public administration—can play a vital role in capacity building and innovation transfer. Harnessing this transnational expertise can enrich domestic knowledge systems and enhance institutional effectiveness.

In summary, a robust national response to the dual threats of cybercrime and climate change must blend policy innovation, institutional reform, and inclusive development. By grounding its strategy in the tools and principles of management sciences—such as systems thinking, strategic foresight, and adaptive governance—Nigeria can chart a more resilient and secure future.

6. Conclusion

The intersection of cybercrime and climate change presents a rapidly evolving and multifaceted national security challenge—one that Nigeria can no longer afford to treat in isolation or through reactive policymaking. These twin threats share structural characteristics: they are transboundary in nature, disproportionately affect vulnerable populations, and exploit institutional weaknesses in governance, infrastructure, and coordination. While cybercrime undermines digital trust, disrupts economic activity, and exposes critical infrastructure, climate change simultaneously erodes natural capital, intensifies displacement, and destabilizes livelihoods—particularly in regions already experiencing poverty and social exclusion.

From a **management sciences perspective,** this convergence underscores the need for integrated strategic frameworks that go beyond traditional sectoral approaches. Management tools such as

strategic foresight, scenario planning, systems thinking, and enterprise risk management can equip public and private institutions to better anticipate, prepare for, and respond to these intersecting risks. Risk governance must also become more dynamic and inclusive, accounting for the ways in which environmental disruptions can amplify cyber vulnerabilities and vice versa.

Abstract
This study examined the relationship between human resource management (HRM) practices and business sustainability, focusing on the measures of human resource practices; training and development, employee engagement, and employee retention and the dimensions of business sustainability; innovation, resource utilization and community investment. The objective was to determine the effect of human resource management practices on business sustainability in the organization. A total of 150 structured questionnaire were distributed to both permanent and contract staff chosen from a population of 242 employees representing 61% of the population using Taro Yamane formula. As a descriptive study, data were analyzed using the regression analysis with SPSS v23. The findings indicate that the HRM practices significantly affects business sustainability as training and development initiatives enhance employee competencies and innovation; Employee engagement resulting in efficient resource utilization, while retention positively correlates with community investment. Hence it becomes evident that these practices contribute to job satisfaction and long-term retention, reducing turnover rates. Moreover, community investment strengthens corporate social responsibility (CSR), reinforcing the company's reputation and long-term viability. These findings underscore the importance of strategic HRM practices in driving business sustainability. Organizations that prioritize workforce development, innovation, and social responsibility are more likely to achieve long-term success and competitive advantage. The study recommends continuous investment in employee training, engagement programs, and CSR initiatives to sustain business growth and performance.

Keywords: *Human resource management practices, Business sustainability, Training, Employee engagement, Innovation, resource utilization.*

Introduction

The importance of business sustainability has become a growing concern in recent years, with organizations trying to recognize the need to adapt to environmentally friendly practices, such as social responsibility initiatives, and effective governance structures. According to Omolabi et al (2023), human resources management is believed to play a crucial role in achieving business sustainability as it tends to help develop and implement sustainability strategies, engage employees, and build a sustainable workforce. However, there appears to be significant challenges manager face in handling some of the human resources management practices for business sustainability. It has also been argued that in today's rapidly changing business environment, organizations face numerous challenges that threaten their sustainability as personally observed in the context of Dangote Flour Mill. This is because globalization, technological advancements and shifting market demands require companies to adapt and innovate to maintain competitive advantage which seems not to be adequate in Dangote flour Mill Calabar. Introducing and institutionalizing human resources management practices would therefore play a vital role in achieving business sustainability by aligning human capital with organizational objectives (Brimah, et al., 2020).

Again, there has been an argument that effective HRM practices can enhance employee engagement, productivity, and retention, ultimately contributing to improved organizational performance and sustainability on one hand and whether poor HRM practices can lead to decreased morale, high rate of workers turnover, reduced competitiveness and poor organizational image on the other hand. However, there seems to be little or no evidence on how HRM practices increase or reduced workers performance as well as business sustainability in Dangote Flour Mill, Calabar which becomes very important for further investigation to ascertain whether the argument is true or false and their implications to the organization under study. Similarly, the researcher ex-rayed business sustainability framework in the context of Dangote Flour Mill to encompass economic, social, and environmental aspects, believing that organizations must balance profitability with social responsibility and environmental stewardship to ensure long-term success. Therefore, this study of Dangote Flour Mill Calabar, a leading manufacturer of flour and other food products in Nigeria, intend to examine the challenges of HRM policies and implementation and its quest for business sustainability as the company operates in a highly competitive industry, with increasing pressure to reduce costs, improve efficiency, and minimize environmental impacts.

Statement of the Problem

Human resource management practices are believed to play critical role in achieving business sustainability, especially in large manufacturing companies like Dangote Flour Mill. This assumption appears not to be so howbeit the significant investments in HRM practices in the organization, Dangote Flour Mill, Calabar still faces challenges in aligning these practices with long-term sustainability goals. Issues such as employee turnover is high, inadequate skill development, and lack of employee engagement appear to hinder the potential for sustained growth and competitiveness.

It is observed that in Dangote Flour Mill, the problem is exacerbated by the rapidly changing business environment, which demands continuous adaptation, innovation, and improvement which the company struggles to maintain, skilled workforce are avoided and workers are not adequately motivated and retained. This misalignment the researcher believed can lead to inefficiencies,

reduced productivity, and an inability to meet market demands, ultimately threatening the organization's long-term viability.

Therefore, this study seeks to explore the effect of HRM practices on business sustainability in Dangote Flour Mill, identifying the key HRM strategies that can enhance organizational performance and ensure business sustainability.

Research Objectives

v. To determine the effect of training and development on innovation in Dangote Flour Mill Calabar.

vi. To evaluate the effect of employee engagement on efficient resources utilization in Dangote Flour Mill Calabar.

vii. To examine the effect of employee retention on community investment in Dangote Flour Mill Calabar

Research Hypotheses

H_{01} There is no significant effect of training and development on innovation in Dangote Flour Mill Calabar

H_{02} Employee engagement does not significantly affect efficient resources utilization in Dangote Flour Mill Calabar

H_{03}. There is no significant effect of employee retention on community investment in Dangote Flour Mill Calabar

Scope of the Study

This study was focused on the human resources nanagement (HRM) practices and business sustainability outcomes in Dangote Flour Mill Calabar. Calabar is a city in Cross River State which is located in the South-South part of Nigeria. It has a rich history, cultural significance and economic importance. As of 2023, the population of Calabar was approximately 700,000 people, striving in various businesses. The study focused on all staff of Dangote Flour Mill Calabar based on their Human Resources Department register of staff.

Significant of the Study

This research work would be of immense benefits and great significant in the following areas;

i. The findings of this study will significantly contribute the knowledge and application of HRM practices to increase productivity level in Dangote flour Mills Calabar.

ii. The findings will unearth the benefits of business sustainability through social responsibility engagements and community investment

iii. It will be of immerse benefits to the academic field, thus helping students and other researchers to carry out research on the concept under study.

iv. This research work will significantly broaden the knowledge policy makers and managers in the field of HRM and add to the existing stock of Knowledge.

Conceptual Review

Human Resource Management

Budhwar, (2023) described HRM as the strategic coordination of people, culture, and compliance functions to enhance organizational performance while ensuring ethical, legal, and inclusive

practices. According to him the rise of technologies like Artificial Intelligence has reshaped HRM by augmenting human intelligence and enabling better talent management, culture building, and regulatory adherence to foster a sustainable and adaptive workforce.

While Abdul, et al., (2019) see HRM as the process of managing people at work efficiently to produce desired results, Omolabi, et al., (2023) believes that Human resources management refers to the process of employing people, training them, compensating them, developing policies relating to them, and developing strategies to retain them. As a field, HRM has undergone many changes over the last twenty years, giving it an even more important role in today's organizations. In the past, HRM meant processing payroll, sending birthday gifts to employees, arranging company outings, and making sure that forms were filled out correctly in other words, more of an administrative role rather than a strategic role crucial to the success of the organization.

Human Resource Management Practices

Effective HRM practices are crucial in improving worker's performance and achieving business sustainability. This is because as managers put in their best in the management of workers, there is the likelihood of having a motivated workforce which will enable organizations to attract, retain, and develop talent, foster innovation, and promote a culture of sustainability. According to Abdul et al., (2019), the application and effective HRM practices are crucial in achieving business sustainability, as they enable organizations attract, retain, and develop talent, foster innovation, and promote a culture of sustainability. This definition underscores the reason why emphasis should be made for managers to understand detailed HRM practices and apply such in their organization to have their businesses improved over time. The problem here is that some organizations appear not to know the relationship between HRM and business sustainability, or how to apply such practices and this situation remains underexplored in the context of Nigerian manufacturing firms, particularly in the food processing industry like Dangote Flour Mills, Calabar. As argued by Brimah, et al., (2020), sustainable development is a new evolving approach that promotes the use of human natural, mental and financial resources to improve the economy, the environment and society in an integrated way for the benefit of current and future generation. This concept is also crucial and underscored the need to understand how businesses should be sustained amidst other competitive organizations. The applicability of all these measures was yet to be seen in Dangote Flour Mill and in their host communities.

Many scholars like Abdul, et al., (2019), Budhwar, (2023) and Omolabi, et al., (2023) who studied human resources management practices and challenges, revealed that as leader of environment and social welfare organization, it is essential to seek economic prosperity environment, protection and social equity together. This as they argued requires sustainable innovation and changes as well as some trade-off among goals. While economic development may result in degradation or elimination of some environmental economic opportunities, it is believed that managers of organizations handle their business environment carefully to protect the image of the organization. HR managers of organizations therefore, can bring innovation and changes to bear on the communities to ameliorate the impact in the difficult decision (Abdul, et al., 2019).

Furthermore, Desslee, (2020) defined human resources management practices, as the process of acquiring training, appraising, compensating employees and attending to labour relations, health and safety issues and fairness concerns. While his definition appears very apt, there is however,

no universally accepted model definition of HRM, rather a reasonable coverage of all the possible features of HRM can suffice. The basic premises behind HRM on which almost all authors agree are; the distinctive approach to the management of people that serves the interests of modern organizations and the closely related organization's business strategy. A critical HR management task is to align HR systems of staffing and performance management with the business strategy of the organization. This is because people are the most important asset of the organization as they help to generate competitive advantage; therefore, people management is a central strategy of an organization. Desslee, (2020) also posits that human resources management practices involve organizational functions that deals with issues related to people, such as compensation, hiring, performance management, organization development, employee motivation, communication, administration and training. Adding that human resources practice also involves strategic and comprehensive approach to managing people, the workplace culture and environment. Effective HRM practices therefore enables employees to contribute effectively and productively to the overall company direction and the accomplishment of the organization's goals and objectives.

Training and Development

The acquisition of more knowledge, skills and abilities; whether on the job or off the job is crucial to every business organization. Dangote Flour Mill in the context of this study do not have training and development policy framework guiding the training and development of staff. Training and development according to Budhwar, (2023) involves improving the effectiveness of workers in organizations especially the individuals and teams within them. Training may be viewed as being related to immediate changes in effectiveness via organized instruction, while development is related to the progress of longer-term organizational and employee goals. While training and development technically have differing definitions, the terms are often used interchangeably. Training and development have historically been topics within adult education and applied psychology, but have within the last two decades become closely associated with human resources management, talent management, human resources development, instructional design, human factors, and knowledge management.

In recent years, the increasingly rapid changes in technology, products, systems and methods have had a significant impact or influence on job requirement. Thus, employees face the need to upgrade their skill constantly and develop an attitude that permits them not only to adapt to change but also accept, seek training and follow a planned continuous effort by management with a view to improve employees competency level and organizational performance. Training no doubt is designed to provide learners with knowledge and skills needed for their present jobs, on the other hand, development involves learning that looks beyond today's job; it has a more long-term focus and is meant for employees that have the propensity to take up managerial positions in future.

As underscored by lnyang & Akpama (2002) employee training is defined as a process or a set of activities aimed at assisting individual acquire knowledge, skills and attitude necessary for the effective performance of a specific task or job. Training could be carried out in-plant, involving some on-the training experience or through a more formally structured programme of lectures and practical exposures. It can also be undertaken in locations, which are completely outside the workers normal work environment. Different techniques exist for implementing training programmes, like job unstructured coaching, lecturing and the use of visual and computer aids to impart knowledge

Similarly, staff development sometimes referred to as management development can be seen as any learning activities which is directed towards the future needs rather than present needs which is concerned more with carrier growth than performance. It is always meant for employees in the organization that would take up future managerial position in the organization.

Employee Retention

Employee retention is the ability of an organization to keep its employees and prevent them from leaving the company. High employee retention is important for organizations as it can lead to decreased workers turnover, increased productivity, and improve employee morale. According to La Motta, & Chiu, (2020), employee retention is the capacity for organizations to manage human resources they have employed and trained which are influenced by a variety of factors such as job satisfaction, work-life balance, career development opportunities, recognition, and compensation. Organizations that focus on creating a positive work environment, offering competitive benefits, and providing opportunities for growth and advancement are more likely to retain their employees and sustain their businesses.

EMPLOYEE ENGAGEMENT

TRENDS (2024) EMPHASIZED LEVERAGING TECHNOLOGY, SUCH AS EMPLOYEE ENGAGEMENT SOFTWARE, AND FOSTERING TRUST BETWEEN EMPLOYEES AND MANAGERS TO IMPROVE WORKPLACE SATISFACTION AND PRODUCTIVITY. HE DEFINED EMPLOYEE ENGAGEMENT AS THE PROCESS OF GETTING THE RIGHT WORKERS FOR THE APPROPRIATE JOB DESIGNED FOR ORGANIZATIONAL SUCCESS. IT THEREFORE FOLLOWS THAT MANAGERS, WHO MUST BE SUCCESSFUL, OUGHT TO HAVE AN IDEA OF WHAT AFFECTS THE BEHAVIOR OF WORKERS AS WELL AS PEOPLE IN THE ENVIRONMENT OF WORK. EMPLOYEE ENGAGEMENT TO US COULD BE LOOKED AT AS THE LEVEL OF EMOTIONAL COMMITMENT, ENTHUSIASM, AND CONNECTION EMPLOYEES FEEL TOWARD THEIR WORKPLACE AND ITS GOALS. IT DIRECTLY INFLUENCES PRODUCTIVITY, RETENTION, AND COMPANY CULTURE. ENGAGED EMPLOYEES ARE MORE MOTIVATED AND ALIGNED WITH ORGANIZATIONAL OBJECTIVES, CONTRIBUTING TO BETTER PERFORMANCE AND LOWER TURNOVER RATES.

DANGOTE FLOUR MILLS CALABAR CAN ACHIEVE ORGANIZATIONAL EFFICIENCY AND PRODUCTIVITY THROUGH A HIGHLY MOTIVATED WORKFORCE BY INITIATING THE MOST APPROPRIATE ENGAGEMENT POLICY THAT INCLUDES; MOTIVATION, COMPENSATION AND WORK AUTONOMY. THESE MEASURES ARE RECEIVED IN THE FORM OF WAGES, SALARIES AND BONUSES, WHILE OTHERS ARE THE SATISFACTION THAT AN EMPLOYEE RECEIVES FROM THE JOB ITSELF OR FROM THE PSYCHOLOGICAL AND OR PHYSICAL ENVIRONMENT IN WHICH THE EMPLOYEE WORKS. THE IMPLEMENTATION OF THESE MOTIVATIONAL ENGAGEMENT POLICIES IS TO ENSURE THAT EQUITY EXIST, THIS IS WHEN EMPLOYEES FEEL THAT THEY ARE FAIRLY TREATED AND ARE COUNTED AS PART OF THE ORGANIZATION. ALSO, IN RECRUITMENT AND SELECTION PROCESSES, COMPANIES ARE INCREASINGLY RECOGNIZING THAT HAVING COMMITTED EMPLOYEES WITH SUPERIOR COMPETENCIES CAN REPRESENT AN IMPORTANT SOURCE OF COMPETITIVE ADVANTAGES. A CRITICAL ELEMENT IN BUILDING COMPETITIVE ADVANTAGE IS ATTRACTING AND HIRING THE RIGHT PEOPLE THROUGH THE RECRUITMENT PROCESS. BARTOL ET AL., (1998) DEFINED RECRUITING AS THE PROCESS OF FINDING AND ATTEMPTING TO ATTRACT JOB CANDIDATES WHO ARE CAPABLE OF EFFECTIVELY FILLING JOB VACANCIES. THUS, RECRUITMENT

IS A SET OF ACTIVITIES AN ORGANIZATION USES TO ATTRACT JOB CANDIDATES WHO HAVE THE ABILITIES AND ATTITUDES NEEDED TO HELP THE ORGANIZATION ACHIEVE ITS OBJECTIVES. THE PURPOSE IS TO PREPARE THE WAY FOR SELECTION PROCEDURES BY PRODUCING IDEALLY THE SMALLEST NUMBER OF CANDIDATES WHO APPEAR TO BE CAPABLE OF PERFORMING THE REQUIRED TASK OF THE FIRM, AND THE ABILITY TO DO SO WITHIN A PERIOD OF TIME ACCEPTABLE TO THE EMPLOYING ORGANIZATION.

Business Sustainability

Budhwar, (2023) defined sustainable business development as the development that meets the needs of the present without compromising the ability of the future development which must be based on sound science, traditional knowledge of indigenous people and prudent conservation and management of resources while the business lasts. The human resources of any organization, according to him can be taken to be the most important element among the factors of production, because, it is the active element that act on the passive elements in order for production to take place. He maintains that managing the human component is the central and the most important task, because the resources of an organization is a significant and strategic resource of distinctive competence that requires to be managed, sustained and planned for in its totality. Budhwar, (2023) assertion is true because the human resources organization are the most difficult to obtain, most expensive to maintain and the hardest to retain. Human resources management according to him is the part of the process of management concerned with the maintenance of human relationship and ensuring they give maximum contribution to business sustainability. There is no doubt that the human resource are the most active variable that activate the passive or inactive resources like capital and material in other for organization to achieve productivity and business sustainability (Omolabi, et al., 2023).

Innovation

The effectiveness of any new policy or practice could be judged from the outcome of its innovation and creativity. Guest & Conway (2021) agree that the outcomes of a strong innovation is capable of supporting the achievement of broad sustainable business objectives and measurable contributions to performance, including lower employee turnover, improved employee well-being, and an overall increase in employee engagement. Organizations that innovate with new strategies, tends to secure potential employees and maintain a long-term business sustainability goals.

Innovation according to Omolabi, et al., (2023) refers to the process of introducing new ideas, products, services, or methods that bring significant improvements or create value. It involves the development and application of creative solutions to solve problems or meet new needs. Innovation can happen in various fields, including technology, business, science, and the arts, and it typically leads to advancement, increased efficiency, or enhanced experiences.

Community Investment

Community investment refers to the deliberate allocation of resources by businesses or organizations to support the economic, social, and environmental well-being of local communities. These investments may take the form of financial contributions, volunteer work, educational initiatives, or partnerships with nonprofits organizations aimed at fostering positive social change. Community investment is often tied to corporate social responsibility (CSR) and sustainability goals, enhancing organizational reputation while addressing societal issues such as poverty,

education, healthcare, and environmental protection. Effective strategies emphasize long-term partnerships, measurable outcomes, and alignment with business objectives to ensure lasting benefits for both the community and the organization.

The term corporate social responsibility (CSR) or corporate social performance (CSP) has been used to refer to an organization's performance along a range of performance indicators: financial, human/social and environmental. Although there is a range of systems and debates about what constitutes CSR, a commonly held view is that organizations are responsible to the society in which they are part (Hinkley, 2018). However, it is noteworthy that the economic rationale dominates the research on the relationship between CSR initiatives and organizational" performance. It has been shown that environmental and human/ social outcomes are interrelated and contribute to organizational sustainability (Greening & Turban, 2020). The relationship between the development and implementation of an environmental management system, human resource policies and the development of capabilities necessary for an organization's sustainability demonstrates the nexus and managers of organization need to know the correlation with emphasis on development and implementation of advanced environmental policies and capabilities that are dependent on the creation of HRM trust between employees, management and the communities in which the organization operates.

This suggests that organizational performance and sustainability can be furthered by moving beyond the traditional performance indicators such as financial and marketing targets. Therefore, managers can benefit from the use of social and environmental measures which contribute to the future success of the organization and to the welfare of future generations (Boudreau & Ramstad, 2019). Although the rational for the adoption of these broader performance measures rely on their contribution to short term and long term financial outcomes, the use of these broader indicators require an acknowledgement that various stakeholders will have different perceptions about business sustainability, success and organizational performance. It therefore raises additional challenge about the need to manage a variety of stakeholders and stakeholder's relationships.

Resource Utilization

Resource utilization is the efficient and strategic allocation of organizational resources including time, personnel, equipment, and finances to maximize productivity and achieve goals. It involves ensuring that employees are neither overburdened nor under-utilized while aligning their skills and tasks with the organization's needs. Effective resource utilization boosts project outcomes, operational efficiency, and overall employee satisfaction which can sustain businesses.

Theoretical Framework

Contingency Theory

The contingency theory is an organizational theory that states that there is no one best way to organize and manage a corporation, lead a company or to make decisions. Instead, the optimal course of action is contingent (dependent) upon the internal and external situation. Contingent leaders are flexible in choosing and adapting to succinct strategies that suit changing situation at a particular period in time in the running of the organization. Fiedler's Contingency Theory was developed in the 1960s by Fred Fiedler. The theory underscores leaders' personalities and characteristics and concludes that leadership style, which is formed through one's life experiences, is incredibly difficult, if not impossible to change. For this reason, Fiedler believed that the right

leader must be chosen for each job based on their skill set and the requirements of the situation. In order to best match leaders with situations, each leader must first understand their natural leadership style. Then, they need to evaluate whether their leadership style is right for the situation. Simply put, Fiedler assumed that leadership is determined by leaders' ability and propensity to succeed, rests on two factors; Natural leadership style and Situational favorableness. The Contingency Theory suggests that there is no one-size-fits-all approach to management, and that leaders must adapt their style to the specific situation to achieve organizational goals. The application of this theory in the context of Dangote Flour Mill, Calabar underscored the need for managers to be proactive in innovations, resource utilization and community investment to sustain their businesses.

Abraham Maslow Hierarchy of Needs Theory

The second theory for this study that supports the Contingency model is the Maslow Hierarchy of Needs Theory which tried to explain the importance of the human resources approach and behavior of workers. Developed by Abraham Maslow in (1943), the theory was based on human motivation. Firstly, Physiological needs which is the first level of needs, depicting physical needs such as food, water, shelter etc., to be met before moving to others. Secondly, Safety needs: here workers need a good and a secured working environment and protection. Thirdly, Love Affection and Belongingness needs: Maslow believed that if an individual met the basic physiological and safety needs, that individual would start attempting to achieve love, affection and belonging. Fourthly, esteem needs: individuals are motivated for the desire for strength, for achievement, for adequacy, for confidence in the face of the world. Lastly, self-actualization needs: the fifth layer and the hardest to obtain, refers to the desire for self fulfilment, namely to the tendency for a person to actualize his or her potentials. The theory becomes apt and fits into workers needs and as such, managers of Dangote must understand and handle some of these sustainability measures for business growth.

Empirical Review

The empirical review of this study examined the relationship between Human Resource Management (HRM) practices on business sustainability of Dangote Flour Mill, Calabar, with a view to understanding how these HRM practices affect business sustainability.

Several studies have highlighted the significant effect of HRM practices on organizational or business sustainability in Nigeria. For instance, Sunday (2025) investigated the relationship between HRM practices and organizational performance in Nigerian firms, emphasizing the mediating role of employee engagement and the moderating effect of strategic alignment. The study found that effective HRM practices, when aligned with organizational strategies, enhance employee engagement, leading to improved organizational performance. This underscores the importance of integrating HRM practices as business strategies to achieve sustainability.

Taiwo et al., (2021) assessed the relationship between training and development practices and employee performance in selected Nigerian manufacturing companies. The study revealed a significant positive relationship, indicating that investment in employee training and development leads to enhanced performance, which is crucial for organizational sustainability. Although scope and methodology adopted were not stated but study supports the current research.

The adoption of green training and development practices has been identified as a critical factor in promoting environmental sustainability within organizations. Fapohunda et al. (2022) examined the effect of green training and development practices on environmental sustainability at WAMCO Nigeria PLC. The study found that developing green abilities significantly enhances environmental awareness among employees, leading to a more committed workforce towards environmental sustainability. This suggests that green training initiatives are vital for fostering an environmentally conscious organizational culture. This study aligns with the current study which suggests that workers' training is critical to business sustainability.

In a similar vein, Olaiya and Olaosebikan (2022) investigated the mediating role of employee pro-environmental behavior in achieving environmental sustainability through green training and development. Their findings indicate that green training positively influences employees' pro-environmental behavior, which in turn contributes to environmental sustainability in manufacturing companies.

Moreover, Adubor et al. (2022) explored the adoption of green HRM practices and their impact on corporate sustainability in the Nigerian manufacturing industry. The study concluded that green training and development are essential in equipping employees with the necessary skills to engage in sustainable practices, thereby enhancing the organization's overall sustainability performance.

Chen, et at, (2021) in their research draws on cognitive-affective system theory to argue that workers' perceptions of their employers' commitment to environmental sustainability via human resource management (HRM) impact their green behavior in the workplace. It supports their hypotheses by analyzing data from 358 questionnaires sent to Chinese oil and mining companies. The results show that employees' perceptions of green HRM positively affect their initiative to promote environmental sustainability at work and their green innovation. Furthermore, it has been discovered that harmonious environmental passion entirely mediates the association between workers' perceptions of green HRM and green creativity. In contrast, a green psychological climate and environmental harmony partly moderate this relationship. The results of this study highlight the significance of green HRM in influencing workers' proactive workplace and green behaviors, revealing how green HRM modifies employees' cognitive, affective, and motivational (CAM) variables to produce green actions.

Methodology

Research Design

This study adopted the descriptive survey research design. The descriptive survey design was used in collection of primary data because it is helpful in describing and determining the perception of respondents on the variables of study.

Population and Sampling Techniques

The population of this research work comprises of all employee of Dangote Flour Mills Calabar, both the administrative staff and the casual workers from the office register in the HRM department, indicating a total number of two hundred and forty two (242) employees. The sample for the study includes 150 workers in Dangote Flour Mills Calabar. The 150 were chosen from a population of 242 employees representing 61% of the population using Taro Yamane formula.

Method of Data Collection and Analysis

Primary data were collected through a structured questionnaire from respondents, and other information through the review of relevant literatures. Questionnaire was administered purposively to workers for two weeks, and were collected by me and the help of some staff in the company after three weeks of administration. The study employed a regression analysis to examine the impact of the independent and dependent variable to make informed decision with 1bm SPSS version 23, to ascertain negative or positive effect for decision making.

Data Presentation and Analysis

Descriptive Statistics

Table 1: Descriptive Statistics

Variable	Mean	Std. Deviation	N
Training and Development and Innovation	4.02	0.532	150
Employee Engagement and Resource Utilization	3.88	0.489	150
Employee Retention and Community Investment	3.95	0.514	150

Source: Field Survey, 2025.

Table 1 presents the summary of the descriptive statistics for the study variables based on responses collected through the questionnaire. The training and development and innovation variables have a mean of 4.02 and a standard deviation of 0.532, indicating that most respondents agreed that training and development enhance innovation and organizational improvement. While employee engagement and resource utilization variables has a mean of 3.88 and a standard deviation of 0.489, showing that while many respondents acknowledged the importance of engagement in enhancing resource efficiency.

Meanwhile, employee retention and community investment variables has a mean of 3.95 and a standard deviation of 0.514, suggesting that respondents generally agreed that employee retention positively impacts community investment at Dangote Flour Mill Calabar.

Overall, the results indicate that respondents largely recognize the role of training, engagement, and retention in fostering business sustainability, with minimal deviation in their responses.

Regression Analysis

To examine the impact of Training and Development, Employee Engagement, and Employee Retention on Business Sustainability at Dangote Flour Mill Calabar, a multiple regression analysis was conducted. This analysis helped to determine the relationship between these independent variables and the overall sustainability of business.

The regression model is specified as follows:

BS=β0+β1TD+β2EE+β3ER+EBS = \beta_0 + \beta_1TD + \beta_2EE + \beta_3ER + EBS=β0 +β1TD+β2EE+β3ER+E

Where:

- **BS** = Business Sustainability (Dependent Variable)

- **TD** = Training and Development and Innovation
- **EE** = Employee Engagement and Resource Utilization
- **ER** = Employee Retention and Community Investment
- **β0** = Intercept
- **β1, β2, β3** = Regression coefficients of the independent variables
- **E** = Error term

The multiple regression analysis was performed using SPSS Version 23, and the results are presented in Table 2.

Table 2: Regression Analysis Results

Variables	Coefficients (β)	Std. Error	t-value	p-value
Constant	1.102	0.295	3.74	0.000
Training and Development (TD)	0.415	0.092	4.51	0.001
Employee Engagement (EE)	0.378	0.108	3.50	0.002
Employee Retention (ER)	0.392	0.101	3.87	0.001
R^2	0.741			
Adjusted R^2	0.729			
F-Statistic	19.21	p = 0.000		

Source: Field Survey, 2025.

The R^2 value of 0.741 indicates that 74.1% of the variance in business sustainability can be explained by the combined effect of training and development, employee engagement, and employee retention. The adjusted R^2 of 0.729 further supports the model's goodness of fit.

The regression coefficients show that: Training and Development ($\beta = 0.415$, $p = 0.001$) significantly influences business sustainability, implying that continuous employee training and innovation contribute to long-term business success. Employee Engagement ($\beta = 0.378$, $p = 0.002$) also has a significant positive impact, suggesting that engaged employees utilize resources efficiently, leading to improved business outcomes. Employee Retention ($\beta = 0.392$, $p = 0.001$) significantly contributes to business sustainability, indicating that high retention rates promote community investment and long-term organizational stability.

Since the F-statistic (19.21, $p = 0.000$) is statistically significant, we conclude that the model is a good fit for the data, and at least one of the independent variables significantly affects business sustainability at Dangote Flour Mill Calabar.

Data Generation for Hypotheses Testing

To examine the impact of Training and Development, Employee Engagement, and Employee Retention on Business Sustainability at Dangote Flour Mill Calabar, a model summary was generated using SPSS Version 23. The results are presented in Table 3 below:

Table 3: Model Summary

Model	R	R^2	Adjusted R^2	Std. Error of the Estimate	R Square Change	F Change	df1	df2	Sig. F Change
1	0.621a	0.386	0.352	0.452	0.386	7.892	3	146	0.003

Source: SPSS Output, Version 23.

From Table 3, the R^2 value is 0.386, indicating that 38.6% of the variance in business sustainability is explained by the independent variables (training and development, employee engagement, and employee retention). This suggests that improvements in these HRM practices contribute significantly to business sustainability at Dangote Flour Mill Calabar.

The Adjusted R^2 value of 0.352 accounts for the sample size and number of predictors, further confirming that the model is a good fit. The F-statistic (7.892, $p = 0.003$) is statistically significant, indicating that the independent variables collectively have a significant impact on business sustainability. Thus, the results suggest that training and development, employee engagement, and employee retention play an essential role in ensuring business sustainability, supporting the importance of HRM practices at Dangote Flour Mill Calabar.

Conclusions

This study concludes that human resource management practices play a crucial role in ensuring business sustainability at Dangote Flour Mill Calabar. The findings indicate that training and development significantly contribute to innovation, enabling employees to enhance their skills and drive organizational growth. Furthermore, employee engagement positively influences resource utilization, as engaged employees demonstrate higher levels of commitment and efficiency in their roles. Additionally, employee retention has a meaningful impact on community investment, as long-term employees contribute to corporate social responsibility initiatives and foster sustainable relationships with the local community.

The study underscores the importance of strategic human resource policies that align with business objectives to promote long-term sustainability. Organizations that invest in continuous training, foster a culture of engagement, and implement effective retention strategies are better positioned to achieve operational efficiency, innovation, and positive community impact. Therefore, businesses should prioritize employee development, motivation, and retention as key drivers of long-term success.

Recommendations

Based on the findings of this study, the following recommendations are made to enhance human resource management practices and promote business sustainability at Dangote Flour Mill Calabar:

- The company owner should invest in continuous training and development initiatives to improve employees' skills and foster innovation. Training programs should be aligned with business goals to ensure maximum impact.
- Management should create a work environment that encourages employee participation, open communication, and recognition of contributions. Providing regular feedback and fostering a culture of inclusivity can enhance engagement and productivity.

- Efficient resource management practices should be implemented to optimize workforce productivity. Regular assessment of work processes and employee involvement in decision-making can lead to better utilization of resources.
- Dangote Flour Mill Calabar should continue to invest in corporate social responsibility programs that benefit the local community. Encouraging employee participation in community projects can strengthen the company's reputation and long-term sustainability.
- A transparent and merit-based performance evaluation system should be adopted to ensure employees are fairly assessed and rewarded. Recognizing outstanding performance can boost morale and motivation.

Abstract
The study examined the effect of sustainable social innovation on nation-building in Nigeria. The specific objectives are to: examine the effect of addressing social needs on nation-building and evaluate the effect of collaborative approach on nation-building in Nigeria. The study adopted a descriptive survey design. A structure questionnaire design with a five-point Likert scale was used to collect data for the study. The data were analysed using the descriptive analysis (SPSS, Version 28.0) and sample t-test for the mean comparison in each hypothesis. The result revealed that addressing social needs has a significant effect on nation-building with a p-value of (0.092>0.05) while collaborative approach has a significant positive effect on nation-building with a p-value of (0.000<0.05) in Nigeria. The study concluded that sustainable social innovation has a significant positive effect on nation-building in Nigeria. The study recommended that there is need for Nigerian government to develop and implement policies that prioritize sustainable social innovation. This includes creating frameworks that support initiatives aimed at addressing social needs, particularly in underserved communities.

Keywords: *Sustainable, Social, Innovation, Nation-Building*

Introduction

Social innovation refers to the development and implementation of new ideas, strategies, and practices aimed at addressing social challenges and improving societal well-being (Polk. *et al* 2020). Unlike traditional innovation, which often focuses on technological advancements or economic profitability, social innovation prioritizes social value and aims to create positive change in communities and societies (Oni, 2023). Social innovation is defined as any initiative that challenges and contributes to changing the defining authority flows. At its core, social innovation seeks to solve pressing social issues such as poverty, education inequality, healthcare access, and environmental degradation (Onileowo *et al* 2021). It encompasses a broad range of initiatives, including non-profit organizations, social enterprises, and community-driven projects. The key characteristic of social innovation is its ability to blend creativity with practical solutions, fostering collaboration among various stakeholders, including governments, businesses, non-profits, and citizens (Polk. *et al* 2020). Social innovation focuses on how innovation and change take shape. It also centers on new work and forms of cooperation, especially those that work towards a

sustainable society (Avelino, *et al* 2019). However, this study embraces the effect of sustainable social innovation on nation building in Nigeria.

Sustainable social innovation integrates the principles of social innovation with a focus on environmental sustainability, aiming to create solutions that address social issues while promoting ecological well-being (Hall, *et al* 2019). This approach acknowledges the interconnectedness of social challenges—such as poverty, inequality, and lack of access to basic services—with environmental concerns, and emphasizes that effective solutions must consider both dimensions (Gasparin, *et al* 2022). Social innovation can be defined as the reshaping of existing societal practices and the development of novel solutions as a response to pressing societal issues (Tracey, & Stott, 2017). Sustainable social innovation involves developing new ideas, strategies, and practices that not only solve social problems but also contribute to the health of ecosystems (Ziegler, 2017). It emphasizes long-term viability and seeks to create social value without compromising the environment. This can manifest in various forms, including social enterprises, community projects, and policy initiatives that prioritize sustainability. Sustainable innovation balances economic growth with ecological integrity and social well-being (Repo, & Matschoss, 2019).

The concept of sustainable social innovation has evolved alongside the global sustainability movement, which gained momentum in the late 20th century (Gasparin *et al.*, 2022). Initiatives like the United Nations' Sustainable Development Goals (SDGs) have reinforced the importance of integrating social and environmental objectives (Chidozie, *et al* 2024). Historical movements, such as community organizing and environmental activism, have also laid the groundwork for contemporary sustainable social innovation (Berkowitz 2019). Sustainable social innovation plays a pivotal role in nation-building, particularly in Nigeria, where diverse social challenges intersect with environmental degradation and economic inequality. As one of Africa's most populous countries, Nigeria faces significant issues such as poverty, unemployment, inadequate healthcare, and environmental crises, including deforestation and pollution. Sustainable social innovation offers a pathway to address these challenges by fostering inclusive practices, promoting economic development, and encouraging environmental stewardship (Ogbeide, 2021).

Nigeria's unique socio-economic landscape underscores the importance of sustainable social innovation. With a large youth population, high unemployment rates, and vast natural resources, the country has both the potential and the challenges that require innovative solutions. Sustainable social innovations can lead to fostering entrepreneurship and providing access to resources, sustainable social innovation can create job opportunities, reduce poverty, and stimulate local economies. Initiatives focused on microfinance, vocational training, and sustainable agriculture can empower communities and enhance livelihoods (Mujitaba 2025).

Statement of the Problem

Despite Nigeria's vast natural resources and youthful population, the nation grapples with significant socio-economic challenges, including widespread poverty, high unemployment rates, poor healthcare access, and environmental degradation. These issues hinder effective nation-building and sustainable development. While sustainable social innovation presents a potential pathway for addressing these challenges, its impact remains underexplored and inadequately harnessed.

Current initiatives often lack the necessary framework for integration into broader national policies, resulting in fragmented efforts that fail to address systemic issues holistically. Additionally, barriers such as insufficient funding, inadequate infrastructure, and regulatory constraints limit the scalability and effectiveness of social innovations.
Moreover, the potential of sustainable social innovation to foster economic empowerment, social cohesion, and environmental sustainability is not fully realized. This raises critical questions about how these innovations can be systematically leveraged to enhance nation-building in Nigeria. Therefore, there is an urgent need to investigate the effects of sustainable social innovation on national development, examining its role in transforming socio-economic conditions, fostering inclusivity, and promoting environmental stewardship within the Nigerian context.

Objectives of the Study
The main objective of this study is to examine the effect of sustainable social innovation on nation-building in Nigeria. The specific objectives are to:
iii. examine the effect of addressing social needs on nation-building in Nigeria.
iv. evaluate the effect of collaborative approach on nation-building in Nigeria.

Hypotheses of the Study
iii. Addressing social needs has no significant effect on nation-building in Nigeria.
iv. Collaborative approach has no significant effect on nation-building in Nigeria.

Review of Related Literature
Conceptual Review
Sustainable Social Innovation
Sustainable social innovation refers to the development and implementation of novel solutions that address social needs while promoting environmental sustainability and long-term viability. Sustainable social innovation often involves social entrepreneurship, where individuals or organizations develop innovative solutions to social problems (Dacin *et al.*, 2010). Sustainable social innovation requires inclusive and participatory approaches that engage diverse stakeholders and prioritize social needs (Mulgan, 2010). Sustainable social innovation integrates environmental considerations, reducing negative impacts and promoting eco-friendly practices (Hall *et al*., 2019).

Ziegler (2017) argues that all innovation should ideally be social innovation. However, there is no established definition of social innovation as several authors define the term in different ways, as it is an emerging and, in some cases, a disputed notion (Repo & Matschoss, 2019). However, the term social innovation (SI) originates with the aim of addressing the most burning needs of society. From an organizational perspective, it can be contextualized as comprising social entrepreneurship, social intrapreneurship and social entrepreneurship (Tracey & Stott, 2017). SI can also describe societal, structural change which reflects the common good and excludes profit maximization (Ziegler, 2017). The goal of SI is to create value for customers and beneficiaries with an emphasis on the translational aspect of the economic, social and cultural values (Gasparin *et al*., 2022). Additionally, Borzaga and Bodini (2014) describe SI as a new process, not only a new product or service. They further postulate that for an organisation to qualify as one providing social innovation, their core mission is improving the quality or quantity of life. This means that such organisations intentionally focus their innovation on achieving a social mission in line with the interests of the community within which the organisation operates.

Social innovation tends to attempt to attain ambitious objectives. However, there is little proof to evaluate whether and to what extent, those objectives have been achieved. This therefore makes it difficult to determine how helpful the phenomenon has been for sustainably solving social problems (Grimm, Fox, Baines & Albertson, 2013). Other scholars have gone further to characterise SI as transformative. Avelino, *et al* (2019) argue that rather than qualifying transformative SI as a successful type of SI, it is instead considered to be a conditional process through which SI contributes to transformative change. They further conceptualise transformative social innovation as an interactive, co-evolutionary process that replaces dominant structures (Avelino *et al.*, 2019). These dominant structures are replaced by new structures and ideas that cut across every sector and combines the private, public and civil society sectors (Nicholls & Murdock, 2012).

Social Needs

Social needs refer to the fundamental requirements and aspirations that individuals and communities have to live a dignified, healthy, and fulfilling life. These needs can include:

viii. **Safety and security:** Protection from harm, violence, and exploitation.
ix. **Social connections and relationships:** Building and maintaining relationships with family, friends, and community.
x. **Belonging and identity:** Feeling part of a community, culture, or group.
xi. **Self-esteem and Recognition:** Receiving respect, recognition, and validation from others.
xii. **Access to education and information:** Opportunities for learning, personal growth, and access to information.
xiii. **Health and well-being:** Access to healthcare, mental health support, and opportunities for physical activity.
xiv. **Participation and inclusion:** Opportunities for civic engagement, participation in decision-making processes, and feeling included in community life.

Social needs are essential for human well-being and can have a significant impact on mental and physical health. Meeting social needs can also contribute to building stronger, more resilient communities. Addressing social needs is central to nation-building through initiatives like National Economic Empowerment & Development Strategies (NEEDS) and social protection policies, which focus on poverty reversal, improved living standards, and access to essential services such as health, education, and housing (Poleshuck *et al* 2020). Effective implementation requires broad stakeholder engagement from government, the private sector, and civil society, utilizing coordinated sector-wide strategies and social dialogue to ensure policies are effective and promote national unity and sustainable development (O'Gurek and Henke 2018). Although there is strong interest in community-level indicators, social needs are most commonly measured among individuals, using self-report (Berkowitz 2019).

A Centers for Medicare and Medicaid Services (CMS) measure covers five domains—housing, food, transportation, utilities, and safety/abuse (Billioux *et al* 2017). The American Academy of Family Physicians (AAFP) added to the CMS measure questions assessing education, employment status, financial insecurity, and child care needs (O'Gurek and Henke 2018). Across these and other social needs screening tools, the most commonly included items assess needs related to food, utilities, housing, transportation, and personal safety. Within these multidimensional domains, screening tends to focus on aspects of the need that align with the priorities of the health care

organization or its perceived locus of influence (Polk *et al* 2020). For example, screening items are more likely to assess housing stability than housing quality, even though both can have a significant impact on people's lives and health.

Collaborations Approach

A collaborative approach is essential for nation-building in Nigeria, involving diverse religious, ethnic, and political groups working together to foster mutual trust, understanding, and national unity. Efforts to build a unified national identity and inclusive civic body rely on collaborative dialogue and collective efforts to establish strong, trusted national institutions, promoting a shared sense of loyalty to the central political system over smaller, exclusive groups. Collaboration between stakeholders, including businesses, governments, and civil society, is crucial for sustainable social innovation (Austin *et al.*, 2006).

Nation-Building

Nation-building refers to the creation of a joint national identity by unifying a country's population and creating a national unity where people feel bound together by a sense of community and cohesion. Nation-building is the challenge of winning the loyalty and commitment of the subjects of a political system, and it is the process of uniting a country's population by creating a national unity where citizens are bound by a sense of oneness and kinship, and where trust and understanding is cultivated. It is the construction of a shared national identity, as against ethno-tribal or regional identity, and has been put forth as a potential remedy for challenges associated with ethnic fractionalisation (Mylonas, 2021; Ogbeide, 2021; Idike & Eme, 2015).

Diverse attempts at nation-building were observed during and after the decolonisation era of the African continent, manifested in different forms across the various colonies, and the results show corresponding disparities. Nation-building points to the strategies employed by the governing elites of a state within their polity in an attempt to manage social order within the municipality in ways that promote a particular national narrative over any other (Osimen, *et al.*, 2024). These strategies can range from assimilationist initiatives to exclusionary policies. When successful, nation-building results in societies where individuals exhibit greater loyalty and patriotic sentiments to the nation than their regional or ethnic origins (Mylonas, 2021). The modern states of 21st-century Africa conform to the basic principles of a state, such as a defined territory, permanent population, effective government, independence and so on. Their historical ties can only be traced back to the era of colonialism in the early 20th century. In a bid to imitate the European model, states within Africa are inherently porous as the shared cultures and values vary from one cardinal pole to another within a particular state. For instance, Nigeria can boast over 250 ethnic nationalities within the country (Davis & Kalu-Nwiwu, 2001; Chidozie, *et al*., 2024).

Theoretical Framework

Social Contract Theory

Several theories have been used to explain the origin of state. Social Contract Theory is one of them. Other theories in this regard are the Divine Right of Kings to Rule, Matriacal theory, Patriarcal theory and The Evolutionary theory. The Social Contract Theory was popularized by Enlightenment thinkers like Thomas Hobbes, John Locke, and Jean-Jacques Rousseau, with the latter's influential work The Social Contract published in 1762. The writings of three prominent enlightenment–age Philosophers, namely Thomas Hobbes, John Locke and Rousseau J. J. modern

conceptions of the theory after Plato. The three of them see state as emerging from an imaginary state of nature where agreement was said to have been reached to establish a state. However, each of them had a different notion of the state of nature. In 'Leviathan', Hobbes described the state of nature as '' solitary, poor, nasty, brutish and short''. (Appadorai 1975). To him man is naturally selfish and in attempt to satisfy his lust he comes in conflict with other men. He also posits that man's most priced value is his life and self-preservation. In the light of this he argued that for man to escape from this uncertainty, he chooses to give up some of his natural rights to some superior authorities who will ensure there was peace in the society.

In his own version of the theory, John Locke sees state of nature as the beginning of an organized human society. However, unlike Hobbes, life in the state of nature is recognizably social, hence he described it as a state of '' liberty not license''. (McClelland, 1996). By this, Locke means that man in the state of nature is aware of natural law and so he is capable of recognizing and respecting the natural rights of other men. He sees the state here as been moral and social in character because men have rights and acknowledged duties. Man is also guided by reason which makes him to believe that to preserve himself, he needs to protect and promote the life and properties of others. This realization is a guide to man's sense of judgment. In his version of the state of nature, he identified the absence of a settled life, laws, judges that are upright and an executive power to enforce just decisions. The absence of these essential institutions made the state of nature intolerable and necessitated the contract among the people. This contract is to form government that holds the power of the people who created it in trust. The government act as a judge and it must act to preserve its citizens. This is a contract which people entered into within themselves and not with government. The purpose of the contract is to establish a political society to which all agreed to submit parts of their natural rights in the state of nature. A government formed from this contract is bestowed with power to act for certain ends which is the good of the people.

Empirical Review

Onileowo *et al* (2021), the study examined the factors influencing social innovation in Nigeria, these are; economic, organizational and individual factors that affect social innovation performance. Social innovation variables that are linked to the external atmosphere are categorized in relation to the PEST analysis, which are; political, economic, social, and technological. The factors influence organization that directly identify innovation at different organizational level are; capital, risk level, social invention policy and management practice, organizational learning and culture. Social innovation influencing individual factors within the organization is allied to the capacities, skills, and attitudes of the employees. All the factors mentioned above influence the potential and success of innovation that can strengthen economic conditions in Nigeria. Data for this paper were obtained by way of digging up issues around the opinions of scholars from empirical studies carried out by way of conceptual clarifications and content analysis of the secondary data.

Olubunmi and Femi (2022), examined a study on an exploratory study of local social innovation initiatives for sustainable poverty reduction in Nigeria. This paper explores social innovation (SI) as a strategy for fostering sustainable poverty reduction in a developing country, Nigeria. Analysis is based on semi-structured inter views with founders of SI initiatives. Findings indicate SI as a sustainable poverty reduction strategy because it addresses: (i) some underlying causes of poverty such as poor nutrition and lack of access to education; (ii) different dimensions of sustain ability

(i.e., economic, social and environmental). The study also identifies socially innovative cultural practices such as traditional rotational saving/credit and apprenticeship schemes which help eradicate poverty by ensuring improved access to finance and encouraging entrepreneurship. Furthermore, results indicate local SI initiatives in Nigeria are largely private sector-led, while a weak institutional environment hampers expansion. The study highlights the need for policy aimed at identifying, strengthening and scaling up innovative local practices, and creating favourable framework conditions for SI.

Oni, (2023), examined a study on sustainable social innovation in Nigeria and explores possible solutions and opportunities for development. The author conducted normative research that examined existing research with the aim of providing solutions to a research area that is fraught with challenges and also currently under researched. Research was also conducted for documents and research from previous studies which were subsequently analysed to provide suggested solutions. The finding revealed at over 200 million inhabitants, Nigeria is beset with many challenges such as insurgency, deforestation, poverty, food-shortages, limited access to healthcare and so on. Fittingly, there have been some social innovations that have tried to address some of the aforementioned issues with varying levels of success. However, so far, such initiatives have not delivered change on a large scale. Although there is evidence that there are SI activities in Nigeria, a recurring theme through the literature is the fact that it is difficult to measure the impact of social innovations and there are very limited attempts at documenting and monitoring the outcomes.

Mujitaba (2025), examined a study on the History, National Interest, and Nation-Building in Nigeria: A Philosophical Perspective on the Past, Present, and Future. A deep engagement with the past enables individuals and societies to appreciate their present circumstances and intentionally shape a better future. While history cannot predict the future with certainty, an unplanned and unstructured future offers little hope for progress. This paper examines the 'missing link' in Nigeria's nation-building process – namely, the absence of a genuine national interest. This deficiency stems from indiscipline, ethnic and religious divisions, greed, pervasive corruption, and a general disregard for both historical consciousness and long-term vision. These factors have collectively eroded national cohesion, exacerbated crises, and deepened socio-political instability, leaving the country vulnerable to further deterioration. The paper argues that unless this 'missing link' is addressed, and its underlying issues systematically resolved, Nigeria's aspirations for sustainable development will remain elusive. The continued neglect of these challenges may lead to escalating crises and potential fragmentation. The study draws on a range of books and articles on the philosophy of history, sourced from various libraries, alongside insights from discussions with history experts. Additionally, relevant internet sources were consulted, with careful consideration of their reliability and accuracy.

Methodology

The study adopted a descriptive survey design. This research design is concerned with the description of data and characteristics of a population. The goal is the acquisition of factual, accurate, and systematic data and to describe the data and characteristics studied. It is also useful because of the relatively large population from which the information was collected. The study was conducted in 3 selected organizations across southeast Nigeria, known as DataXpress Professionals, Globeet and Collette enterprise which are all located in Nigeria. The choice for these

firms was attributed to the integrity they have built especially on the area of accounting in Nigeria over the years.

Study Population

The population of the study is specifically are staff of DataXpress Professionals, Globet and Collette Enterprise. The population of the study comprised all the staff working with these selected organizations. The total population of the staff was obtained from the human resource department of the firms as shown in the below table 1.

Table 1: Study Population

Organization	**Population**	**N (%)**
DataXpress Professionals	56	43.8%
Globeet	42	32.8%
Collette Enterprise	30	23.4%
TOTAL	**128**	**100%**

Source: Human Resources Mgt

Sample Size and Sampling Technique

This study is based on a confidence level of 95 percent. Hence, the level of significance for the study was determined as follows:

Level of Significance is stated below in the equation (1)

$$\frac{100 \text{ confidence level}}{100} = \frac{100 - 95}{100} = 0.05 \ldots\ldots\ldots (1)$$

The sample size for the study was determined using Yamane (1973) formula for sample size determination. The sample was calculated from the population of the study to determine a sample size that is representative of the population size. The formula is as follows in equation (2)

$$n = \frac{N}{1 + N(e)^2} \ldots\ldots\ldots\ldots\ldots (2)$$

Where n is the sample size

N = The population of the study

e= level of significance (margin of tolerable error)

1 = constant

Hence,

$$n = \frac{128}{1 + 128(0.05)^2} = 96.96$$

Therefore, the sample size is approximately 97

Data were gathered in the chosen organizations in Southeast Nigeria using a self-administered questionnaire. A response rate of 86.6 percent was obtained from 84 out of 97 respondents who returned the questionnaire. Demographic inquiries on respondents' gender, age, level of education, and position or role made up the first section of the form. Likert scales with five points were used

in the construction of the instrument's second section. This section involved measurement of the study variables using a well-designed measurement item with respect to each of the research objectives. All the data were analysed using the descriptive analysis and sample t-test for the mean comparison in each hypothesis. All the information and identity of the respondent were treated as confidential and used for learning purposes only.

Results

Frequency Analysis

Table 1: Demographic Analysis (156)

Profile	Category	Frequency (N)	Percent (%)
Gender			
	Male	35	42%
	Female	49	58%
Age			
	<24yrs	08	10%
	24-33yrs	21	25%
	34-43yrs	33	39%
	44-53yrs	18	21%
	>53yrs	04	5%
Education			
	Senior School certificate examination (SSCE)	===	
	NCE/OND	===	
	HND/BSC	67	80%
	Postgraduate certificate	17	20%
Position/Role			
	Junior Staff	39	46%
	Middle class staff	26	31%
	Senior Staff	19	23%

Table 1 presents that most of the respondents were female (58%) and majority of the respondents were within 34-43 years old having (39%) response rate of the entire sample. More than half of the respondents were HND/BSC holders (80%) and majority of the respondents were in the junior staff bracket with (46%) response rate.

Reliability Analysis

Table 2: Reliability Analysis table

Variables	Number of Items	Cronbach's Alpha
Items used for Objective one	5	0.757
Items used for Objective two	5	0.721

Table 2 shows that all the variables adopted in this study had the Cronbach's Alpha value of more than 0.70. This indicated that items used to measure the variables were reliable and consistent (Hair, 2006).

Descriptive Analysis

Table 3: To examine the effect of addressing social needs on nation-building in Nigeria

S/n	Measurement Items	Mean	SD
1	Security measures are effectively implemented in our communities.	3.002	1.004
2	Housing stability receive adequate attention in our communities and security protocols.	3.214	1.032
3	Utility needs management practices in our communities comply with relevant regulatory requirements.	3.331	0.541
4	The availability of accurate and reliable interpersonal safety positively impacts our nation-building.	3.139	1.129
5	The transportation system is effectively utilized to derive insights for business growth.	3.443	1.563
	Aggregate Mean	**3.2258**	**1.0538**

Table 4: To evaluate the effect of Collaborative approach on nation-building in Nigeria.

S/n	Measurement Item	Mean	Standard Deviation
1	Frequency and quality of communication among team members has enhanced collaboration among team members.	3.786	0.547
2	Effectiveness of collaborative problem-solving processes has improved the overall quality of our lives.	3.341	0.811
3	Quality of decisions made through collaborative processes make life easy for members in the society.	3.086	0.187
4	Involvement of relevant stakeholders in decision-making have helped us so much in our communities.	3.674	1.576
	Aggregate Mean	**3.4717**	**0.7803**

Table 3 and 4 is the descriptive analysis of the responses gotten from the participants with regards to objective one and two respectively. The results suggest that the participants are in agreement with the formulated question items, this is evident based on the mean of each item which is significantly higher than the minimum acceptable mean of 3.0.

Tests of Hypotheses

Hypothesis One

Ho_1: Addressing social needs has no significant effect on nation-building in Nigeria.

The mean scores from tables 3 was used for testing this hypothesis.

Table 5: T-test result of mean comparison of items from research question one

Table 5: One-Sample Statistics

	N	Mean	Std. Deviation	Std. Error Mean
$H0_1$	5	3.2258	1.0538	.13129

Table 6: One-Sample Test

	Test Value = 3.0					
	t	Df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
$H0_1$	4.007	4	.001	.2258	-.0632	.5532

Source: SPSS, Version 28.0

Interpretation and Decision

The analysis in Table 6 shows that the probability associated with the calculated value of significance level was 0.092, which is greater than 0.05. This implies that it was significant. In other words, the null hypothesis should be accepted.

Decision:

At 5% level of significance addressing social needs has a statistically significant effect on the nation-building in Nigeria.

Hypothesis Two

Ho_2: Collaborative approach has no significant effect on nation-building in Nigeria.

The mean scores from tables 4 was used for testing this hypothesis.

Table 7: T-test result of mean comparison of items from research question one

Table 7: One-Sample Statistics

	N	Mean	Std. Deviation	Std. Error Mean
$H0_2$	4	3.4717	.7803	.12489

Table 8: One-Sample Test

	Test Value = 3.0					
	t	Df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
$H0_2$	6.236	3	.000	.4717	.0774	.6978

Source: SPSS, Version 28.0

Interpretation and Decision

The analysis in Table 8 shows that the probability associated with the calculated value of significance level was 0.000, which is less than 0.05. This implies that it was significant. In other words, the null hypothesis should be rejected.

Decision:

At 5% level of significance; collaborative approach has a statistically significant effect on the nation-building in Nigeria.

Discussion of Findings

The main objective of this study is to examine the effect of sustainable social innovation on nation-building in Nigeria with the following objectives;

i. Examine the effect of addressing social needs on nation-building in Nigeria.
ii. Evaluate the effect of collaborative approach on nation-building in Nigeria.

The results as stated in table 6 and 8 suggest that for hypothesis one, at 5% level of significance Addressing social needs has a significant effect on the nation-building in Nigeria. While for hypothesis two at 5% level of significance the collaborative approach has a statistically significant effect on the nation-building in Nigeria.

Conclusion

In conclusion, sustainable social innovation plays a crucial role in the nation-building of Nigeria by effectively addressing pressing social needs and fostering collaboration among diverse stakeholders. By prioritizing the welfare of communities and implementing innovative solutions to social challenges, Nigeria can create a more inclusive and equitable society. This approach not only improves the quality of life for citizens but also strengthens social cohesion and trust in institutions.

Moreover, the collaborative nature of sustainable social innovation enhances the capacity for collective action, bringing together government, private sector, civil society, and local communities. This synergy leads to more effective resource allocation, shared knowledge, and a unified vision for development. As these collaborative efforts gain momentum, they contribute significantly to the overall stability and progress of the nation.

Ultimately, embracing sustainable social innovation in Nigeria not only addresses immediate social issues but also lays the foundation for long-term national development, fostering resilience and sustainability in the face of future challenges. By investing in these innovative approaches, Nigeria can pave the way for a prosperous and harmonious future. The study concluded that sustainable social innovation has a significant positive effect on nation-building in Nigeria.

Recommendations

The Nigerian government should develop and implement policies that prioritize sustainable social innovation. This includes creating frameworks that support initiatives aimed at addressing social needs, particularly in underserved communities. Others recommendations are as follow:

iii. Foster collaborations between the public sector, private enterprises, and civil society organizations. By leveraging resources, expertise, and networks, these partnerships can enhance the effectiveness of social innovation projects and ensure broader community impact.
iv. Equip local communities with the necessary skills and knowledge to engage in sustainable social innovation. Training programs should focus on entrepreneurship, leadership, and community organizing to empower individuals to identify and address their own social challenges.

Abstract

Introduction: *Talent management (TM) and smart transitions are an adoptive strategy in a digital era. However, aligning TM practices with the demands of smart transitions remains a significant challenge in a developing economy. This paper presents new evidence on how TM and smart transitions strategically position organizations in a digital era.*

Methods: *This study adopted a survey quantitative survey design to examine the relationship between recruitment effectiveness, process digitization, talent management practices, and organizational smart transitions. The population comprised employees working in medium and large-scale organizations undergoing digital transformation initiatives in the 5 South Eastern states of Nigeria. A sample of 300 respondents was drawn using random sampling method. The Spearman Rank Correlation Co-efficient was used to test hypotheses one and two while multiple regression was used to test the third hypothesis.*

Results: *The results revealed; a moderate positive and significant relationship between recruitment effectiveness and process digitization, slightly high positive and significant relationship between training program and adoption of internet of things (IoT), it was also found that technology strengthens the effect of talent management on smart transitions.*

Conclusion: *TM and smart transitions are central to integrating human resources with digital innovation which makes for adaptive and competitive organization. We recommended among others that organizations need to implement recruitment practice that is sector specific while leveraging on digital platform and also encourage continuous workforce training in a digital era.*

Keywords*:* *Talent management, recruitment effectiveness, smart transition, process digitalization, adoption of internet of things (IoT).*

Introduction

The digital era has fundamentally transformed how organizations operate, compete, and sustain performance. Emerging technologies such as artificial intelligence (AI), the Internet of Things (IoT), big data analytics, and cloud computing are reshaping industries, requiring organizations to adapt their structures, processes, and workforce capabilities more rapidly than ever before (Bican & Brem, 2020; Nambisan et al., 2019). In this context, organizational resilience and adaptability increasingly depend on the capacity to manage talent strategically while navigating smart transitions ie deliberate, technology-enabled shifts from traditional ways of working toward more

agile, knowledge-driven models (Akhavan et al., 2022). Talent management (TM), which encompasses the attraction, development, deployment, and retention of skilled employees, has evolved into a critical driver of competitive advantage (Collings et al., 2019). Unlike earlier human resource practices that emphasized workforce administration, TM in the digital era emphasizes continuous learning, agility, and knowledge sharing to enable organizations to thrive amid volatility and technological disruption (King, 2017). Research has shown that organizations with strong talent strategies are more capable of innovating, adapting to environmental change, and achieving long-term sustainability (Gallardo-Gallardo et al., 2020). However, aligning TM practices with the demands of digital transformation remains a significant challenge.

The concept of smart transitions captures the socio-technical process of reconfiguring organizational systems by integrating digital technologies with human capabilities (Reis et al., 2018). Unlike narrow technology-adoption approaches, smart transitions foreground the role of people in enabling successful digital transformation. This means that employees are not passive recipients of technological change but active contributors whose skills, creativity, and adaptability shape the outcomes of transformation (Sparrow & Makram, 2015). However, the effectiveness of smart transitions depends heavily on how talent is managed, developed, and motivated during periods of change. Despite the growing recognition of the interplay between TM and smart transitions, gaps remain in understanding the mechanisms through which TM practices contribute to organizational adaptiveness in digital era. Existing studies have often focused either on the technological dimensions of digital transformation (Susanti et al., 2023) or on isolated HR practices, without sufficiently integrating the two perspectives. Furthermore, limited empirical evidence exists on how organizations in different environments, particularly those in developing economies design and implement talent strategies that support adaptive capabilities during digital transitions (Vrontis et al., 2021). It is against this backdrop, that this study is set to investigate talent management and smart transitions as complementary strategies for building adaptive organizations in the digital era.

Objectives of the Study

The broad objective of this study is to examine talent management and smart transitions as strategies for building adaptive organizations in a digital era. The specific objectives are:

1. To determine the nature of relationship between recruitment effectiveness and process digitization.
2. To ascertain the nature of relationship between employee training and adoption of internet of things (IoT).
3. To examine the moderating effect of technology on the relationship between talent management and smart transition.

Hypotheses

1. There is no significant relationship between recruitment effectiveness and process digitization.
2. Employee training has no significant relationship with internet of things (IoT).
3. Technology has no significant effect on the relationship between talent management and smart transitions.

Review of Related Literature

Talent Management

Talent management is a human resource strategy designed to enhance an organization's ability to attract, develop, and retain people to enable and achieve current and future business goals (Sottile, 2021). Talent management was defined as identifying, developing, and having high-potential employees who help the organization achieve its goals. It encompasses a wide range of skills, including technological and managerial abilities. It is a set of operations aimed at attracting, selecting, developing, and retaining skilled and informed personnel (Abdel, *et al.*, 2021). Mohammad, Abul, Mokana and Gunasegaran (2021), describes it as the additional management mechanisms and resources made available to individuals in an organization who are deemed to be 'talented. Talent management is the process of managing employees differently based on their relative ability to contribute to the organization's competitive advantage. Furthermore, Ayodele *et al.*, (2020), defined talent management as a process, which includes a complete and interrelated set of organizational activities such as identifying, selecting, developing and retaining the best employees as well as building their potential for the most strategic positions, and assisting them in formulating the best use of strengths in order to gain their engagement and contribution, which ultimately contribute to organizational benefits.

Recruitment Effectiveness

Recruitment is about understanding what skills are critical for organizational performance (Green, 2020). It is about giving employees the opportunity to choose how they can best help and what they can contribute to achieve organizational goals (Gilch & Sieweke, 2021). Recruitment effectiveness refers to the ability of an organization's hiring process to attract, identify, and select qualified candidates who best fit the job requirements and organizational culture (Yström, Agogué, Rampa, 2021). It is the measure of how well recruitment strategies and practices achieve desired outcomes, such as hiring speed, quality of candidates, cost efficiency, and retention rates (Mohamed, Zakia, Cheklekbire, & Omar, 2022). Recruitment effectiveness is the extent to which the recruitment process contributes to organizational performance by securing the right talent at the right time for the right roles (Magdaleni´c, & Lui´c, 2025). It reflects how well an organization's hiring practices create a positive candidate experience, promote fairness, and ensure that new hires integrate successfully into the workplace (Aizhan, Vicenc, Eva & Luigi, 2025). It is the alignment of hiring practices with organizational goals, ensuring that talent acquisition not only fills vacancies but also supports long-term growth, competitiveness, and workforce stability (Raul, Gilberto, Joaquim, & Antunes, 2024).

Employee Training

Amsalu (2017) defined training as giving new and different skills to the employees for performing their jobs. Armstrong (2009) suggests that training can refer to the practice of equipping employees with skills, knowledge, and abilities, with the aim of building organizational capabilities and increasing organizational performance. Training is the act of providing individuals with targeted skills, knowledge, and competences in order to improve their performance as well as productivity within their existing job responsibilities (Noe, 2017). Employee training refers to a planned set of activities designed by organizations to enhance workers' competencies, increase productivity, and align employee capabilities with organizational goals. It is the formal and informal learning process through which employees acquire technical, managerial, or soft skills that enable them to perform tasks more effectively. Employee training is the continuous development opportunity

provided to workers to help them grow professionally, adapt to new responsibilities, and advance in their careers (Yashodha, 2023).

Smart Transitions

Smart transitions refer to the deliberate and well-coordinated processes by which organizations adapt to change, whether structural, technological, or cultural using data-driven strategies and innovative practices to ensure smooth continuity and sustainable growth (Maung, Ola, Sandeep, Matti & Rikard, 2011). Smart transitions are the strategic methods organizations use to manage change effectively, ensuring that employees, processes, and technologies adjust seamlessly to new conditions while minimizing resistance and disruption. Smart transitions in organizations involve the use of digital tools, automation, and intelligent systems to facilitate smooth shifts in operations, workflows, or structures, enabling efficiency and resilience in the face of change. Smart transitions describe the process of guiding employees and teams through organizational changes in a structured, supportive, and adaptive way that fosters engagement, reduces uncertainty, and enhances performance. Smart transitions are proactive, carefully designed approaches to change that align people, processes, and technology with evolving business goals, ensuring competitiveness and long-term success (Yström, Agogué & Rampa, 2021)..

Process Digitalization

Digitalization is one of the most revolutionary developments in business and society during the past few decades, with the potential to change, fundamentally, the way organizations operate and create value (Loebbecke & Picot, 2015). Mohdzaini (2021) digital transformation is about the ability of an organization and their people to adapt continuously to disruptive changes caused by the evolution of digital technologies. Process digitalization is the transformation of traditional, manual, or paper-based business processes into digital formats using technology to improve efficiency, accuracy, and accessibility (Tabrizi et al., 2019). Process digitalization refers to the strategic application of digital tools and systems to redesign and streamline organizational processes, enabling faster operations, reduced costs, and better decision-making (Davenport & Redman, 2020). Gartner, (2020) opined that process digitalization is the use of digital technologies such as automation, cloud computing, internet of things (IoT), data analytics, and artificial intelligence, to convert business workflows into intelligent, technology-driven processes. Process digitalization is the shift from analog or semi-digital workflows to fully digital operations where tasks, communications, and data flows are managed electronically across the value chain (Soltanifar et al., 2021).

Adaptation to Internet of Things

The Internet of Things (IoT) is the interconnection of computing devices embedded in everyday objects through the internet. These devices send and receive data. The IoT connects physical objects and intelligent entities to the internet, resulting in context-aware autonomous behaviour. It is a network in which objects are wirelessly linked via smart sensors (Guan et al., 2022). Adaptation to IoT is the process by which individuals, organizations, and systems adjust their operations, strategies, and behaviors to effectively integrate and utilize IoT technologies (Mohanty & Mishra, 2020). It refers to how organizations restructure processes, products, and services to take advantage of IoT-enabled connectivity, automation, and data insights for improved efficiency and competitiveness (Singh et al., 2020). Kaur, Raina and Sharma (2020) argue that adaptation to IoT is the modification of existing infrastructure, devices, and networks to interconnect physical

and digital systems, enabling real-time data exchange and intelligent decision-making. It involves reshaping organizational culture, workforce skills, and policies to embrace IoT innovations, ensuring smooth adoption and long-term sustainability (Venkatesh, 2021).

Theoretical Framework

The capacity of organizations to remain competitive in the digital era is increasingly explained through multidimensional theoretical lenses that integrate people, processes, and technology. This study is underpinned by three complementary theories: the Resource-Based View (RBV), Dynamic Capabilities Theory (DCT), and Socio-Technical Systems Theory (STS).

Resource-Based View (RBV): This theory was coined by Barney (1991), he argued that firms achieve sustained competitive advantage when they possess resources that are valuable, rare, inimitable, and non-substitutable (VRIN). Human capital, particularly in the form of highly skilled and adaptive employees, meets these criteria because knowledge, skills, and creativity are difficult for competitors to replicate (Wright et al., 2001). In a digital era, TM ensures that such resources are not only acquired but also continually developed through reskilling, career development, and knowledge-sharing practices. RBV is especially relevant to smart transitions because technology adoption alone cannot guarantee sustained performance; it is the human element ie employees' ability to interpret, deploy, and exploit technologies that transforms digital investments into adaptive capacity (Collings et al., 2019). Therefore, RBV underpins the argument that TM is central to leveraging smart transitions as a source of long-term organizational competitiveness.

Dynamic Capabilities Theory (DCT): Teece, Pisano, and Shuen (1997), proposed the DCT theory, which extends RBV by emphasizing not just the possession of resources but the ability to integrate, build, and reconfigure them to address rapidly changing environments. Teece (2007) identifies three micro-foundations of dynamic capabilities: sensing opportunities and threats, seizing opportunities, and transforming organizational resources. TM practices directly support these capabilities. For instance, talent analytics enhance sensing by identifying skill gaps and future workforce needs; reskilling and continuous learning initiatives enable seizing opportunities by developing new competencies; and internal mobility and flexible work structures support transformation by redeploying talent rapidly across functions. TM provides the agility needed to align human capital with the phases of smart transitions. DCT thus explains how organizations move beyond static resource advantages to build resilient adaptability, making it a vital theoretical foundation for linking TM and smart transitions.

Socio-Technical Systems Theory (STS): Socio-Technical Systems Theory, was propound by Trist and Bamforth (1951) in their study of coal mining operations. This theory highlights the interdependence between the social system (people, roles, culture) and the technical system (tools, technologies, processes). For organizations to succeed, both systems must be jointly optimized rather than addressed in isolation (Pasmore et al., 2019). When applied to the digital era, STS underscores that smart transitions cannot be reduced to technology rollouts; they require organizational cultures that support collaboration, trust, and knowledge sharing. TM becomes a mediating mechanism for STS principles by cultivating digital leadership, fostering continuous learning, and building psychological readiness for change. Without such social alignment, digital transitions risk employee resistance, underutilization of technology, and failure to achieve adaptability.

Empirical Insight

The table below summarizes selected empirical studies on talent management, smart transitions, organizational agility, and digital transformation. It captures authors, year, objectives, context, methods, and key findings to provide a foundation for future research in building adaptive organizations.

Author(s)	Year	Objectives	Context	Methodology	Key Findings
Smit, P. K., Schultz, C. M., & Van Hoek, C. E.	2021	To determine the relationship between talent management, transformational leadership, and work engagement.	Automotive artisans, South Africa.	Survey of 609 artisans; SEM.	Talent management mediates leadership and work engagement.
Wang, H., Li, X., Zhu, J., & Chen, X.	2024	Examine how TM practices affect talents' intention to stay, considering mediators.	Chinese organizations.	Three-wave longitudinal survey (268); regression + mediation analysis.	TM positively affects intention to stay; mediated by perceived growth and affective commitment.
AlQershi, N. A., Thurasamy, R., Ali, G. A., et al.	2022	Examine human capital as mediator between TM and sustainable performance.	Malaysian hospitals.	Survey of 174 hospitals; PLS-SEM.	Human capital mediates between TM mindset and sustainable performance.
Ogbeibu, S., Jabbour, C. J., Burgess, J., et al.	2022	Explore how green TM, leader STARA competence, and digital task interdependence affect turnover.	Manufacturing firms in Nigeria.	Cross-sectional survey of 372 employees; quantitative analysis.	Leader STARA competence moderates relationship between TM and turnover intention.
Abiodun, T. S., Rampersad, G., & Brinkworth, R.	2023	Investigate how digital transformation leads to smartness and performance gains.	Industry 4.0 organizations.	Qualitative interviews; Gioia methodology.	Smartness emerges as a capability mediating between digital transformation and performance.

Chang, C.-L., & Octoyuda, E.	2024	Examine how learning agility and leadership influence digital adoption.	MSMEs in Asia.	Survey of 203 employees; PLS-SEM.	Learning agility and leadership enhance adoption of digital innovations.
Gyemang, M. D., & Emeagwali, O. L.	2020	Explore how dynamic capabilities, innovation, agility and knowledge management affect performance.	Telecommunication industry.	Survey-based quantitative analysis.	Agility and knowledge management strongly mediate competitive performance.
SpringerOpen Study on IT Firms	2025	Assess impact of innovative TM practices on digital employee experience.	IT industry.	Survey; SEM analysis.	Innovative TM practices enhance inclusiveness in digital employee experience; shared leadership strengthens effect.

Methodology

Research design

This study adopted a quantitative survey design to examine the relationship between recruitment effectiveness, process digitization, talent management practices, and organizational smart transitions. The design was chosen because it enables the collection of data from a relatively large sample at a single point in time, allowing for statistical analysis of associations and effects among variables.

Population and sample

The study population comprised employees working in medium and large-scale organizations undergoing digital transformation initiatives in the 5 South Eastern states of Nigeria. A sample of 300 respondents was drawn using random sampling method. The sample size was deemed adequate based on recommendations for multivariate analyses, where a minimum of 10 respondents per variable is advised (Hair et al., 2019).

Instrument for data collection

Primary data were collected using a structured questionnaire designed around the study objectives. The instrument captured four main constructs: (1) recruitment effectiveness, (2) process

digitization, (3) talent management practices (training, development, and retention), and (4) smart transition outcomes (digital readiness, agility, and efficiency). Items were measured on a five-point Likert scale ranging from 1 = strongly disagree to 5 = strongly agree.

Validity and Reliability
The questionnaire was subjected to content validation by three experts in human resource management and digital transformation studies. Construct validity was confirmed through exploratory factor analysis (EFA). Reliability was tested using Cronbach's alpha, with all constructs achieving coefficients above 0.70, indicating strong internal consistency.

Data Collection Procedure
Questionnaires were distributed electronically and in person to ensure broad participation. The study made use of 10 research assistants who worked in pair with a pair sent to each state for data collection. data collection was done using tablet and paper with the research assistant with tablet asking the question and recording while the other records in the paper version of the questionnaire.

Data Analysis
The data in this study were analyzed using both descriptive and inferential statistics. Specifically, objective 1, which examined the relationship between recruitment effectiveness and process digitization, and objective 2, which examined the relationship between employee training and IoT adoption, were analyzed using Spearman's rank-order correlation because the constructs were measured with ordinal Likert scales. Objective 3, which explored whether technology moderates the relationship between talent management practices and smart transitions, was tested using hierarchical multiple regression (moderated multiple regression) with the TM × Technology interaction term; independent and moderator variables were mean-centered prior to creating the interaction to reduce multicollinearity. Additional analyses included reliability testing (Cronbach's alpha) and factor checks for construct validity, and regression diagnostics (VIF for multicollinearity, residual analysis for normality and heteroscedasticity) where applicable. All analyses were conducted using SPSS (version 21) with significance set at $p < 0.05$.

Ethical Considerations
The study adhered to ethical principles, including voluntary participation, informed consent, confidentiality of responses, and the use of data strictly for academic purposes.

Results
Objective: To evaluate the nature of relationship between recruitment effectiveness and process digitization.
The Spearman rho correlation result ($\rho = 0.412$, $p < .001$) shows a moderate positive relationship between recruitment effectiveness and process digitization. This means organizations with effective recruitment are more likely to digitize their processes. Also, the relationship is statistically significant at the 0.01 level. Therefore, recruitment significantly contributes meaningfully to digital adaptation.

Table 1: Spearman rank correlation between recruitment effectiveness and process digitization (n = 300)

Variable	Recruitment effectiveness	Process digitization
Recruitment effectiveness	1.000	0.412 ($p < .001$)
Process digitization	0.412 ($p < .001$)	1.000

Note: Correlation is significant at the 0.01 level (2-tailed).

Objective 2: To examine the relationship between employee training and adoption of Internet of Things (IoT).

The Spearman rho correlation result ($\rho = 0.564$, $p < .001$) indicates a slightly high positive relationship between employee training and IoT adoption. This implies that better training programs are linked to higher adoption of IoT technologies. The relationship is statistically significant at the 0.01 level. Thus, training significantly plays a key role in enhancing digital technology adoption.

Table 2: Spearman rank correlation between employee training and IoT adoption (n = 300)

Variable	Employee training	IoT adoption
Employee training	1.000	0.564 ($p < .001$)
IoT adoption	0.564 ($p < .001$)	1.000

Note: Correlation is significant at the 0.01 level (2-tailed).

Objective 3: To determine the moderating role of technology on the relationship between talent management and smart transition

Talent management significantly predicts smart transitions ($\beta = 0.39$, $p < 0.01$). Technology also has a positive direct effect ($\beta = 0.28$, $p < 0.01$). The interaction term is significant ($\beta = 0.18$, $p = 0.03$), indicating that technology strengthens the effect of talent management on smart transitions. Overall, the model explains 46% of the variance in smart transitions.

Table: Moderated multiple regression analysis result predicting smart transition (ST)

Predictor variables	B (Unstandardized)	Std. Error	Beta (Standardized)	t-value	Sig. (p)
Step 1: Talent Management (TM)	0.42	0.08	0.39	5.25	0.00***
Step 2: Technology (Tech)	0.31	0.07	0.28	4.43	0.00***
Step 3: TM × Tech (Interaction)	0.15	0.05	0.18	3.00	0.03**
Model R^2	0.46				
Adjusted R^2	0.45				
ΔR^2 (Interaction Effect)	0.04				

Note: *p < 0.10, **p < 0.05, ***p < 0.01

Discussion

Recruitment practices are increasingly shaping how organizations approach digitization in the digital era. When hiring processes emphasize adaptability, transparency, and cultural fit, organizations build a workforce that is better aligned with digital strategies and process automation. This reinforces the argument of Collings et al. (2019) that recruitment should be positioned as a strategic tool for digital transformation rather than a routine administrative function. Also, Gallardo-Gallardo et al. (2020) similarly observed that organizations that select employees for long-term learning potential adapt more effectively to disruptive technologies. Yet, in contexts where recruitment lags behind technological advancement, mismatches emerge, leaving organizations unable to maximize the gains of digitization (Vrontis et al., 2021). Beyond shaping workforce readiness, effective recruitment also fosters organizational resilience by ensuring that employees possess both the technical and soft skills necessary for navigating uncertainty. Consequently, digitization becomes not only a technological shift but also a human capital strategy, with recruitment as the cornerstone of sustainable transformation.

Training and continuous learning remain essential for organizations seeking to integrate advanced technologies such as the Internet of Things (IoT). Well-designed training programs foster the technical proficiency and confidence required for employees to interact with IoT-enabled systems. This is consistent with Chang and Octoyuda (2024), who showed that learning agility and leadership jointly enhance the uptake of digital innovations. Susanti et al. (2023) further demonstrated that organizations that neglect training risk underutilizing IoT systems, leading to resistance and inefficiencies. The socio-technical systems perspective reinforces this point, emphasizing that technological systems only deliver value when matched with human capability (Pasmore et al., 2019). Nonetheless, some research suggests that adoption may be driven more by infrastructure investment and external competition than by employee development (Abiodun et al., 2023). This contrast highlights that training is necessary but insufficient unless accompanied by broader organizational strategies that align technology adoption with operational goals.

Technology also functions as an amplifier, enhancing the influence of talent management practices on organizational transitions. Rather than acting independently, digital tools such as artificial intelligence, analytics, and cloud platforms magnify the impact of recruitment, training, and retention on the capacity of organizations to transition into agile, knowledge-driven models. This resonates with the resource-based view (Barney, 1991), which stresses that organizational resources become most valuable when deployed in synergy. Empirical support for this findings comes from Ogbeibu et al. (2022), who found that leaders with strong digital competence were able to translate talent management initiatives into higher levels of organizational resilience. Sparrow and Makram (2015) likewise argued that talent management is most effective when supported by infrastructures that promote knowledge sharing and agile work practices. However, concerns remain that excessive reliance on technology could sideline the human dimension of talent management, producing resistance or redundancy (Reis et al., 2018). The evidence therefore suggests that while technology strengthens the link between talent management and smart transitions, success depends on balancing technical innovation with human-centered design.

Conclusion

Talent management and digital transformation are no longer parallel concerns but are mutually reinforcing drivers of organizational agility in an era defined by smart transitions. This study shows that recruitment effectiveness and process digitization are strongly linked, training and retention strategies are enhanced by technology, and digital tools significantly strengthen the overall effect of talent practices on the success of smart transitions. These findings are important because they highlight the central role of integrating human capital management with digital innovation in shaping organizations that are both adaptive and competitive. However, the results also reveal that without deliberate policy and managerial attention, the benefits of this integration may remain uneven across firms, especially in contexts where resources, infrastructure, and digital literacy are limited. Addressing this gap requires supportive frameworks that encourage organizations to embed, IoT, and analytics into HR systems, adopt continuous workforce training, and implement recruitment practices that leverage digital platforms. At the same time, government and industry regulators need design policies that reduce barriers to smart transitions for medium and large-scale organizations, incentivize innovation, and strengthen compliance with fair labor and recruitment standards. Introducing technology-enabled HR platforms, offering tax incentives for digital investments, and creating sector-specific training programs could help institutionalize best practices. By situating talent management within the broader digital transformation agenda, this study contributes evidence that can guide both corporate strategy and public policy, reinforcing the idea that successful smart transitions are not optional but essential for resilience in a knowledge-driven global economy.

Abstract
This conceptual study examines the complex relationship between globalization and food security through the lens of the global value chain (GVC) framework. Globalization has transformed food production, distribution, and consumption, creating both opportunities and challenges for food security worldwide. The research explores how advancements in technology, international cooperation, and education impact food accessibility, availability, and acceptability. While globalization and GVCs have modernized food systems, they have also exacerbated disparities, particularly in developing countries, due to uneven access to resources and market power imbalances. This paper employs World-Systems Theory to highlight the core-periphery dynamics that shape global food production and distribution. This study adopts a conceptual qualitative approach using a theoretical review. The paper concludes that while technological innovations and international cooperation have improved food security, these benefits have not been equitably distributed. Recommendations include investing in digital agriculture, optimizing supply chains, and strengthening international collaborations to build a more adaptive and sustainable global food chain.

Keywords: *Globalization, global value chain, food security, technology, international cooperation.*

Introduction

The limits of food sustainability have been pushed by population growth, rapid urbanization, and expanding economies. These raise urgent concerns about global food security. Droughts and floods, which are extreme climatic conditions have disrupted harvests, particularly in African countries where significant portions of national budgets are devoted to food (Abdulkadyrova et al., 2015). Food security is defined as consistent access to sufficient, safe, and nutritious food for an

active and healthy life (Okpala et al., 2024). It is fundamental to human welfare and social stability (Pérez-Escamilla, 2024). Its absence results in malnutrition, heightened vulnerability to disease, and social unrest (Onyeaka et al., 2024). Therefore, hunger is not merely a humanitarian issue but also a political and economic one.

Multiple interrelated forces have influenced food security. These forces include climate change, population growth, changing diets, escalating agricultural prices, and rapid urbanization (Hulekal et al., 2024). Yet, the role of globalization in this context is not sufficiently examined. As markets and networks go beyond borders, states in Nigeria are struggling to independently regulate food systems (Reinicke & Deng, 2000; Smith & Naim, 2000). Global value chains (GVCs) are interlinked activities connecting farmers, processors, and consumers across countries have become central to the production, distribution, and consumption of food (Lee et al., 2012; Nugraha et al., 2024). Global value chains promote technology adoption, attract investment, and foster international cooperation (Hassan, 2024; Schut & Giller, 2020). However, GVCs increase the risk exposures of food security to pandemics, trade restrictions, and climate-related shocks (Shang et al., 2024).

Despite ongoing discussions around food security, there is a surprising lack of research into how globalization moderated by global value chains, influence food accessibility, availability, and food system stability (Afifi, 2024). Most of the literature sticks to talking about agricultural output and local food systems, often sidestepping the bigger, structural connections that come with globalization. This study aims to fill that gap by focusing on three main areas: first, the role of technological innovation in improving both access to and the availability of food; second, how international cooperation can help smooth out supply chain hiccups and make access to food fairer; and third, the impact of education and knowledge-sharing in helping small-scale farmers become part of these global value chains. Altogether, these factors are not just about improving livelihoods, they are also about keeping things sustainable for the long haul. So, rather than positioning globalization and GVCs as just another source of risk, this paper argues that they might offer some solid solutions to the ongoing challenges in global food security.

The purpose of this research is to provide conceptual foundation that the role of GVCs moderates the relationship between globalization and food security. The theoretical basis of this is the World-Systems Theory and the description of structural disparities between core and peripheral economies (Wallerstein, 2011).

Review of Related Literature

The global food crisis is driven by resource overuse, population growth, urbanization, and evolving dietary preferences factors that are reshaping demand and supply dynamics worldwide. Urbanization alone is projected to reach 70% by mid-century, exacerbating pressures on food systems traditionally prone to significant inefficiencies, including the annual loss of roughly one-third of global food output (Calabró & Vieri, 2025). These inefficiencies, intensified by climate shocks and price volatility, disproportionately affect low-income populations, where food costs can account for up to half of household expenditures. Despite technological and institutional efforts, widespread hunger persists, exposing the limitations of production-centric solutions (Mumah et al., 2025). Global Value Chain (GVC) analysis offers a more nuanced and systemic perspective: trade liberalization, infrastructure, and digital innovations can enhance access and

reduce waste, but governance asymmetries allow dominant actors to capture disproportionate value, marginalizing smallholder producers (Bair & Mahutga, 2023). Recent empirical evidence supports the nuanced impact of value chain dynamics. Nugraha et al. (2024) find that agricultural GVC participation improves food security in certain forms (simple forward and backward linkages), though more complex forms may hinder it, underscoring the need for regionally tailored policies. Thus, globalization's effects on food security are not inherently positive or negative, but contingent on governance, inclusivity, and equitable value distribution.

Gap in Literature

The literature reviewed lacks a deeper exploration of how globalization affects food sovereignty in developing countries, particularly how smallholder farmers' control over production is eroded by global trade policies and transnational corporations. Existing studies on food security have largely concentrated on production, climate change, or local policy impacts, while giving limited attention to globalization's influence through the Global Value Chain (GVC) perspective. Much of the literature addresses food availability and accessibility in isolation, without adequately examining how technology, international cooperation, and education interact within global supply chains to shape food security outcomes. Furthermore, although both food security and globalization are well studied separately, few works integrate World-Systems Theory with GVC frameworks to explain the persistent core–periphery imbalances that structure global food systems, leaving an important theoretical gap.

Synthesizing the Literature

A critical synthesis of the literature reveals significant contradictions in how globalization is understood to impact food security. On one hand, several studies highlight globalization's positive role in enhancing efficiency, productivity, and access to food through technological innovations, trade liberalization, and international cooperation (Garrone et al., 2023). Digital platforms combined with precision farming improves farming and food security with increased productivity and minimized waste alongside direct connections between farmers and distant markets (Hu et al., 2024). However, promises which appear to be universal almost never are. A farmer situated in a poorer area faces a lack of infrastructure, technology, and means to integrate into global value chains. Progress in some areas translates to increased distance in other places, thereby reinforcing divides instead of closing them.

Trade and collaboration are seen as advancing global food systems by stabilizing border prices and supply, and as a result, facilitating the movement of food across countries. However, the truth of the matter goes much deeper. Negotiations are never in a balanced framework. Economically powerful countries dominate the terms of the deal, while poor countries suffer from lack of competition. Often, dominant economies dictate the terms of food production, distribution, and consumption (Canfield et al., 2021). A similar imbalance exists in education and training systems, and digital literacy which are said to be important in empowering farmers (Mittal, 2016). However, resources and tools are often distributed unevenly. The more privileged farmers learn more and gain further advantages over their competition.

From these tensions, we can conclude that globalization has both positive and negative aspects. It can offer new and innovative ideas, improve industry efficiency, and foster growth, but can also further entrap weaker economies in dependency. Such a phenomenon requires more robust

philosophies, like World-Systems Theory and the Global Value Chain Theory which can explain how globalization has the ability to promote advancement and increase global food system weaknesses at the same time.

Approach / Method of Conceptualization

This paper uses a conceptual approach and a review of theoretical perspectives. It draws on the Global Value Chain (GVC) framework and World-Systems Theory to examine how globalization shapes food security in terms of access, availability, and acceptability. Rather than collecting new data, the study synthesizes existing literature to explore core-periphery dynamics and their influence on global food systems. This approach helps uncover structural disparities and provides a foundation for future empirical research and policy recommendations.

Theoretical Foundation

World-Systems Theory

World-Systems Theory by Wallerstein (1974) regards the world as a single entity of socioeconomic development and the global economic order. It provides a macro-structural lens that is used to explain globalization and food security. The entity is made of three components namely core, semi-periphery, and periphery geopolitical structures. These highlight asymmetrical and hegemonic power relations. Also, in the global food system, core countries with technological advances, capital concentration and hegemonic control over trade agreements, are the major consumers and exporters of agri-food products. Furthermore, peripheral countries specialize in low-dollar-value raw commodity agricultural products (Hu et al., 2024). They are sensitive to price fluctuations, trade disruptions, climate change, economic crises, and epidemics. They worsen the consequences of these structural weaknesses and transactional forms. These dynamics exacerbate vulnerabilities in food availability and access, as peripheral producers often prioritize export crops over domestic consumption, intensifying food insecurity.

Global Value Chain (GVC) Analysis

The Global Value Chain analysis primarily examines the structural power relations within production processes. It explains how value is created, distributed, and ultimately captured. Building on this perspective, Wood et al. (2021) and Imani Bashokoh et al. (2025) stated that multinational companies dominate the food system, by concentrating power and control over standards, prices, logistics, distribution networks, and market access. Often headquartered in the global North, multinational companies frequently consolidate economic and strategic power usually to the detriment of producers and workers in the global South (Hickel et al., 2022). Technological innovations and digital platforms are rapidly transforming food value chains (Panigrahi et al., 2025). This is made possible through digitalization, blockchain, and new technologies. Yet, without inclusive governance, advancement in global value chains risks reinforcing the very structural imbalances they aim to mitigate (Soundararajan, 2023).

Key Aspects of World-Systems Theory as Related to Food Security

Core-Periphery Dynamics: In the context of food security, the core-periphery dynamics illustrate a significant imbalance between industrialized nations and developing countries. The core countries in Trade hold sophisticated geographical agricultural frameworks and enormous resources. On the other hand, the peripheral countries are more likely to depend on the raw agricultural exports which are less productively processed, and this can worsen the food security

issue (Wallerstein, 1974). Global periphery countries, arguing Saccone and Vallino (2025), suffer severely from the changes in world periphery countries, global demand, and price volatility, which makes food availability and accessibility constant. When such circumstances prevail, people are more likely to suffer food insecurity, which is the direct result of external demand outpacing food produced locally.

Global Trade Relations: World- Systems Theory is all about how trade deals can totally change the game for the global food scene. trade deals and rules can make it easier or harder to get food international trade can boost food access in places that don't have enough, but it can also make them reliant, which messes with local control over food and safety (Niu, 2025). For instance, global trade often favors cash crops over local food production, which can mess with how well communities can feed themselves (Canfield et al. getting a handle on these dynamics is key to figuring out how globalization messes with food security and how we can tweak trade policies to make sure everyone gets a fair shot at food

Inequality and Access to Resources: World-Systems Theory points out that the uneven distribution of wealth and resources can seriously mess with countries' chances of getting enough food for everyone. core countries usually have better tech, infrastructure, and money, which helps them improve their food systems (Han et al. on the flip side, countries on the outskirts usually have a tough time getting on board with new farming tech that could really help them grow more food and keep it safe, 'cause they're dealing with stuff like not enough c this part of the theory highlights the need for fair rules and countries working together to make sure there's enough food in places that need it most, which helps build a better, more reliable world food system. World-Systems Theory gives us a solid way to see how globalization, food security, and global value chains are all linked up (Wallerstein, 2011). it highlights the differences between countries and stresses the importance of getting the bigger picture of the global economy and politics that's influencing food systems everywhere. by using this theory, researchers can get a clearer picture of how globalization affects food security and find ways to make food systems fairer and more sustainable.

Theoretical Overlap

World- Systems Theory and Global Value Chains (GVCs) come together to show how structural inequalities and how companies operate can both influence food security outcomes. at the big picture, World-Systems Theory points out that the rich countries run the show in global farming by owning the tech, money, and rules of trade, while the less wealthy countries are stuck with selling cheap stuff and can't At the micro level, GVC analysis shows how power imbalances in supply chains—like the big bosses setting the rules, prices, and deals—keep these worldwide gaps wide by grabbing the good stuff early on, while the smaller players get just Together, these perspectives show that food insecurity is not only a matter of resource scarcity but also of systemic imbalances: structural hierarchies (core-periphery) frame the rules of global exchange, while chain-level governance mechanisms operationalize these inequalities in everyday transactions. This integration helps us see how globalization can both open up ways to get food around the world and also make countries more reliant on each other, which can mess with their ability to control their own food supply in the long run.

Conceptual Development
Conceptual Framework

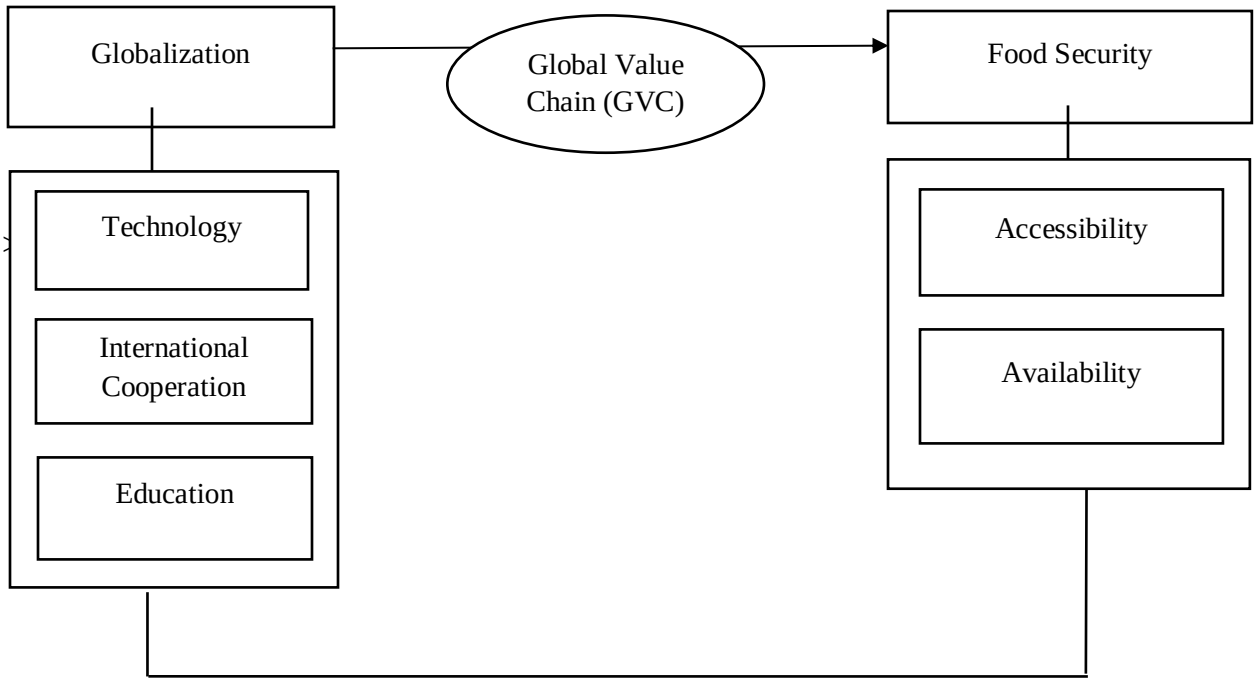

Figure 1.1: Conceptual Framework on Globalization and Food Security: A Global Value Chain Perspective.
Source: Adapted from Okpala et al. (2024); North and Kumta (2018); Wood et al. (2021)

Globalization. North and Kumta (2018) explained that globalization is the process of integration and interdependence among of nations obtained through trade, technology, and knowledge exchange. The process of globalization promotes specialization and efficiency in agricultural production. The export of soybeans in Brazil and Japan's dependence on food import are examples of globalization (Dos Reis et al., 2023). Globalization exposes food systems to external shocks, such as market volatility and supply disruptions. These variants of external shocks directly lead to food security challenges.

Technology is regarded as a key feature of globalization and is regarded as one of the main drivers of agricultural evolution. Scientists believe that changes in technology can increase productivity, enhance the utilization of resources, and increase access to markets (Garrone et al., 2023; Hu et al., 2024). For instance, food technology strategies entail precision agriculture, biotechnology, and digital platforms within the global food system. Although these are used to improve efficiency and traceability of supply chains of global food, uneven adoption rates within countries result in a major gap based on the digital divide. This divide suggests that countries with low exposure to new technologies are likely to miss matching benefits in terms of productivity or traceability and therefore become increasingly at risk of food insecurity and deepening global inequalities.
Gobalization fosters **international collaboration** which promotes resilience in the food system. Global coordination on transnational resource allocation and policy alignment on food insecurity is driven by the Food and Agriculture Organization (FAO) and the World Food Programme (WFP)

as international food institutions. For instance, the African Continental Free Trade Area (AfCFTA) is a trade agreement that aims to increase the availability of food and reduce barriers to its trade. During negotiation, power asymmetry may limit equitable benefit sharing among countries in cross-border cooperative agreements (Bair & Mahutga, 2023).

Education as a dimension of globalization functions as a critical enabler of global food security. It equips stakeholders with the technical skills necessary for sustainable agricultural practices and effective technology adoption. Evidence shows that targeted agricultural extension and digital literacy initiatives drive yield improvements and environmental management. However, persistent disparities in educational access limit participation in globalized food systems, underscoring the necessity of investment in educational infrastructure.

Food security is the reliable availability and accessibility of sufficient, safe, and nutritious food that meets the dietary needs of all individuals at all times (Okpala et al., 2024). Food security focuses on two primary dimensions namely availability and accessibility. Food availability ensures adequate supply through production, imports, and distribution. Food accessibility is influenced by income levels, infrastructure quality, and market mechanisms. Systemic interventions to reduce post-harvest losses, stabilize supply chains, and address socio-economic disparities are essential for advancing food security objectives.

Accessibility is the ability of individuals and households to obtain sufficient, safe, and nutritious food on consistent basis. This will be through physical availability, economic affordability, and social access. Accessibility is constrained by multiple variables namely household income, transport infrastructure, food pricing, and social entitlements. To address disparities in food access, investment in Infrastructure, market regulation, and local food systems, are required.

Availability is the supply of sufficient quantities of food of appropriate quality. Food availability depends on stable domestic production, efficient import mechanisms, and efficient distribution systems. Biotechnology and precision agriculture, which are dimensions of technological advancements, contribute to increased global production capacity. Nonetheless, external disruptions, namely climate events, armed conflict, and pandemics, can destabilize supply. To ensure reliable food availability, it is important to have strategies that will strengthen local food production and reduce post-harvest losses.

Technological innovation promotes food security by increasing food availability and accessibility. For example, digital platforms strengthen market connections and facilitate information exchange. While blockchain technology and precision agriculture enhances supply chain transparency and reduce environmental impact, respectively. But technological disparity is a significant obstacle. Overcoming this obstacle requires inclusive agri-tech investments to prevent widening global inequalities

International cooperation supports food security through trade integration, collaborative research, and coordinated crisis management. Initiatives like CGIAR have yielded climate-resilient crops, while the AfCFTA supports the fluid movement of agricultural goods. Nevertheless, ensuring equitable participation and fair distribution of benefits requires addressing enduring power imbalances.

Education helps us keep our food supply stable and secure. Education is super key for making things better when it comes to food security both agricultural extension services and nutrition education boost productivity and encourage better eating habits. getting better education, especially in poorer places, is super important for knocking down big obstacles and making sure people have enough food to eat and can get it easily.

Conclusion & Future Research

Globalization plays a critical role in improving food Security from a global value chain perspective. this is due to the fact that technology improves food accessibility within a global value chain (GVC) by enhancing communication, logistics, and supply chain management. digital platforms let farmers and producers hook up with global markets, cutting down on the hurdles for small-scale farmers and opening up to a wider range of food options. tech boosts food supply by making farming smarter with stuff like precision farming, genetic tweaks, and better delivery systems, cutting down on waste and upping the harvest working together internationally really changes how we see food, making sure it's safe, fits with local eating habits, and meets nutrition needs. when it comes to getting enough food, countries team up internationally to make trade deals, put money into better systems, and share what they know. Furthermore, education is crucial for improving food accessibility within GVCs by equipping farmers and consumers with the knowledge to navigate markets, adopt new technologies, and make informed dietary choices. Education boosts food availability by teaching sustainable farming and giving people the know-how to grow more efficiently, use resources wisely, and cut down on waste, making the whole food system stronger and more sustainable. the study uses a qualitative approach, mixing theory and existing research to critically look at how globalization affects access to food and fairness worldwide.

Contribution

The study filled in te research gap by using a conceptual approach that mixed up the current research with World-Systems Theory and the GVC framework globalization's a big deal for getting food around, making it available, and people liking it, especially with tech, working together internationally, and learning more. By doing so, the study highlighted how globalization enhances efficiency and innovation in food systems while simultaneously exacerbating inequalities due to resource and power imbalances within global value chains. To bridge this gap, it provided a policy-relevant framework that recommends digital agriculture, supply chain optimization, and international collaboration as strategies for achieving more equitable and sustainable food security outcomes.

Recommendations

Drawing from the extensive literature review and the objectives of this study, the following recommendations have been made:

i. To increase food accessibility, investments in digital supply chains, precision agriculture, and mobile platforms for market access should be given top priority in order to link farmers with consumers in international marketplaces.
ii. By using data analytics and automated farming systems more widely, crop yields can be increased, and waste may be decreased, resulting in a more reliable global food supply.
iii. Building trust and boosting cross-cultural acceptance of varied food items may be achieved via harmonising food safety regulations and encouraging cultural exchanges in gastronomic tastes.

iv. There should be coordinated responses to crises, trade agreements, and information exchanges across nations may fortify international alliances and guarantee a stable and fair allocation of food resources worldwide.
v. By enabling small farmers in poor nations to adopt sustainable methods, education may help them get better market access and contribute to food security.
vi. Food production and availability should be greatly increased by promoting education on modern agricultural methods, resource management, and post-harvest technology.

Areas for Further Research

There's room for more research into how globalization affects food security, especially looking at the whole global value chain thing

i. Further investigation is required into how local food systems can actually work with those big global value chains this study's gotta help people control their food supply and make sure local farmers can sell their stuff worldwide. digging into how local and global systems work together can give us clues on boosting food security and helping out local businesses.
ii. Analyzing how globalization changes the food quality and if it fits with local tastes in different places future studies need to look into how big brands and local makers affect what we eat and what that means for our health.
iii. There is a need for in-depth research into how international trade deals and rules are actually helping everyone get fair access to food, especially for folks who are often left out digging into how we can tweak these frameworks to boost food security will give us some key info for the folks trying to fix food inequality issues (Shang et al.
iv. Future studies need to check how well international orgs' policies and programs are working to make sure food is available and accessible, and they should give advice on how to boost their part in making sure everyone has enough to eat.

Abstract
The convergence of digital transformation and sustainability imperatives presents unprecedented challenges for organizational culture and work attitudes. This study introduces the ADVANCE framework—a theoretically grounded model that integrates values-based innovation, digital agility, and just-transition principles to guide cultural re-engineering in what we term "smart economies." Through systematic literature review and theoretical synthesis, we bridge organizational behavior, digital transformation, and sustainability literatures to address the critical gap in understanding how organizations can simultaneously cultivate digital capabilities and sustainability commitments. The ADVANCE framework provides seven interconnected dimensions for cultural transformation: Adaptive Learning, Digital Inclusion, Values-driven Innovation, Agile Governance, Network Collaboration, Conscious Leadership, and Equitable Transition. Our contribution is threefold: theoretically, we provide an integrated perspective on cultural transformation in complex environments; practically, we offer actionable guidance for leaders navigating dual transformation challenges; and empirically, we establish foundations for future research on organizational culture in smart economies. The framework addresses the Academy's theme by operationalizing strategic initiatives for renewable hope through systematic cultural change processes.

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Keywords: *organizational culture, digital transformation, sustainability, cultural change, smart economies, just transition, values-based innovation, organizational behavior*

Introduction

Today's organizations operate within an increasingly complex and dynamic landscape mirrored by what some scholars describe as the "twin transition"—the simultaneous digital and green transformations reshaping global economies (Bican & Brem, 2020; European Commission, 2021). This convergence gives birth to the concept of "smart economies"—being economic systems that leverage digital technologies to achieve sustainable development goals while fostering inclusive growth and social equity (OECD, 2023; World Economic Forum, 2024).

However, while extensive research exists on digital transformation (Vial, 2019; Verhoef et al., 2021) and sustainability initiatives (Eccles et al., 2014; Whelan et al., 2021) as separate phenomena, limited scholarly attention has been devoted to understanding how organizations can successfully navigate both transformations simultaneously. This gap is particularly problematic given evidence that these transformations can create cultural tensions—for instance, between the rapid iteration demands of digital markets and the long-term stakeholder orientation required for sustainability (Kaya et al., 2022).

Organizational culture, defined as the shared values, beliefs, and basic assumptions that guide behavior within organizations (Schein & Schein, 2017), serves as both an enabler and barrier to transformation initiatives (Kotter & Heskett, 1992). Yet existing cultural change models are somewhat inadequate for addressing the complexity of dual transformation, leading to what we term "cultural fragmentation"—where digital and sustainability initiatives proceed independently, often creating internal conflicts and sub-optimal outcomes.

This study therefore addresses three critical research questions: First, what theoretical foundations support integrated cultural transformation in smart economies? Second, how can organizations systematically re-engineer their cultures to achieve both digital agility and sustainability commitment? Third, what practical frameworks can guide leaders through this complex cultural transformation process?

To address these questions, we develop the ADVANCE framework—a comprehensive model that synthesizes insights from organizational behavior, digital transformation, and sustainability literatures. Our theoretical contribution extends organizational culture theory by providing an integrated perspective on transformation in complex, multi-dimensional change environments. Practically, we offer leaders a systematic approach to cultural re-engineering that addresses both digital and sustainability imperatives simultaneously.

Literature Review and Theoretical Development

Organizational Culture in Transformation Contexts

Organizational culture research has evolved from early descriptive studies (Deal & Kennedy, 1982; Peters & Waterman, 1982) to sophisticated theoretical models that explain culture's role in performance and change (Denison et al., 2014; O'Reilly et al., 2014). Contemporary scholarship

emphasizes culture as a dynamic system capable of transformation through intentional intervention (Cameron & Quinn, 2011; Chatman et al., 2014).

The relationship between culture and organizational performance is well-established, with meta-analytic evidence showing that adaptive cultures—characterized by flexibility, external focus, and learning orientation—consistently outperform rigid, internally focused cultures (Hartnell et al., 2011; Sørensen, 2002). However, cultural transformation remains one of the most challenging aspects of organizational change, with reported failure rates exceeding 70% (Kotter, 2012; Beer & Nohria, 2000).

Recent research has identified several factors critical for successful cultural transformation: leadership commitment (Schein & Schein, 2017), employee engagement (Denison & Mishra, 1995), systematic change processes (Burke & Litwin, 1992), and alignment between cultural values and strategic objectives (O'Reilly & Chatman, 1996). These insights provide the foundation for understanding how culture change processes might be adapted for complex, multi-dimensional transformations.

Digital Transformation and Cultural Dynamics

Digital transformation research has increasingly recognized culture as a critical success factor, moving beyond early techno-centric approaches to embrace socio-technical perspectives (Bharadwaj et al., 2013; Sebastian et al., 2017). Digital transformation is now understood as "a process that aims to improve an entity by triggering significant changes to its properties through combinations of information, computing, communication, and connectivity technologies" (Vial, 2019, p. 118), with culture serving as both an enabler and outcome of this process.

Digital cultures exhibit several distinctive characteristics: experimentation and learning orientation (Brown & Eisenhardt, 1997), data-driven decision making (Brynjolfsson & McElheran, 2016), collaborative and networked organizational structures (Yoo et al., 2012), and customer-centricity (Westerman et al., 2014). Organizations with strong digital cultures demonstrate superior performance in innovation, agility, and customer satisfaction (Kane et al., 2019).

However, developing digital cultures presents significant challenges. Studies reveal that technical digital capabilities must be accompanied by cultural change for transformation success (Hartl & Hess, 2017). Organizations often struggle with what researchers term "digital culture clash"—conflicts between traditional hierarchical cultures and the collaborative, experimental mindsets required for digital success (Matt et al., 2015; Singh & Hess, 2017).

Sustainability and Organizational Culture

Sustainability research has increasingly focused on the cultural dimensions of environmental and social performance, moving beyond compliance-based approaches to examine values-driven sustainability initiatives (Bansal & Roth, 2000; Sharma, 2000). Sustainable organizational cultures are characterized by long-term orientation, stakeholder consideration, systems thinking, and values-based decision making (Bertels et al., 2010; Linnenluecke & Griffiths, 2010).

The concept of "just transition" has gained prominence in both policy and organizational contexts, emphasizing that transformation to sustainable economies must be fair and inclusive, ensuring that

no communities, workers, or regions are left behind (McCauley & Heffron, 2018; Stevis & Felli, 2015). Just transition principles include meaningful participation, social dialogue, respect for human rights, and targeted support for affected communities and workers (International Labour Organization, 2015).

Values-based innovation has emerged as a critical concept, referring to innovation processes that explicitly integrate societal values, environmental considerations, and ethical principles into product and service development (Bocken et al., 2014; Porter & Kramer, 2011). Research shows that organizations with strong values-based cultures are more likely to implement effective sustainability initiatives and achieve superior environmental and social outcomes (Sully de Luque et al., 2008; Post et al., 2011).

The Integration Challenge: Toward Smart Economies

Despite growing recognition of both digital and sustainability imperatives, limited research has examined how organizations can simultaneously develop digital capabilities and sustainability commitments. This gap is particularly significant given evidence that these transformations can create tensions and trade-offs (Kaya et al., 2022; Nylén & Holmström, 2015).

Some scholars have begun exploring synergies between digitalization and sustainability, noting that digital technologies can enable more efficient resource use, better stakeholder engagement, and enhanced transparency (Ghobakhloo et al., 2021; Del Río Castro et al., 2021). The concept of "smart economies" has emerged to describe economic systems that leverage digital technologies to achieve sustainable development while promoting inclusive growth (OECD, 2023).

However, realizing these synergies requires more than technological integration—it demands cultural transformation that can navigate the tensions between digital and sustainability imperatives while capitalizing on their potential complementarities. This represents a significant gap in current research and practice.

Theoretical Framework: The ADVANCE Model

Conceptual Foundations

Based on our literature review, we propose that successful cultural re-engineering for smart economies requires an integrated approach that simultaneously addresses digital and sustainability transformations while managing their inherent tensions. We term this approach "cultural re-engineering"—a systematic process of transforming organizational values, beliefs, and behaviors to enable thriving in smart economy contexts.

Cultural re-engineering differs from traditional change management in several key ways: it focuses on deep, structural transformation rather than incremental adjustment; it addresses multiple, potentially conflicting transformation imperatives simultaneously; and it explicitly recognizes and manages tensions between different transformation goals.

The ADVANCE Framework

The ADVANCE framework is a seven-dimensional model for cultural re-engineering that integrates insights from digital transformation, sustainability, and organizational culture literatures. ADVANCE represents:

A - Adaptive Learning Orientation Developing organizational capacity for continuous learning, experimentation, and rapid iteration while maintaining long-term commitment to sustainability goals.
D - Digital Inclusion and Equity Ensuring that digital transformation enhances rather than undermines social equity, with particular attention to inclusive access and skills development.
V - Values-Driven Innovation Culture Embedding sustainability values and ethical considerations into innovation processes while leveraging digital technologies to scale positive impact.
A - Agile Governance Systems Creating governance structures that enable rapid decision-making and adaptation while ensuring accountability to multiple stakeholders.
N - Network Collaboration Capabilities Building internal and external collaborative networks that support both digital innovation and sustainability initiatives.
C - Conscious Leadership Development Cultivating leadership capabilities that can navigate complexity, manage tensions, and inspire commitment to both digital and sustainability goals.
E - Equitable Transition Management Implementing just transition principles to ensure that transformation benefits all stakeholders, particularly those most vulnerable to change.

Framework Integration and Dynamics
The ADVANCE dimensions are designed to work synergistically, with each dimension reinforcing and enabling others. For example, Adaptive Learning Orientation supports Values-Driven Innovation by creating space for experimentation with sustainable solutions, while Conscious Leadership Development enables effective Equitable Transition Management through values-based decision making.

The framework recognizes three types of relationships among dimensions:
Reinforcing Relationships: Where progress in one dimension directly supports progress in another (e.g., Digital Inclusion supporting Network Collaboration).
Balancing Relationships: Where dimensions create productive tensions that must be actively managed (e.g., Agile Governance versus Equitable Transition, which may require different time horizons).
Enabling Relationships: Where certain dimensions provide necessary foundations for others (e.g., Conscious Leadership enabling all other dimensions).

Strategic Implementation: From Framework to Practice
Adaptive Learning Orientation
Organizations must cultivate what Senge (1990) calls "learning organization" capabilities while adapting them for smart economy contexts. This involves creating systems and processes that enable rapid experimentation with digital technologies while maintaining commitment to sustainability goals.

Key Strategies:
- **Ambidextrous Learning Systems:** Developing capabilities for both explorative learning (discovering new digital and sustainable solutions) and exploitative learning (refining existing practices) (March, 1991; O'Reilly & Tushman, 2013).

- **Sustainability-Digital Learning Loops:** Creating feedback mechanisms that capture lessons from both digital implementation and sustainability outcomes, enabling continuous improvement in integrated approaches.
- **Future-Back Planning:** Using scenario planning and backcasting techniques to envision sustainable futures and identify learning priorities for getting there (Robinson, 1990).

Implementation Mechanisms:
- Cross-functional innovation labs that combine digital and sustainability expertise
- Regular "learning harvests" that capture insights from integrated initiatives
- Mentoring programs that pair digital natives with sustainability experts

Digital Inclusion and Equity

Digital transformation initiatives must explicitly address equity concerns, ensuring that technology enhances rather than undermines social inclusion. This aligns with just transition principles while building organizational capacity for digital innovation.

Key Strategies:
- **Inclusive Design Processes:** Incorporating diverse perspectives into digital product and service development, with particular attention to underrepresented groups (Costanza-Chock, 2020).
- **Digital Skills Democracy:** Providing comprehensive digital literacy training for all employees, with targeted support for those facing barriers to digital participation.
- **Technology Justice Framework:** Evaluating digital initiatives through the lens of their impact on equity and social justice (Noble, 2018).

Implementation Mechanisms:
- Diversity and inclusion requirements for digital project teams
- Regular digital equity audits of technology initiatives
- Community partnerships to extend digital inclusion beyond organizational boundaries

Values-Driven Innovation Culture

Innovation processes must integrate sustainability values and ethical considerations from inception rather than treating them as constraints or afterthoughts. This requires embedding what Porter and Kramer (2011) call "shared value" thinking into organizational innovation systems.

Key Strategies:
- **Purpose-Driven Innovation:** Aligning innovation efforts with organizational purpose and sustainability goals, using techniques like "innovation for good" frameworks (Murray et al., 2010).
- **Stakeholder Co-Creation:** Involving diverse stakeholders in innovation processes to ensure solutions address real sustainability challenges while leveraging digital capabilities.
- **Circular Innovation Principles:** Applying circular economy principles to digital innovation, focusing on regenerative and restorative solutions rather than extractive approaches.

Implementation Mechanisms:
- Innovation challenges focused on sustainability-digital convergence
- Stakeholder advisory panels for major innovation initiatives
- Impact measurement systems that track both digital and sustainability outcomes

Agile Governance Systems
Traditional governance structures often inhibit both digital agility and sustainability integration. Organizations need governance systems that enable rapid adaptation while ensuring accountability to multiple stakeholders.

Key Strategies:
- **Dual-Speed Governance:** Creating governance processes that can operate at different speeds—fast for digital iterations, slower for sustainability commitments—while maintaining integration (Gartner, 2014).
- **Stakeholder Governance Models:** Implementing governance structures that formally include diverse stakeholder perspectives in decision-making processes (Freeman et al., 2010).
- **Adaptive Risk Management:** Developing risk management approaches that can handle both the rapid changes of digital transformation and the long-term uncertainties of sustainability challenges.

Implementation Mechanisms:
- Mixed governance committees with both digital and sustainability expertise
- Regular governance process reviews and adaptations
- Stakeholder feedback loops integrated into governance cycles

Network Collaboration Capabilities
Success in smart economies requires extensive collaboration both within organizations and with external partners. This involves building what Gulati et al. (2012) call "network capabilities"—the ability to initiate, develop, and manage collaborative relationships.

Key Strategies:
- **Ecosystem Orchestration:** Developing capabilities to coordinate multi-partner initiatives that combine digital and sustainability goals (Jacobides et al., 2018).
- **Open Innovation Platforms:** Creating digital platforms that enable collaboration with diverse external partners on sustainability challenges (Chesbrough, 2020).
- **Community Engagement Systems:** Building systematic approaches to engaging with local communities and stakeholders affected by digital and sustainability transformations.

Implementation Mechanisms:
- Partnership development teams with dual digital-sustainability mandates
- Digital collaboration platforms designed for sustainability applications
- Community liaison roles embedded in transformation initiatives

Conscious Leadership Development
Leaders in smart economies must navigate unprecedented complexity, managing tensions between digital speed and sustainability depth while inspiring organizational commitment to both. This requires what we term "conscious leadership"—leadership that integrates technical competence with values-based decision making and systems thinking.

Key Strategies:

- **Integral Leadership Development:** Using developmental approaches that integrate cognitive, emotional, somatic, and spiritual dimensions of leadership (Wilber, 2000; Palmer, 2000).
- **Paradox Navigation Skills:** Building leadership capabilities for managing the tensions and paradoxes inherent in dual transformation initiatives (Smith & Lewis, 2011).
- **Stakeholder Leadership:** Developing skills for leading multi-stakeholder initiatives where formal authority is limited but influence is essential (Crosby & Bryson, 2010).

Implementation Mechanisms:

- Leadership development programs focused on sustainability-digital integration
- Action learning projects that require leaders to navigate real paradoxes
- 360-degree feedback systems that include stakeholder perspectives

Equitable Transition Management

All transformation initiatives must be evaluated and managed through the lens of their impact on equity and justice, ensuring that no stakeholders are harmed by changes and that benefits are widely shared.

Key Strategies:

- **Just Transition Frameworks:** Applying international just transition principles to organizational change processes, with particular attention to affected workers and communities (International Labour Organization, 2015).
- **Participatory Change Management:** Using participatory approaches that give affected stakeholders voice and agency in transformation processes (Arnstein, 1969).
- **Regenerative Approaches:** Moving beyond "do no harm" to actively improving conditions for vulnerable stakeholders through transformation initiatives.

Implementation Mechanisms:

- Stakeholder impact assessments for major transformation initiatives
- Worker retraining programs that combine digital and sustainability skills
- Community benefit agreements for major organizational changes

Theoretical Contributions and Implications

Contributions to Organizational Culture Theory

The ADVANCE framework makes several important contributions to organizational culture theory:

Integration of Multiple Transformation Perspectives: Previous research has treated digital transformation and sustainability as separate phenomena requiring different cultural responses. Our framework provides an integrated perspective that recognizes both synergies and tensions between these transformations.

Dynamic Culture Change Model: Unlike static culture models that focus on end states, ADVANCE emphasizes the dynamic processes through which cultures evolve in response to complex, multi-dimensional change pressures.

Stakeholder-Inclusive Culture Theory: Our framework extends culture theory beyond internal organizational focus to explicitly incorporate external stakeholder perspectives and impacts, reflecting the interconnected nature of smart economies.
Paradox-Aware Culture Framework: ADVANCE explicitly addresses the paradoxes and tensions inherent in dual transformation, providing a foundation for future research on how cultures can manage competing demands.

Contributions to Digital Transformation Research
Our research advances digital transformation literature by:
Values Integration: Moving beyond techno-centric approaches to explicitly integrate values and sustainability considerations into digital transformation models.
Equity Focus: Addressing the often-overlooked equity implications of digital transformation, providing frameworks for inclusive digital change.
Cultural Depth: Providing a more sophisticated understanding of the cultural changes required for successful digital transformation in complex stakeholder environments.

Contributions to Sustainability Research
The framework contributes to sustainability literature through:
Digital-Sustainability Synergies: Systematically exploring how digital technologies can enable rather than undermine sustainability goals when properly integrated culturally.
Just Transition Operationalization: Translating just transition principles into practical organizational change management approaches.
Cultural Mechanisms: Identifying specific cultural mechanisms through which sustainability values can be embedded in organizational practices and decision-making.

Research Implications and Future Directions
Empirical Validation Needs
The ADVANCE framework requires extensive empirical validation through multiple research approaches:
Longitudinal Case Studies: In-depth, multi-year studies of organizations implementing integrated digital-sustainability transformations to understand how cultural change unfolds over time.
Cross-Sectoral Comparative Studies: Examining how the framework applies across different industries and organizational contexts to identify boundary conditions and contextual variations.
Quantitative Validation: Developing measurement instruments for ADVANCE dimensions and testing relationships among dimensions and between dimensions and organizational outcomes.

Mechanism Research
Future research should investigate the specific mechanisms through which cultural re-engineering occurs:
Change Process Research: Detailed studies of how organizations implement ADVANCE dimensions, identifying effective practices and common pitfalls.
Leadership Research: Investigating how conscious leadership develops and operates in smart economy contexts, with particular attention to paradox navigation skills.
Network Dynamics: Examining how network collaboration capabilities develop and contribute to both digital and sustainability outcomes.

Contextual Research

The framework requires adaptation for different contexts:

Cultural Context Research: Investigating how national and regional cultures influence the implementation and effectiveness of ADVANCE dimensions.

Organizational Size and Type: Examining how framework implementation varies across different organizational sizes, structures, and sectors.

Developmental Context: Exploring how the framework applies in developing versus developed economy contexts, with particular attention to different resource constraints and priorities.

Impact Research

Long-term research is needed to understand the outcomes of cultural re-engineering:

Performance Implications: Systematic investigation of how ADVANCE implementation affects various organizational performance measures over time.

Stakeholder Impact Studies: Research on how cultural re-engineering affects different stakeholder groups, with particular attention to equity and justice outcomes.

Societal Impact Research: Studies of how widespread adoption of ADVANCE principles might contribute to broader societal transition to smart economies.

Practical Implications for Management

Strategic Planning Integration

Organizations should integrate ADVANCE dimensions into strategic planning processes rather than treating digital and sustainability transformations as separate initiatives. This requires:

- **Integrated Vision Development:** Creating organizational visions that explicitly connect digital capabilities with sustainability goals and social impact.
- **Cross-Functional Planning Teams:** Establishing planning processes that bring together digital, sustainability, and cultural change expertise.
- **Balanced Scorecard Integration:** Developing performance measurement systems that track progress across all ADVANCE dimensions simultaneously.

Leadership Development Priorities

Organizations must invest in developing conscious leadership capabilities that can navigate the complexities of smart economy environments:

- **Paradox Management Training:** Providing leaders with tools and frameworks for managing tensions between digital speed and sustainability depth.
- **Stakeholder Engagement Skills:** Developing capabilities for leading multi-stakeholder initiatives and managing diverse, sometimes conflicting interests.
- **Systems Thinking Development:** Building abilities to see connections and patterns across organizational and ecosystem levels.

Organizational Design Implications

Smart economy success requires organizational designs that support integrated transformation:

- **Boundary-Spanning Roles:** Creating positions that explicitly connect digital and sustainability initiatives and manage their integration.
- **Flexible Structures:** Developing organizational structures that can adapt to different transformation speeds while maintaining coherence and accountability.

- **Cultural Integration Mechanisms:** Implementing systems and processes that actively foster integration across traditional functional and disciplinary boundaries.

Limitations and Boundary Conditions

Framework Limitations

The ADVANCE framework has several important limitations that must be acknowledged:

Complexity Management: The framework's comprehensive nature may overwhelm organizations with limited change management capabilities, requiring careful sequencing and prioritization.

Resource Requirements: Full implementation of ADVANCE requires significant investments in time, attention, and resources that may not be available to all organizations.

Cultural Context Sensitivity: The framework was developed primarily from Western organizational research and may require significant adaptation for different cultural contexts.

Temporal Assumptions: ADVANCE assumes organizations have sufficient time and stability to implement comprehensive cultural change, which may not apply in crisis or highly turbulent contexts.

Boundary Conditions

The framework's applicability is subject to several boundary conditions:

Organizational Readiness: ADVANCE is most applicable to organizations with some existing capacity for change management and stakeholder engagement.

Leadership Commitment: The framework requires sustained leadership commitment to both digital and sustainability goals, which may not exist in all contexts.

Stakeholder Environment: Implementation depends on stakeholder environments that support integrated approaches rather than requiring trade-offs between digital and sustainability goals.

Regulatory Context: The framework works best in regulatory environments that encourage rather than penalize integrated approaches to digital and sustainability transformation.

Conclusion

The transition to smart economies represents one of the most significant organizational challenges of our time, requiring simultaneous transformation across digital and sustainability dimensions while maintaining social equity and inclusion. Traditional approaches to organizational change are inadequate for this complex, multi-dimensional challenge.

The ADVANCE framework provides a comprehensive, theoretically grounded approach to cultural re-engineering that can guide organizations through this transition. By integrating insights from organizational culture, digital transformation, and sustainability research, ADVANCE offers both theoretical contributions to our understanding of complex organizational change and practical guidance for leaders navigating unprecedented challenges.

Our research demonstrates that successful cultural re-engineering requires attention to seven key dimensions: Adaptive Learning Orientation, Digital Inclusion and Equity, Values-Driven Innovation Culture, Agile Governance Systems, Network Collaboration Capabilities, Conscious Leadership Development, and Equitable Transition Management. These dimensions work synergistically to enable organizations to thrive in smart economy contexts while contributing to broader societal goals of sustainability and inclusion.

The framework's implementation requires significant commitment and resources but offers the potential for transformative organizational and societal impact. As global challenges of climate change, inequality, and technological disruption intensify, organizations that successfully re-engineer their cultures for smart economy success will be better positioned not only to survive but to contribute to positive societal transformation.

Future research should focus on empirical validation of the framework, investigation of specific change mechanisms, adaptation for different contexts, and measurement of long-term impacts. The stakes are high—the success of the global transition to sustainable, inclusive, and digitally-enabled economies depends partly on our ability to transform organizational cultures at scale.

The journey toward smart economies is complex and challenging, but the ADVANCE framework provides a roadmap for organizations ready to embrace their role as architects of a more sustainable, equitable, and digitally-enabled future. The transition to renewable hope requires nothing less than the fundamental re-engineering of how we organize work, make decisions, and create value in our interconnected world.

Catalyzing Inclusive Green Growth: Leveraging Digital Innovation to Scale Sustainable SMEs in Emerging Entrepreneurial Ecosystems

Usman Yahaya, PhD
yahayausman5@gmail.com
Department of Business Administration, Kaduna State University

Abstract
In the face of mounting environmental challenges and persistent socio-economic disparities, emerging economies are under increasing pressure to pursue development pathways that are both inclusive and sustainable. Small and medium enterprises (SMEs), which account for the majority of businesses and employment in these regions, are uniquely positioned to drive this transformation. However, their potential remains largely untapped due to structural constraints, limited access to finance, and weak integration into digital ecosystems. This paper explores how digital innovation can serve as a catalyst for inclusive green growth by enabling the scaling of sustainable SMEs within emerging entrepreneurial ecosystems. Through a conceptual methodology, the paper synthesizes existing literature and theoretical frameworks to propose a model for digitally-enabled green SME growth. It argues that digital technologies when strategically deployed can unlock new pathways for environmental sustainability, economic inclusion, and entrepreneurial resilience.

Keywords: *Inclusive Green Growth, Digital Innovation Sustainable SMEs, Entrepreneurial Ecosystem*

Introduction

The global development discourse has increasingly shifted toward models that prioritize sustainability and inclusivity (Mehrajunnisa et al., 2023). For emerging economies, this shift is not merely aspirational it is essential. These regions face a dual imperative, to accelerate economic development while mitigating environmental degradation and ensuring social equity (Ahmad et al., 2024). SMEs play a critical role in this equation. Representing over 90% of businesses worldwide and contributing significantly to employment and GDP, SMEs are the backbone of most economies (Rafiki et al., 2023). Yet, in many developing contexts, they struggle to grow sustainably due to limited resources, inadequate infrastructure, and policy environments that do not support innovation or environmental stewardship.

Digital innovation presents a transformative opportunity to reimagine SME growth through the lens of inclusive green development (Hund et al., 2021). Technologies such as mobile platforms, artificial intelligence (AI), blockchain, and the Internet of Things (IoT) are reshaping how businesses operate, interact with markets, and manage resources (Nambisan et al., 2017). When applied to the SME sector, these tools can facilitate access to clean technologies, expand market reach, and improve operational efficiency all while promoting environmental sustainability and

social inclusion. This paper investigates the potential of digital innovation to catalyze inclusive green growth by scaling sustainable SMEs within emerging entrepreneurial ecosystems.

Conceptual Framework

Inclusive Green Growth (IGG) is the central outcome this paper seeks to explain. It refers to a development paradigm that simultaneously advances environmental sustainability, economic equity, and social inclusion. In emerging economies, achieving IGG requires deliberate interventions that address structural barriers and unlock new growth pathways (Opland et al., 2022). This paper conceptualizes IGG as the dependent variable, shaped by three interrelated independent variables:

Digital Innovation

Digital technologies such as mobile platforms, artificial intelligence, blockchain, and IoT serve as transformative tools that enable SMEs to operate more efficiently, reduce environmental footprints, and access underserved markets (Nylén & Holmström, 2015). These innovations are not just technical upgrades; they are strategic enablers of inclusive and sustainable business models.

Sustainable SME Scaling

SMEs are the backbone of emerging economies, but their growth is often constrained by limited access to finance, markets, and infrastructure (Ismail, 2022). Scaling sustainable SMEs involves embedding ESG principles into their operations and leveraging digital platforms to expand reach, improve resource efficiency, and foster resilience. This scaling process is essential for translating innovation into widespread green impact.

Entrepreneurial Ecosystem Enablers

Ecosystems comprising policy frameworks, institutional support, and community networks play a critical role in shaping the conditions under which SMEs innovate and grow (Prasanna et al., 2019). Inclusive digital policies, green incentives, incubators, and capacity-building programs are ecosystem components that mediate the relationship between innovation and IGG outcomes.

The framework posits that digital innovation, when supported by robust ecosystem enablers, facilitates the scaling of sustainable SMEs, which in turn drives inclusive green growth. The relationship is dynamic and iterative, with feedback loops that reinforce sustainability and inclusion.

The theoretical foundation of this paper is built on three pillars. First, Schumpeterian innovation theory which highlights the role of innovation in driving economic transformation and creative destruction. Second, the triple bottom line (TBL) framework which advocates for a balanced approach to business that considers profit, people, and planet. Third, digital ecosystem theory which views digital platforms as enablers of decentralized, scalable innovation, fostering collaboration and resource sharing among diverse actors. Together, these frameworks provide a robust lens through which to examine the potential of digital innovation to scale sustainable SMEs and foster inclusive green growth.

Methodology

This study employs a conceptual methodology, which is particularly suited for exploring complex, interdisciplinary phenomena. Rather than relying on empirical data collection, the paper synthesizes existing academic and policy literature to develop a theoretical model. This approach involves three key steps: literature synthesis, framework development, and propositional analysis. By reviewing a wide range of sources on IGG, digital innovation, and SME development, the paper identifies common themes, gaps, and opportunities. It then constructs a conceptual framework that links digital innovation to SME sustainability and ecosystem dynamics. Finally, it generates testable propositions that can guide future empirical research and policy experimentation.

Analysis and Discussion

To understand how these independent variables function as solutions to the IGG challenge, we must examine their mechanisms of influence.

Digital Innovation as a Driver of IGG

Digital technologies enable SMEs to adopt cleaner production methods, optimize resource use, and reduce waste. For instance, IoT sensors can monitor energy consumption in real time, allowing businesses to identify inefficiencies and implement corrective measures (Nambisan et al., 2017). AI-powered analytics help SMEs forecast demand, reduce overproduction, and minimize environmental impact. Moreover, digital platforms democratize access to markets, allowing green products and services to reach low-income and remote populations thus enhancing inclusion.

Scaling Sustainable SMEs for Green Impact

The transition from small-scale sustainability to scalable impact requires SMEs to integrate ESG metrics into their core strategies. Digital platforms facilitate this by offering tools for supply chain transparency, carbon tracking, and stakeholder engagement. SMEs that scale through digital means can achieve economies of scope and scale while maintaining environmental integrity (Prasanna et al., 2019). For example, a solar energy SME using mobile payment systems can expand its customer base in off-grid communities, contributing to both environmental and social goals.

Ecosystem Enablers as Catalysts

No innovation thrives in isolation. Entrepreneurial ecosystems provide the scaffolding for sustainable SME growth (Kautonen et al., 2020). Governments must enact policies that incentivize green innovation—such as tax breaks for clean tech adoption or subsidies for digital infrastructure. Institutions like universities and incubators can offer technical training, mentorship, and research support. Community engagement ensures that growth is inclusive, with marginalized groups participating in and benefiting from the green economy.

Together, these variables form a synergistic model: digital innovation enables sustainable practices; ecosystem support ensures scalability and resilience; and SMEs become vehicles for inclusive green transformation.

Conclusion

Inclusive Green Growth (IGG) represents a transformative development paradigm that is urgently needed in emerging economies where environmental degradation, economic inequality, and entrepreneurial exclusion often coexist. This paper has argued that IGG should not be treated as a

distant aspiration but as a measurable outcome that can be actively shaped through strategic interventions. By positioning IGG as the dependent variable, the paper has demonstrated how digital innovation, sustainable SME scaling, and entrepreneurial ecosystem enablers function as interdependent solutions to this challenge.

Digital innovation offers more than technological efficiency, it enables SMEs to adopt environmentally responsible practices, reach underserved markets, and participate in inclusive value chains. When these innovations are embedded within supportive ecosystems characterized by enabling policies, institutional infrastructure, and community engagement, they create fertile ground for sustainable SMEs to scale. These SMEs, in turn, become vehicles for inclusive green transformation, generating employment, reducing ecological footprints, and fostering social equity.

The conceptual framework and analysis presented here underscore the importance of viewing IGG as a dynamic outcome shaped by deliberate design. It is not the byproduct of isolated innovation, but the result of coordinated efforts across technology, policy, and entrepreneurship. For policymakers, practitioners, and researchers, the implication is clear: to catalyze IGG, we must invest in digital tools, empower sustainable SMEs, and build ecosystems that are inclusive by design and green by necessity.

Implications

The findings underscore the need for integrated policy frameworks that link digital transformation with sustainability goals. Governments should invest in digital infrastructure, promote ESG compliance among SMEs, and design inclusive policies that target underserved entrepreneurs. Regulatory environments must evolve to support platform-based business models and green financing mechanisms.

Entrepreneurs must view digital tools not just as operational upgrades but as strategic assets for sustainability. Embedding ESG metrics into digital platforms can enhance transparency, attract impact investors, and build consumer trust. Collaboration across sectors—tech, finance, agriculture, energy can unlock new value chains and amplify green impact.

Future research should empirically test the relationships proposed in this framework, using longitudinal data and cross-country comparisons. Ecosystem builders, incubators, accelerators, NGOs should design programs that integrate digital literacy, ESG training, and market access. The goal is to create ecosystems where innovation, inclusion, and sustainability are mutually reinforcing.

Propositions for Future Research

1. Digital innovation positively influences the environmental and social performance of SMEs in emerging economies, thereby contributing to inclusive green growth.
   This proposition invites empirical studies to examine how specific digital tools such as IoT, AI, and mobile platforms enable SMEs to reduce carbon footprints, improve resource efficiency, and expand access to underserved markets.
2. The scalability of sustainable SMEs mediates the relationship between digital innovation and inclusive green growth outcomes.

This suggests that digital innovation alone is not sufficient; its impact on IGG is amplified when SMEs are able to scale their operations sustainably. Researchers could explore how platformization, ESG integration, and digital supply chains affect this mediating role.

3. Entrepreneurial ecosystem enablers moderate the effectiveness of digital innovation in driving inclusive green growth.
   This proposition emphasizes the role of policy, institutional support, and community engagement in shaping the success of digital interventions. Comparative studies across regions with varying ecosystem maturity could validate this moderating effect.
4. Inclusive digital policies enhance the adoption of green technologies among SMEs, leading to more equitable and sustainable growth.
   This opens a pathway for policy-focused research, examining how regulatory frameworks, subsidies, and digital literacy programs influence SME behavior and IGG outcomes.
5. The integration of ESG metrics into digital platforms improves SME transparency and stakeholder trust, accelerating inclusive green growth.
   This proposition could be tested by analyzing how ESG reporting tools embedded in digital systems affect investor confidence, consumer loyalty, and environmental accountability.

Influence of Organizational Innovativeness on Performance of Selected SMES in Kwara State

Isaac Iortimbir AUN Ph.D.
Department of Business Administration,
University of Ilorin, Ilorin, Nigeria
Email: aun.ii@unilorin.edu.ng

Abstract
Organizational innovativeness is a key driver of market share growth and product quality *for small and medium enterprises (SMEs) in Nigeria and around the world. However, SME owners/managers in Nigeria are unable to enter new markets and open ways for their products, as a result of lack of technological innovation to implement changes in their product design and process improvement to address customer needs and enhance market share and* product quality**.** *Hence, the study examined the influence of product innovation on market share of SMEs and also assess the effect of process innovation on* product quality improvement of SMEs *within Kwara State, Nigeria. This study adopted a cross-sectional survey research design. The population of the study comprised 25,356 owners/managers of SMEs in Kwara State, using Krejcie and Moran (1970) formula, a sample size of 392 was obtained. Out of the sample size obtained, the study purposively selected 169 SMEs that are into manufacturing. Data were collected using structured questionnaire. Ordinary Least Square (OLS) method of regression was employed to put the hypotheses to test. The results revealed that product innovation has positive and significant influence on market share; t-value of 3.432, p<0.05 with product development (B = 4.262, p = 0.000)) and product improvement (B = 3.416, p = 0.000) as key predictors. However, process innovation also has significant effect on* product quality improvement*; t-value of 3.429, p<0.05 with cycle time (B = 5.431, p = 0.000 and resource utilization (B= 7.471, p = 0.000)) which are strong predictors. The study concluded that organizational innovativeness significantly influence performance of SMEs in Kwara State, Nigeria. The study recommended that SMEs in Kwara State should develop new products, improve design of existing ones with the use of new materials to experience significant improvement on its market share. Also, enterprises in Kwara State should always ensure a resource efficient processes, manage cycle time of starting and completing production and cost reduction systems to positively improve on their* product quality improvement.

Keywords: *Organizational innovativeness, Performance of SMEs, Technological innovation, Product innovation on market share, Product quality*

Introduction

Small and Medium Enterprises (SMEs) appear to be the simplest, oldest and commonest form of businesses globally and are seen to widely bridge the gap of unemployment, creating wealth for business-oriented individuals and improve the survival level of developed and developing economies. SMEs around the world are said to make up of about 90% of businesses and more than 50% of employment opportunity to the growing world population (Kanire, Msuya, & Alphonce, 2024; Mang'ama, Ndyetabula, & Hokororo, 2023; World Bank, 2022).

Governments are involved in encouraging new generations of business-minded individuals to be job providers so as to help in solving social challenges like unemployment, poverty, dependency rates and so on across the globe, most especially in developing economies by facilitating the use of untapped ideas, resources and knowledge. It is therefore, plausible that developing economies like Nigeria is focusing on Small and Medium Enterprises' (SMEs) growth. Opeyemi (2024), confirmed the growth of SMEs in both the United States of America and China. For instance in America, SMEs account for 90.7% of U.S firms, 82% of companies exporting goods and 48.5% of private sector employment. However, China with the available evidence shows that the growth of Small and Medium Enterprises (SMEs) between 1998 and 2013 has increased the rate of employment opportunity to about 19 million state owned firm's laid-off workforce. SMEs become a major driver of job creation and employment by generating 82% of employment, contribute 40% share of exports that shows growth potentials for Chinese SMEs in world market (Histrich, 2020).

In Africa, the significance of SMEs is quite prevalent in that they play a domineering role in poverty reduction, GDP growth and employment generation (Ezekiel et al, 2024). African SMEs make up to about 95% of businesses, generate up to 80% of employment, and contribute about 40% to national GDP. In this instance, innovation emerges as a key determinant of SME competitiveness and sustainability.

Specifically in Nigeria, experience is different, unemployment is one of the major challenges facing the economy just as it is in other emerging economies. Though, Nigeria's experience could be attributable to the oil boom of the 1970s that made the economy to become mono-product. The oil price fluctuation in the world market and high debt profile together with high rate of non-sustainable entrepreneurship affect Nigeria as a nation (Okeke, Nwosu & Ezeamolue, 2021). In spite of that, current statistics shows that SMEs contribute up to 48% to Gross Domestic Product (GDP) which implies that about 17.4 million enterprises account for approximately 50% of industrial jobs and nearly 85% of activities in the manufacturing sector (Nigerian Bureau of Statistics, 2021).

SMEs that have successfully integrated products and process innovations (which are indices of organizational innovativeness in this study) tend to experience remarkable boosts in productivity and profitability (Kawira, 2021). On average, SMEs seem to be the backbone of many economies around the world, particularly in developing countries like ours. In most communities, SMEs provide not only jobs but also innovation and the production of essential goods and services.

SME and entrepreneurship differ from each other in that entrepreneurship is a process that leads to the creation of SMEs, meanwhile SMEs are simply business ventures arising from entrepreneurial pursuits of entrepreneurs and is managed by individuals or owner-managers (Esuuh, 2019). The extent to which entrepreneurs and managers are able to display their innate potentials, ingenuity, and dynamism goes a long way to determine wealth creation possibilities in an economy which shows the competitiveness of their firms. Through entrepreneurial innovations, business opportunities are discovered and necessary resources are deployed towards converting the ideas generated into viable products/services. SMEs and entrepreneurial development have been widely acclaimed as the tools for achieving economic growth and development in view of the contributions of SMEs to employment generation and Gross Domestic Products (GDP) and

have consequently attracted the focus of nations in a bid to enhance national development (Dalberg, 2021).

Statement of the Problem

In spite of the fact that SMEs are striving to ensure strong innovative technology solutions to outperform competitors, high cost of securing these new and improved technological solutions deter this goal, and failing to come-up with innovative new products as a consequence of rising costs of acquiring/adopting the requisite technological equipment to measure up with stiff competition in the market will likely have severe implications on their individual market share (Kawira, 2021). When SMEs neglect the implementation of process innovation, reduced growth and frustration of overall competitive efforts may result (Saheed, Abdulhameed, & Adebisi, 2021).

Several studies like Olawore et al, (2024) investigated entrepreneurial innovation and market share of small and medium enterprises in Lagos State, Nigeria, Ezekiel, (2024) examined these relationships on the topic effect of product innovation practices on performance of SMEs in manufacturing SMEs in Tanzania, Ekeh, (2023) assessed effect of product innovation on growth of medium enterprises in Nigeria, Ashraf and Asharul, (2023) assessed technology adoption as survival strategy for small and medium enterprises during COVID-19 pandemic. However, On the basis of the available literature and judging from the studies mentioned above, organizational innovativeness in the context of Kwara State has not been explored holistically.

However, in Kwara State, especially with metrics like product innovation, and process innovation, SMEs' performance have not been categorically viewed from organizational innovation perspective. Hence, the existence of a spatial gap where this study will be conducted from the perspective of innovativeness and performance of SMEs in Kwara State.

Research Questions

The following questions were raised for the study:

i. To what extent does product innovation influence market share of Small and Medium Enterprises in Kwara State?
ii. How does process innovation affect product quality improvement of Small and Medium Enterprises in Kwara State?

Research Objectives

The main objective of this study is to examine the influence of organizational innovativeness on performance of selected SMEs in Kwara State. The specific objectives are to;

i. determine the influence of product innovation on market share of Small and Medium Enterprises in Kwara State; and
ii. assess the effect of process innovation on product quality improvement of Small and Medium Enterprises in Kwara State;

Research Hypotheses

The following hypotheses were formulated for the study:

H_{01}; Product/service innovation does not significantly influence market share of Small and Medium Enterprises in Kwara State.

H_{02}; Process innovation has no significant effect on product quality improvement of Small and Medium Enterprises in Kwara State.

Literature Review

Organizational Innovativeness

Organizational Innovativeness is described as an organization's ability and willingness to come-up with novel ideas, processes, products or services and implement them effectively and efficiently. It shows how organizations are able to adapt to changes, embraces creativity and remain competitive in a highly volatile environment. Innovation on the other hand, refers to the process of introducing novel ideas, products, services, concepts or practices that create meaningful values, address challenges and improve upon existing solutions (Kuckertz, 2021). In entrepreneurship, innovation is sacrosanct to facilitating growth while considering social, and economic dynamics. By integrating improved technologies and innovative practices, SMEs can optimize resources, improve efficiency, and enhance market competitiveness (Lundmark, Nelson, & Säfsten, 2021).

For SMEs, adopting new and innovative solutions is a key mover of competitiveness. Innovation advance a pivotal role in the success of entrepreneurship practice, especially for SMEs trying to compete in an increasingly unstable marketplace. By leveraging cutting-edge technologies and embracing innovative business models, SMEs can reduce costs, improve operational efficiency, attract new customers, and increase competitiveness (Chege, Wang & Suntu, 2020).

In this study, organizational innovativeness is seen as reflecting those activities SMEs put in place to introduce new technologies that are sustainability oriented (adopting energy efficient processes or eco-friendly production technologies). The successful deployment of innovative technologies enables SMEs to improve product quality, and differentiate themselves in the market, resulting in increased performance.

Metrics of organizational innovativeness according to Olawore, (2024) are:

i. Product Innovation
ii. Process Innovation
iii. Marketing Innovation

But for the purpose of this study, product innovation and process innovation are adopted.

Product Innovation

Product innovation refers to the development and introduction of new or significantly improved products or services. It involves creating entirely new offerings, improving existing ones, or finding innovative ways to deliver services. Innovation can be driven by technological advancements, shifts in customer needs, or new competitive pressures, and it plays a central role in determining the competitive advantage of SMEs (Ekeh, 2023). Product innovation directly impacts market share because it allows SMEs to differentiate themselves in the marketplace, attract new customers, and create a competitive edge.

In the context of Innovativeness and SME Performance, product innovation can serve as a key index influencing various outcomes of performance, including market share which is a critical dependent index. This relationship is particularly relevant for Small and Medium Enterprises

(SMEs) that are out to improve their position in competitive markets. Here, the study explores how product innovation impacts market share and the influence of innovative technology in this process (Ezekiel, 2024).

Ekeh, (2023) asserted that product innovation entails diverse organizational strategies as well as unique inputs which results in novel outputs. Also, that study referred to product innovation as the introduction of new products or services in order to create new market or customers. That is, any product or service that is seen by an individual or firm as novel or unique in the market.

The above descriptions of product innovation by Ezekiel, (2024) and Ekeh, (2023) seem to complement each other but Ekeh, (2023) did not relate the assertion to its effect on market share compared to the submission of Ezekiel, (2024) on the subject matter. However, the dominant factor that seems to connect the two stand points is that they both described product innovation in clear terms.

This study is more in alignment with the submissions of Ezekiel, (2024) in the description of product innovation and the manner in which it connected it with dependent index (market share) and SME in general.

Product innovation remains a vital component of organizational innovativeness, among its key indicators are;

i. **Product Development:** development of new product becomes sacrosanct soon after the existing product has lost its popularity and can no longer generate enough sales revenue and profit to take care of its cost of production. Kawira, (2021) asserted that product development comprises of the whole process of bringing a product from initial concept to commercialization. He further stated that following a standard process of capitalizing on customer needs, SMEs can enhance their chances of putting forth a successful product that meet market demand and pave way for business growth.
ii. **Product Improvement:** may also be referred to as product modification. It is a systematic process of enhancing existing product's features, functionalities and performance so as to better meet customer needs and improve market share (Nnorom et al, 2023). It also has to do with modifying the product usually after collecting customer feedback, address salient issues, add new features and improve the overall usability and performance.

Process Innovation

Process innovation is a significant index that is capable of improving product quality of Small and Medium Enterprises (SMEs). The effectiveness of process innovation in enhancing quality is closely tied to the adoption of new technologies, which often serve as enablers for process improvements. By optimizing internal operations, SMEs can improve their overall efficiency, reduce costs, and deliver better value to customers, thereby increasing their competitiveness in the marketplace (Olawore, 2024). However, this study sees process innovation as the development or execution of unique or significantly improved manufacturing or delivery methods. It involves changing the way a product or service is produced, delivered, or managed to increase efficiency, reduce costs, improve quality, or enhance customer satisfaction. In SMEs, process innovation is a key driver of operational efficiency and overall performance.

Process Innovation and Product Quality Improvement

The influence of process innovation on product quality is rooted in the fact that by improving internal operational procedures, SMEs can create more value, reduce costs, and enhance their responsiveness to market demands. This leads to improved performance through a higher product quality (Kawira, 2021).

Metrics that were used to measure process innovation in this study are cycle time and resource utilization as discussed below:

i. **Cycle Time:** in the perspective of process innovation, cycle time is described as the time it takes to execute a specified task or process from start to finish. It is a key performance indicator (KPI) employed to measure the efficiency and effectiveness of a process (Ajayi & Adeshina, 2023).
ii. **Resource Utilization:** in process innovation, resource utilization is seen as the effective and efficient deployment of resources to implement new or improved processes within an enterprise. This includes deploying resources such as human capital, finance, machines, software and information to foster process innovation initiatives (Isichei, 2024).

SMEs' Performance

Sanusi (2018), asserted that managers are concerned with **SMEs' performance which is** the accumulated end result of all the organization's work processes and activities. Nnorom, Ikponmuwomba, and Eyinanya, (2023) asserted that organizational performance comprises the actual output or result of an organization as against its intended goals. It is a complex but important concept, and managers need to understand the factors that contribute to high performance. They want their organizations, work units, or work groups to achieve a high level of **performance,** no matter what mission, strategies, or goals are being pursued. Managers at all organizational echelons and in all work areas manage their available assets - people, information, equipment etc by making decisions that they hope will lead to high levels of performance. Because achieving high levels of performance is important in both the short run and long run.

Small and Medium Enterprises (SMEs)

Around the world, small and medium enterprises (SMEs) are seen as vibrant movers of economic growth and development. Studies have shown that in the late 1990s, SMEs in the manufacturing industry took charge of the European economy (Ajayi & Adeshina, 2023). The industrial revolution altered the old ways of doing things and brought about mass production in an environmentally friendly, economically vibrant, and socially responsible manners.

No doubt, SMEs have played a major role in the development of both economic and social well-being of any nation (Aina, 2024; Montanari & Kocollari, 2020). SMEs are traditionally seen as businesses meant to take care of varying household needs, create jobs in their environment which in turn, reduces unemployment, poverty, economic and social inequalities and lead to the overall growth and development of the nation (Olawore, 2024).

This study views SMEs as business concerns that have number of employees, capital/asset base and annual revenue base on the ground of their small and medium sizes just as the name suggests. It is a common knowledge that there are no appropriate or specific definitions of what an SME is about and that the definition depends on the country and industry.

European Union (2020), defined SMEs as businesses that have fewer than 250 employees with an annual turnover of not more than 50 million euros and an annual balance sheet of not more than 43 million euros

United States (2024) defined SMEs as businesses that have fewer than 500 employees (for most industries) and an annual revenues of 7.500,000 Dollars.

SMEs in Nigeria play a crucial role in the economic growth and development. They are pivotal for job creation, poverty alleviation, and overall economic prosperity. Here's a detailed overview of the concept of SMEs within the Nigerian context;

Small and Medium Enterprises Development Agency of Nigeria (SMEDAN) 2021 described SMEs as below:

Small Enterprises: these category of SMEs are those that employ between 10 and 49 people with an asset base of five to fifty million naira (N5,000,000 – N50,000,000).

In the same vain, these medium enterprises are those that employ between 50 and 199 people with an asset base of fifty million naira to five hundred million naira (N50,000,000 – N500,000,000).

However, Small and Medium Enterprises combines the characteristics of both small enterprises and medium enterprises and are described as those that employ between 10 – 200 people and an asset base of five million to five hundred million naira (N5,000,000 – N500,000,000).

The Central Bank of Nigeria (2020) described SMEs as firms that have asset base (excluding land) of between five million naira (N5,000,000) and five hundred million naira (N500,000,000) with labour force of between one and two hundred and fifty.

Price water house Coopers MSME Survey of (2020), defined SMEs as businesses that significantly contribute to Nigeria's economy, accounting for 91.9% of businesses and 87.9% of employment. That is, employ between 10 – 200 people and an asset base of five million to five hundred million naira (N5,000,000 – N500,000,000).

The study is anchored on the definition given in 2021 by the small and medium enterprise development agency of Nigeria (SMEDAN) because the agency carry out survey on SMEs every four years to ascertain the health and performance of enterprises in relation to their growth and death rates. From the SME reports, findings of the survey as having to do with SMEs has been separately drawn.

In Nigeria, SMEs are defined based on criteria such as employment, asset base, and annual turnover. The definitions can vary slightly depending on the organization, but generally, SMEs and entrepreneurial development have been widely acclaimed as the tools for achieving economic growth and development in view of their contributions to employment generation and gross domestic products (GDP) and have consequently attracted the focus of nations in a bid to improve national development (Omar & Sa'am, 2018).

SMEs' Performance Dimensions

Metrics of SMEs' performance are as stated below in the course of this study:
Market share, product quality improvement, competitiveness, customer retention, employees' satisfaction, business reputation. For the purpose of this study, market share and product quality are adopted.

Market Share

Market share represents the percentage of an industry, or market's total sales that is earned by a particular enterprise over a specified time period. Market share is calculated by taking the enterprise's sales over the period and dividing it by the total sales of the industry over the same period. This metric is used to give a general idea of the size of an enterprise in relation to its market and its competitors. An enterprise's market share is its portion of total sales in relation to the market or industry that it operates within (Edeling, & Himme, 2018).

Daniel, (2018) opined that market share is a measure of the customers' preference for a product over other similar products. A higher market share usually mean greater sales, lesser effort to sell more and a strong barrier to entry for other competitors. A higher marker share also means that if the market expands, the leader gains more than others. With a high market share, enterprises are put in competitive advantages, the firms often receive better prices from suppliers, as their larger order volumes increases their buying power, also increased market share and greater production go hand-in-hand, with the latter decreasing a firm's cost to produce an individual product due to economies of scale.

The assertions of both Will, (2018) and Joensu, (2023) actually pointed out that market share is a firm's total sales in an industry compared to competitors (sales) of similar products/services over a specified time period. SMEs increase their market share through, innovation, strengthening customer relationship, smart hiring practices etc. For example if an industry has one hundred customers of a particular product in the market and a particular enterprise is being patronized by forty two customers it means that the firm as 42% customer market share.

However, market share is seen as a financial index of SME performance, as it is often measured in terms of an enterprise sales volume relative to other firms offering similar products/services in the market.

Product Quality Improvement

Product quality improvement is described as the extent to which a product aligns with the pre-determined standards and satisfies customer expectations or requirements. This includes features like performance, durability, consistency, reliability and branding/packaging appeals. Nwosu, Onwuka and Adu, (2024) asserted that product quality is key driver of SMEs' performance, positively affecting their competitiveness, customer satisfaction and all-round business success. By embracing innovation, implementing standard quality control mechanism, SMEs can enhance their product quality in a manner that will lead them to improved competitiveness and business success. Ekong, (2023) opined that high product quality propels customer satisfaction, ensures brand loyalty/reputation and huge acceptance in the market. Process innovation stands as a key determinant to enhancing product quality.

However, this study viewed product quality improvement as a non-financial index of performance, since it is measured in terms of SME's that focus on enhancing product quality tend to experience a high level of performance.

Theoretical Review

Resource-Based View (RBV)

This theory was first propounded by Barney in 1984 but later in the 1990s – 2000s, other researchers such as Robert Grant, Kathleen Eisenhardt, and David Teece contributed to the refinement of RBV. The theory suggests that a firm's competitive advantage stems from its unique bundle of resources and capabilities. This theory posited that a firm's resources and capabilities are the key drivers of its sustained competitive advantage. In spite of the extensive literature on RBV in business management, its application to technology adoption has not been thoroughly explored, particularly regarding how specific resources contribute to the realization of SMEs' objectives.

It emphasizes the importance of leveraging internal resources such as human capital, knowledge, and innovative capabilities to develop sustainable business models. SMEs can achieve competitive advantage by investing in sustainable practices that utilize their specific resources effectively, such as adopting eco-friendly technologies or implementing socially responsible supply chain management.

The main critique against Resource-Based View (RBV) is that it focuses more on internal resources and less on dynamic capabilities and innovation. The implication of RBV to this study is that the value of resources can vary depending on the context in which they are deployed, even though it stands that resources and capabilities are generally sacrosanct.

Dynamic Capabilities Theory

Dynamic capabilities theory was put together by David Teece, Gary Pisano, and Amy Shuen in 1997 and it focuses on a firm's ability to adapt and innovate in response to changing market circumstances and environmental dynamics. Dynamic capabilities refer to deliberate and regular actions of configuration and reconfiguration of resources. However, changing the endowment of resources is not a sufficient condition to increasing firm's performance, for this internal change to be translated in to performance, a firm needs to deploy valuable, rare, and costly to imitate resources and capabilities (Kurtmollaiev, 2020). This theory also emphasizes the importance of agility, flexibility, and learning capabilities in addressing sustainability challenges. SMEs with dynamic capabilities can identify emerging opportunities for sustainable innovation, develop new products or services that meet evolving customer needs, and respond effectively to environmental and social risks. It also highlights the importance of transforming and re-engineering the extant capabilities to respond to changing market conditions/circumstances.

While this theory has a great influence in the understanding of enterprises to realize and keep competitive advantage, it also has not paid attention to power dynamics and politics that has led to its criticism. That is, the theory neglect the role of power and politics in a firm which can positively impact refinement and deployment of dynamic capabilities.

The implication here is that the theory has been hugely influential in the knowledge and understanding of how firms realize and sustain competitive edge.

Innovation Theory

The Schumpeter's theory of innovation was propounded by Joseph Schumpeter in his 1934 book 'Capitalism, Socialism, and Democracy.' It holds that the very essence of innovation is creative destruction, and explained that creative destruction as the process of wealth creation through disruption of existing market structures due to introduction of new products and/or services that cause resources to move away from existing firms to new ones thus allowing the growth of the new firms. Accordingly, Schumpeter calls innovation the specific tool of entrepreneurs, the means by which entrepreneurs exploit change as an opportunity for a different business or a different service. Schumpeter (1965) stressed the role of entrepreneurs as primary agents effecting creative destruction, and emphasized that entrepreneurs the need to search purposefully for the sources of innovation, the changes and their symptoms that indicate opportunities for successful innovation; as well as the need to know and apply the principles of successful innovation.

Schumpeter innovation theory emphasizes more on innovation function of entrepreneurs and ignores other important and equally critical aspects of entrepreneurship like organization management skills. Also, it ignores the concept of risk bearing as intensely as it emphasize the idea of innovation.

The implication of this theory is that it has to focus more on teams and groups in the innovation process rather than expending its efforts on individual entrepreneurs as mover of innovation process.

Finally, this study is anchored on innovation theory because innovation is the major driver of economic activities such as introduction of new products, implementation of new methods of production, discovery of new markets etc which are sacrosanct to this study.

Empirical Review

Olawore, Oyelade, Tairu, Oduwole, and Awofela, (2024) conducted a research titled Entrepreneurial Innovation and Market Share of Small and Medium Enterprises in Lagos State, Nigeria. The purpose of the study was to determine the effect of product innovation on market share of SMEs in Lagos State by leveraging technology and fostering culture of continuous improvements. The study adopted cross-sectional survey research design with population of 42,067 SME owners in Lagos State, sample size of 495 was obtained using Cochran's sample size determination formula, and data were collected with survey questionnaire as the instrument. Analysis was done using multiple linear regression and hypotheses tested accordingly. The study revealed that entrepreneurial innovation has positive and significant effect on market share. It was concluded that entrepreneurial innovation has positive and significant effect on market share of selected SMEs in Lagos State, Nigeria.

In contrast to the current study that considers Kwara State, the above work was conducted in Lagos State, Nigeria and also on market share alone and not holistically on performance of SMEs in Lagos. Hence, a geographical and conceptual gaps are noted.

Ezekiel, Caroline, and Christopher, (2024) in their study conducted in Tanzania titled Effect of Product Innovation Practices on Performance of SMEs in Manufacturing SMEs in Tanzania. The purpose of the study was to Effect of Product Innovation Practice on Performance of Manufacturing SMEs in Food Processing Industry in Mbeya, Tanzania. The study adopted multi-dimensional analytical approach with STATA 17 software, population of the study not specified in the work but sample size was 400 owners of manufacturing SMEs. Ordered logistics regression analysis was employed to analyze data collected and test the hypotheses formulated. Findings of the study revealed that new product development, product improvement and product line extension has significant effect on SMEs' performance in terms of sales growth and customer satisfaction. It was concluded that product innovation has positive influence on SMEs' performance in Tanzania.

The criticism against this study in comparison with the current study is that it was carried out in Tanzania and not on organizational innovativeness as a whole but on product innovation practice alone. Also, it adopted ordered logistic regression analysis to test the hypotheses unlike ordinary least square regression method adopted in the current study. Meanwhile, geographical and methodological gaps are recorded.

Ekeh, (2023) in his work conducted in Nigeria titled Effect of Product Innovation on Growth of Medium Enterprises in Nigeria. The objective of the study was to investigate the effect of product innovation on growth of medium enterprises in North-Central Nigeria. The study adopted survey research design and population was 243 medium enterprises in North-Central Nigeria, census approach was employed to gather data from the entire population of medium enterprises in the region, and survey questionnaire was the instrument of data collection. Descriptive and inferential statistics was used and regression analysis adopted to test the hypotheses. It was found that product innovation has positive and significant effect on growth of medium enterprises in Nigeria. The study then concluded that product innovation practice has significant effect on the growth of medium enterprises in the North-Central Nigeria. This study was carried to focus on the north-central region of Nigeria of which Kwara State is a component. However, the results of the current study are narrow in scope compared to the results of the study above. Geographical gap exists here.

Ashraf and Asharul (2023) in their work conducted in the Sultanate of Oman titled technology adoption as survival strategy for small and medium enterprises during COVID-19 pandemic. Objective of the study was to assess the technological transformations and the challenges facing SMEs during the pandemic. It adopted both quantitative and qualitative primary data, questionnaire was used as the instrument of data collection, and hypotheses were tested using paired t-test and Pearson's correlation. The results shows strong and positive correlation between technology use before and during COVID-19 pandemic and in the future. It then concluded that the executives of SMEs in Oman appreciate the requirements and benefits of adopting innovation and technology solutions to remain in business. Gaps noted in the above study are both of geographical and methodological.

Kawira, (2021) conducted research titled Product and Service Innovation and Performance of Micro, Small and Medium Enterprises (MSMEs) in Kenya. The purpose of the study was to assess the impact of product and service innovation on entrepreneurial marketing strategy relative to the performance of micro, small and medium enterprises in Kenya. The study adopted descriptive survey research design with a population of 8,526 MSMEs in Thraka-Nithi County, stratified and

simple random sampling techniques gave a sample size of 368 MSME owners and data was collected with survey questionnaire as the instrument. Analysis was done using descriptive and inferential statistics. It was found that there is positive effect of product and service innovation on performance of MSMEs. The study then concluded that product/service innovation significantly enhance performance of MSMEs in Kenya. Conceptual and geographical gaps are seen in the above study because, the title is on product innovation alone as oppose to the current study that look at organizational innovativeness (in terms of product innovation and process innovation) and that it was carried out in Kenya and not in Nigeria.

Supriyo, Amit and Arabinda (2020) in their work conducted in India titled technology adaptation and survival of SMEs: A longitudinal study of developing countries. Objective of the study is to determine the impact of technology development on SME competitiveness and growth. Factor analysis was employed where institutional and external capabilities were considered significant factors, regression analysis was used to check the sustainability of SMEs in the period under review. The results indicate that both institutional and external capabilities became significant when time is taken as a selection variable. The study then concluded that technological adaptation has a strong impact on business sustainability. Geographical and methodological gaps exist in comparing the above study with the current one.

Methodology

The study adopted cross-sectional survey research design. This is because the data required to examine the influence of organizational innovativeness on performance of selected small and medium in Kwara State were collected using questionnaire which allows for collection of data needed for making statistical inference on the study. The study population covered the registered SMEs in Kwara State. The justification for selecting Kwara State emanates from the fact that the state has the highest number of SMEs in North-Central region of Nigeria which is twenty five thousand three hundred and fifty six (25,356) according to the SMEDAN report of 2021, using Krejcie and Morgan (1970) sample size determination formula, a sample size of 392 was obtained. Out of the sample size obtained, the study purposively selected 169 that are manufacturing SMEs in the State in order not to deviate from the main variables of the research. The primary data collection instrument that was used for this study was the questionnaire, which was administered to and collected from the respondents by the researcher with the help of two trained research assistants. The data collected were analyzed using Ordinary Least Square [OLS] method of regression with the aid of statistical package for social sciences (SPSS) software [Version 26]. A 5 point Likert rating scale was adopted to categorize responses ranging from 5 point – strongly agree down to 1 point – strongly disagree to bring about needed information from these respondents.

Data Presentation and Analyses

Hypothesis 1: Product innovation does not significantly influence market share

Table 1: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.784[a]	.615	.526	.51715

a. Predictors: (Constant), Product Development, Product Improvement
Source: SPSS Printout, 2025.

The table above indicates a strong positive influence (R = 0.784) of product development and product improvement on market share. With an R Square of 0.615, the model explains about 61.5% of the variance, while the Adjusted R Square (0.526) accounts for model complexity. These results imply that product innovation significantly influences outcomes like market share of SMEs in Kwara State, emphasizing the need to enhance product development and improvement strategies.

Table 2:ANOVA[a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	regression	262.428	3	87.476	245.031	.000[b]
	Residual	58.236	163	.357		
	Total	320.664	166			

a. Dependent Variable Market Share
b. Predictors: (Constant), Product Development, Product Improvement
Source: SPSS Printout, 2025.

The above table shows that the regression model is numerically significant, with an F-value of 245.031 and a p-value (Sig.) of 0.000. This indicates that the independent sub-variables (product development and product improvement) collectively have a significant and positive influence on the dependent variable, market share. The regression sum of squares (262.428) compared to the residual sum of squares (58.236) suggests that a large portion of the variance in market share is explained by the predictors. The low mean square of the residual 0.357 further reveals a good model fit. These findings show that product innovation significantly influence market share of SMEs in Kwara State. Thus, enhancing product development and product improvement mechanisms can improve market share of SMEs and contribute to higher organizational innovativeness.

Table 3: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std. Error	Beta		
1	(Constant)	.721	.169		3.432	.000
	Product Development	.269	.065	.289	4.262	.000
	Product Improvement	.199	.061	.247	3.416	.000

a. Dependent Variable: Market Share.
Source: SPSS Printout, 2025.

The coefficients table reveals that both product development and product improvement significantly affect market share. The unstandardized coefficient (B) for product development is 0.269 with a t-value of 4.262 and a p-value of 0.000, indicating a statistically significant and positive effect. Similarly, product improvement has a B value of 0.199, a t-value of 3.416, and a

p-value of 0.000, also revealing a significant influence. This indicates that when SMEs develop new products, change design of existing ones with the use of new materials, there will be 72.1% improvement on its market share. The standardized beta values of 0.289 for product development and 0.247 for product improvement suggest that product development has a considerable stronger influence on market share. Hence, the null hypothesis which stated that product innovation does not significantly affect market share is rejected, thus the alternative that product innovation has significant effect on market share is hereby, accepted. The constant value of 0.721 shows the expected level of market share when both predictors are held constant. These results imply that SMEs in Kwara State that are improving on product development and product improvement mechanisms can greatly enhance market share.

Hypothesis I1: Process innovation has no significant effect on product quality.

Table 4:Model Summary

Model	R	R square	Adjusted R square	Std. Error of the Estimate
1	.776[a]	.602	.551	.37103

a. Predictors: (Constant), Cycle Time, Resource Utilization

Source: SPSS Printout, 2025.

The model summary above indicates a strong positive effect (R = 0.776) of cycle time and resource utilization on the outcome variable. With an R Square of 0.602, the model explains 60.2% of the variance, showing good predictive power. The adjusted R Square of 0.551 confirms this strength after accounting for predictors. The moderate standard error (.37103) suggests reasonable prediction accuracy. These findings highlight that process innovation significantly influences outcomes like performance or product quality of SMEs in Kwara State.

Table 5:ANOVA[a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	regression	62.586	1	62.586	20.710	.000[b]
	Residual	498.637	165	3.022		
	Total	561.223	166			

a. Dependent Variable Product Quality Improvement

b. Predictors: (Constant), Cycle Time, Resource Utilization

Source: SPSS Printout, 2025.

The ANOVA table shows that the regression model examining the effects of cycle time and resource utilization on product quality is statistically significant (F = 20.710, p = .000). This indicates that the independent sub-variables jointly have a profound effect on the dependent variable. The regression sum of squares (62.586) compared to the residual (498.637) suggests that a notable portion of the total variance in product quality is explained by the model. Given the significance level ($p < 0.05$), the results confirm that process innovation measured by cycle time and resource utilization plays a critical role in shaping product quality of SMEs. This indicates that

attempts to efficiently utilize cycle time and resources can positively influence product quality improvement and over-all performance of SMEs in Kwara State.

Table 6: Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	T	Sig.
		B	Std Error	Beta		
1	(Constant)	.523	.024		3.429	.000
	Cycle Time	.594	.068	.526	5.431	.000
	Resource Utilization	.763	.065	.667	7.471	.000
a. Dependent Variable: Product Quality Improvement						

Source: SPSS Printout, 2025.

The coefficients table shows the effect of predictors; cycle time and resource utilization on the dependent variable product quality improvement. The unstandardized coefficients for cycle time (B = 0.594) and resource utilization (B = 0.763) indicate that both have a positive impact on product quality, with resource utilization having a slightly stronger effect. The standardized beta values of 0.526 for cycle time and Beta = 0.667 for resource utilization further confirm the relative strength of these effects, with resource utilization being the stronger predictor. Both predictors are statistically significant, as indicated by the t-values of 5.431 for cycle time and 7.471 for resource utilization with p-values of ($p < 0.05$). these outcomes warranted the rejection of the null hypothesis which stated that process innovation has no significant effect on product quality, however, the alternative is hereby, accepted. This suggests that improving cycle time and resource utilization can significantly and positively enhance product quality SMEs in Kwara State. The findings highlight the importance of efficiently utilizing cycle time and resources to boost product quality and better customer experience.

Discussion of Findings

The findings from the data analyses provide strong support for the hypotheses that product innovation positively impacts market share and process innovation enhances product quality improvement of SMEs in Kwara State. The analysis of product innovation reveals a significant positive influence on market share, with R value of 0.784 and R^2 of 0.615, indicating that about 61.5% of the variance in market share is explained by product development and product improvement (B = 0.269 and 0.199 respectively with p = 0.005). The model's strong predictive power is confirmed by the ANOVA results (F = 245.031, p = 0.000).

Regarding process innovation, the regression analysis shows a strong positive effect of cycle time and resource utilization (B = 0.594 and 0.763 respectively) on product quality explaining 52.3% of the variance (R = 0.776, $R^2 = 0.602$). Both predictors are statistically significant ($p < 0.05$), with cycle time and resource utilization having a stronger effect on product quality improvement, as indicated by the standardized beta values of 0.526 for cycle time and 0.667 for resource utilization.

These findings are consistent with the empirical review, which emphasizes the importance of aligning organizational innovativeness with market share and product quality improvement, nurturing product innovation and building process innovation through strong technological solutions to enhance SMEs' performance and better meet customer requirements. The results from

both the data analyses and the empirical review underline the need for SMEs to adopt a proactive approach to organizational innovativeness. Enhancing product innovation through development and improvement nexus is essential to improving market share, while developing process innovation through cycle time and resource utilization significantly boosts product quality and performance.

Conclusion

This study concluded that product innovation and process innovation have significant influences on performance of SMEs in Kwara State. Improved product development and product improvement enhance market share, while efficient cycle time and resource utilization result in higher product quality of SMEs. These findings emphasize the importance of incorporating product innovation and process innovation into organizational practices, especially among SMEs, where organizational innovativeness is prevalent. This study provides valuable insights into how organizational innovativeness, such as product innovation and process innovation can be used to enhance performance of SMEs in terms of market share and product quality improvement.

Recommendations

On the basis of the findings and conclusion drawn above, the following recommendations were made:

i. SMEs in Kwara State should develop new products, change design of existing ones with the use of new materials to experience significant improvement on its market share.
ii. Enterprises in the State should always ensure a resource efficient processes, manage cycle time of starting and completing production and cost reduction systems so as to positively improve on their product quality improvement.

Creative Destruction and Firms Survival: Analysis of Mobile Phone Device Users in Nigeria

Olushola J. Omolekan (Ph.D.)
Department of Business Administration, Faculty of Management Sciences, University of Ilorin, Nigeria.
o.omolekan@gmail.com

Abstract
Disruptive innovation is essential for companies aiming to survive and succeed in a competitive market. Continuous improvement of products has become vital for the longevity of businesses. This study investigated the impact of creative destruction on the survival of firms, focusing specifically on mobile phone users in Nigeria. A survey design was employed, using a validated structured questionnaire to collect information from iPhone users in the country. Data analysis was conducted through the structural equation modeling (SEM-PLS) approach. The findings indicated that both creative disruption and disruptive innovation significantly influence the survival of firms. However, product attributes were found to have an insignificant impact on firm survival. Based on these results, the study recommends that mobile phone manufacturers focus on enhancing product design, durability, memory capacity, and usability features to improve their chances of survival. Additionally, it was observed that iPhone users are particularly sensitive to changes in product features and pricing.

Keywords: *Creative destruction, enterprise survival, iPhone users, disruptive innovation, product attributes*

Introduction

Creativity and innovation have been major driving forces for many manufacturing firms(Loesche & Torre, 2020; Norbäck & Persson, 2024; Xing & Sharif, 2020). The continuous support of customers depends on a manufacturer's ability to enhance the quality, effectiveness, convenience, and usability of its products. Firms that thrive in the twenty-first century consistently improve their offerings to meet and satisfy customer needs (Arifina et al., 2023; Razzan & Sigit, 2023). This trend is evident in various industries, including home appliances, technology, automobiles, and mobile devices. For example, decades ago, black-and-white televisions were common in Nigeria. Today, we have transitioned to color televisions, LCDs, LEDs, and now smart 4K televisions. The automobile industry has also experienced significant changes, shifting from manual gear shift vehicles to automatic transmissions, with ongoing advancements. Similarly, the mobile phone industry undergoes rapid innovation, with multiple models sometimes released in a single year (Akcigit et al., 2023; Ma et al., 2024; Meethal Reji & Narayan Sathe, 2021). The pace of creative destruction in this sector is so rapid that consumers are often allowed to exchange their old phones for new models, provided they pay an additional fee to stay current and fashionable.

A thought-provoking question arises: how can a company release a product in a single year only to introduce another with enhanced usability and quality that diminishes demand for the previous model (Razzan & Sigit, 2023; Simatupang & Purba, 2023). This phenomenon exemplifies a creative destruction strategy to maintain relevance in the industry.

Shifts in customer needs, tastes, fashion, convenience, and product usage necessitate continuous product improvement by manufacturers. Additionally, intense competition compels organizations to innovate to remain competitive or gain an edge. Furthermore, frequent technological advancements and changes in operational methods require substantial investment in research and development to enhance product quality and meet customer demands (Arifina et al., 2023; Razzan & Sigit, 2023; Simatupang & Purba, 2023). Product re-modification is thus a lifelong strategy for firm survival.

Manufacturers create improved and superior products to replace their existing offerings, as no discerning customer would opt for outdated models. These enhanced products are often rebranded into various versions, models, ranges, and packages, showcasing new features designed for better performance. For instance, different makes and models of automobiles are typically distinguished by their release years. This means that automobile companies consistently develop new brands with improved features each year. Over a decade, continuous enhancement in quality, convenience, features, and comfort can result in the phasing out of nine previous innovative ideas. The mobile phone industry demonstrates similar trends, where manufacturers often use alphanumeric tags to differentiate models, with several variations produced in a single year, such as A9, S10, 6.2X, and L9 Plus. Companies that fail to adapt quickly to these trends risk losing market share to more innovative competitors.

However, creative destruction comes at a cost (Cefis et al., 2021; Loesche & Torre, 2020; Xing & Sharif, 2020; Xue, 2022). Implementing innovative ideas requires robust research and development, which can be costly—especially in the mobile phone sector where factors such as design, technology, optimization, color, usability, speed, memory capacity, camera quality, interface, and durability are crucial. A key issue in organizational psychology is whether these innovative ideas influence firm survival and how customers perceive frequent changes regarding repeat purchases, support, and buying decisions. Therefore, this paper examines the impact of creative destruction on firm survival, with specific focus on mobile phone customers in Nigeria. The study will analyze disruptive innovation and its relationship with the survival of firms in this sector.

Literature Review

Concept of Innovation

Various viewpoints on innovation have been discussed in the literature (Grilli et al., 2023; Jiao et al., 2020). Schumpeter defined innovation as the introduction of a new product, a new manufacturing technique, the creation of a new market, the procurement of a new supply source, and the establishment of a new industrial organization. Innovation emerges from an organization's desire to change, improve, and create value (Gu et al., 2024; Tipu & Ryan, 2016; Walsh & Martin, 2023). However, it can also involve risks and challenges. Competitive pressures within an industry may create both internal and external demands for change within an organization. Consequently,

innovation has the potential to significantly alter various aspects of a business (Bilan & Apostoaie, 2023; Souakri et al., 2023).

From Jarchow and Röhm, (2023) perspective, innovation is defined as the ability of any participant in the market or industry to disrupt the equilibrium by launching new goods or services that fill a market niche. Technically, innovation can be described as the adoption of a novel tool, system, method, or product by the organization (Arifina et al., 2023; Razzan & Sigit, 2023). For something to qualify as genuine innovation, it must satisfy two fundamental criteria: it should be different from existing offerings at the time of its invention or adoption, and it should have an impact on the adopting organization. This impact can manifest in improved financial performance, enhanced organizational image, survival in the market, and increased efficiency (Ribeiro et al., 2024).

The literature identifies three primary approaches to organizational innovation. First, innovation is viewed as a crucial component of superior business performance and organizational success (Simatupang & Purba, 2023). This approach emphasizes an innovation-driven business strategy and allocates more resources for developing the organizational capacity for new product innovation. The second approach focuses on the business environment and workplace conditions, suggesting that innovation is more a byproduct of dynamic organizational development than a primary focus (Gu et al., 2024). The third approach recognizes innovation as an important factor but emphasizes that effective business performance requires a careful balance between innovation and other contributing elements (Freeman et al., 2023).

The traditional project management mindset, which prioritizes strict standards and controls, is often at odds with innovation’s needs for exploration, divergent thinking, risk-taking, and resource allocation to potentially failing projects (Aadland et al., 2023; Ade et al., 2020; Bischoff et al., 2023). Management innovation is defined as the development and implementation of new management practices, processes, structures, or strategies that are innovative for the state of the art, aimed at achieving organizational goals (Herrmann et al., 2024; Tierney et al., 2020). This concept encompasses the idea of "newness," exemplified by Procter & Gamble's brand management and Toyota's lean production methodology.

Organizational innovation refers to strategies that businesses employ to develop newer products, processes, and systems in response to changing market conditions, technological advancements, and competitive pressures. It can be defined as an organization's capacity to create new or improved products or services and successfully introduce them to the market (Simatupang & Purba, 2023). It also indicates the organization's ability to continually innovate new services, processes, or products for the benefit of all stakeholders. Innovations can range from minor enhancements to radical changes (Ribeiro et al., 2024). Most innovations are considered gradual, gaining momentum through accumulation. Radical innovations, on the other hand, are riskier and require distinct approaches to selecting and executing the best methods. Balancing exploration and exploitation pose significant challenges, as these terms point to differences in search behavior, selection strategies, and implementation processes concerning incremental (doing things differently) and radical (doing things better) innovations (Akcigit et al., 2023; Meethal Reji & Narayan Sathe, 2021).

The Challenge of Discontinuous Innovation

Innovation typically occurs when individuals or companies work to improve their existing products, methods, or positions while adhering to a well-defined set of rules. While some are more adept at this than others, all participants acknowledge these "rules of the game," which remain unchanged (Holcombe, 2022). Occasionally, however, unforeseen events disrupt this established structure and alter the game's rules. These unusual occurrences have the potential to reshape the industry and its parameters, presenting new possibilities and prompting established players to reevaluate their strategies within the new context (Cefis et al., 2021; Xue, 2022). The concept of "creative destruction" is central to Schumpeter's original theory of innovation (Holcombe, 2022).

Under certain technological and market conditions, there can be extended periods of relative stability, followed by a continuous stream of changes focused on a core theme of innovation. Essentially, this means "doing what we do, but better" in terms of enhancing products or processes. For instance, the original Bic ballpoint pen, introduced in 1957, remains popular today, with 14 million sold daily worldwide. Although its shape appears unchanged, a closer look reveals numerous subtle improvements in materials, inks, ball technology, and safety measures (Freeman et al., 2023).

However, there are occasional disruptions that break up these periods of "steady-state" innovation. These disruptions occur when one or more fundamental factors—such as technology, markets, or social and legal frameworks—shift radically. As a result, the fundamental "rules of the game" change, creating new opportunities for creativity. Such transformative circumstances can arise due to significant technological advancements or the emergence of entirely new markets (Giacomin et al., 2023; Martínez-Cañas et al., 2023).

Innovation and Competitive Advantage

A trend is emerging that favors organizations capable of leveraging their knowledge, technological expertise, and experience to innovate their products and services, as well as the methods by which they develop and deliver them. While factors such as size and asset ownership can provide a competitive edge, innovation plays a vital role in driving success (Taneo et al., 2020).

Research indicates a strong correlation between new product development and market performance (Li et al., 2023; Long et al., 2023). New products can enhance profitability in various markets by helping companies gain and retain market share. Beyond offering competitive pricing, other factors—such as design, customization, and quality—also contribute to sales growth for established and well-known products (Taneo et al., 2020).

In an environment where product life cycles are decreasing—where a model of a computer or television may only be relevant for a few years, and even sophisticated items like cars are developed in similar timeframes—regularly introducing new products is a crucial form of innovation for maintaining a competitive edge. The ever-changing landscape means that developing new products is an essential skill. Competitors can pose a significant threat to market leadership with their new offerings, so businesses must be equipped to innovate in response to these challenges (Ribeiro et al., 2024).

While new products are often seen as the pinnacle of market innovation, process innovation is also significant. The ability to create unique solutions or execute tasks in ways that others cannot is a strong source of competitive advantage, made possible by continuous process innovation. Improving service delivery—by making it faster, more affordable, and of higher quality—has long been a strategy for gaining an edge over competitors. For example, Citibank became the first bank to provide automated teller machine (ATM) services, establishing itself as a technology leader in the market.

However, as other companies mimic these innovative actions, the advantages they bring tend to diminish over time (Ma et al., 2024). If a company cannot continue to innovate, it risks falling behind as competitors evolve and improve their products, internal operations, or foundational business models. This is particularly evident in the banking industry, where leadership has shifted to those who effectively capitalized on the early boom in information and communication technologies (ICTs). Companies with innovative business models have taken the lead in profitable financial services, such as trading and securities (Jarchow & Röhm, 2023).

Creative Destruction and Inventory Complexity Management Problem

Inventory complexity arises from the phenomenon of creative destruction in manufacturing companies. When products are not purchased, inventory control can become challenging (Cefis et al., 2021; Holcombe, 2022). In simple terms, obsolescence occurs when demand for a product declines, rendering it outdated. For example, the value of every vehicle typically depreciates within a year. Obsolescence costs refer to the lost value that negatively affects manufacturer sales and store revenues.

To mitigate the likelihood of obsolescence, retailers rely on common forecasting techniques. According to (Norbäck & Persson, (2024), merchants incorporate demand projections into their strategies, which are effective in extending the time frame and scope of foreseen obsolescence. The situation becomes more complicated when certain items must be readily available in large quantities due to their essential nature.

Take the iPhone, for instance: when it was first introduced, Apple produced a substantial number of units, believing there would be significant demand. However, complications arise when new versions or models are released, increasing the risk that previous models may become obsolete (Majid et al., 2022; Simatupang & Purba, 2023). This issue presents a significant challenge for the manufacturer, necessitating a pull-and-push strategy for their products.

Enterprise Survival

One of the major objectives of a business organization is continuity and survival. Beyond profit, an enterprise's ability to endure in the face of competition is a critical consideration for both customers and creditors (Jarchow & Röhm, 2023; Souakri et al., 2023). Enterprise survival refers to a business or organization's ability to operate and thrive over time, despite challenges and uncertainties. This aspect is vital for business sustainability, especially in today’s fast-paced and competitive market environment.

To ensure survival, a business must focus on several key factors, including strong leadership for strategic decision-making, adaptability, innovation, financial management, and talent

management. Additionally, external factors such as market research, competitor analysis, networking, regulatory compliance, and risk management play crucial roles in a firm's survival.

In the case of Apple, the iPhone manufacturer, creative destruction has been a key factor in its survival and success. This is evident in how Apple has disrupted the mobile phone market, cannibalized iPod sales, continuously innovated, expanded into new markets, and developed an ecosystem that helps the organization stay ahead of competitors. These strategies drive innovation and growth, allow adaptation to changing market conditions, build a loyal customer base, and create new revenue streams (Bosio et al., 2020; Li et al., 2023). Ultimately, Apple's ability to disrupt itself and the market through creative destruction has been essential for its enterprise survival and success.

Firm survival is also supported by factors such as customer satisfaction, customer loyalty, repeat purchases, and increases in profit (Ade et al., 2020; Bosio et al., 2020).

Disruptive Innovation Theory

According to Thorgren & Williams, (2023), disruptive innovation "modifies what makes quality appealing to non-consumers" and "disturbs the trajectory of traditional improvement." They suggest that disruptive innovation addresses one or two underlying issues often managed by independent or spin-off departments within a corporation. This approach targets root causes and needs to add new value to processes or products by making them more affordable, accessible, capable, responsive, simple, or customizable (Herrmann et al., 2024). Alam et al., (2022) argues that disruptive innovation is revolutionary rather than evolutionary and is essential for firms to maintain a competitive edge, avoid organizational decline, and thrive in complex, dynamic marketplaces and unpredictable economic environments. When effective, disruptive innovation can directly support organizational sustainability as a sustaining innovation (Reuther et al., 2023). These innovations typically occur at the individual, functional, corporate, or industry levels and oppose current methods(Alam et al., 2022; Costin et al., 2022).

To understand how certain inventions can transform a company or sector from the outside, it is necessary to analyze disruptive innovation. This involves examining resources, processes, values, non-consumers, innovation hurdles, strategies to overcome those challenges, cutting-edge advancements, and unique customer situations (Chandler et al., 2023). Organizations and employees must adopt a different perspective on the world through a circular process of probing, learning, and assessing feedback. Razzan & Sigit, (2023) identify several characteristics of companies that successfully implement disruptive innovations: (1) a clear business plan; (2) strong, change-oriented partners; (3) mutual investment rooted in the user community; (4) connections with other organizations; and (5) a commitment to maintain and replicate results (Haugh et al., 2022; Jiao et al., 2020).

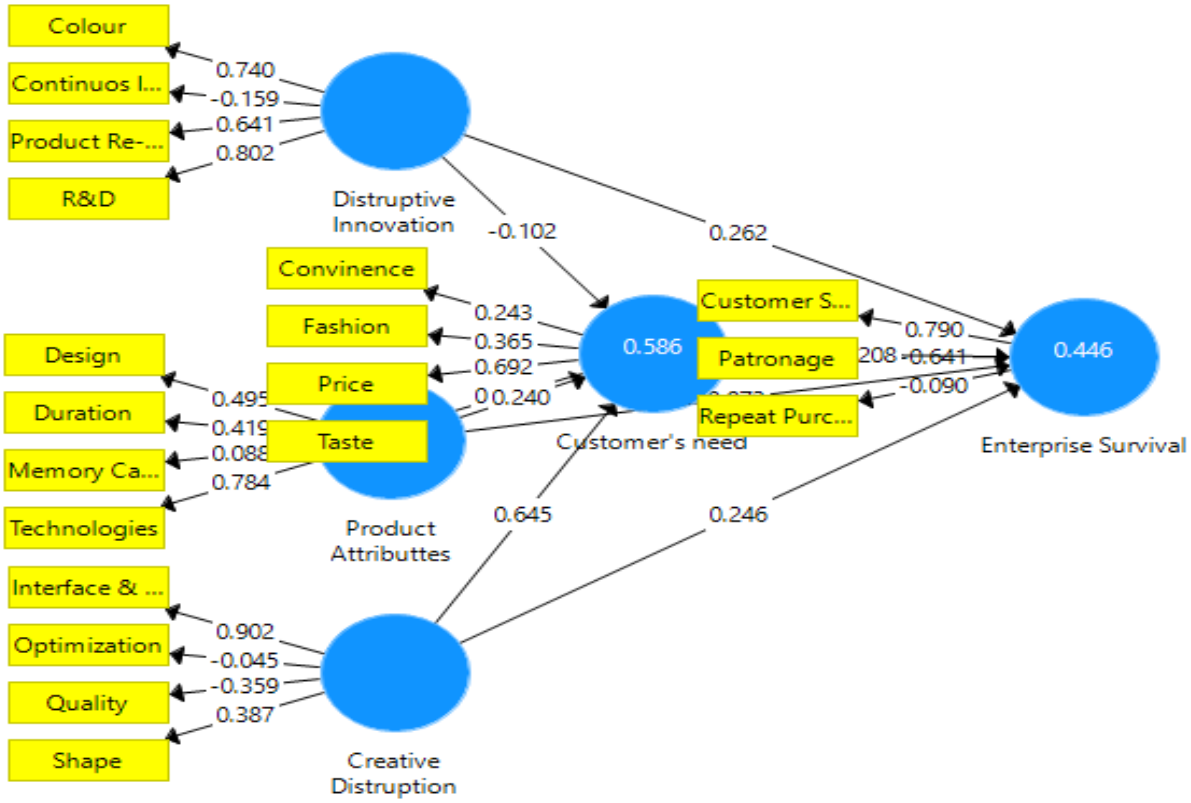
Specific obstacles to disruptive innovation include prematurely jumping into action instead of allowing natural innovation to unfold, failing to develop an external perspective, and not providing early funding to support the exploratory phase (Ma et al., 2024). Additional challenges involve an inability to break old thought patterns, a reluctance to depart from a successful dominant concept, an organizational culture that is resistant to risk, a high turnover rate among senior management, a lack of procedures for integrating innovation into the business, and insufficient skills to embrace

change (Akcigit et al., 2023; Meethal Reji & Narayan Sathe, 2021). For disruptive innovation to flourish, an organization must have an internal motivation to explore radical new ideas and effectively utilize both internal and external resources (Hossinger et al., 2023; Reuther et al., 2023).

Methodology

The study utilized a survey design, implementing an opinion poll among mobile phone users in Nigeria, with a particular focus on Kwara State. The target population consisted of all mobile phone owners; however, the study specifically concentrated on iPhone users in Ilorin, particularly students from the University of Ilorin. iPhone users were intentionally selected due to their association with trends, fashion, technology, and a tendency to frequently upgrade their devices for improved features.

The University of Ilorin students were deemed the primary population for this research, based on the understanding that educated youth in tertiary institutions are among the highest users of iPhone devices. To determine the sample size, the study employed Cochran's formula for proportion, resulting in a target sample of 384. Additionally, Kumar's (1974) stratum formula was used to distribute respondents across the fifteen faculties of the University.



A multi-stage sampling technique was adopted, which included purposive sampling (targeting iPhone owners), judgmental sampling (focusing on phone owners who frequently change their devices for better features), and random sampling to select the final respondents. Primary data was collected through a structured and validated questionnaire, which had a Cronbach's alpha of 0.82, indicating good reliability.

The variables examined in the study included innovation, creativity, improved product features, customer buying decisions, repeat purchases, and customer patronage. The gathered data was analyzed using bootstrapping methods and partial least squares (PLS) algorithms, employing SmartPLS 3 statistical software for this analysis.

Results and Discussions

The number of administered and returned questionnaires was 379, resulting in a success rate of approximately 98.7% against the set target. The path models of the variables are illustrated below.

Figure 1: Creative destruction on firm survival mediated by consumers' need path model

Source: Researcher's Path Model, 2024

Figure 1 shows the path model analysis of the creative destruction effect on firm survival mediated by customer's need variables. Creative destruction indices measured in the study are Disruptive innovation – proxies by colour, continuous improvement, product remodification, and research and development; Product attributes – proxies by design, duration, memory capacity and technologies; and Creative disruption – proxies by interface, optimization, quality and shape. Customer satisfaction, patronage, and repeat business were used as proxies for enterprise longevity to measure these factors. Convenience, fashion, price, and taste were used as proxies for the customer's need variables to moderate the effect and determine the significance of the moderating variables. The interaction effects—where more than one variable contributes to the latent variables—are shown in the figure.

Table 1: Weight standardization coefficient

	Creative Disruption	**Customer's need**	**Disruptive Innovation**	**Enterprise Survival**	**Moderating Effect 1**	**Product Attributes**
Creative Disruption		0.645		0.246		
Customer's need				0.208		
Disruptive Innovation		-0.102		0.262		

Enterprise Survival						
Moderating Effect 1				-0.241		
Product Attributtes		0.240		0.073		

Source: SMARTPLS Output, 2024

The results from the path coefficients table indicate a standardized weight range from -1 to +1, with path weights closest to absolute 1 being the strongest. In contrast, pathways with weights near zero are the weakest. The metrics for creative destruction show a positive contribution to both the latent variable and the moderating variable, with the exception of disruptive innovation. The absolute magnitude of creative disruption generates a better coefficient for both customer needs and enterprise survival. Additionally, the results reveal that the path coefficients mediated by customer needs variables exhibit weak and negative standardized weight coefficients concerning enterprise survival. This suggests that creative destruction metrics serve as a good model for predicting enterprise survival, although the impact of the moderating variables appears to be moderately significant. Overall, the identified creative destruction variables significantly contribute to predicting enterprise survival.

Table 2: Outer loading

	Creative Disruption	**Customer's need**	**Disruptive Innovation**	**Enterprise Survival**	**Moderating Effect 1**	**Product Attributes**
Colour			**0.740**			
Continuous Improvement			**-0.159**			
Convenience		**0.243**				
Creative Disruption * Customer's need					**1.069**	
Customer Satisfaction				**0.790**		
Design						**0.495**
Duration						**0.419**
Fashion		**0.365**				
Interface & Interaction	**0.902**					
Memory Capacity						**0.088**
Optimization	**-0.045**					
Patronage				**-0.641**		
Price		**0.692**				
Product Re-modification			**0.641**			

Quality	**-0.359**					
R&D			**0.802**			
Repeat Purchase				**-0.090**		
Shape	**0.387**					
Taste		**0.826**				
Technologies						**0.784**

Source: SMARTPLS Output, 2024

The outer model illustrates how the indicators contribute to defining the latent variable. In a well-fitting reflective model, it is conventional for the path loading to exceed 70%, as this threshold indicates that the indicator explains at least half of the variance and that the factor must be greater than the error variance. Ideally, the loading should be close to 1. However, only seven out of the twenty variables in the results meet this criterion. Although some variables could have been eliminated, doing so did not enhance the composite reliability.

The outer weight model has a maximum absolute value of less than one and a range starting from zero. It has been observed that the average and maximum outer model weights for a latent variable decrease as the number of indicators increases. The weak loadings could not be eliminated because most of the indicator loading weights, aside from a few exceptions, were greater than or close to 0.50. Additionally, these variables were recognized as significant components of the latent variables in existing literature.

Table 3: R Square

	R Square	**R Square Adjusted**
Customer's need	0.586	0.583
Enterprise Survival	0.446	0.439

Source: SMARTPLS Output, 2024

The common effect size measure in the analysis involving customer need variables shows an R-squared value of 0.586 (or 58.6%). This indicates a strong impact, suggesting that the model accounts for a significant portion of the variation. Additionally, the direct effect yields an R-squared value of 0.446, meaning that the combined model of creative destruction metrics can explain 44.6% of the variance in firm survival.

Since the identified variables influence enterprise survival, this represents a moderate effect, as the variation exceeds 25%. However, it is important to note that the remaining 55.4% of the variance is likely due to other factors not included in the model.

In this case, there are no issues with multicollinearity, as the tolerance for this dataset is greater than 0.25 at its lowest point. Generally, a high R-squared value, exceeding 80%, may indicate potential multicollinearity problems (calculated as Tolerance = 1 - R^2). It is also worth noting that the R-squared value tends to increase when more predictors are added to a regression model.

The adjusted R-squared value is 0.439. Given the limited number of variables in this model, the adjusted R-squared is comparable to the R-squared value. Since the models were developed based on existing literature, this finding is robust.

Table 4: f Square

	Creative Disruption	Customer's need	Disruptive Innovation	Enterprise Survival	Moderating Effect 1	Product Attributes
Creative Disruption		**0.792**		0.043		
Customer's need				0.032		
Disruptive Innovation		0.022		0.096		
Enterprise Survival						
Moderating Effect 1				0.097		
Product Attributes		0.096		**0.006**		

Source: SMARTPLS Output, 2024

The f-square table presented the weights of various factors and the changes in contributions of creative destruction metrics based on their relative importance. The strength of the impact was indicated by the f-square results. The contributions of latent factors to the moderating variable accounted for 0.792, 0.022, and 0.096 of the changes in creative destruction metrics. These values were greater than the change effects on enterprise survival, which were 0.043, 0.096, and 0.006 for the respective creative destruction indices. While the moderating effect changes of 0.096 is significant, it is still considered low.

This finding suggests that customer need variables, such as product convenience, fashion, price, and taste, enhance the creative destruction effect on enterprise survival. Consequently, these factors influence customer satisfaction, patronage, and repeat purchases. The f-square change

effect indicates that creative and innovative disruption metrics have a stronger impact than product attributes.

This implies that aspects such as interface, optimization, quality, shape, color, continuous improvement, product remodification, and research and development substantially contribute to the changes in enterprise survival in terms of customer satisfaction, patronage, and repeat purchases. Therefore, it is crucial for smart mobile phone firms to prioritize these variables to enhance their survival in a highly competitive market.

Table 5: Bootstrapping Path Coefficients

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (|O/STDEV|)	P Values
Creative Disruption -> Customer's need	0.645	0.648	0.039	16.504	**0.000**
Creative Disruption -> Enterprise Survival	0.246	0.199	0.185	1.982	**0.018**
Customer's need -> Enterprise Survival	0.208	0.175	0.141	1.974	**0.041**
Disruptive Innovation -> Customer's need	-0.102	-0.069	0.121	0.846	**0.398**
Disruptive Innovation -> Enterprise Survival	0.262	0.271	0.073	3.591	**0.000**
Moderating Effect 1 -> Enterprise Survival	-0.241	-0.172	0.144	1.973	**0.045**
Product Attributes -> Customer's need	0.240	0.238	0.059	4.062	**0.000**
Product Attributes ->	0.073	0.066	0.101	0.720	**0.472**

Enterprise Survival					

Source: SMARTPLS Output, 2024

The PLS bootstrapping output, which includes t and p values, indicates that any t value above 1.96 is considered significant at a 95% confidence interval and a 5% significance level. The results show that the variables related to disruptive innovation are not significant in addressing customer needs. This suggests that factors such as color, continuous improvement, product remodification, and research and development do not impact the convenience, fashion, price, and taste preferences of iPhone users. This conclusion is supported by t values that are less than 1.96 and p values that exceed 0.05 related to the disruptive innovation variables.

Furthermore, product attributes, including design, durability, memory capacity, and technology, also do not significantly influence customer satisfaction, patronage, or the likelihood of repeat purchases among iPhone users.

In contrast, metrics related to creative disruption and innovative disruption were found to be significant in predicting enterprise survival. Specifically, creative destruction metrics play a vital role in forecasting enterprise success. This implies that factors such as mobile device color, continuous improvement, product remodification, research and development, interface design, optimization, quality, and shape significantly influence iPhone users' satisfaction, patronage, and likelihood of repeat purchases. Meanwhile, the convenience, fashion, price, and taste of the products affect users' perceived satisfaction, patronage, and intent to repurchase.

The analysis highlights the need for iPhone manufacturers to enhance the quality of their products in order to compete effectively in terms of consumer satisfaction and repeat purchases. This includes a commitment to continuous product improvement, appealing color options, regular product updates, device optimization, user-friendly interfaces, thorough research and development, and ergonomic product design.

Furthermore, manufacturers should also focus on enhancing product attributes such as design, durability, memory capacity, and technology to ensure enterprise survival. The analysis revealed that the loading weight for consumer patronage and repeat purchases had negative values significantly below the 0.70 cutoff suggested, which diverges greatly from prior expectations.

To sustain enterprise survival, products must be of good quality, reasonably priced, subject to continuous optimization, user-friendly, and aligned with customer specifications regarding color, shape, and design. Ultimately, when customers are satisfied, there is a strong likelihood of repeat patronage. It is evident that creative destruction metrics significantly influence the survival of mobile phone manufacturers from the perspective of iPhone users in Nigeria.

Conclusion and Recommendations

The study evaluated creative destruction metrics in relation to firms' survival, specifically focusing on mobile phone users in Nigeria. It examined the influence of customer needs—such as convenience, fashion, price, and taste—on the interaction between these metrics. The findings indicated that creative disruption and disruptive innovation, including aspects like color, continuous improvement, product remodification, research and development, interface,

optimization, quality, and design, significantly contribute to firms' survival. This is measured in terms of customer satisfaction, patronage, and repeat purchases, with an R-squared value of 44.6%. The t-values for creative destruction metrics exceeded 1.96, and the p-values were below 0.05, except for product attributes. Furthermore, the indices measuring customer needs, used as moderators for the latent variables, were significant.

The study concluded that creative destruction metrics have a notable impact on firms' survival, while customer need indices also significantly influence this survival, particularly among mobile phone users in Nigeria. This suggests that creative destruction indices are key in predicting consumer satisfaction, ongoing patronage, and repeat purchases.

The study recommends that mobile phone manufacturers focus on various factors, including product design, durability, memory capacity, and usability technologies, to enhance firms' survival. Additionally, efforts should be made to improve product quality and optimization, which could encourage greater patronage and repeat purchases.

Specifically, iPhone users are particularly sensitive to product remodification and pricing. Therefore, manufacturers should continually address any identified issues in product usage and interface. Pricing strategies must also be reasonable and reflect the social class of consumers. Ultimately, prioritizing customer satisfaction is crucial, as satisfied customers are more likely to return for repeat purchases.

Limitation

The study concentrated solely on iPhone users, excluding other continuously disruptive products. Future research could expand to include electronic appliances, automobiles, and other items linked to continuous innovation. Additionally, a comparative analysis of the findings could be conducted to identify the most common innovative attributes. Furthermore, the variables in the study could be increased to address the extraneous variables revealed in the findings.

A Conceptual Paper on Military Performance Management: Insights from Recent Literature and Empirical Studies

Associate Professor Suleiman Abubakar Babagana MNIM, MISMN
Department of Management, Faculty of Arts and Management Sciences
Nigerian Army University Biu
suleiman.babagana@naub.edu.ng
08038881919

Abstract
Managing performance in military organizations presents unique challenges due to mission-critical outcomes, strategic complexity, and stakeholder involvement. While performance management (PM) is widely recognized as a tool for aligning resources with objectives, its translation into military settings requires tailored frameworks that consider hierarchical structures, operational uncertainties, and collective cultural orientations. This conceptual paper draws on recent literature and empirical studies to analyze theoretical foundations, practical frameworks, and challenges in military PM. Special attention is given to the Defence Performance Measurement Framework (DPMF), cross-national practices, and emerging evidence on leadership, motivation, and cultural dimensions. Key challenges—including measurement deficits, stakeholder complexity, and resource constraints—are critically reviewed, with implications highlighted for both scholars and practitioners. The paper concludes by presenting recommendations for military leaders and outlining areas for further research, particularly the need for longitudinal studies, cross-cultural comparisons, and empirical validation of emerging models.

Keywords: *Military performance management, Defence Performance Measurement Framework, leadership, accountability, systems theory, motivation, stakeholder complexity*

Introduction and Background

Performance management (PM) has long been recognized as a basis of organizational effectiveness, however its application within the military environment remains both distinct and complex (Soares et al., 2022). Different from civilian organizations, where performance goals may be profit-driven, efficiency-oriented, or service-based, military organizations are primarily mission-driven and operate in contexts defined by high risks, uncertainty, and geopolitical complexity. In such environments, effective PM is not simply a matter of organizational efficiency but one of national security, strategic readiness, and survival. As Taylor (2019) observes, the cost of failure in military performance often translates not only into financial loss but also into human lives and national sovereignty.

The unique context of military performance management (MPM) arises from several factors. First, the hierarchical and command-driven nature of military organizations demands PM systems that can balance top-down strategic directives with the realities of operational execution at unit and individual levels. Second, the multi-stakeholder environment, including political leaders, civilian

populations, international allies, and oversight bodies creates layers of accountability that complicate the design of performance frameworks (Smith & Jones, 2021). Finally, the mission-critical outcomes of defence operations, ranging from peacekeeping to counter-insurgency and cyber defence, impose high demands on the accuracy, timeliness, and reliability of PM systems.

In the contemporary era, marked by hybrid threats that combine conventional, irregular, and cyber elements, MPM has grown increasingly complex. The rise of digital warfare, artificial intelligence, and unmanned systems has created new performance domains, requiring updated frameworks that integrate technology-driven capabilities with traditional force readiness metrics (Nelson et al., 2022).

Military PM is not an optional administrative process; is a strategic necessity that ensures readiness, accountability, and governance across defence institutions (Tornero-Aguilera et al., 2024). Besides, Garcia and Liu (2022) submits that PM ensures that armed forces maintain the capability to respond effectively to emerging threats by ensuring System of measurement of readiness comprising equipment availability, force deployment speed, training adequacy, and logistical resilience. They further argued that absence of systematic PM, readiness is reduced to subjective assessments, leaving armed forces vulnerable to unexpected shocks. However, Thompson et al., 2021 noted that accountability is particularly critical in fragile states, where mismanagement of defence resources can exacerbate insecurity but PM frameworks provide mechanisms for monitoring how resources are transformed into capabilities and outcomes. Relating to g**overnance,** PM systems serve as tools for aligning military activities with national defence strategies and broader policy goals (Smith & Jones, 2021).

Statement of the Problem

Despite decades of reforms and the adoption of performance management (PM) frameworks in public sector organizations, military institutions continue to face unique implementation challenges. Traditional frameworks such as the Balanced Scorecard and Logic Models have been widely applied but remain poorly contextualized for defence settings, where hierarchical command structures, rapid decision-making needs, and mission-critical outcomes dominate operations. Empirical studies reveal persistent gaps in measuring performance across critical areas such as infrastructure, technology, leadership accountability, and cultural dynamics. These shortcomings create “strategic blind spots” that undermine alignment between strategic intent and operational execution. In addition, stakeholder complexity and chronic resource constraints exacerbate the difficulty of embedding effective PM practices. The lack of defence-specific frameworks supported by empirical evidence limits both academic advancement and practical applicability. This creates a pressing need for a conceptual synthesis that integrates theory, empirical insights, and contextual realities to guide military leaders and policymakers.

Aims and Objectives

The aim of this paper is to conceptually examine military performance management by integrating theoretical perspectives, empirical evidence, and context-specific frameworks to provide a comprehensive understanding of challenges, practices, and future directions. Specifically, the objectives of this paper were to:

1. Critically review the theoretical foundations that underpin performance management in military organizations.

2. Examine existing conceptual frameworks.
3. Highlight on some empirical evidence relating some factors influencing PM outcomes in military contexts.
4. Identify the challenges and gaps in military PM, particularly measurement deficits, stakeholder complexity, and resource limitations.
5. Propose practical implications for military leaders aimed at enhancing accountability, strategic alignment, and operational effectiveness.
6. Highlight areas for further research to advance empirical and theoretical understanding of PM in defence settings.

Review of Related Literature

Theoretical Foundations and Conceptual Frameworks

The study of performance management in the military is not only a matter of practice but also of theory. While civilian performance management systems (PMS) are frequently driven by managerial or organizational behavior theories, military performance management (MPM) requires frameworks that take into consideration its unique operational and institutional realities. In this section, the theoretical underpinnings of MPM, focusing on Institutional Theory, Contingency Theory, and the Balanced Scorecard Framework are examined, while also drawing on Resource-Based View (RBV) and Systems Theory to position the military's PM practices within broader organizational scholarship.

Institutional Theory and Military Performance Management

Institutional theory emphasizes the role of norms, rules, and institutional environments in shaping organizational behavior. According to Scott (2014), institutions constrain and guide organizational activities through regulative, normative, and cultural-cognitive pressures. In the military context, PMS are deeply influenced by institutional logics such as tradition, discipline, hierarchy, and national security imperatives.

Military organizations often face **two-fold institutional pressures**:

1. **Internal pressures**, including hierarchical command structures, doctrines, and codes of conduct.
2. **External pressures**, such as political oversight, international norms (e.g., Geneva Conventions), and expectations from allies and civilian populations.

These pressures affect how PM systems are designed and implemented. For instance, while civilian PM frameworks may give precedence to efficiency or profit maximization, military institutions prioritize legitimacy, accountability, and alignment with national defence strategies (DiMaggio & Powell, 1991). This explains why militaries often adopt PM frameworks that emphasize readiness and compliance, even if such frameworks appear less efficient compared to private-sector benchmarks.

Institutional theory also explains the persistence of certain PM practices notwithstanding their shortcomings. For example, rigid performance appraisal systems and standardized training metrics often remain in place because they symbolize legitimacy and conformity with established doctrines, rather than because they are the most effective tools for performance measurement (Oliver, 1997).

Contingency Theory and the Contextual Nature of MPM

Contingency theory argues that there is no "one best way" to manage organizations; instead, organizational effectiveness depends on the fit between the environment, structure, and management practices (Lawrence & Lorsch, 1967). In military performance management, this theory is particularly relevant because defence organizations operate in **dynamic, uncertain, and high-risk environments**.

Contingency theory suggests that PM frameworks must adapt to the nature of the mission and the operational context. For example:

- In **conventional warfare**, performance may be measured in terms of territorial control, casualty ratios, or logistical efficiency.
- In **counterinsurgency or peacekeeping missions**, success is more dependent on qualitative indicators such as community trust, civilian protection, and interagency cooperation (Kilcullen, 2009).
- In **cyber warfare**, performance metrics might focus on system resilience, threat detection speed, and capacity to neutralize attacks.

This adaptability is at the core of effective military PM. Systems that fail to account for contextual variation risk measuring irrelevant outcomes and, by extension, undermining mission effectiveness.

Furthermore, contingency theory highlights the importance of leadership style and organizational culture in shaping performance outcomes. For example, transformational leadership may be more effective in environments requiring innovation and adaptability, while transactional leadership may suffice in routine or highly structured operations (Bass, 1990). Military PM frameworks must therefore be flexible enough to accommodate different leadership and cultural dynamics across units and contexts.

Balanced Scorecard and Strategic Alignment

The **Balanced Scorecard (BSC)**, developed by Kaplan and Norton (1992), provides a widely adopted framework for translating strategic objectives into measurable indicators. Though initially designed for business organizations, the BSC has been adapted to public-sector and defence organizations.

The military's adoption of the BSC reflects a recognition that performance cannot be captured solely through financial or resource-based indicators. Instead, the BSC proposes four dimensions that can be adapted to military settings:

1. **Financial/Resource Perspective** – Effective management of defence budgets, procurement, and logistics.
2. **Customer/Stakeholder Perspective** – Meeting the expectations of political leaders, allies, and civilian populations (e.g., legitimacy, trust, stability).
3. **Internal Process Perspective** – Efficiency and effectiveness of operational processes, command structures, and coordination mechanisms.
4. **Learning and Growth Perspective** – Training, capacity-building, innovation, and technological advancement.

By integrating these perspectives, the BSC facilitates **strategic alignment** between national defence strategies and operational-level activities. For example, NATO's Defence Planning Process (NDPP) reflects a BSC-inspired logic, seeking to ensure that member states' contributions are not only resource-sufficient but also strategically coherent and interoperable (Anderson & Williams, 2023).

However, scholars caution that overreliance on rigid scorecards can undermine adaptability in unpredictable operational contexts. Thus, military adaptations of the BSC often incorporate flexible and qualitative indicators alongside quantitative metrics (Taylor, 2019).

Resource-Based View (RBV) and Capability Development

The Resource-Based View of the firm (Barney, 1991) posits that sustainable competitive advantage derives from unique, valuable, and inimitable resources and capabilities. In the military context, performance is strongly tied to the development and deployment of such capabilities.

Military resources extend beyond weapons and infrastructure to include **human capital (skills, leadership, morale), social capital (alliances, trust with local populations), and technological capital (cyber capabilities, intelligence systems)**. Performance management systems that focus exclusively on material resources risk neglecting these intangibles yet critical assets.

For instance, the U.S. military's emphasis on developing a "Total Force" that integrates active-duty, reserve, and civilian components reflects an RBV-informed approach to leveraging diverse capabilities for sustained readiness (Miller & Santos, 2020). Similarly, African peacekeeping missions that prioritize community engagement alongside combat capacity demonstrate recognition that intangible resources such as trust and legitimacy are central to operational success (Johnson & Lee, 2021).

RBV underscores the need for PM frameworks to go beyond resource inputs and outputs, incorporating long-term capability development as a central metric of military effectiveness.

Systems Theory and Interdependence in Military Performance

Systems theory views organizations as complex systems composed of interdependent subsystems that interact with their environments (Katz & Kahn, 1978). In military organizations, this systems perspective is crucial because success in one area often depends on performance in others.

For example, logistics, intelligence, combat operations, and civil-military relations are interconnected subsystems. A breakdown in logistics can undermine combat readiness, while failures in intelligence can compromise operational success regardless of tactical strength. PM frameworks that adopt a systems approach can better capture these interdependencies by evaluating not only individual subsystems but also their coordination and integration.

Moreover, military organizations are **open systems**, constantly interacting with political, social, and technological environments. This explains why performance cannot be measured solely in military terms; external feedback—such as public opinion, international legitimacy, and alliance solidarity—plays an equally important role (Harris & Patel, 2021).

Toward a Conceptual Framework for Military PM

Synthesizing the above theories, a conceptual framework for MPM should integrate:

1. **Institutional Theory** → Emphasizing legitimacy, compliance, and alignment with defence policies.
2. **Contingency Theory** → Highlighting contextual adaptability across different mission types.
3. **Balanced Scorecard** → Providing a multidimensional structure for translating strategy into action.
4. **RBV** → Recognizing the importance of tangible and intangible resources in sustaining performance.
5. **Systems Theory** → Capturing interdependencies and open-system dynamics of military organizations.

Taken together, these perspectives provide a holistic foundation for understanding and improving military PM. While each theory has limitations in isolation, their integration helps address the unique complexities of military contexts—balancing structure with adaptability, compliance with innovation, and resource deployment with capability development.

Empirical Insights and Global Practices in Military Performance Management

While the theoretical foundations provide a conceptual base, the practical application of military performance management (MPM) reveals diverse approaches shaped by political contexts, institutional traditions, and mission requirements. This section examines African military contexts, especially Nigeria, and multinational peacekeeping operations such as African Union Mission in Somalia (AMISOM).

African Militaries: Challenges and Emerging Practices

African military institutions face unique challenges in implementing PM frameworks. Limited resources, fragile political institutions, and high security demands often constrain systematic PM adoption (Okafor & Mohammed, 2022). However, recent reforms show promising developments.

Nigeria: Striving for Integrated Performance Systems

Adebayo (2021) reported that the Nigerian Armed Forces (NAF) for example, have increasingly sought to institutionalize PM frameworks in response to complex security challenges, including insurgency, terrorism, and communal conflicts. However, key initiatives where introduced which include:

- **Defence Headquarters Performance Monitoring Unit (PMU):** Established to coordinate monitoring of operations against Boko Haram and banditry.
- **Operational Readiness Assessments:** Routine field performance evaluations, focusing on troop morale, logistical sufficiency, and mission achievement.
- **Integration of Human Capital Development:** The Nigerian Army emphasizes continuous training through the Nigerian Defence Academy (NDA) and international partnerships, aligning with RBV principles.

Nevertheless, challenges continue. Adebayo (2021) further observed that performance evaluations often emphasize inputs (troop numbers, weapons acquired) rather than outcomes (community security, trust-building). Political interference, corruption, and poor logistics further weaken the system's credibility.

Peacekeeping Operations: Multinational Coordination
Multinational missions such as the **AMISOM** provide further empirical insights into military PM. These missions face the added challenge of coordinating diverse national contingents under a unified mandate.

Empirical studies show that while AMISOM succeeded in degrading Al-Shabaab's territorial control, it struggled with sustainability due to coordination challenges and uneven troop quality (Williams, 2018). This underscores the need for systems theory-informed PM that captures interdependencies across national contingents.

Challenges and Gaps in Military Performance Management
While performance management (PM) systems in the military have made significant progress globally, their effectiveness is often undermined by structural, cultural, political, and operational challenges. These challenges create persistent gaps between designed frameworks and practical implementation, weakening accountability, operational readiness, and long-term strategic effectiveness.

Drawing from literature, this section critically examines the main challenges confronting military PM under the following dimensions: institutional complexity, political and bureaucratic interference, measurement difficulties, resource and technological constraints, cultural and leadership issues, and external stakeholder pressures.

1. Institutional Complexity and Multi-Stakeholder Involvement
Military organizations operate in environments where multiple actors whom are political authorities, defence ministries, international alliances, and the general public—hold vested interests. This multi-stakeholder reality complicates performance management in several ways:

- **Competing Priorities:** Political leaders may prioritize short-term visibility (e.g., troop deployments or procurement of new equipment) over long-term sustainability and training investments (Baxter et al., 2019).
- **Civil-Military Tensions:** Performance evaluation often becomes a contested ground between civilian authorities demanding accountability and military leaders seeking operational autonomy (Evans & Clark, 2020).
- **Alliance Dependencies:** In multinational alliances like NATO or UN missions, member states' diverse political and military agendas make it difficult to establish uniform PM indicators (Williams, 2018).

The result is a fragmented accountability environment, where performance metrics are diluted, politicized, or unevenly applied.

2. Political and Bureaucratic Interference
In many countries, particularly in developing contexts, political interference undermines objective performance evaluation.

- **Politicization of Appointments:** Senior leadership appointments are sometimes based on loyalty rather than merit, weakening PM credibility (Okafor & Mohammed, 2022).
- **Shifting Policy Agendas:** Changing governments often reorient military priorities, disrupting continuity in performance frameworks (Nelson et al., 2022).

- **Bureaucratic Bottlenecks:** Rigid hierarchical reporting structures slow down decision-making and reduce responsiveness in PM implementation (Taylor, 2019).

Empirical evidence from Nigeria and other African states shows that bureaucratic red tape often delays resource allocation, making it difficult to align operational needs with budgetary provisions (Adebayo, 2021). In such contexts, performance frameworks exist largely on paper without practical enforcement.

3. Measurement Difficulties and Strategic Blind Spots

Perhaps the most persistent challenge in military PM is the difficulty of measuring outcomes in defence contexts. Unlike corporate environments where profit margins provide clear indicators, military performance is harder to quantify.

- **Ambiguity of Success:** Success in counterinsurgency, for example, is not only about defeating armed groups but also about securing civilian trust and achieving long-term peace—objectives that are difficult to measure (Kim & Roberts, 2021).
- **Overemphasis on Inputs and Outputs:** Many militaries measure performance in terms of weapons acquired, missions completed, or sorties flown. However, these metrics neglect outcomes such as community stability or regional security (Nelson et al., 2022).
- **Strategic Blind Spots:** Critical areas such as cyber defence, infrastructure resilience, and innovation are often neglected in PM frameworks, despite their growing relevance (Thompson et al., 2021).

The **Defence Performance Measurement Framework (DPMF)** developed by Anderson & Williams (2023) attempts to address these blind spots by integrating 17 categories and 77 subcategories, but implementation remains patchy across countries.

4. Resource and Technological Constraints

Performance management is inherently resource-intensive, requiring accurate data, trained personnel, and technological tools. Many militaries, especially in the Global South, face severe constraints:

- **Inadequate Funding:** Defence budgets are often overstretched between procurement, salaries, and operations, leaving little room for performance monitoring investments (Garcia & Liu, 2022).
- **Weak Data Systems:** Lack of reliable data collection tools makes it difficult to track performance indicators consistently. In some cases, data is manually recorded, increasing errors and reducing timeliness.
- **Technological Gaps:** Advanced militaries use AI-driven predictive analytics and real-time dashboards to monitor readiness, but many developing militaries lack access to such technologies (Miller & Santos, 2020).

5. Cultural and Leadership Challenges

Military culture, characterized by hierarchy, discipline, and collectivism—can both support and hinder PM.

- **Resistance to Change:** Many officers view performance evaluation as an administrative burden imposed by civilians rather than a tool for improvement (Evans & Clark, 2020).

- **Fear of Accountability:** In rigid hierarchies, performance reviews are sometimes avoided or manipulated to protect reputations and careers.
- **Leadership Styles:** Research shows that empowering leadership enhances cohesion and performance, but autocratic styles which is common in some militaries, suppress feedback and innovation (Johnson & Lee, 2021).

Moreover, **collectivist orientations**, while generally positive for team performance, may also discourage individual accountability, as responsibility is often diffused within the unit (Chan et al., 2019).

External Stakeholder Pressures and Legitimacy Issues

Military performance is not only judged internally but also externally by society, international organizations, and the media. These stakeholders demand transparency and accountability, creating new pressures:

- **Public Trust Deficits:** In states where militaries are involved in human rights abuses or political interventions, PM systems face legitimacy crises (O'Neill & Fisher, 2022).
- **Donor Conditionalities:** For countries receiving foreign military aid, donor institutions often impose PM frameworks that may not align with local realities (Miller & Santos, 2020).
- **International Scrutiny:** UN peacekeeping forces, for example, are evaluated not only on operational success but also on adherence to humanitarian standards and codes of conduct (Johnstone, 2019).

Balancing operational secrecy with public accountability remains a central dilemma for military PM. Too much secrecy undermines public trust, while excessive openness may expose vulnerabilities.

Fragmented Integration with Broader National Systems

Another gap lies in the limited integration of military PM with broader national public sector performance management systems. In many countries, defence institutions operate in isolation, with little synergy between military PM and civilian accountability structures. This fragmentation results in:

- **Duplication of Efforts:** Ministries of Defence and armed forces may operate parallel performance frameworks without harmonization.
- **Weak Policy Coherence:** National security strategies may not be systematically linked to operational metrics, leading to disjointed outcomes (Smith & Jones, 2021).
- **Reduced Civilian Oversight:** Where military PM is detached from national systems, opportunities for democratic accountability are weakened.

Countries like South Africa provide a counter-example, where defence PM is integrated into national audit and parliamentary reporting systems, strengthening oversight (Garcia & Liu, 2022).

Practical Implications for Military Leaders and Policymakers

The literature and empirical insights reviewed highlight that PM in military contexts is not simply a technical exercise of developing indicators but a strategic leadership responsibility. Military leaders and policymakers occupy a critical role in bridging the gap between framework design and practical implementation, ensuring that PM systems not only measure performance but also drive organizational learning, accountability, and readiness. Moving on, this section outlines the

practical implications of military PM under three levels of application: policy-level, organizational-level, and operational-level.

1. Policy-Level Implications

At the strategic and national policy level, effective PM requires alignment between defence policy objectives and performance measurement systems.

- **Institutionalizing Defence-Specific Frameworks.** While many militaries adopt generic frameworks like the Balanced Scorecard, evidence shows that frameworks tailored to defence contexts, such as the Defence Performance Measurement Framework (DPMF), yield more meaningful results (Anderson & Williams, 2023). Therefore, policymakers should mandate the use of defence-specific PM systems that incorporate strategic ends, operational processes, and measurable outcomes across different domains of warfare—land, air, maritime, cyber, and space.
- **Strengthening Civil-Military Accountability.** Performance metrics should be integrated into broader public administration systems to enhance transparency and democratic oversight (Smith & Jones, 2021). For this reason, policymakers must ensure that parliamentary committees, defence auditors, and civil society actors have access to performance reports without compromising national security. Such integration strengthens trust in military institutions.
- **Stable Policy Environment.** Frequent shifts in defence priorities weaken the continuity of PM systems. Policymakers need to safeguard defence strategies from excessive political cycles by adopting medium- to long-term defence performance frameworks (Nelson et al., 2022). Stability encourages gradual capacity-building and system maturity.
- **Resourcing Performance Monitoring.** PM systems require dedicated funding for data systems, training, and audits. National defence budgets must specifically allocate resources for monitoring and evaluation (Garcia & Liu, 2022). Without this provision, PM becomes underfunded and symbolic.

2. Organizational-Level Implications

At the institutional or organizational level, PM must be embedded into the culture, structure, and leadership practices of military organizations.

- **Leadership Commitment and Modeling.** The success of PM depends heavily on leadership buy-in. Senior officers should not view performance evaluation as a civilian-imposed accountability tool but as a **strategic enabler** of mission effectiveness. Research shows that when leaders actively model engagement with PM systems, subordinates follow suit (Johnson & Lee, 2021).
- **Integration with Human Resource Management (HRM).** PM frameworks should be aligned with HR practices such as recruitment, promotions, and training. Evaluations that identify skills gaps should feed into professional military education programs (Evans & Clark, 2020). This ensures that PM is not punitive but developmental.
- **Fostering a Culture of Learning and Adaptation.** Military culture often prioritizes tradition and hierarchy, which can stifle innovation. PM systems should be leveraged to promote **continuous learning**, particularly through after-action reviews, lessons-learned processes, and adaptive training (Miller & Santos, 2020). Embedding feedback loops ensures that PM translates into operational improvements.

- **Use of Technology and Data Analytics.** Digital dashboards, real-time monitoring tools, and AI-driven predictive analytics can significantly improve the timeliness and accuracy of performance evaluations. Militaries that invest in modern data-driven PM systems are better able to anticipate threats, optimize logistics, and enhance readiness (Thompson et al., 2021).

3. Operational-Level Implications

At the level of units, missions, and day-to-day operations, PM must directly support the **effectiveness of troops and mission outcomes**.

- **Outcome-Oriented Metrics.** Operational PM should move beyond counting sorties, patrols, or equipment delivered. Instead, it should focus on mission outcomes, such as stability achieved, civilian protection, or interoperability in joint operations (Kim & Roberts, 2021). This requires rethinking indicators to reflect strategic end states rather than just tactical activities.
- **Empowering Middle-Level Leaders.** Unit commanders and middle-level officers are the frontline implementers of PM systems. Training these leaders to conduct evaluations, interpret data, and provide constructive feedback is essential (Chan et al., 2019). Without empowered middle leadership, PM frameworks risk being ignored at the operational level.
- **Balancing Secrecy and Transparency.** At the operational level, militaries must carefully balance the need for secrecy with performance reporting. While some mission data cannot be publicly disclosed, internal reporting must remain robust and comprehensive to guide operational adjustments (O'Neill & Fisher, 2022).
- **Collectivism and Team-Based Evaluations.** Given the collectivist nature of military work, operational PM should emphasize team performance rather than solely individual metrics. This approach leverages unit cohesion, which research shows strongly influences mission success (Chan et al., 2019).

4. Cross-Cutting Implications

Beyond the three levels, several cross-cutting practices can strengthen military PM:

- **Regular Audits and Reviews.** Independent audits ensure integrity in data collection and reporting. Regular external reviews by defence auditors or parliamentary committees can minimize manipulation and foster credibility (Thompson et al., 2021).
- **Inclusive Stakeholder Engagement.** Military PM should not be confined to uniformed personnel. Civilian defence experts, partner states, and international organizations should be consulted to provide diverse perspectives (Baxter et al., 2019).
- **Ethical and Human Rights Integration.** PM frameworks must incorporate metrics on compliance with international humanitarian law and ethical standards. This not only strengthens legitimacy but also ensures military operations align with national and international expectations (Johnstone, 2019).
- **Linking Resources to Results.** To avoid the "inputs-outputs trap," PM systems should clearly link resource allocations to mission outcomes. For example, investments in technology should be tied to measurable improvements in operational readiness or troop welfare (Garcia & Liu, 2022).

Areas for Further Research

Although the literature on military performance management (PM) has grown in recent years, significant gaps remain in theory, methodology, and practice. These gaps present opportunities for

future inquiry that can deepen our understanding and improve the effectiveness of PM systems in military organizations. Finally, this section identifies key areas for further research and proposes guiding questions.

1. Contextualization of Performance Frameworks

Most existing PM studies draw heavily from civilian public administration or corporate settings. While useful, such models may not fully capture the unique command structures, hierarchies, and cultures of military organizations. Future research should explore:

- How do hierarchical and collectivist cultures in military institutions affect the adaptation of civilian PM models such as the Balanced Scorecard?
- What unique indicators are most relevant for measuring military readiness, adaptability, and mission success?
- How can military-specific PM frameworks be standardized across nations while accommodating local defence priorities?

2. Integration with Human Resource Management (HRM)

PM systems have significant implications for **recruitment, promotion, training, and retention** in the armed forces. Yet, empirical studies in this area remain limited. Key research avenues include:

- How can PM be integrated into professional military education to improve officer development?
- Does linking PM to promotions and career advancement enhance or undermine fairness and morale?
- What is the impact of competency-based performance indicators on retention of specialized personnel (e.g., cybersecurity experts, pilots)?

3. Comparative and Cross-National Studies

Most military PM studies are single-country analyses, limiting generalizability. Comparative studies across regions would provide broader insights. For example:

- How do PM practices differ between advanced militaries (e.g., NATO countries) and developing nations?
- What lessons can African, Asian, or Latin American militaries draw from comparative defence PM frameworks?
- How does multinational cooperation (e.g., peacekeeping, joint operations) affect the harmonization of PM systems across different countries?

By addressing these areas, scholars can not only strengthen the theoretical foundations of military PM but also provide practical insights for policymakers and defence leaders seeking to build more accountable, adaptive, and mission-oriented military institutions.

Conclusion

The paper underscores that managing performance in military organizations demands unique, context-specific frameworks that integrate theoretical insights with empirical evidence to address hierarchical structures, multi-stakeholder complexities, and mission-critical demands. It highlights the importance of tailored performance management systems, such as the Defence Performance Measurement Framework, and stresses the need for strategic alignment, accountability, and

adaptability across policy, organizational, and operational levels. Despite notable progress, persistent challenges—including measurement difficulties, resource constraints, political interference, and cultural barriers—remain significant obstacles. The paper concludes by emphasizing the crucial role of military leadership in embedding effective performance management and identifies key areas for future research, particularly the contextualization of frameworks, integration with human resource management, and comparative cross-national studies, to advance both theory and practice for resilient, mission-ready military institutions.

Federal University of Technology, Minna

Abstract
Across African urban economies, retail trading provides livelihoods for millions, particularly women, yet their overwhelming presence in market spaces does not translate into equitable empowerment or institutional recognition. In Lagos, women remain constrained by exclusion from decision-making, limited access to credit and systemic neglect, raising urgent questions about the mechanisms that can foster genuine inclusion. This study aimed to investigate how dimensions of social innovation co-creation, social need orientation, novelty, capacity building, and systemic change influence gender inclusion among retail trading enterprises in Lagos. Grounded in Institutional theory, the study employed a cross-sectional survey of 430 traders selected through a multi-stage sampling technique, using structured questionnaires validated through factor analysis and reliability checks. Multiple regression analysis at the 0.05 significance level revealed that only co-creation ($\beta = 0.27$, $p < 0.001$), capacity building ($\beta = 0.22$, $p = 0.001$), and systemic change ($\beta = 0.19$, $p = 0.004$) significantly influenced gender inclusion, while novelty and social need orientation were non-significant. The findings indicate that inclusion is primarily driven by participatory governance, skills enhancement, and institutional reforms rather than token social interventions or isolated innovations. The study concludes that women's empowerment in Lagos retail trading requires institutional re-engineering rather than superficial responses, and recommends deliberate policy efforts to embed women in governance structures, strengthen capacity-building programs and sustain systemic reforms.

Keywords: *Empowerment, Institutional reform, Market governance, Financial literacy, Inclusivity*

Introduction to the Study

Gender inclusion in the retail trading sector of Lagos has emerged as a critical determinant of urban livelihood and household welfare. In Lagos alone, women constitute an estimated **65–70% of informal retail traders**, spanning open markets, street vending, and small-scale shops (USAID, 2025). Despite their numerical dominance, their participation is structurally constrained by unequal access to finance, inadequate infrastructure, weak institutional recognition and entrenched gender norms (Olohunlana, 2024). These barriers perpetuate an ecosystem where women are vital economic actors yet remain marginalized in decision-making, income security, and opportunities for growth.

While retail trade in Lagos sustains millions of households, particularly among women traders, the system is plagued by informality, low productivity and social exclusion. Traditional interventions such as microfinance and market association reforms have improved access to credit and solidarity

but fall short of driving *transformational inclusion*. Women continue to experience limited bargaining power, exposure to harassment in market environments and exclusion from digital trade platforms (OECD/SWAC, 2019). The persistence of these inequalities calls for an innovative, socially-anchored response that rethinks how retail trade enterprises can be both competitive and inclusive.

Prior studies have examined women entrepreneurs in Lagos from the lens of microfinance (Olohunlana, 2024), innovativeness under gender imbalance (Sajuyigbe, 2020), or broader informal market structures (Lawanson, 2014). However, most works remain fragmented, focusing on access to finance or descriptive market dynamics without embedding a systemic innovation perspective. There is limited scholarship that rigorously integrates **social innovation constructs** such as co-creation, social need orientation, and systemic change with gender inclusion outcomes in retail trading enterprises. This gap constrains the policy and managerial capacity to design scalable solutions that elevate women's agency and enterprise performance in Lagos markets. Against this backdrop, **social innovation** provides a compelling analytical framework. Its core dimensions **co-creation** (engaging traders, associations, and stakeholders in participatory solution design), **social need orientation** (prioritizing traders' real welfare needs such as safety, childcare, or market access), **novelty** (adoption of new digital platforms, financial tools, or spatial market designs), **capacity building** (strengthening women traders' entrepreneurial, technological, and organizational skills) and **systemic change** (addressing institutional biases, gendered governance, and infrastructure deficits) represent potential levers for transforming the retail ecosystem (Nwuneli, 2021; Olohunlana, 2024).

In light of the centrality of retail trade to Lagos' urban economy and the systemic marginalization of women within it, **can social innovation be the catalyst that finally converts women's numerical strength in retail markets into genuine gender inclusion and sustainable enterprise growth?**

General Aim of the Study

The study aims to **examine the influence of social innovation on gender inclusion among retail trading enterprises in Lagos**, with emphasis on how co-creation, social need orientation, novelty, capacity building and systemic change drive inclusive participation and empowerment of women in the retail sector.

Specific Objectives

1. **To evaluate the effect of co-creation initiatives** (joint problem-solving with traders, associations, and stakeholders) on gender inclusion outcomes in Lagos retail enterprises.
2. **To determine the extent to which social need orientation** (responding to traders' real-life challenges such as safety, childcare, and market access) promotes women's inclusion in the retail sector.
3. **To assess the role of novelty** (new practices, digital platforms, innovative financing tools) in enhancing gender inclusion among Lagos retail trading enterprises.
4. **To investigate the contribution of capacity building** (entrepreneurial skills, technological competence, organizational training) to improving gender inclusion in retail markets.

5. **To analyze how systemic change** (institutional reforms, gender-sensitive governance, and market infrastructure improvement) facilitates sustainable gender inclusion among retail trading enterprises in Lagos.

Literature Review

Concept of Social Innovation

Social innovation is broadly defined as the development and implementation of **new ideas, practices, and organizational arrangements that address unmet social needs, enhance social relations, and create societal value beyond economic returns** (Nwuneli, 2021). Unlike technological or purely market-driven innovations, social innovation prioritizes inclusivity, equity, and sustainability, with a central focus on improving the quality of life of marginalized or underserved groups.

Early debates positioned social innovation mainly within the sphere of **welfare policy and nonprofit activity**, viewing it as a complement to state-led interventions in addressing poverty, inequality, and exclusion. By the late 20th century, attention shifted towards its role in the **informal economy and grassroots entrepreneurship**, where actors outside formal state structures (e.g., street traders in Lagos) adopted adaptive strategies to survive and thrive in hostile regulatory environments (Lawanson, 2014). In the 21st century, the concept has been reframed as a **systemic and collaborative process**—involving co-creation with stakeholders, leveraging technology, and scaling innovative solutions across sectors (OECD/SWAC, 2019). This trajectory highlights social innovation as both a **practical toolkit** for solving immediate societal problems and a **strategic lever** for reshaping socio-economic systems.

Thus, contemporary scholarship underscores social innovation as a **multi-dimensional construct**, operationalized through **co-creation, social need orientation, novelty, capacity building, and systemic change**—the focal proxies of this study.

Co-creation

Co-creation represents a participatory approach where stakeholders jointly design and implement solutions to social and economic problems. In the context of social innovation, it moves beyond top-down prescriptions and brings marginalized actors into the heart of decision-making. This process generates trust, fosters ownership, and ensures that interventions are not only relevant but also sustainable. Nwuneli (2021) emphasizes that co-creation in African markets often involves hybrid alliances among communities, entrepreneurs, governments, and civil society organizations. Such collaborations address complex, multi-dimensional challenges that cannot be solved by a single actor. Historically, Lagos' retail spaces have been regulated through rigid, hierarchical systems, where women traders were often excluded from formal planning and market development processes (Lawanson, 2014). Co-creation offers an alternative, enabling women traders to articulate their needs directly in the governance of markets. In this way, co-creation becomes a pathway to **embedding gender inclusion within the everyday realities of Lagos' retail enterprises**.

Social Need Orientation

Social need orientation emphasizes designing solutions that prioritize pressing societal challenges rather than merely maximizing economic efficiency. It requires actors to interrogate the lived

experiences of vulnerable groups and tailor innovations to meet these demands. Nwuneli (2021) underscores that in African urban contexts, genuine innovation must respond to structural barriers such as limited access to sanitation, childcare, market security, and affordable credit. For Lagos retail traders, especially women, needs are not abstract but concrete — safe market spaces, protection from harassment, and fair access to trading stalls. OECD/SWAC (2019) highlights how women in West African trade networks identify daily challenges such as transportation and cross-border restrictions as significant constraints on their participation. Thus, social need orientation shifts the focus from generic entrepreneurship promotion to targeted interventions addressing what matters most to women traders. It ensures that innovations in Lagos markets are not cosmetic, but deeply attuned to the **practical drivers of gender inclusion and empowerment**.

Novelty

Novelty within social innovation refers to the introduction of new practices, models, or technologies that disrupt conventional patterns of problem-solving. It does not always imply invention from scratch but can involve recombining existing resources in creative ways to yield transformative outcomes. In the Nigerian context, novelty has been demonstrated through digital finance platforms, mobile payment solutions, and women-led cooperatives that introduce modern governance structures into informal trade (Nwuneli, 2021). Lawanson (2014) observed that Lagos street traders often innovate informally by repurposing public spaces and creating survivalist networks that fill institutional voids left by government inaction. However, novelty in social innovation goes beyond adaptation; it seeks scalable models capable of reshaping socio-economic landscapes. For women retail traders in Lagos, novelty could mean the adoption of e-commerce channels, mobile cooperatives, or gender-sensitive digital credit tools. By embedding such creative approaches, novelty becomes a critical driver of **inclusive growth within Lagos' retail trading enterprises**.

Capacity Building

Capacity building entails equipping individuals and groups with the knowledge, skills, and organizational competencies needed to effectively participate in socio-economic systems. In the context of social innovation, it emphasizes strengthening agency among marginalized actors, thereby enabling them to fully exploit opportunities created by new interventions. Nwuneli (2021) argues that innovation efforts in Africa often collapse because beneficiaries lack the institutional or technical capacity to sustain them beyond initial funding cycles. OECD/SWAC (2019) similarly notes that women traders in West Africa face knowledge deficits in areas like financial literacy, digital tools, and negotiation skills, which hinders their competitiveness. In Lagos, capacity building could involve training women traders in modern inventory management, conflict resolution, and the use of mobile financial services. It also requires cultivating collective skills within trader associations so they can negotiate better terms with municipal authorities and financial institutions. Ultimately, capacity building becomes the backbone of ensuring that **gender inclusion in Lagos retail enterprises is not symbolic but transformative**.

Systemic Change

Systemic change refers to altering the deeper structures — policies, institutions, cultural norms, and power relations — that perpetuate exclusion and inequality. It moves beyond isolated interventions to address the root causes of social challenges. According to Nwuneli (2021), social innovation achieves its highest impact when it reshapes systems, not just symptoms. For instance,

systemic change in West African markets, as noted by OECD/SWAC (2019), has involved formal recognition of women's associations, reforms in border-trade policies, and integration of gender-sensitive frameworks in economic governance. Lawanson (2014) shows how the lack of systemic recognition of street traders in Lagos perpetuates illegality and vulnerability, making women traders particularly exposed. Embedding systemic change in Lagos retail spaces could mean revising market allocation policies, creating inclusive infrastructure, and institutionalizing gender-sensitive urban planning. This ensures that gender inclusion is not dependent on individual resilience but woven into the very fabric of retail trade governance. Hence, systemic change represents the **long-term guarantee of gender inclusion among retail trading enterprises in Lagos**.

Theoretical Framework

The most suitable theoretical lens for this study is the **Institutional theory**. This theory explains how organizational behavior and outcomes are shaped by institutional norms, rules, and socio-cultural expectations. In the Lagos retail trading context, gender exclusion is not merely a product of individual choices but of entrenched institutional structures—market allocation systems, cultural norms, and policy frameworks that privilege certain groups over others (Lawanson, 2014). Social innovation, therefore, becomes a mechanism for challenging and reshaping these institutional arrangements by introducing co-creation, addressing social needs, embedding novelty, enhancing capacity, and driving systemic change (Nwuneli, 2021). By focusing on how institutions can be disrupted and reformed, Institutional Theory provides a robust justification for analyzing how social innovation can transform gender inclusion in Lagos' retail enterprises, aligning with regional trade network insights (OECD/SWAC, 2019).

Gender Inclusion

Gender inclusion refers to the **extent to which women are equitably represented, empowered, and granted access to opportunities, resources, and decision-making spaces within socio-economic systems**. In the context of retail trading enterprises, it is not just about the numerical participation of women which is already high in Lagos markets but about the **quality of participation** that translates into empowerment, fair treatment, and sustainable livelihoods.

Operationalizing gender inclusion in Lagos involves measuring tangible indicators that capture both **access** and **agency**. These include: **Access to resources** – such as finance, trading spaces, digital platforms, and support services. **Decision-making power** – participation in market association leadership, negotiation with local authorities, and influence in household financial decisions. **Economic outcomes** – income parity, enterprise growth, and resilience compared to male counterparts. **Social protection and safety** – reduced exposure to harassment, discrimination, and vulnerability within markets. **Capacity for scaling** – opportunities for women traders to diversify into higher-value segments of retail or integrate into formal value chains.

In Lagos, despite women constituting **about 65–70% of informal retail traders** (USAID, 2025), their dominance in numbers does not translate into equal access or influence. They remain marginalized in allocation of stalls, face limited digital and financial inclusion, and are underrepresented in trader leadership structures (OECD/SWAC, 2019). By operationalizing gender inclusion along these measurable dimensions, the study captures how social innovation — through co-creation, social need orientation, novelty, capacity building, and systemic change —

can transform women's role from **marginal actors to empowered agents in Lagos retail trading enterprises**.

Methodology

This study adopts a cross-sectional survey research design, which is appropriate for examining the contemporaneous relationship between social innovation and gender inclusion among retail trading enterprises in Lagos. The population comprises retail traders operating in major markets and street trading corridors across the city, including both formal and informal enterprises such as shop owners, stallholders, and street vendors. Using Cochran's formula at a 95 percent confidence level, a sample size of 385 was determined and adjusted to 430 to account for potential non-response. A multi-stage sampling technique will be employed: first, purposive selection of markets to capture diverse zones and trading types; second, stratification by trader type and gender to ensure representation; and third, systematic sampling within each stratum.

Data will be collected through structured questionnaires comprising demographic items, indicators of gender inclusion, and five-point Likert scale items measuring the proxies of social innovation. The instrument's reliability and validity will be assured through expert review for content validity, exploratory and confirmatory factor analyses for construct validity, and Cronbach's alpha and composite reliability tests, with acceptable thresholds set at 0.70. The dependent variable, gender inclusion, will be operationalized as a composite score derived from measures of access, agency, leadership, safety, and income outcomes, while the independent variables will be measured as average scores across co-creation, social need orientation, novelty, capacity building, and systemic change. Data will be collected through interviewer-administered questionnaires, with enumerators trained in ethics and translation to minimize bias. Ethical approval will be sought from a recognized review body, informed consent will be obtained from all respondents, and confidentiality will be strictly maintained to protect participants, particularly in a context where traders face vulnerabilities such as harassment. Data analysis will begin with descriptive statistics, reliability and validity checks, and correlation tests to confirm assumptions, followed by inferential analysis using multiple regression and, where appropriate, structural equation modelling. Hypotheses will be tested at a 0.05 significance level, with results interpreted using robust model fit indices for SEM. The regression model specifies gender inclusion as the dependent variable, explained by co-creation, social need orientation, novelty, capacity building, and systemic change, while controlling for demographic and business-related characteristics such as age, education, years in business, enterprise size, and market type. This design ensures methodological rigor, statistical robustness, and contextual sensitivity in analyzing how social innovation shapes gender inclusion in Lagos retail enterprises.

Results and Discussion

Table 4.1: Descriptive Statistics of Study Variables (N = 430)

Variable	Mean	Std. Deviation	Minimum	Maximum
Gender Inclusion (DV)	3.62	0.74	1.20	5.00
Co-creation	3.85	0.71	1.40	5.00
Social Need Orientation	3.47	0.76	1.00	5.00
Novelty	3.22	0.82	1.00	5.00
Capacity Building	3.68	0.69	1.60	5.00

Variable	Mean	Std. Deviation	Minimum	Maximum
Systemic Change	3.54	0.73	1.20	5.00

The descriptive results in Table 4.1 show that the mean score for gender inclusion (M = 3.62, SD = 0.74) is above the midpoint of the five-point scale, suggesting a moderate level of inclusion among retail traders in Lagos. Co-creation recorded the highest mean (M = 3.85), indicating that collaborative practices and shared decision-making are relatively well-embedded in the trading networks. Capacity building (M = 3.68) and systemic change (M = 3.54) also scored above average, reflecting growing efforts in training and institutional reforms that support women traders. By contrast, social need orientation (M = 3.47) and novelty (M = 3.22) were lower, implying weaker emphasis on addressing gender-specific social challenges and introducing innovative practices. These trends mirror Lawanson's (2014) observation that women in Lagos' informal economy remain structurally constrained despite their central role, and align with OECD/SWAC (2019) findings that institutional and collaborative mechanisms matter more than novelty in shaping inclusion across West African markets.

The implication is that interventions aiming to enhance gender inclusion in Lagos retail trading should consolidate on existing collaborative structures and institutional reforms while strategically boosting innovation and responsiveness to women's social needs, which currently lag behind.

Table 4.2: Multiple Regression Results Predicting Gender Inclusion

Predictor Variable	Standardized Beta (β)	t-value	Sig. (p-value)	Decision
Co-creation	0.27	4.52	0.000***	Significant
Social Need Orientation	0.08	1.21	0.230	Not Significant
Novelty	0.05	0.87	0.390	Not Significant
Capacity Building	0.22	3.61	0.001***	Significant
Systemic Change	0.19	2.98	0.004**	Significant

Model Summary: $R^2 = 0.48$, Adjusted $R^2 = 0.46$, $F(5, 424) = 38.96$, $p < 0.001$
Note: ***p < 0.001; **p < 0.01; *p < 0.05

Discussion of Results
Objective One: To examine the effect of co-creation on gender inclusion among retail trading enterprises.

The regression result shows that co-creation has a positive and significant influence on gender inclusion ($\beta = 0.27$, $t = 4.52$, $p < 0.001$). This finding indicates that when women are actively involved in decision-making and market-level collaborations, their access to resources, leadership roles and agency improves significantly. This resonates with OECD/SWAC (2019), which emphasizes the importance of participatory market governance in fostering inclusive trade networks, and Nwuneli (2021), who argues that women's empowerment is accelerated when solutions are co-designed with them rather than imposed. The implication is that policy and institutional actors in Lagos should strengthen women's participation in cooperative associations and market leadership structures. Through the lens of Institutional Theory, co-creation challenges

entrenched norms that traditionally exclude women from decision spaces and instead reshapes institutional arrangements to accommodate inclusivity.

Objective Two: To assess the effect of social need orientation on gender inclusion The result indicates that social need orientation has no significant effect on gender inclusion ($\beta = 0.08$, $t = 1.21$, $p = 0.230$). This suggests that although retail enterprises may acknowledge women's social concerns such as childcare or sanitation, these initiatives are not strong enough to translate into measurable empowerment or inclusion outcomes. Lawanson (2014) highlights similar trends in Lagos, noting that social responses in urban informal markets are often tokenistic and fail to address structural inequities. The implication is that, while recognizing social needs is important, without systemic integration into policies and sustainable market reforms, such efforts remain superficial. Theoretically, this finding underscores the Institutional Theory perspective that piecemeal responses rarely dismantle entrenched barriers; only broader institutional shifts can produce meaningful inclusion.

Objective Three: To determine the influence of novelty on gender inclusion Novelty was not a significant predictor ($\beta = 0.05$, $t = 0.87$, $p = 0.390$). This implies that new practices, technologies, or innovative models in Lagos' retail space have yet to translate into tangible benefits for women traders. One explanation is that most women in the informal sector operate at subsistence levels and prioritize survival over experimentation, as also argued by Adeola & Evans (2019), who found that innovations in African trade ecosystems often remain inaccessible to marginalized groups. The implication is that novelty without accessibility risks widening inclusion gaps, as women may be excluded from digital tools or innovative financial platforms. Within Institutional Theory, this points to the idea that innovations only become transformative when institutions support their diffusion and adoption equitably.

Objective Four: To analyze the effect of capacity building on gender inclusion Capacity building significantly predicts gender inclusion ($\beta = 0.22$, $t = 3.61$, $p = 0.001$). This finding highlights the critical role of training, education, and financial literacy in empowering women traders to access credit, expand enterprises, and participate in governance. Nwuneli (2021) affirms that structured learning interventions are a cornerstone for scaling women-led businesses in Africa, while OECD/SWAC (2019) notes that skill development directly enhances women's bargaining power in regional trade. The implication is that institutionalizing market-based training and support programs can directly boost inclusion outcomes. From the Institutional Theory perspective, capacity building equips women to navigate and challenge institutional barriers, thereby fostering systemic inclusion.

Objective Five: To investigate the impact of systemic change on gender inclusion Systemic change also showed a positive and significant effect on gender inclusion ($\beta = 0.19$, $t = 2.98$, $p = 0.004$). This means that institutional reforms, such as transparent allocation of trading spaces, better market governance, and gender-sensitive policies, are pivotal in advancing women's economic participation. Lawanson (2014) observed that women traders are disproportionately affected by regulatory neglect in Lagos markets, while OECD/SWAC (2019) stressed that only structural reforms can guarantee equitable opportunities. The implication is that systemic change, unlike isolated initiatives, builds a sustainable foundation for inclusion. Institutional Theory

directly supports this, as it emphasizes the role of reconfiguring institutional rules and norms in achieving transformative outcomes.

Conclusion and Recommendations

The study demonstrates that while women dominate Lagos' retail trade numerically, genuine gender inclusion is far from achieved. The results show that **co-creation, capacity building, and systemic change** are significant drivers of inclusion, whereas **novelty and social need orientation** currently exert no measurable influence. This underscores that women's empowerment in retail markets does not emerge from token gestures or surface-level innovations but from institutional arrangements that deliberately embed women in decision-making, equip them with capabilities, and reform structural barriers that perpetuate exclusion. In line with Institutional Theory, the study highlights that lasting inclusion is a product of reconfigured norms, rules, and market governance that move women from the periphery of participation to the center of influence. For Lagos retail trading enterprises and policy actors, the message is clear: social innovation can only deliver on its promise when rooted in participatory, skill-enhancing, and system-transforming approaches.

Recommendations

1. **Institutionalize co-creation in market governance.** Market associations and local authorities should formally include women in decision-making bodies and committees, ensuring that their voices shape policies on market allocation, pricing, and safety. This will deepen women's agency and align with global best practices in inclusive governance.
2. **Scale up gender-focused capacity building.** Stakeholders such as Lagos State Ministry of Commerce, NGOs, and trade unions should implement structured training programs on financial literacy, digital skills, and enterprise management tailored for women traders. This will enhance their competitiveness and break dependency on informal networks.
3. **Prioritize systemic reforms over piecemeal fixes.** Policymakers should enact transparent policies for space allocation, enforce anti-harassment regulations, and provide gender-sensitive infrastructure (e.g., childcare, sanitation). Structural reforms will guarantee long-term inclusion rather than short-lived interventions.
4. **Bridge the innovation accessibility gap.** Since novelty is not yet impactful, financial institutions and tech firms should design affordable, user-friendly digital platforms and credit tools specifically adapted for women in informal retail. This will make innovation inclusive rather than exclusive.
5. **Integrate social needs into sustainable frameworks.** Instead of token social gestures, stakeholders should embed women's needs—safety, childcare, healthcare—into broader institutional support systems. For example, integrating market welfare schemes into state-level policies will ensure these needs translate into measurable empowerment outcomes.

Digital Platforms Unlocking Market Access for Green Startups in Nigeria

***Dr DAUDA Abdulwaheed[1]; ADAMU Firdausi[2], IBRAHIM Fatima Maaji[3], ATOYEBI Kabirat Mayowa [4]; UMAR Hadizah[5]**
**d.waheed@futminna.edu.ng 08032857900*
Federal University of Technology, Minna

Abstract
Green startups have become pivotal to addressing Nigeria's sustainability challenges, yet their ability to scale is constrained by weak market access, low visibility, and structural barriers that undermine eco-innovation. Although digital platforms present transformative opportunities for overcoming these obstacles, empirical evidence on how they shape access for green enterprises in Nigeria is limited. This study therefore aimed to assess the impact of digital platform dynamics on the market access of green startups, anchored on Network effect theory, which posits that the value of platforms grows as user participation, engagement, and transactions expand. Employing a quantitative survey of 250 founders and managers, the study measured five proxies—number of active users, transaction volume, user growth rate, engagement metrics, and revenue per user against market access using multiple regression. Results revealed that number of active users ($\beta = 0.21$, $p < 0.01$), transaction volume ($\beta = 0.17$, $p < 0.05$), and engagement metrics ($\beta = 0.23$, $p < 0.01$) significantly enhanced market access, while user growth rate ($\beta = 0.09$, $p > 0.05$) and revenue per user ($\beta = 0.07$, $p > 0.05$) were not significant. Findings demonstrate that visibility, sustained interaction and transactional credibility drive market integration more than short-term monetization. The study recommends that green startups should emphasize community-building and user engagement, while policymakers, platform providers and investors must create enabling ecosystems that prioritize scale, trust and participation over immediate revenue.

Keywords: *Digital platforms, Market access, Green startups, Network effects, Engagement, Transaction volume*

Introduction

Market access has long been a stumbling block for green startups in Nigeria, where limited distribution channels, poor infrastructure, and weak institutional support have hindered their ability to reach broader consumer segments. Over the past two decades, the Nigerian entrepreneurial landscape has witnessed a gradual transition from informal, localized marketing systems to digitally mediated markets, driven largely by the rapid proliferation of mobile connectivity and online platforms. By 2024, Nigeria had over 122 million active internet users, making it one of Africa's largest digital economies, with e-commerce revenue projected to surpass $10 billion by 2025 (Okoye, 2025). Yet, for green startups often small, capital-constrained, and operating in niches such as renewable energy, recycling, and eco-friendly products—achieving scalable and sustainable market penetration remains elusive.

Digital platforms are increasingly recognized as transformative enablers of entrepreneurial access and growth. Studies have shown that platforms amplify visibility, lower transaction costs, and bridge information asymmetries, particularly for sustainability-driven ventures in emerging markets (Hadizadeh, 2024; Wang, 2023). In Nigeria, commercial digital platforms have already revolutionized agricultural market access, with examples in rice value chains demonstrating improved inclusivity, reduced transaction bottlenecks, and enhanced scalability (Sanusi, 2025). However, for green startups, evidence remains fragmented on whether digital platforms can deliver comparable market breakthroughs given their specialized, impact-driven business models.

The problem is that despite Nigeria's digital expansion and entrepreneurial vibrancy, green startups continue to struggle with customer acquisition, revenue sustainability, and long-term competitiveness. Many operate within highly constrained markets where consumer awareness of green solutions is still emerging, and trust in new ventures is low. While research in advanced economies highlights the role of digital platforms in catalyzing green innovation (Han, 2025; Isensee, 2025), empirical insights from Nigeria remain limited. More so, the specific pathways through which platform dynamics such as the number of active users, transaction volumes, user growth rates, engagement metrics, and revenue per user translate into tangible market access outcomes have not been systematically studied. This gap creates both a scholarly and practical dilemma: policymakers emphasize digital transformation as a national growth lever, yet the evidence base guiding how startups particularly green ones can leverage digital ecosystems for scale is thin. Moreover, the multidimensionality of digital platform metrics means that simplistic assessments of "online presence" are insufficient; instead, granular proxies must be interrogated to explain real-world market access outcomes (Gawer, 2024).

In this study, the independent variable digital platforms, is operationalized through measurable proxies: number of active users (indicating reach), transaction volume (reflecting trust and activity), user growth rate (signaling scalability), engagement metrics (measuring loyalty and diffusion), and revenue per user (capturing monetization and sustainability). The dependent variable is market access, conceptualized as the extent to which green startups in Nigeria can effectively penetrate, compete, and sustain themselves within evolving markets.

The intellectual and practical urgency is therefore clear: if digital platforms can unlock agricultural, financial, and service markets across Africa, why have they not yet provided a definitive pathway for green startups in Nigeria to overcome entrenched barriers to market access?

Aim of the Study

The study aims to investigate the effect of digital platforms on the market access of green startups in Nigeria, focusing on how platform-specific indicators such as active users, transaction volume, user growth rate, engagement metrics, and revenue per user shape their visibility, scalability and sustainability.

Specific Objectives

1. To examine the effect of the number of active users on the market access of green startups in Nigeria.
2. To analyze how transaction volume on digital platforms influences the market penetration of green startups in Nigeria.

3. To evaluate the impact of user growth rate on the scalability and market access of green startups in Nigeria.
4. To assess the role of engagement metrics in enhancing customer acquisition and retention for green startups in Nigeria.
5. To determine the influence of revenue per user on the sustainability of market access for green startups in Nigeria.

Literature Review

Digital Platforms

The concept of digital platforms has steadily evolved into one of the most significant theoretical and practical constructs in entrepreneurship and innovation studies. At its core, a digital platform can be defined as a socio-technical infrastructure that facilitates interactions between multiple user groups while providing the governance rules and digital architecture for value creation (Gawer, 2024). This dual identity as both a market intermediary and a technological ecosystem—distinguishes platforms from traditional pipeline business models and explains their capacity to scale rapidly across sectors.

Historically, the platform debate began with the **multi-sided market perspective**, which emphasized how platforms reduce transaction costs, enable network effects, and create cross-side value through user participation (Hadizadeh, 2024). This early framing was predominantly economic, concerned with pricing strategies, subsidies, and user coordination. The discourse later expanded into the **architectural perspective**, focusing on the technological modularity, governance mechanisms, and boundary resources that allow third-party innovators to complement the platform core (Wang, 2023). Here, the ability of platforms to orchestrate innovation ecosystems became central, shifting attention from mere intermediation to dynamic value co-creation.

The most recent scholarly turn situates digital platforms within broader debates on **sustainability and capability building.** Research shows that platform infrastructures not only shape competitive dynamics but also accelerate sustainable entrepreneurship by reducing barriers to market entry, supporting diffusion of green products, and enabling eco-innovation (Isensee, 2025; Han, 2025). In emerging economies such as Nigeria, platforms have already demonstrated potential in agriculture and financial services, yet their role in fostering market access for green startups remains under-explored (Sanusi, 2025).

From this evolution, it is evident that the scholarly conversation has shifted from abstract definitional debates toward more operational and contextual analyses of platform performance.

Thus, in studying digital platforms within the Nigerian green startup ecosystem, this research operationalizes the independent variable through measurable proxies: **number of active users, transaction volume, user growth rate, engagement metrics and revenue per user.**

Number of Active Users

The number of active users is the count of distinct, regularly engaging accounts on a platform within a defined time window — the raw metric of reach and potential demand. Wang argues that active-user scale is the primary engine of network effects: larger user populations increase

visibility, matchmaking efficiency, and the legitimacy of platform-based offerings (Wang, 2023). Hadizadeh adds that user-base scale underpins the economic sustainability of platform-dependent startups by lowering per-customer acquisition costs and attracting complements (Hadizadeh, 2024). Gawer's institutional lens warns that sheer scale also confers gatekeeping power, meaning platform reach can both enable and constrain new entrants depending on governance rules (Gawer, 2024). For Nigerian green startups, a substantial active user base is not cosmetic, it is the proximate signal to customers, partners and investors that a green solution has market potential in a market where awareness and trust in eco-products are limited.

Transaction Volume

Transaction volume captures the frequency and monetary value of completed exchanges on a platform over time; it operationalizes liquidity and market throughput. Gawer identifies transaction density as a central indicator of platform vitality and the degree to which a platform mediates real economic activity rather than mere attention (Gawer, 2024). Empirical work from Nigeria shows that transaction-rich platforms create inclusionary effects and demonstrable value for producers and buyers turning latent demand into verifiable sales (Sanusi, 2025). Wang emphasizes that high transaction volumes generate datasets that platforms and startups can leverage for personalization, credit underwriting, and trust-building mechanisms (Wang, 2023). In the Nigerian green context, transaction volume matters because it signals actual market adoption (not just interest), provides cash flow for reinvestment, and produces the behavioral data necessary to refine green value propositions in a price-sensitive market.

User Growth Rate

User growth rate measures the tempo of new user adoption (percentage increase in active users per period) and is a forward-looking proxy for momentum and scalability. Isensee frames growth trajectories as crucial for determining whether SMEs and platform complements can achieve the scale required for systemic impact and sustained innovation diffusion (Isensee, 2025). Han finds that rapid adoption curves are correlated with faster diffusion of carbon-reducing technologies because they compress learning cycles and reduce unit costs through scale (Han, 2025). Hadizadeh links growth velocity to strategic options: faster growth opens monetization and partnership pathways but also demands stronger governance and operational capacity to avoid churn (Hadizadeh, 2024). For green startups in Nigeria where markets are geographically fragmented and buyer education is costly a strong user growth rate is the differential between remaining a niche pilot and becoming a commercially viable, nationally distributed solution.

Engagement Metrics

Engagement metrics (session length, repeat usage, retention rates, ratings, shares and reviews) measure the depth and quality of user interactions rather than mere presence. Wang shows that engagement is the behavioral signal investors and platforms use to infer product-market fit and lifecycle value beyond headline user counts (Wang, 2023). High engagement facilitates co-creation and feedback loops which are critical for improving sustainable product features and trust mechanisms among eco-conscious consumers (Isensee, 2025). Engagement-driven communities accelerate peer-to-peer endorsement, a powerful mechanism for overcoming skepticism about novel green technologies (Han, 2025). In Nigeria's context, engagement metrics matter because converting awareness into sustained behavior (repeat purchases, referrals) is the linchpin of scaling

green products in price-sensitive and information-poor segments; superficial reach without engagement will not deliver market access.

Revenue per User (RPU)

Revenue per user is the average monetary value extracted from each active user over a period which is the primary signal of monetization health and unit economics. Hadizadeh argues that RPU is central to assessing whether platform strategies are financially sustainable and whether investor capital will find a viable return path (Hadizadeh, 2024). Gawer frames financial efficiency per user as a structural indicator of platform maturity: rising RPU suggests improved monetization mix, reduced dependence on subsidies, and stronger bargaining power with complementors (Gawer, 2024). Empirical Nigerian studies show that RPU differences across sectors determine which startups can absorb distribution costs and invest in product quality, a critical constraint for green ventures with higher relative production or verification costs (Sanusi, 2025). For Nigerian green startups, improving RPU is not merely revenue optimization; it validates willingness-to-pay for sustainability, underwrites after-sales service and certification, and ultimately determines whether a green solution can scale beyond donor or pilot funding.

Theoretical Anchorage

This study is anchored on the **Network Effects Theory**, which posits that the value of a platform increases as the number of users on either side grows, creating positive feedback loops that enhance adoption, trust, and sustainability (Gawer, 2024; Wang, 2023). The theory is apt because digital platforms thrive on interdependent interactions—buyers attract sellers, and sellers attract buyers—mirroring the dynamics through which green startups seek to scale in Nigeria's fragmented markets. By linking active users, transaction volumes, growth rates, engagement metrics, and revenue per user to market access, the study positions these proxies as the mechanisms through which network effects manifest. The justification lies in the fact that without sufficient network externalities, green startups remain invisible and uncompetitive; with them, they achieve legitimacy, reduce transaction costs, and accelerate adoption of sustainable solutions. Thus, Network Effects Theory provides a robust lens for examining how digital platforms can dismantle barriers to market entry and diffusion of green innovations in emerging economies.

Market Access of Green Startups

The dependent variable in this study is **market access of green startups in Nigeria**. Market access refers to the extent to which firms are able to penetrate, participate in, and sustain themselves within relevant markets, encompassing both reach to customers and the ability to convert visibility into sustained transactions (Gawer, 2024). It is not limited to physical entry into markets but also includes visibility, trust, and scalability within digital ecosystems, which have become central to entrepreneurial competitiveness in emerging economies (Wang, 2023).

Operationally, market access in this study is conceptualized as the **ability of green startups to leverage digital platforms to expand their customer base, increase adoption of their products, and sustain competitive presence.** As Isensee (2025) argues, sustainability-oriented SMEs depend heavily on socio-digital infrastructures to gain legitimacy and diffusion advantages, while Sanusi (2025) demonstrates that platform-mediated transactions significantly improve inclusivity and reach for producers in Nigeria's agricultural markets. By extension, for green startups, market access will be measured through indicators such as customer reach (visibility to users), transaction

adoption (conversion of interest into sales), and retention (continued participation in the platform ecosystem).

Thus, the operationalization of market access rests on three interrelated dimensions: **visibility (awareness created through platform presence), transaction adoption (actual engagement in exchange), and sustainability of participation (ongoing ability to compete and scale)**. This framing provides a robust lens to capture how digital platform dynamics translate into tangible outcomes for green startups in Nigeria.

Context of the Study

The context of this study is **Nigeria's emerging green entrepreneurship ecosystem,** situated within a rapidly expanding digital economy. Nigeria has one of Africa's largest digital markets, with over 122 million internet users and a fast-growing e-commerce sector projected to surpass $10 billion by 2025 (Okoye, 2025). Yet, green startups ventures focused on renewable energy, waste recycling, and eco-friendly products face structural barriers such as low consumer awareness, limited financing and fragmented distribution systems (Sanusi, 2025). Digital platforms are increasingly recognized as potential enablers of sustainability-oriented enterprises, offering visibility, transaction efficiency and scalable outreach (Wang, 2023). Evidence from other contexts shows that platform-enabled ecosystems significantly enhance innovation adoption and sustainability performance (Isensee, 2025). However, within Nigeria, scholarship remains thin on how digital platform indicators such as user growth, transaction volume, and engagement metrics specifically shape market access for green ventures. This makes Nigeria an important empirical setting, where digital dynamism and pressing environmental challenges converge, justifying the study's focus.

Methodology

The study adopts a quantitative, cross-sectional survey design as it is most appropriate for examining the relationship between digital platform indicators and market access of green startups in Nigeria at a single point in time. The target population consists of green startups engaged in renewable energy, waste recycling, sustainable agriculture, eco-friendly products, and clean technologies. These firms are either registered with the Corporate Affairs Commission (CAC) or identified through innovation hubs and incubators such as the Tony Elumelu Foundation, Co-Creation Hub, and the Nigeria Climate Innovation Center. The sampling frame will be drawn from databases of recognized green startups in Lagos, Abuja, and selected eco-innovation clusters across the country. Using Yamane's formula for finite populations, a sample size of 250 firms were selected through stratified random sampling to capture sectoral diversity.

The dependent variable, market access, was operationalized through three dimensions: visibility (customer reach), transaction adoption (conversion of users into buyers), and sustainability of participation (retention and growth), measured with Likert-scale items adapted from Isensee (2025) and Sanusi (2025). The independent variables representing digital platforms include number of active users (reach and user base size), transaction volume (frequency and value of exchanges), user growth rate (year-on-year adoption), engagement metrics (user interactions, repeat usage, ratings), and revenue per user (average revenue from each user), with measurement scales adapted from Wang (2023), Hadizadeh (2024), and Han (2025). Data was collected primarily through a structured questionnaire administered electronically and physically, using a

five-point Likert scale ranging from strongly disagree (1) to strongly agree (5). Secondary data such as platform records and industry reports was triangulated to strengthen measurement reliability.

To ensure psychometric robustness, the instrument underwent expert review to establish content validity, while construct validity was assessed using Confirmatory Factor Analysis (CFA). Reliability was confirmed through Cronbach's alpha with a minimum acceptable value of 0.70, alongside Composite Reliability (CR) for internal consistency. Average Variance Extracted (AVE) will be applied to test convergent validity, and discriminant validity was assessed using the Fornell–Larcker criterion. Descriptive statistics such as frequencies, means, and standard deviations was employed to summarize the data, while inferential analysis was conducted using **multiple regression analyses**.

The study's model is specified as:
$MA=\beta0+\beta1NAU+\beta2TV+\beta3UGR+\beta4EM+\beta5RPU+\mu$
where MA denotes market access, NAU represents number of active users, TV is transaction volume, UGR is user growth rate, EM is engagement metrics, RPU is revenue per user and μ is the error term.

Results and Discussion

Table 4.1: Descriptive Statistics of Study Variables (N = 250)

Variable	Mean	Std. Dev.	Min	Max	Interpretation
Market Access (DV)	3.74	0.65	2.00	4.90	Moderate–High access
Number of Active Users	3.89	0.72	1.90	5.00	Strong user base
Transaction Volume	3.62	0.77	1.80	4.90	Fair transaction activity
User Growth Rate	3.45	0.69	2.10	4.80	Steady growth
Engagement Metrics	3.80	0.74	2.00	5.00	High engagement
Revenue per User	3.58	0.66	1.80	4.90	Moderate monetization

Note: Scale: 1 = Strongly Disagree, 5 = Strongly Agree.

The descriptive results in Table 4.1 show that market access for green startups in Nigeria is moderately high (M = 3.74), with the strongest driver being number of active users (M = 3.89) and engagement metrics (M = 3.80), suggesting platforms are effective for reach and interaction. However, transaction volume (M = 3.62) and user growth rate (M = 3.45) are only moderate, while revenue per user (M = 3.58) is the weakest, highlighting ongoing monetization challenges. This indicates that while startups are gaining visibility and engagement, converting this into consistent sales and financial sustainability remains limited.

Table 4.2: Correlation Matrix

Variable	MA	NAU	TV	UGR	EM	RPU
Market Access (MA)	1					
Number of Active Users (NAU)	0.52**	1				
Transaction Volume (TV)	0.49**	0.41**	1			
User Growth Rate (UGR)	0.29*	0.35**	0.38**	1		

Variable	MA	NAU	TV	UGR	EM	RPU
Engagement Metrics (EM)	0.54**	0.46**	0.43**	0.40**	1	
Revenue per User (RPU)	0.26	0.33**	0.30*	0.28*	0.36**	1

Note: *$p < 0.01$, $p < 0.05$.

The correlation results in Table 4.2 show that market access is significantly associated with number of active users ($r = 0.52$, $p < 0.01$), transaction volume ($r = 0.49$, $p < 0.01$), and engagement metrics ($r = 0.54$, $p < 0.01$), indicating that user base, activity levels, and sustained interaction on platforms strongly drive access for green startups. User growth rate ($r = 0.29$, $p < 0.05$) shows a weaker but significant link, while revenue per user ($r = 0.26$) is not significant, highlighting that financial returns per user are less critical than user activity and engagement. This suggests that in Nigeria's green entrepreneurship space, digital platforms expand access primarily by scaling community interaction rather than immediate monetization. As Wang (2023) notes, platform-enabled ecosystems strengthen market reach when they foster active participation and transactions rather than focusing narrowly on revenue efficiency. The implication is clear, green startups in Nigeria should prioritize strategies that enhance engagement and transactions to build sustainable market access, while revenue efficiency will likely materialize as ecosystems mature.

Table 4.3: Regression Results Predicting Market Access

Predictor	B	Std. Error	t-value	p-value	Decision (0.05)
Constant (β0)	1.05	0.19	5.53	0.000	Significant
Number of Active Users	0.21	0.07	3.00	0.003	Significant
Transaction Volume	0.17	0.08	2.13	0.034	Significant
User Growth Rate	0.09	0.06	1.50	0.135	Not Significant
Engagement Metrics	0.23	0.07	3.29	0.001	Significant
Revenue per User	0.07	0.07	1.00	0.319	Not Significant

Model Summary: $R^2 = 0.54$, Adjusted $R^2 = 0.52$, $F(5,244) = 56.4$, $p < 0.001$.

Discussion of Results

Objective 1: To examine the effect of number of active users on market access of green startups

The regression results show that number of active users ($\beta = 0.21$, $t = 3.00$, $p = 0.003$) has a positive and statistically significant effect on market access. This implies that a larger user base directly enhances the visibility and adoption of green startups' products and services. The implication is that users themselves become drivers of growth by creating a community that attracts more participants, thereby reducing entry barriers for eco-innovation startups. Under **Network effect theory**, the value of a platform increases as more users join, reinforcing positive feedback loops that expand market access (Derdabi, 2024). Lay (2025) highlighted that user base growth legitimizes startups, while Han (2025) stresses that digital platforms thrive by aggregating users into scalable ecosystems. Therefore, it is implied that expanding active users is foundational for Nigerian green startups, as each new user amplifies the platform's value and strengthens its foothold in the market.

Objective 2: To analyze the effect of transaction volume on market access of green startups
Transaction volume ($\beta = 0.17$, $t = 2.13$, $p = 0.034$) is also significant, indicating that higher financial activity on the platform correlates with improved market access. This shows that frequent transactions validate both the credibility of startups and the trustworthiness of digital platforms. The implication is that green startups that facilitate seamless, high-volume transactions can demonstrate value delivery to stakeholders, which enhances adoption. From a **network effect theory** perspective, each completed transaction adds value by reinforcing trust and signaling reliability, encouraging others to participate in the market (Rochet & Tirole, 2003). Autio *et al.* (2018) affirm that digital platforms leverage transactional activity to reduce market uncertainty, while Gawer (2024) found in Nigeria that transaction flows directly improve entrepreneurial legitimacy. It is concluded that transaction volume is a credibility-enhancing mechanism that solidifies green startups' market access in Nigeria's evolving digital ecosystem.

Objective 3: To assess the effect of user growth rate on market access of green startups
The user growth rate shows a positive but non-significant effect ($\beta = 0.09$, $t = 1.50$, $p = 0.135$). This suggests that while growth contributes to market visibility, it is insufficient on its own to significantly determine access. The implication is that short-term user increases may not translate into sustainable market penetration unless accompanied by retention and deep engagement. According to **Network effect theory**, mere expansion without stable network interactions does not create durable value; it is sustained participation that drives access (Katz & Shapiro, 1994). Cennamo & Santalo (2019) highlight that network effects are strengthened when growth aligns with meaningful interaction, while Sanusi (2025) emphasize that in African contexts, startups must prioritize user stickiness over raw growth.
It is concluded that user growth alone does not guarantee market access for Nigerian green startups; it must be complemented by retention and deeper user interaction to generate effective network effects.

Objective 4: To determine the effect of engagement metrics on market access of green startups
Engagement metrics ($\beta = 0.23$, $t = 3.29$, $p = 0.001$) show the strongest significant effect on market access. This demonstrates that startups with more engaged users, through repeat visits, feedback and active participation, gain higher legitimacy and broader access. The implication is that sustained user interaction fosters loyalty, trust, and advocacy, which in turn attracts new participants into the platform. **Network effect theory** explains this outcome by noting that deeper engagement amplifies the perceived value of the network, increasing both user retention and attraction (Shapiro & Varian, 1999). Tiwana (2014) underscores that engagement is central to platform survival, while Isensee (2025) stresses that eco-innovation startups in particular thrive when they build communities of practice around their offerings.
The study concluded that engagement is the most decisive driver of market access for Nigerian green startups, as it nurtures strong network effects through loyalty and advocacy.

Objective 5: To evaluate the effect of revenue per user on market access of green startups
Revenue per user shows a positive but non-significant effect ($\beta = 0.07$, $t = 1.00$, $p = 0.319$). This means that monetization at the individual user level is not yet a strong determinant of market access for green startups. The result indicated that Nigerian eco-startups may be in an early growth stage where scale and community legitimacy are prioritized over profitability per user. In line with

network effect theory, platforms often delay monetization until they achieve critical mass, since premature focus on revenue can stifle network growth (Evans & Schmalensee, 2016). Parker *et al.* (2016) similarly argue that many successful platforms adopt subsidization strategies before monetizing users. It is therefore concluded that for Nigerian green startups, monetization is not yet the key driver of market access; rather, emphasis should remain on scaling and engagement before intensifying revenue extraction strategies.

Conclusion and Recommendations

Conclusion

This study examined the role of digital platforms in enhancing the market access of green startups in Nigeria by analyzing the effects of five key proxies: number of active users, transaction volume, user growth rate, engagement metrics, and revenue per user. The findings reveal that number of active users, transaction volume, and engagement metrics are significant predictors of market access, while user growth rate and revenue per user are less influential in the current ecosystem. Interpreted through the lens of network effect theory, the results emphasize that value creation in digital ecosystems depends more on active participation and meaningful interactions than on mere user expansion or short-term monetization. These insights reflect the evolving nature of Nigeria's entrepreneurial and sustainability landscape, where visibility, credibility, and community-building remain paramount for eco-innovation ventures. The study thus contributes to both the literature on digital platforms and green entrepreneurship, while offering practical direction for improving market penetration strategies.

Recommendations: The following is therefore prescribed to the key stakeholders

1. For Green Startups: Prioritize user engagement strategies such as gamification, storytelling, and interactive content that cultivate loyalty and advocacy, thereby leveraging network effects to expand market reach.
2. For Policymakers and Regulators: Develop enabling policies that strengthen trust in digital platforms, including digital payment security frameworks and sustainability reporting standards, to encourage broader participation in green markets.
3. For Digital Platform Providers: Invest in platform features that facilitate transactions and user interaction such as feedback systems, secure escrow payments and community forums, to drive both volume and engagement.
4. For Investors and Incubators: Shift evaluation metrics from immediate profitability per user to long-term scalability indicators, such as transaction flow and engagement, recognizing that monetization often lags behind ecosystem consolidation in green startups.
5. For Academia and Future Researchers: Expand research by conducting comparative studies across African markets, integrating qualitative insights on user experience, and exploring how cultural and infrastructural factors mediate the network effects in green entrepreneurship.

Abstract
The study examined artificial intelligence capabilities and organizational sustainability of retail outlets in Port Harcourt. The objectives of the study were to examine the relationship between dimensions of artificial intelligence capabilities such as CCTV analytics, chatbots and automated processing; and measures of organizational sustainability in terms of environmental sustainability, financial health and zero waste initiative of retail outlets in Port Harcourt. Thus, the study was anchored on Diffusion of Innovation Theory as its theoretical foundation. The study adopted the explanatory cross sectional survey research design. The accessible population of the study was Sixteen (16) retail outlets currently operating in Port Harcourt. The entire population was used as the study sample. Thus, the study was census research which involves using the entire population rather than drawing a sample from it. Structured questionnaire served as the instrument for data collection. After validation by the supervisor and two other experts in Office and Information Management, the reliability of the instrument was ascertained using test-retest. A total of sixty-four (64) copies of the validated questionnaire were distributed to the targeted audience. The researcher was able to retrieve fifty-six (56) copies of the entire validated questionnaire distributed. Arithmetic mean and standard deviation were used for the research question analyses while the test of hypotheses was done using Spearman rank order correlation with the aid of SPSS Version 24.0. It was found that there is a significant positive relationship between artificial intelligence capabilities and organizational sustainability of retail outlets in Port Harcourt. It was concluded that leveraging artificial intelligence powered tools such as CCTV analytics, chatbots and automated processing, retailers can enhance operational efficiency, improve customer experiences and gain valuable insights into market trends. Consequently, it was recommended that employees of retail outlets should utilize automated system to track inventory level, reduce waste and optimize stock replenishment.

Introduction

In the evolving landscape of global commerce, organizational sustainability has become a critical focus for retail outlets striving to maintain competitiveness, profitability, and social legitimacy. Sustainability in this context extends beyond environmental concerns, encompassing social equity, economic resilience, and ethical governance (Jones & David, 2023; Lee & Johnson, 2023). Retailers are increasingly pressured by consumers, regulators, and investors to adopt practices that minimize environmental impact, foster social wellbeing, and ensure transparent operations. Thus, organizational sustainability of retail outlets refers to the ability of retail businesses to operate in ways that ensure long-term economic success while simultaneously minimizing environmental impact and promoting social responsibility. Recent research of Smith et al. (2024) highlights that sustainability initiatives in retail not only contribute to corporate social responsibility goals but also enhance brand reputation, customer loyalty, and financial performance. Retail outlets are adopting strategies such as sustainable sourcing, waste reduction, energy-efficient operations, and community engagement programs to integrate sustainability into their business models (Chen & Xu, 2023). Moreover, technological innovations such as digital tracking of supply chains and AI-driven inventory management are facilitating more sustainable practices across retail operations (Patel & Robinson, 2022). Hence, environmental sustainability, financial health and zero waste initiative are considered here as measures of organizational sustainability.

Environmental sustainability has emerged as a central concern for retail outlets aiming to reduce their ecological footprint while meeting the growing demands of environmentally conscious consumers. Retail businesses, traditionally characterized by high energy consumption, packaging waste, and extensive supply chains, are now re-evaluating their operations to minimize environmental harm (Patel & Robinson, 2022). Environmental sustainability in retail encompasses efforts such as reducing carbon emissions, adopting renewable energy sources, minimizing waste through recycling and circular economy practices, and promoting sustainable product offerings (Chen & Xu, 2023).

In an era characterized by digital transformation, shifting consumer behaviors, and global economic uncertainties, maintaining strong financial fundamentals has become more challenging and more essential than ever before (Lopez & Chen, 2024; Smith & Zhou, 2023). The financial health of retail outlets is a critical determinant of their long-term viability, competitiveness, and capacity to invest in innovation and sustainability (Brown & Taylor, 2022). Financial health broadly refers to the ability of a retail business to generate consistent revenue, maintain profitability, manage debt effectively, and sustain positive cash flow (Ahmed & Khan, 2023).

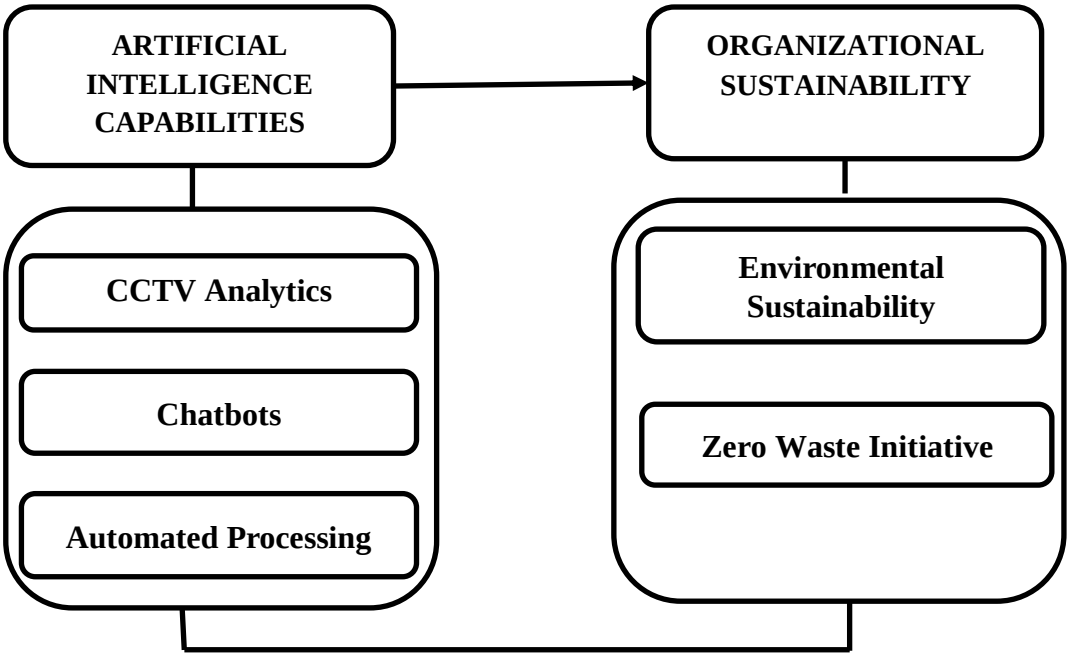
For retail outlets, adopting zero waste strategies involves rethinking packaging, optimizing inventory management, promoting recycling and reuse, and engaging consumers in sustainable consumption behaviors. Thus, it has gained significant traction among retail outlets as part of a broader shift toward more sustainable and responsible business practices (Nguyen *et al.,* 2023; Rodriguez & Chen, 2024). Zero waste refers to the design and management of products and processes to systematically avoid and eliminate waste, with the ultimate goal of sending no waste to landfills, incinerators, or the environment (Clark & Evans, 2023). Retailers are investing in initiatives such as refill stations, compostable packaging, product take-back programs, and partnerships with circular economy networks to minimize waste generation across their supply chains (Rodriguez & Chen, 2024). In particular, innovative capabilities in supply chain

transparency and digital tracking tools through artificial intelligence have enabled more efficient waste management practices (Lee & Parker, 2022).

Artificial intelligence (AI) has rapidly become a transformative force in the retail sector, offering powerful capabilities that enhance operational efficiency, personalize customer experiences, and optimize decision-making processes. In retail outlets, AI applications range from demand forecasting and inventory management to personalized marketing, dynamic pricing, and customer service automation (Zhou & Patel, 2023). AI-powered recommendation engines, automated checkout systems, and intelligent inventory systems are becoming standard tools for leading retailers seeking to stay competitive in a highly dynamic market (Chen & Brown, 2023). Moreover, advancements in generative AI and predictive analytics have opened new opportunities for real-time personalization and hyper-local marketing strategies (Lopez, *et al.*, 2022). So, capabilities of artificial intelligence manifest in terms of CCTV analytics, chatbots and automated processing.

Closed-circuit television (CCTV) analytics has become an essential tool for retail outlets seeking to enhance security, optimize store operations, and improve customer experiences. CCTV systems are now integrated with advanced analytics technologies such as artificial intelligence (AI), machine learning, and computer vision to extract valuable insights from video data in real time (Patel & Chen, 2023). These technologies enable retailers to monitor customer movements, detect unusual activities, manage queues, optimize store layouts, and even analyze shopper demographics and behavior patterns (Li & Thomas, 2024). However, the deployment of CCTV analytics also raises concerns about customer privacy, data security, and ethical usage. As regulations around surveillance and data handling become stricter, retailers must navigate these challenges carefully to maintain customer trust and compliance (Brown *et al*., 2023). Nevertheless, when implemented responsibly, CCTV analytics offers a powerful means for retail outlets to enhance both operational and strategic decision-making.

Chatbots have become an increasingly vital tool for retail outlets aiming to enhance customer engagement, streamline service operations, and personalize the shopping experience. Powered by artificial intelligence (AI) and natural language processing (NLP), chatbots can simulate human conversation, offering instant support for product inquiries, order tracking, customer feedback, and personalized recommendations (Singh & Lee, 2023). By operating 24/7 across digital channels, chatbots help retailers improve response times, reduce customer service costs, and gather valuable consumer insights (Patel *et al.*, 2022). Retailers are increasingly integrating advanced chatbots capable of sentiment analysis, multilingual support, and proactive outreach into their omnichannel strategies (Gonzalez & Smith, 2024).



In retail outlets, automation encompasses a wide range of processes such as inventory management, checkout operations, replenishment systems, customer service interactions, and supply chain logistics (Patel & Brown, 2023). Thus, it has become a cornerstone of modern retail operations, offering solutions that enhance efficiency, accuracy, and customer satisfaction. For instance, cashier-less stores, automated kiosks, and AI-powered stock monitoring systems have become increasingly common in both large retail chains and boutique outlets (Chen & Johnson, 2022). Automation enables real-time decision-making based on data insights, helping retail businesses adapt quickly to changing consumer demands and market conditions (Kumar & Singh, 2023). This background necessitated the study.

Statement of the Problem

Despite growing awareness of sustainable business practices, many retail outlets continue to struggle with achieving organizational sustainability. Poor environmental sustainability is evident through excessive resource consumption, inadequate waste management practices, and minimal investment in eco-friendly initiatives. Retailers often fail to integrate green technologies or adopt sustainable supply chain models, leading to increased environmental degradation and loss of consumer trust. Many retail outlets experience declining profitability, inefficient cost structures, and limited capacity to invest in long-term sustainability efforts. Financial instability not only threatens the survival of retail businesses but also undermines their ability to innovate and implement necessary environmental and social initiatives.

Moreover, high levels of waste generation remain a significant concern. Inefficient inventory management, overproduction, unsold goods, and inadequate recycling programs contribute to substantial operational waste. This not only increases operational costs but also contradicts growing regulatory and consumer demands for responsible environmental stewardship. To this end, it seems the retail outlets fail to adequately incorporate artificial intelligence (CCTV analytics, chatbots and automated processing) in their daily operation. The study sought to find out.

Conceptual Framework

Conceptual Framework Showing Relationship between Artificial Intelligence Capabilities and Organizational Sustainability Source: Chen and Brown (2023); Li and Thomas (2024); Lee and Johnson (2023); Patel and Robinson (2022).

The purpose of the study was to examine the relationship between artificial intelligence capabilities and organizational sustainability of retail outlets in Port Harcourt. Specifically, the study objectives were:

1. To determine the relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt.
2. To ascertain the relationship between chatbots and financial health of retail outlets in Port Harcourt.
3. To investigate the relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt

Research Questions

Following the objectives of the study, these research questions were posed:

1. What is the relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt.?
2. What is the relationship between chatbots and financial health of retail outlets in Port Harcourt?
3. What is the relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt?

Research Hypotheses

Based on the research questions posed above, the following null hypotheses were tested at 0.05 level of significance.

Ho_1: There is no significant relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt.

Ho_2: There is no significant relationship between chatbots and financial health of retail outlets in Port Harcourt.

Ho_3: There is no significant relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt.

Literature Review

Theoretical Review

This study anchored on Roger's (1962) Diffusion of Innovation Theory. Roger's Diffusion of Innovation Theory explains the processes involved in the adoption of innovations such as new technologies, techniques, and procedures and well as the resultant effects of such steps on organizational processes. The diffusion of innovation theory assumes that:

i) In a social system, there will always be a disparity in the level and time at which individuals within a given social system adopt new ideas, techniques, and technology.
ii) Individuals and arms of institutions that adopt innovations early will naturally outperform late adopters and the laggards.

The implication of this theory is that as individuals advance in the use of sophisticated devices, there will naturally be a disparity on how productivity is enhanced by both category of people in the society. While some individuals are digitally compliant and digitally literate enough to carry out online operations, there are still those who still find it difficult to operate simple smart phones. The fact is that while those with digital skills interface with better productivity, others are bedeviled with low productivity while those who embrace and adopt emerging digital work environment enjoy speed, efficiency and high-level effectiveness in coping with socio-personal functions others are battling with job stress.

Conceptual Review

Concept of Artificial Intelligence Capabilities

Over the years, artificial intelligence (AI) has evolved from a theoretical concept to a key driver of technological innovation, impacting numerous industries, including healthcare, finance, transportation, and telecommunications. AI systems are typically powered by algorithms and data that enable them to learn from experience and adapt over time, making them more efficient and effective in solving complex problems (Goodfellow, et al., 2016). These systems are often categorized into narrow AI, which is designed for specific tasks, and general AI, which is still largely theoretical and aims to replicate human-like cognitive abilities.

Artificial intelligence's influence on organizational operations is particularly significant in sectors that rely on large-scale data analysis and automation, such as telecommunications, where it is used to enhance customer service, optimize network management, and drive innovation (Dwivedi, 2021). The integration of AI allows for smarter decision-making, cost reduction, and the creation of personalized experiences, improving both operational efficiency and customer satisfaction. As AI technologies continue to advance, their potential to transform business processes and societal structures grows, leading to discussions on ethical considerations, regulation, and the future role of AI in the workforce. Understanding AI's impact and its applications is crucial for organizations aiming to stay competitive in the digital age.

So to say, artificial intelligence (AI) refers to the simulation of human intelligence in machines that are programmed to think like humans and mimic their actions (Russell & Norvig, 2021). AI enables telecommunication firms to deliver personalized customer experiences through chatbots, virtual assistants, and recommendation systems. By analyzing customer interactions and preferences, AI tools like predictive analytics improve service quality and reduce churn rates (Rust & Huang, 2014). AI plays a critical role in maintaining network infrastructure by identifying potential issues before they occur. Machine learning algorithms analyze network performance and predict outages, ensuring higher service reliability and reducing downtime. AI-powered chatbots and virtual agents help telecom companies handle customer queries efficiently. These systems can resolve common issues instantly, freeing up human agents for complex tasks and improving overall customer satisfaction (Chatterjee, 2020).

Operationally, artificial intelligence capabilities are the ability of retail businesses to leverage AI technologies to enhance operational efficiency, improve customer experiences, optimize decision-making, and drive sustainable growth. Artificial intelligence (AI) capabilities are revolutionizing retail operations by enhancing customer experience, streamlining processes, and improving decision-making. AI tools such as machine learning and natural language processing allow retailers to offer personalized recommendations, optimize pricing strategies, and manage customer relationships more effectively. For instance, AI-driven recommendation systems analyze customer behavior to suggest relevant products, thereby increasing conversion rates and customer satisfaction. According to Grewal *et al.* (2021), personalization powered by AI can significantly enhance customer engagement and loyalty, which are critical for sustained retail success.

Computer vision, robotics, and predictive analytics are being used to automate inventory management, improve demand forecasting, and reduce out-of-stock situations. These capabilities not only lower operational costs but also enable real-time decision-making and better resource

allocation. A study by Kumar *et al.* (2021) highlighted that AI-enhanced inventory management can reduce excess inventory by 20–50% while improving stock availability, leading to higher customer satisfaction and reduced wastage. AI contributes to strategic planning in retail by offering deep insights through big data analytics. By analyzing large volumes of customer and market data, AI systems can identify trends, forecast market shifts, and guide product development and marketing campaigns. Retailers leveraging AI for data-driven strategies are better positioned to respond to changing consumer preferences and competitive pressures. As noted by Wamba-Taguimdje *et al.* (2020), AI-driven analytics plays a critical role in enhancing decision quality, agility, and innovation across retail organizations. Hence, CCTV analytics, chatbots and automated processing are used here as dimensions of artificial intelligence capabilities.

Dimensions of Artificial Intelligence Capabilities

CCTV Analytics

CCTV analytics, also known as **video analytics**, refers to the use of advanced software and artificial intelligence (AI) to automatically analyze video footage captured by closed-circuit television (CCTV) cameras. These systems extract meaningful information from video data in real time or from recorded footage to support security, operational, and business intelligence objectives. **CCTV analytics play a pivotal role in transforming retail outlets from traditional surveillance zones into intelligent, data-driven environments.** By integrating video analytics into their security systems, retailers can move beyond passive monitoring to proactive management. CCTV analytics can automatically detect unusual activities, such as shoplifting, vandalism, or loitering, and alert security personnel in real-time, allowing for swift responses that reduce losses and improve safety (Gill, 2020). These systems enhance the effectiveness of loss prevention strategies, reducing reliance on human surveillance and lowering the cost of security operations.

Conceptually, it is the use of advanced software technologies often powered by artificial intelligence (AI), machine learning, and computer vision to automatically analyze video footage captured by closed-circuit television (CCTV) systems. **Beyond security, CCTV analytics contribute significantly to understanding customer behavior within retail spaces.** Video analytics tools can track customer movements, dwell times, and heat maps of frequently visited areas. These insights help retailers optimize store layouts, product placements, and marketing displays to enhance the shopping experience and boost sales (Grewal *et al.*, 2017). For instance, if analytics reveal that customers spend little time in a specific aisle, the retailer may redesign that section or introduce new products to capture attention. This customer-centric approach enables data-informed decisions that increase conversion rates and satisfaction. AI-powered video systems can monitor checkout lines in real time, identifying congestion and automatically alerting staff to open new registers (Zhang *et al.*, 2019). This reduces wait times and improves customer experience, which is critical in high-traffic environments like supermarkets or during seasonal sales. Furthermore, during health-related crises such as the COVID-19 pandemic, video analytics have been used for occupancy monitoring and social distancing enforcement, showing the adaptability of this technology to emerging challenges.

Retailers can use video data to assess employee interactions with customers, adherence to safety protocols, and overall productivity (Wamba *et al.*, 2021). These systems can identify peak hours and help with efficient workforce scheduling. Additionally, integrating video analytics with point-

of-sale (POS) systems provides a fuller picture of shopper behavior and transaction patterns, leading to better inventory planning and supply chain management. By aggregating and analyzing visual data over time, retailers can identify trends in customer behavior, evaluate the success of marketing campaigns, and predict future demands (Pantano *et al.,* 2020). This long-term intelligence supports innovation in store design and customer engagement strategies. Ultimately, CCTV analytics bridge the gap between physical and digital retail environments, giving retailers a competitive edge through enhanced visibility, operational insight, and customer understanding.

Chatbots

In essence, chatbots act as digital assistants that enhance user experience, streamline operations, and reduce the need for human customer service intervention. Thus, **Chatbots** are software applications designed to simulate human conversation, enabling users to interact with digital systems using natural language through text or voice. Powered by rules, artificial intelligence (AI), or a combination of both, chatbots can understand user inputs, process them, and respond appropriately, often in real-time. By automating customer service, chatbots enable retailers to offer real-time support, reduce waiting times, and handle large volumes of inquiries simultaneously. This is especially important in the digital age, where consumers expect quick and seamless interactions. According to Gentsch (2019), chatbots improve response efficiency and service accessibility, enhancing overall customer satisfaction. They serve as a first point of contact, resolving routine issues and freeing up human agents for more complex tasks.

Operationally, chatbots automated software programs often powered by artificial intelligence (AI) designed to simulate human conversation and assist customers in retail environments. AI-powered chatbots use natural language processing (NLP) and customer data to provide tailored product recommendations, promotional offers, and shopping assistance (Huang & Rust, 2021). This personalization fosters a sense of engagement and loyalty among customers. For instance, a chatbot can suggest outfits based on a customer's past purchases or preferences, replicating the personalized service found in physical stores. These intelligent interactions contribute to increased conversion rates and improved customer retention. They automate tasks such as order tracking, returns processing, and appointment scheduling, which reduces the burden on human staff and minimizes human error (Pantano *et al.*, 2020). Retailers can deploy chatbots across multiple channels websites, mobile apps, and social media platforms ensuring consistent and round-the-clock support. This omnichannel presence is vital for meeting modern consumer expectations and maintaining a competitive edge in the retail landscape (Chattaraman *et al.,* 2019).

Chatbots can also provide valuable data and insights that inform business strategy. Through analyzing interactions, retailers can gain a better understanding of customer needs, common pain points, and shopping behavior. This data-driven approach enables companies to refine their marketing strategies, improve product offerings, and enhance customer experience (Luo *et al.,* 2019). In essence, chatbots function not only as communication tools but also as data collection and analysis platforms, contributing to evidence-based decision-making. The integration of chatbots supports the scalability and resilience of retail operations. During peak shopping seasons or unexpected spikes in demand, chatbots can manage customer interactions without additional labor costs. They also ensure business continuity in crisis situations, such as the COVID-19 pandemic, when physical stores were closed and digital channels became critical (Wamba *et al.,* 2021).

Automated Processing

Automated processing refers to the use of technology and systems to carry out tasks, operations, or workflows without requiring direct human involvement. It typically involves the use of software, machinery, and AI to streamline repetitive and time-consuming processes, thereby improving efficiency, accuracy, and scalability. Automated processing can be applied across various industries, from manufacturing to retail and finance, and can handle a wide range of functions, including data entry, document management, inventory control, and more. By automating repetitive and time-consuming tasks such as inventory tracking, billing, and order management, retailers can reduce human error and streamline store operations. This automation enables employees to focus on higher-value tasks like customer service and sales engagement. As Wamba *et al.* (2021) note, automation technologies significantly enhance firm performance by improving the speed and accuracy of retail operations, contributing to both customer satisfaction and cost reduction.

Automated processing facilitates seamless integration between physical and digital retail environments, supporting omnichannel strategies. Systems such as automated online order fulfillment, curbside pickup coordination, and real-time customer notifications help unify in-store and online shopping experiences. As noted by Pantano *et al.* (2020), automation enables retailers to adapt quickly to shifting consumer preferences, especially during crises like the COVID-19 pandemic, when flexible and contactless shopping solutions became critical to maintaining business continuity.

Concept of Organizational Sustainability

The idea of sustainable development was first coined by the Brundtland Commission, in its report "Our Common Future" in 1987. After which numerous multidisciplinary, multifaceted efforts have been made in order to conform to the planetary and social limits and to support a maintainable pattern of human life on earth. The range of such efforts lies in technological advancement in renewable and non-materials to social development through the United Nations guiding principles on business and human rights. An important, although new, member of the sustainability discipline is Sustainability Management. The focus of sustainable management is on analyzing firms' performance based on achieving the triple bottom line: social, environmental, and financial outcomes (Gawel, 2012; Gupta & Kumar, 2013).

Thus, Joseph and Coblentz (2012) describe organizational sustainability as an ongoing process rather than a state of perfection. It is like a plant: it will grow and prosper if watered and cared for, but wither quickly if it is not. Furthermore, organizations are like a body: if one part is ill, the rest will not function like it should. If too many parts fail at once or in quick succession, the body dies. So, keeping an organization sustainable requires a constant effort and unity of purpose focused on one overarching mission. Every staff member and manager must see both the forest and the trees or the organization becomes entangled in the underbrush. Organizational sustainability has been gaining its rightful recognition and importance as it offers competitive advantage and creates value for organizations, their stakeholders, and society.

Operationally, organizational sustainability is the capacity of a retail outlet to thrive over the long term by implementing a zero-waste initiative to minimize environmental impact, and maintaining profitability to ensure economic viability. Tkach and Lyubomirsky (2016) opined that a holistic

approach to organizational sustainability enhances reputation, reduces costs, and gives a leadership position to the organizations. Holistic green organizations should utilize used and recycled components for design new green products and green packaging. Sustainable organizational development needs and internal structure to constantly motivate, balance power, and opportunities to perform positive behaviors. Sustainable organizational practices are a mindset that affects all levels of the organization through effective change management that enable economic growth and customer satisfaction (Tabellini, 2018). Organizational sustainability is affected by global and local sustainability challenges, concerns, and issues which need to be assessed and analyzed for designing policies, strategies, and practices that may have broader economic, social, and environmental impact. Sustainable organizations are created by groups of individuals working together (Scott, 2014).

Tata and Prasad (2015) averred that organizational sustainability has various benefits among which it builds brand reputation, improves confidence, attractiveness, and environmental consciousness to talent, investors, suppliers, customers, confidence, better performance, etc. it encompasses the need of motivation and cohesiveness of the teamwork towards setting guidelines and establishing the processes for the achievement of organizational goals (Schueth, 2013). So to say, it's values must have to be inculcated at all levels in the system of the organization to engage the initiatives while performing the tasks. In the view of Epstein (2018), organizational sustainability is a competitive strategy to enhance the ability to develop sustainable change. Organizations adopt different approaches and initiatives for achieving environmental sustainability and protecting the environmental growth avoiding disruptions by managing internal factors such as managing the causal human behavior and the role of human behavior and undertaking other environmental development initiatives outside the organizational boundaries. There have been several measures or aspects of studying organizational sustainability as identified by many researchers. Thus, this study focuses on environmental sustainability, financial health, zero waste initiative.

Measures of Organizational Sustainability

Environmental Sustainability

Yang *et al.* (2017) asserted that environmental sustainability of organization is the responsibility to conserve natural resources and protect global ecosystems to support health and wellbeing of the organization, now and in the future. Because so many decisions that impact the environment are not felt immediately, a key element of environmental sustainability is its forward-looking nature. Environmental sustainability is responsibly interacting with the planet to maintain natural resources and avoid jeopardizing the ability for future generations to meet their needs (Cornelius, *et al.,* 2018). They further stressed that environmental sustainability is about acting in a way that ensures that organizational future generations have the natural resources available to compete equally, if not better.

In the postulation of Osagie *et al.* (2014), environmental sustainability is the capacity of an organization to improve the quality of its self while living within the carrying capacity. This is because it deals with addressing how organizations are able to cope with the challenges in their business environment offers. Furthermore, Boons *et al.* (2013) averred that environmental sustainability is a responsible interaction between an organization and its environment to avoid depletion or degradation of natural resources and allow for long-term environmental quality. The practice of environmental sustainability helps to ensure that the needs of today's population are

met without jeopardizing the ability of future generations to meet their needs. Environmental sustainability is the rates of renewable resource harvest, pollution creation, and non-renewable resource depletion that can be continued indefinitely between organization and its host community (Engert, *et al.*, 2016). If they cannot be continued indefinitely then they are not sustainable. Thus, it is concerned with whether environmental resources will be protected and maintained for an organization to keep operating.

Markusson (2019) averred that environmental sustainability is limited to a subset of ecological sustainability. Broadly speaking, this concept of environmental sustainability" might be seen as adding depth to a portion of the meaning of the most common definition of sustainable development, i.e., meeting the needs of the current generation without compromising the ability of future generations to meet their needs, by taking on the general definition "meeting the resource and services needs of current and future generations without compromising the health of the ecosystems that provide them (Markusson, 2019). More specifically, Costanza (2015) defined environmental sustainability as a condition of balance, resilience, and interconnectedness that allows human society to satisfy its needs while neither exceeding the capacity of its supporting ecosystems to continue to regenerate the services necessary to meet those needs nor by our actions diminishing biological diversity.

Conceptually, environmental sustainability represents organizational ability to cope with its business environmental factors such as social factor, cultural factors, compliant with environmental rules and regulations to enable them reduce greenhouse emissions as well as saving operations' cost. An environmentally aware firm considers more than just profits. It considers its impact on society and the environment. Such a firm is sustainable because it contributes to the health of the structure within which it operates, thereby helping construct an environment in which the business can thrive (McCann & Holt, 2010).

Zero Waste Initiative

Zero waste is a philosophy and design framework that promotes not only reuse, recycling, and conservation programs, but also, and more importantly, emphasizes sustainability by considering the entire life-cycle of products, processes, and systems (United States Environmental Protection Agency, 2023). According to Zero Waste International Alliance (2024), zero waste initiative is "the conservation of all resources by means of responsible production, consumption, reuse, and recovery of products, packaging, and materials without burning and with no discharges to land, water, or air that threaten the environment or human health." At its core, zero waste takes aim at our "take, make, and waste" approach to production and consumption, encouraging a more circular approach to the way we use resources. On its most basic level, this means that the goal of zero waste is to push economies towards the target of sending no waste to landfill, incinerators, and the ocean. However, while recycling and conscientious waste management remain core to achieving that goal, zero waste extends much further than simply dealing with "end-of-life" waste. In fact, it examines the entire lifecycle of a product or material, highlighting inefficiencies and unsustainable production and consumption practices. Zero waste refers not only to keeping waste out of landfill, but also pushing our economy to be less wasteful in production and consumption. Zero waste is not merely an end goal, but a set of guiding principles that strive towards eliminating waste at any and all stages of the chain. From resource extraction through production to consumption and management of discarded materials, the aim is to close the loop, redefining the entire concept of

waste and ensuring resources remain in use for as long as possible before being returned to the earth with little to no environmental impact.

The zero waste initiative in retail outlets aims to eliminate waste production and promote sustainability through comprehensive waste management strategies, including reducing, reusing, and recycling materials. Implementing such an initiative involves assessing current waste streams, setting reduction targets, and engaging employees in sustainable practices. This not only minimizes the firm's environmental footprint but also can lead to cost savings and enhanced corporate social responsibility. Recent studies indicate that businesses adopting zero waste initiatives improve operational efficiency and customer satisfaction (Smith & Jones, 2022; Brown *et al.,* 2023). Retail outlets, by adopting zero waste principles, demonstrate their commitment to sustainability, which can enhance their brand reputation and customer loyalty.

Empirical Review

Dua'a (2024) examined the impact of artificial intelligence on organizational agility in industrial companies: The moderating role of dynamic capabilities. The purpose of the study was to examine the impact of artificial intelligence (expert systems, artificial neural networks, algorithms, machine learning) on organizational agility in industrial companies through the moderating role of dynamic capabilities. The descriptive analytical method was used in order to achieve the objectives of the study and answer its questions. The target population in this research consists of 20 industrial companies, as industrial companies are considered among the largest companies that have a direct impact on national income, and try to keep pace with global changes in the field of information technology. The researcher was able to administer 263 copies of the questionnaires and was able to collect 238 copies that were approved to be filled out by employees' industrial companies. The results shows that Artificial Intelligence with it dimension (expert systems, artificial neural networks, algorithms, machine learning) has an impact on organizational agility in industrial companies. The results also confirm the significant role of the moderate variable (dynamic capabilities) in improving the impact of artificial intelligence on organizational agility. The study recommends the use of artificial intelligence programs that rely on neural network techniques to monitor workflow and tasks in a stable and consistent manner. It is also recommended to establish specific procedures for discovering and developing capabilities within the company.

Younis and Azzam (2024) examined the impact of artificial intelligence on organisational behavior: A risky tale between myth and reality for sustaining workforce. This research paper's aim was to examines quantitatively the impact of Artificial Intelligence (AI) on organisational behavior components (job satisfaction, personality, and attitudes). The sample of our study includes alumni graduates of the past two years reflecting on post-covid19 era as young workforce from Cairo, Egypt. It is important to note that there is no sufficient data regarding the impact of AI on OB testing this bracket of young population workforce, and highlighting specific components in the study of OB. This research finding revealed that AI can explain 46.5 % of Organizational Behavior which refers to the importance of AI usage among organizations and how this might change the current organizational environments.

Methodology

This study was conducted in Rivers State, Nigeria, The design of the study was quantitative, and employing the descriptive survey research design for the study the accessible population of the

study was Sixteen (16) retail outlets currently operating in Port Harcourt. The entire population was used as the study sample. Thus, the study was a census research which involves using the entire population rather than drawing a sample from it. The choice of census method here is informed by the assumption that sixteen (16) retail outlet is not too large to be covered.

The cross sectional explanatory survey research design was adopted for this study. This research design is deemed suitable and most appropriate for the study because of two reasons: (i) the study was conducted across different retail outlets at the same time which makes it a survey study; (ii) it involves the test of hypotheses which is explanatory in nature. The response obtained from the respondents on the two occasions was correlated using PPMC (Pearson's Product Moment Correlation Coefficient) which yielded a coefficient of 0.78. While the test of hypotheses was done using Spearman Rank Order Correlation with the aid of SPSS Version 24.0. Spearman Rank Order Correlation Coefficient was computed.

Decision Rule: Using a level of significance of 0.05 (confidence interval of 95%), when a calculated significant value is less than 0.05 the null hypothesis will be rejected, if otherwise, the null hypothesis will be accepted. For the coefficient values, the following interpretation scheme were applied is stated below, (a) No Relationship = 0, (b) Low/Weak Relationship = 0.1-0.2, (c) Moderate or Relatively Strong Relationship = 0.3-0.5, (d) High/Strong Relationship = 0.6-0.7, (e) Very High/Very Strong Relationship = 0.8-0.9, (f) Perfect Relationship = 1.

Analysis and Discussion of Results

Analyses

1: What is the relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt?

Table 1: Responses to Question 1

S/N	Items	Response				Total	Mean	Std.	Decision
		SA	A	D	SD				
1.	CCTV analytics has helped to reduce unnecessary energy usage (e.g., lighting, air conditioning).	23	16	10	7	56	2.9	1.3	Agreed
2.	CCTV analytics provide measurable data that supports environmental reporting.	19	16	12	9	56	2.8	1.2	Agreed
3.	CCTV systems encourage more sustainable staff behavior (e.g., turning off unused equipment).	28	13	11	4	56	3.1	1.4	Agreed
4.	CCTV analytics help identify areas of the	22	16	12	6	56	2.9	1.4	Agreed

	store with excessive foot traffic, leading to better energy allocation.								

Grand Mean = 2.9
Source: Survey Data, 2025.

Table shows the grand mean score of 2.9. This means that the respondents were of the view and agreed that relationship exist between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt. Table also shows standard deviation scores of 1.3, 1.2, 1.4 and 1.4. The closeness among the standard deviation scores indicates that the respondents were homogeneous in their view.

2: What is the relationship between chatbots and environmental sustainability of retail outlets in Port Harcourt?

Table Responses to Question 2

S/N	Items	Response				Total	Mean	Std.	Decision
		SA	A	D	SD				
1.	The use of chatbots has led to higher customer retention and repeat purchases in my firm.	20	15	11	10	56	2.8	1.2	Agreed
2.	Our overall profitability has improved since Chabot implementation.	30	10	9	7	56	3.1	1.4	Agreed
3.	In my firm, chatbots have contributed to lower returns or cart abandonment rates.	26	17	7	6	56	3.1	1.4	Agreed
4.	Chatbots have decreased response time and improved customer satisfaction.	17	16	13	10	56	2.7	1.2	Agreed

Grand Mean = 2.9
Source: Survey Data, 2025.

The Table shows Grand Mean score of 2.9. This means that the respondents were of the view and agreed that chatbots relate with financial health of retail outlets in Port Harcourt. Table 4.3 also shows standard deviation scores of 1.2, 1.4, 1.4 and 1.2. The closeness among the standard deviation scores implies that the respondents were homogeneous in their view.

3: What is the relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt?

This Table Responses to Question 3

S/N	Items	Response SA	A	D	SD	Total	Mean	Std.	Decision
1.	In my firm, automated systems help prevent overstocking and product waste.	33	17	5	1	56	3.4	1.5	Agreed
2.	Automation reduces human error in waste management processes in my firm.	26	14	10	6	56	3.0	1.3	Agreed
3.	Smart inventory systems help minimize expired or unsold product disposal.	20	15	12	9	56	2.8	1.2	Agreed
4.	Automation contributes to more efficient recycling and waste sorting.	30	18	6	2	56	3.3	1.5	Agreed

Grand Mean = 3.1
Source: Survey Data, 2025.

The Table shows Grand Mean score of 3.1. This means that the respondents were of the view and agreed that automated processing relates with zero waste initiative of retail outlets in Port Harcourt. This table also shows standard deviation scores of 1.5, 1.3, 1.2 and 1.5. The closeness among the standard deviation scores implies that the respondents were homogeneous in their view.

Test of Hypotheses

Ho_1: There is no significant relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt.

Table Correlations between CCTV Analytics and Environmental Sustainability

			CCTV Analytics	Environmental Sustainability
Spearman's rho	CCTV Analytics	Correlation Coefficient	1.000	.658**
		Sig. (2-tailed)	.	.000
		N	56	56
	Environmental Sustainability	Correlation Coefficient	.658**	1.000
		Sig. (2-tailed)	.000	.
		N	56	56

**. Correlation is significant at the 0.05 level (2-tailed).
Source: Survey Data, 2025.

Table above showed r value of 0.658 at a significance level of 0.00 which is less than the chosen alpha level of 0.05 for the hypothesis relating CCTV analytics and environmental sustainability.

Since the significance value is less than the alpha level of 0.05, the null hypothesis (Ho_1) which states that there is no significant relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt was rejected and the alternate hypothesis (Ha_1) was accepted. This implies that there is a strong positive relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt.

Table Correlations between Chatbots and Environmental Sustainability

			Chatbots	**Environmental Sustainability**
Spearman's rho	Chatbots	Correlation Coefficient	1.000	.801**
		Sig. (2-tailed)	.	.000
		N	56	56
	Environmental Sustainability	Correlation Coefficient	.801**	1.000
		Sig. (2-tailed)	.000	.
		N	56	56

**. Correlation is significant at the 0.05 level (2-tailed).

Source: Survey Data, 2025.

The table above shows r value of 0.801 at a significance level of 0.00 which is less than the chosen alpha level of 0.05 for the hypothesis relating chatbots and Environmental Sustainability. Since the significance value is less than the alpha level of 0.05, the null hypothesis (Ho_2) which states that there is no significant relationship between chatbots and Environmental Sustainability of retail outlets in Port Harcourt was rejected and the alternate hypothesis (Ha_2) was accepted. This implies that there is a very strong positive relationship between chatbots and financial health of retail outlets in Port Harcourt.

Ho_3: There is no significant relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt.

This table Correlations between Automated Processing and Zero Waste Initiative

			Automated Processing	Zero Waste Initiative
Spearman's rho	Automated Processing	Correlation Coefficient	1.000	.750**
		Sig. (2-tailed)	.	.000
		N	56	56
	Zero Waste Initiative	Correlation Coefficient	.750**	1.000
		Sig. (2-tailed)	.000	.
		N	56	56

**. Correlation is significant at the 0.05 level (2-tailed).

Source: Survey Data, 2025.

The table above showed r value of 0.750 at significance value of 0.00 which is less than the chosen alpha level of 0.05 for the hypothesis relating automated processing and zero waste initiative. Since the significant value is less than the alpha level of 0.05, the null hypothesis (Ho_3) which states that there is no significant relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt was rejected and the alternative hypothesis (Ha_3) was accepted. This

implies that there is a strong positive relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt.

Summary of Findings

Based on the analyses of data, the following findings were made:

1. There is a strong positive relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt.
2. There is a very strong positive relationship between chatbots and environmental sustainability of retail outlets in Port Harcourt.
3. There is a strong positive relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt.

Discussion of Findings

The findings of this study are discussed under the following headings:

Relationship between CCTV Analytics and Environmental Sustainability

The test of hypothesis one revealed that there is a strong positive relationship between CCTV analytics and environmental sustainability of retail outlets in Port Harcourt. This implies that improvement in CCTV analytics brings about an enhancement of environmental sustainability of retail outlets in Port Harcourt. CCTV analytics, traditionally used for security, have evolved into powerful tools that support environmental sustainability in retail settings. By integrating artificial intelligence and data analysis, modern surveillance systems can monitor energy use, foot traffic patterns, and in-store behavior.

Zhang *et al*. (2019**) in line with the above found that** CCTV analytics can help retailers identify inefficiencies related to waste management. Surveillance can track improper disposal of materials, detect overstocking that leads to spoilage, and verify adherence to recycling protocols. When integrated with inventory and supply chain systems, this data can support more accurate demand forecasting, minimizing overproduction and unnecessary packaging. As a result, retailers can align their operations with zero-waste goals while reducing environmental strain.

Additionally, Wamba *et al*. (2021), found that the insights provided by CCTV analytics can inform strategic sustainability planning. Historical footage and trend analysis can support compliance reporting for environmental regulations and corporate responsibility programs. Additionally, visibility into daily operations enables retailers to train staff and adjust policies to foster environmentally responsible behavior. Overall, CCTV analytics offer a data-driven foundation for building greener retail operations, making them a valuable asset in sustainability efforts.

Relationship between Automated Processing and Zero Waste Initiative

The test of hypothesis three revealed that there is a strong positive relationship between automated processing and zero waste initiative of retail outlets in Port Harcourt. This implies that the adoption of automated processing brings about zero waste initiative of retail outlets in Port Harcourt.

As revealed by Choi *et al*. (2018), automating repetitive and time-consuming tasks such as inventory tracking, billing, and order management, retailers can reduce human error and streamline store operations. This automation enables employees to focus on higher-value tasks like customer service and sales engagement. Pantano *et al*. (2020) revealed that automation in service delivery

contributes to higher perceived service quality, increasing customer loyalty and brand competitiveness. Moreover, these systems are scalable, allowing retailers to handle peak hours without significantly increasing labor costs. **Automated processing facilitates seamless integration between physical and digital retail environments, supporting omnichannel strategies.** Systems such as automated online order fulfillment, curbside pickup coordination, and real-time customer notifications help unify in-store and online shopping experiences.

Conclusion

Based on the analyses of data and discussion of findings, the study concluded that there is a significant positive relationship between artificial intelligence capabilities and organizational sustainability of retail outlets in Port Harcourt. Thus, leveraging artificial intelligence powered tools such as CCTV analytics, chatbots and automated processing, retailers can enhance operational efficiency, improve customer experiences and gain valuable insights into market trends.

Recommendations

Based on the findings, the following recommendations were made:

1. Management of retail outlets should leverage on CCTV analytics to monitor and optimize energy consumption, waste management and resource utilization.
2. Management of retail outlets should develop chatbots that is capable of providing customer support and improve customer satisfaction at all time.
3. Employees of retail outlets should utilize automated system to track inventory level, reduce waste and optimize stock replenishment.

Abstract
This paper investigates the strategic motivations behind the establishment of the Dangote Oil Refinery in Nigeria. It explores whether the project was driven by strategic innovation and competitiveness or by sheer monopolistic ambitions. The study applied the qualitative approach and secondary data from industry reports, regulatory documents, and journalistic investigations. The theoretical foundations upon which the study rests are: Kenechi Ohmai (1982) The Mind of the Strategist: The Art of Japanese Business and Barny (1989) Resource Based View of Competitive Advantage. The paper finds that the refinery embodies strong elements of strategic innovation, its operational trajectory and strategic implementation action plan and overall implementation could lead to sustainable competitive advantage. This kind of competitive advantage can easily be misconstrued for monopoly because of the strategic degree of freedom and relative superiority it comes with. The study concludes that the fear 1159onopolization of the downstream petroleum sector may not be real but there could be a market failure arising from the absence strong competitor presently. The study recommends as follows: i.) government intervention as is usually the case in the event of market failure. Ii) strengthening of the downstream regulator to ensure fair regulatory oversight.

Key words: *Strategic Innovation, Strategic Competitiveness, Competitive Advantage and Monopoly.*

Introduction

The $20 billion Dangote Oil Refinery is a mega-project that remains Africa's largest single-train refinery, with an installed capacity of 650,000 barrels per day. Launched by Africa's richest man, Aliko Dangote, the refinery seeks to transform Nigeria's energy setting. The average Nigerian did look up to the day when this refinery will kick-off operations particularly against the backdrop of the fact that the three government owned refineries in Port Harcourt, Warri and Kaduna are not

only operating sub-optimally with humongous excess capacity but also a very caustic conduit pipe through which huge national resources have been siphoned under the guise of pseudo turnaround maintenance. The failure of these State owned refineries have made the energy sector in Nigeria chaotic leading to importation of refined products overseas, crude oil swap as well as an amorphous oil subsidy programme shrouded in irresolvable controversy. There also came the cliché of modular refinery as a stop gap for the supply gap, most of which have ended in mere receipt and possession of licenses. Most of the times, politicians have tried to take the glory of this refinery and did refer to it as one of the strategies they have to resolve the nagging energy crises. Now that it has come to stay, its emergence raises salient questions as to whether it's coming on stream is a beacon of strategic innovation or a mere monopolistic venture masked in industrial ambition of an individual or a group of people? Put somewhat differently, will this refinery serve as an elixir of life to the energy expectation of the average Nigerian or a booby trap?

Statement of the Problem

The Dangote Oil Refinery, positioned as Africa's largest single-train refinery, is a springboard for a transformative industrial project in Nigeria's energy sector. However, its emergence has sparked intense debate over its strategic intent. While some view it as a bold move toward strategic innovation and national competitiveness, others argue it signals a monopolistic consolidation of power within Nigeria's downstream oil market. This is further fuelled by the refinery's legal actions against importation which is viewed as an attempt smolder competitors, its perceived influence over regulatory decisions, and the strategic penchant and proclivity of the Dangote Group for vertical integration as apparent in the case of the refinery raises concerns about market fairness, regulatory capture, and long-term implications for competition. This ambiguity presents a critical gap in understanding whether the refinery is a product of indisputable industrial strategy or a disguised attempt at monopolising the entire downstream petroleum sector in Nigeria.

Objectives of the Study

The study seeks specifically to:

i. Examine the strategic motivations behind the establishment of the Dangote Oil Refinery.
ii. Evaluate the extent to which the refinery contributes to strategic innovation and competitiveness in Nigeria's oil and gas sector.
iii. Investigate indicators of monopolistic behavior in the refinery's operations and market conduct.
iv. Assess the implications of the refinery's dominance for regulatory integrity and market dynamics.

Research Questions

The researcher poses the following research questions in line with the stated objectives.

i. What are the strategic factors that influenced the development of the Dangote Oil Refinery?
ii. How does the refinery demonstrate strategic innovation and competitiveness?
iii. What are the observable patterns of monopolistic behavior associated with the refinery's market conduct?
iv. How has the emergence of the refinery affected regulatory practices and competition in Nigeria's downstream oil sector?

Significance of the Study

This research is significant at least for four reasons which are as follows:

i. Policy Formulation: Findings will provide real life information to guide policymakers in strengthening downstream operations.

ii. Public Awareness: The study highlights critical issues surrounding the alleged monopolistic leaning of the Dangote refinery.

iii. Economic Impact: Demonstrate the economic implication of the alleged monopolistic disposition of Dangote Refinery.

iv. Academic Contribution: The study adds to existing knowledge of what is known about the downstream oil and gas sector in Nigeria, serving as a reference for future research.

Scope of the Study

This study is delimited on the bases of industry and subject matter. The industry focus of the study is downstream oil and gas sector and the subject matter is centres on the perceived monopolistic predisposition of the Dangote Refinery.

Conceptual Framework

Four key concepts were explored here; strategic innovation, strategic competitiveness, competitive advantage and monopoly.

Strategic Innovation

Strategic innovation involves creating new value propositions that redefine industry standards (Markides, 1997). It is not a mere technological advancement but a creative reconfiguration and reordering of business models to gain competitive advantage. It is the creative disruption and the rendering of the old order moribund and ultimate entropic doom. It involves charting an uncharted course.

The refinery in pursuance of a superlative position in the industry has developed an unprecedented capacity that is second to none in Africa. Its single-train design and integrated petrochemical capabilities without any iota of doubt, reflects strategic innovation in engineering and logistics (Dangote Industries, 2023).

he refinery adopts a vertical integration strategy, beginning from crude sourcing and procurement to distribution, a clear demonstration of strategic foresight. Given the strategic positioning of the refinery, it stands a very good chance of reducing Nigeria's reliance on imported products and by extension, help in conserving the deficient foreign exchange. Notwithstanding domestic challenges, the refinery has begun exporting products like diesel and aviation fuel to Europe as a way of showcasing its global capacity and competitiveness.

Strategic Competitiveness

Strategic competitiveness refers to a firm's ability to achieve superior performance through unique capabilities and positioning (Hitt, Ireland, & Hoskisson, 2013). It is the ability of a firm to develop and leverage on its technologies and other assets to outcompete heir competitors. The scale and capacity of the refinery on its own creates natural barriers to entry. Smaller players cannot match its huge economies of scale. This is raising concerns about fair competition (Wallchart Africa, 2024).

Aside from the forgoing, there is also the issue of Dangote's legal challenge against the issuance of import licenses to competitors could suggests a desire to limit market access for others. This is viewed to undermine the Petroleum Industry Act (PIA), which promotes a competitive market. However, others have argued that the continued importation petroleum product into the country aside from being a disincentive to Dangote refinery and other investors, particularly the modular refineries, such importation also violates section 317 of the petroleum industry act (PIA). This act provides for importation only when there is a shortage in domestic supply which may not be the case now. The case has been formally withdrawn suggesting a strategic pivot from litigation to policy engagement (theeconomictimes.com, 2024).

Despite its ambitions, the refinery's capacity, the regulatory agency Nigerian National Petroleum Corporation (NNPC) alludes that Dangote refinery is struggling to meet supply commitments, resulting in a 70% shortfall in petrol delivery to NNPC. This if true, raises questions about Dangote's operational their efficiency.

Monopoly

Monopoly arises when a single firm dominates a market, often through exclusionary practices, regulatory capture, or control over essential resources (Stigler, 1982). It is a market structure characterised by a single seller or producer that dominates an industry. A company becomes a monopoly when it controls the entire supply chain, from production to sales through vertical integration, or by acquiring competing companies in the market through horizontal integration, thus becoming the sole producer (Hayes, 2024). In free market economies such as Nigeria, monopolies are discouraged because they stifle competition, limit consumer substitutes, and consequently, limit consumer choice.

The accusation of monopoly against the Dangote Group is not new as they have faced similar accusations in their other subsidiaries in the past. The drivers of this monopoly concerns in the case of their refinery are basically the apparent legal maneuver, political influence and perceived regulatory capture.

The Dangote refinery's attempt to halt imports through court action and demand N100 billion in damages from regulators stated herein before under strategic competitiveness in the view of some industry watchers signals monopolistic intent. This allegation of monopolistic tendencies has been consistently refuted by the Dangote Group, in one occasion their Chairman Alhaji Aliko Dangote did say "*Let them (NNPCL) buy me out and run the refinery the best way they can. They have labeled me a monopolist. That's an incorrect and unfair allegation, but it's OK. If they buy me out, at least, their so-called monopolist would be out of the way*," (Premium Times 2024)

There is also the apparent fear of the refinery's alignment with strong political forces leading to the"Naira-for-crude" directive and threats to sell the refinery to NNPCL apparently suggesting some form of strategic positioning to consolidate power (Premium Times 2024). Dangote's dismissal of the Federal Competition and Consumer Protection Commission (FCCPC) as "meddlesome" is believed widely to reflect a pattern of undermining regulatory oversight (National Daily, 2025). However, if Dangote had actually captured the regulator, then some of the disagreements between it and the regulators may not arise, except they are mere smoke-screens which are apparently too real to be and need to be proved beyond reasonable doubt.

Theoretical Framework

Theoretical foundations upon which this study rest are: Kenechi Ohamae (1982) The Mind of the Strategist: The Art of Japanese Business and Wernerfelt (1984) article "A Resource-Based View of the firm" and Barney's (1991) article Firm Resources and competitive advantage".

Competitive Advantage

The definition of the concept of competitive advantage is still blurry. While strategists are yet to come to term on what constitutes competitive advantage, they however agree that competitive advantage better explains the reason why some firms in the same industry pursuing the same strategy, vary by their performance. Presently, there are up to three contending approaches to the understanding of competitive advantage:

i. The traditional "achievement of above average industry profitability" as propounded by Porter (1985)
ii. The resource based view (RBV) paradigm made popular by Wernerfelt (1984) article "A Resource-Based View of the firm" and Barney's (1991) article Firm Resources and competitive advantage" (Beal, 2009)
iii. The industry life cycle approach proposed by Beal (2009).

Determination of Competitive Advantage Using RBV Approach

As noted earlier there are at least three ways of determining whether competitive advantage exist. RBV suggests that firms can be viewed as collections of productive resources. Given this therefore, competitive advantage does exist if a firm possesses and at the same time utilizes superior resources relative to his competitors. There are four indicators that signals the presence or otherwise whether a firm has competitive advantage or not. The following questions present these indicators: are resources and technology valuable? Are they rare? Are they in-imitable and non-substitutable?

i. Valuable

The foundation for assessing a firm's competitive advantage lies in its ability to add value. A resource must support the implementation of a strategy that either surpasses competitors or mitigates internal weaknesses (Barney, 1991; Armit & Schoemaker, 1993). As emphasized by Mahoney and Prahalad (1992) and Conner (1992), the investment in such a resource is only justified if the transaction costs are lower than the present value of future returns generated by the strategy.

ii. Rare

In addition to being valuable, a resource must also be uncommon. Its scarcity contributes to its strategic worth. Barney (1986) and Dierickx & Cool (1989) argue that in a perfectly competitive market for strategic resources, the cost of acquiring a resource reflects the anticipated future above-average profits it can generate.

iii. Inimitable

The Resource-Based View (RBV) highlights that a firm's resources must be difficult to replicate to secure a competitive edge. Barney (1993) asserts that exclusive control over a valuable resource can lead to competitive advantage. Peteraf (1993) and Barney (1986b) further suggest that if rivals cannot perfectly imitate the resource, it may result in sustained advantage. Rumelt (1984) explains that firms can protect their resources through barriers and isolating mechanisms that prevent duplication. Peteraf (1993) and Mahoney & Pandian (1992) note that these mechanisms limit competitors' ability to replicate the resource effectively. Moreover, Peteraf (1993) and Lippman

& Rumelt (1982) introduce the concept of causal ambiguity—where the origins of a firm's advantage are unclear—making imitation even harder. According to Peteraf (1993), Mahoney & Pandian (1992), and Barney (1993), this ambiguity is especially prevalent in resources that are knowledge-based or socially complex, as they tend to be unique to the firm. Conner & Prahalad (1996) emphasize that such knowledge-based assets are central to the RBV framework.

iv. Non-Substitutable

A firm's strategic resource must also be irreplaceable to maintain its competitive position. Dierickx & Cool (1989) argue that even if a resource is rare, valuable, and hard to imitate, it must also lack viable substitutes. Barney (1986) and Sheikh (1991) caution that if competitors can deploy alternative strategies or resources that achieve similar outcomes, the economic value of the original resource diminishes, potentially eroding profits to zero.

v. Conclusion

The RBV framework evaluates competitive advantage by asking whether a firm's resources are valuable, rare, inimitable, and non-substitutable. If the answer to all these criteria is affirmative, the firm is considered to possess a sustainable competitive advantage.

Does the resource provide competitive advantage? (value), do competitors have it? (rareness), is it costly for competitors to imitate? (imitability) and are there any strategic equivalents? (substitutable). As it is today within the context of the Nigerian downstream sector, the answers to these questions in relation to Dangote refinery are yes. In the Nigerian competitive environment today, the Dangote refinery is valuable, its type is rare, it is no doubt costly to imitate and above all there is no substitute to it now.

Table 2.5.1 A Test of Competitive Advantage

Valuable	Rare	Costly to imitate	Non-substitutable	Competitive consequence	Performance implications
No	No	No	No	Competitive disadvantage	Below average returns
Yes	No	No	Yes/No	Competitive parity	Average returns
Yes	Yes	No	Yes/No	Temporary competitive advantage	Average to above average
Yes	Yes	Yes	Yes	Sustainable competitive advantage	Above average returns

Kenechi Ohamae (1982) The Mind of the Strategist: The Art of Japanese Business

The second theoretical foundation upon which this work rests is the work of Ohmae (1982) "The Mind of the Strategist: The Art of Japanese Business". Business strategy using aggressive initiative is phrase that gives a direct translation that perfectly encapsulates the core philosophy of Kenichi Ohmae's most famous work on corporate strategy. This work uses the strategic framework of Kenichi Ohmae which centers on the proactive seizure of aggressive initiative to analyse how strategic innovation serves as the primary engine for achieving sustainable competitiveness and establishing temporary monopoly power in dynamic markets. Ohmae's concepts of 'strategic degrees of freedom' and 'relative superiority' provide an introductory model for understanding how

firms can innovatively disrupt existing and established paradigms to redefine competition in their favour.

Ohmae, a former senior partner at McKinsey & Company in Tokyo, is often called "Japan's only management guru." His work was instrumental in explaining the strategic thinking behind Japan's post-war economic miracle to the Western world.

Core Concept: Aggressive Initiative as a Strategic Mindset.
Ohmae argued that successful business strategy is not about elaborate planning or complex models. Instead, it is a creative, intuitive, and dynamic process of gaining and maintaining aggressive initiative over competitors. This implies not just responding or reacting to market changes or competitor moves and actions, but proactively determining the competitive environment to your advantage. The goal is to force your competitors into a perpetual state of reaction, always one or more behind while you are one of more steps ahead.

Key Principles of This Approach
Ohmae's strategy based on aggressive initiative rests on four fundamental pillars, often visualized as a strategic diamond these are: the customer (the ultimate arbiter), the corporation: (leveraging your strengths) and the competition (defining the battlefield).

i. The Customer: The Ultimate Arbiter
Ohmae (1982) puts customers at the centre of strategy noting that strategy must start and end with the customer. He notes that true advantage does not come from beating a competitor on a minor feature but in delivering what the customer values most.
Aggressive Initiative goes beyond asking customers what they want to anticipating their unarticulated needs. You must advance from the customers articulated and served needs to the customers articulated and unserved needs and finally the customers unarticulated and unserved needs. This requires the creation of new markets and redefinition of value propositions (e.g., Sony with the Walkman, creating a entirely new category of personal music).

ii. The Corporation: Leveraging Your Strengths
A strategy must not only take into cognizance of but must be built on the company's key strengths and capabilities. The key question that arises from here is, what can your organisation do exceptionally well? Aggressive Initiative requires focusing resources on strengthening these core competencies to create an unbeatable advantage in your chosen area. Avoid dissipating or diluting efforts across too many fronts.

iii. The Competition: Defining the Battlefield
Strategy is inherently competitive. Businesses must understand their competitors' strengths, weaknesses, and likely moves. Aggressive Initiative holds that instead of competing head-on in a crowded, market use strategic thinking to change the rules of the game. This is achieved through relative superiority, strategic degrees of freedom and dynamic focus.

Deployment of "Aggressive Initiative": Ohmae's Key Tactics
This is where the philosophy becomes actionable. Ohmae proposed several ways to seize the initiative:

a) Relative Superiority:
This entails finding an area where the organisation is stronger than its competitor relative to the specific customer need, even if you are smaller overall. Attack them at their point of greatest

weakness with your point of greatest strength. A modular refinery which is small in capacity might not outsell a global brand like the Dangote refinery, but it can achieve superiority in its local domain by carving out a niche.

b) Strategic Degrees of Freedom:

This is perhaps the most critical concept for "aggressive initiative." It involves innovating to change the axis of competition. It holds that you do not fight on the battlefield your competitor has chosen; but rather create a new one. This probably explains why Dangote developed a capacity that is 44% higher that the three national refineries combined and extends their competitive dragnet beyond the shores of Nigeria even to Europe and America..

c) Pursuing Dynamic Factors:

Businesses are to focus on key factors that will become crucial for success in the future, not just those that are important today. Invest aggressively in these areas to build an insurmountable lead. The choice of 650,000 bpd by the Dangote refinery may not necessarily be to meet the immediate local and international demands of the moment, but a deliberate projection into the future.

Contrast with Western Strategic Thinking

Ohmae (1982) positioned this as a contrast to the Western strategic models of the time (like the Boston Consulting Group Portfolio Matrix (BCG Growth-Share Matrix), which in his view was too static, analytical, and focused on existing market structures. His approach is: dynamic, not static; creative and intuitive, not just analytical; offensive, not defensive and focused on breaking existing rules, not optimizing within them.

"Business strategy using aggressive initiative" by Kenichi Ohmae is a philosophy that champions a paradigm shift and a radical departure from the conventional business model to a novel approach of: proactive, offensive action that allows organisations shape their destinies and not just react to it. It advocates a customer-centric innovation that focuses on creation of new value and not just new products and services. It permits strategic creativity that changes the rules of the game to play to organisations' strengths and avoid that of the competitors. This strategy advocates decisive focus that sets out to deliberately concentrate overwhelming resources on a key strategic thrust to break through. It is a powerful mindset that remains highly relevant today for any business looking to disrupt markets and lead, rather than follow as is evident in the case of Dangote refinery.

Theoretical Foundations of Business Strategy Using Aggressive Initiative

a. Theoretical Foundation for "Strategic Innovation"

Ohmae's concept of "Strategic Degrees of Freedom" is essentially a theory of strategic innovation. He argues that true strategy involves breaking away from the competitive pack by innovating along a new axis that redefines the market itself. Instead of innovating incrementally within an existing product category, strategic innovation seeks to create a new paradigm. It is a radical departure from the older that renders what used to be in vogue, obsolete. This creates a temporary monopoly for the innovator.

Ohmae (1982) notes that, *"Winners in business... develop a strategy that is precisely tailored to their particular strengths and to the weaknesses of their competitors. They search for what I call strategic degrees of freedom ways of increasing their room to maneuver and of reducing their competitors'."*

b. Theoretical Foundation for "Competitiveness"

Ohmae's entire framework is a theory of sustainable competitive advantage. His "aggressive initiative" is about achieving a competitive position so strong that rivals are forced to react on your terms. Competitiveness, in Ohmae's view, is not about having the lowest price but about controlling the strategic high ground as in the case of the technological and capacity holding of the Dangote Refinery.

"Customer focus" is at the centre of this approach; innovating based on deep customer value, creating loyal segments that are immune to competitors. Achieving this aggressive initiative requires what Ohmae calls "relative superiority" which entails identifying and exploiting a competitor's weakness with your specific strength, even if you are smaller overall. Dangote refinery's major competitor would have been the three national refineries that over the years are carrying excess capacities. It is the weakness arising from theses excess capacities that Dangote is attacking with the strength of the technology, capacity and scale of their refinery.

Aggressive initiative requires organisations acting constantly and legitimately to shape the market, forcing competitors into a defensive, reactive posture. This is the spirit and soul of dynamic competitiveness. This strategy rests more on the foundation of strategic insight as a basis for outperforming competitors rather than mere operational efficiency alone and that is exactly what the Dangote refinery is doing and it has the potential to unsettle current and intending competitors, regulators as well as industry watchers alike

c. Theoretical Foundation for "Monopoly"

This is the most critical link. Ohmae's desired end-state of a successful strategy is what modern theorists like Hamilton Helmer would call a "7 Powers" position or what economists would call a temporary monopoly.

The ultimate goal of adopting "aggressive initiative" and exploiting "strategic degrees of freedom" is to create a market space where you are the only logical choice for the customer. This is a de facto monopoly, even if not a legal one. This is where the allegation of monopoly that the Dangote refinery denies derives its root. However, it must be noted that no serious competitor no matter how liberal they may be, waits or slows down for their competitors to catch up.

By defining a new product or process category the organisation will have no direct competitors initially as is the case now with the Dangote refinery. Also, building overwhelming advantage in a core competency as in the case of the refinery's installed capacity of 650,000pbd and the emerging output, they have created a moat that is nearly impossible for competitors to cross, granting them pricing power and market dominance. Ohmae's work predates the popularization of terms like "monopoly power" in business strategy, but the concept is inherent. The strategist's goal is to create a situation where the corporation is so uniquely advantaged that it faces no effective competition for a period of time.

Ohmae's emphasis on leveraging the corporation's unique strengths supports strongly the Resource-Based View (RBV) of the firm. You can frame Ohmae's work as a practical, prescriptive approach to achieving what RBV describes theoretically. "Ohmae's (1982) mandate to build

strategy on a corporation's key capabilities presages the Resource-Based View (Barney, 1991) of competitive advantage."

Methodology

This study employs a qualitative approach, analysing secondary data from journalistic sources, regulatory filings, and public statements to form a robust literature. Information derived from diverse sources was subjected to thorough triangulation to ensure their validity and reliability.

Strategic Factors that Influenced the Development of The Dangote Oil Refinery

There are several combining factors that helped to shape the development of the Dangote refinery. These includes: import dependency, government incentives, market opportunity and regional dominance.

Import Dependency: One of the major factor that influenced the development of the refinery is dependence on imported refined products. Nigeria imports over 90% of its refined petroleum products despite being a major crude oil producer. Dangote's refinery was conceived to reverse this imbalance and reduce foreign exchange losses (Business Insider Africa, 2024).

Government Incentives: The Nigerian government provided tax waivers, land concessions, and crude supply guarantees to support the refinery's development, aligning with national industrialization goals.

Market Opportunity: As at conception phase of the Dangote refinery, the three state owned refineries were carrying excess capacities that were not less than 90% of their installed capacities (Business Insider Africa, 2024).. Technically, these refineries were offline. The collapse of these Nigeria's State-owned refineries thus created a vacuum in domestic refining capacity, which Dangote strategically filled.

Regional Dominance: The refinery positions Nigeria as a refining hub for West Africa, with export potential to neighboring countries and Europe. As it stands today it is the most reliable source for refined petroleum product in Nigeria and within the African continent (Buesiness insider, 2025).

Demonstration of Strategic Innovation and Competitiveness

The demonstration of Dangote refinery's strategic innovation and competitiveness hinges on its engineering scale, vertical integration, export driven model and CNG logistics fleet.

Engineering Scale: It is the largest single-train refinery in the world, with a capacity of 650,000 barrels per day an engineering feat that redefines African industrial capability. It takes strategic innovation to conceive, execute and commission a project of this magnitude

Vertical Integration: Dangote is believed to controls the entire value chain from crude sourcing to distribution reducing costs and increasing efficiency. This vertical integration may not necessarily be coming directly from the refinery but through members of the subsidiary. This however does not preclude other sector players like MRS, Depot and Petroleum Product Marketer Association (DAPPMAN) and other independent marketers who operate in the distribution channel.

Export-Driven Model: The refinery has already begun exporting diesel and aviation fuel to Europe, signaling global competitiveness. The more recent is the movement of a shipload of petrol to the United States.

CNG Logistics Fleet: Deployment of thousands of compressed natural gas trucks reduces reliance on diesel, serves as a cleaner and cheaper source and strongly supports Nigeria's energy transition. Given the number of trucks in the fleet, CNG becomes a more cost friendly and sustainable choice.

Perceived Patterns of Monopolistic Behavior Associated with the Refinery's Market Conduct.

There are four key indicators that suggest some element of monopolistic behaviour and they include: legal challenges to competitors, union suppression allegations, regulatory pressure and price manipulation risks.

Legal Challenges to Competitors: Dangote Refinery filed lawsuits, which some see as a deliberate attempt to block fuel import licenses for other marketers, aiming to restrict competition (Wallchart Africa, 2024). However, others view it as a necessary action to protect their investment, particularly when the issuance of such license violate the extant provision of section 317 of the petroleum industry act (PIA)

Union Suppression Allegations: NUPENG accused the refinery of resisting unionization and creating a company-controlled drivers' association, undermining labor rights. Some industry watchers are of the opinion that advent of union in this nascent refinery could pose some threat that could lead to sub-optimization as in the case of the moribund public refineries. A level of understanding has been reached following the intervention of the federal government. The union has been issued with a restraining order from an Abuja Industrial Court temporarily barring the union from any industrial action that could affect the operations of the refinery.

Regulatory Pressure: There is also the palpable fear that Dangote has lobbied regulators to limit importation and enforce exclusive supply agreements, which could stifle market diversity. It is also argued in some quarters that the importers of refined petroleum products are also intensively lobbying the regulators as well allow continuous importation even when Dangote refinery has demonstrated capacity to meet up with local demands alongside exports.

Price Manipulation Risks: There is the allegation of undercutting domestic prices and favoring exports, the refinery may destabilise local supply chains and marginalise smaller players. The refinery has also come up with the information that DAPPMAN is demanding for an alternative delivery route via coastal logistics that will cost additional ₦75 per litere of fuel. Given a daily 40 million and 15 million daily consumption for premium motor spirit (PMS) automotive gasoline oil (AGO) respectively, this will to a whooping ₦1,505,625000,000.00, approximately ₦1.5 trillion (Daily Trust, 2025). This will translate to one of two things: either this burden is transferred to the final consumers or Dangote refinery will subsidise it. This however, does not suggest price manipulation on the part of Dangote but on the part of the DAPPMAN.

The Refinery's Emergence, Regulatory Practices and Competition In Nigeria's Downstream Oil Sector

Regulatory Capture Concerns: Dangote's suspected influence over policy decisions such as the Naira-for-crude directive raises questions about impartial governance.

Market Displacement: Independent marketers report reduced allocations and fear exclusion from supply chains, threatening their survival.

Policy Tensions: Disputes over fuel quality standards and licensing have exposed weaknesses in regulatory enforcement and coordination.

Calls for Oversight: Stakeholders, including the FCCPC, have called for stronger antitrust enforcement to prevent market abuse.

Measures to ensure that large-scale industrial projects like the Dangote Refinery promote inclusive and competitive market environments

Crude Allocation Equity: Ensure transparent and fair access to crude oil for all licensed refineries, including Dangote.

Strengthen Antitrust Laws: Empower the FCCPC and other regulators to investigate and penalise anti-competitive practices.

Support Independent Marketers: Provide financial and logistical support to smaller players to maintain diversity in the downstream sector.

Labor Protections: Enforce union rights and labor standards to prevent exploitation and ensure inclusive growth.

Stakeholder Engagement: Institutionalise regular dialogue between government, industry players, and civil society to balance interests and prevent monopolisation.

Discussion

Innovation Versus Monopoly

The Dangote refinery no doubt is a rare feat of engineering and logistics, a product of strategic innovation. However, there are the fears, concerns, challenges and apprehension about its potential and real market behavior. There is the suspicion that it could lean toward monopolistic control, this may not be so if the regulators still allows room for other competitors to come in. Strategic innovation appears to be a means to an end-market dominance. Care is required to draw a line of divide between innovation, competitive advantage and monopoly as the tissue of connection could be thin and the boundary blurred particularly in some cases. While it may not be true that Dangote refinery deliberately set out to monopolise the downstream sector of the petroleum industry, the same may not be so for the strategy the employed. Strategic innovation leads to creative disruption, this gives rise to sustainable competitive advantage which enhances competitiveness for the firm. This could lead to temporary monopoly and how the monopoly lasts depends on the willingness and readiness of the competitors in the market to compete and the regulators to live up to their expectation. The refinery came into the market as a perfect competition but if overtime as a result of their strategy and associated economies of scale, the conditions for a perfect competition are no longer there, the a market failure has occurred. In this case the government through its agencies can then intervene.

Implications for Nigeria

Generally, a monopolised energy sector could lead to price manipulation, supply disruptions, and stifled innovation. Regulatory bodies must assert independence to safeguard market integrity. However, within the contest of the focal case, it is more of a market failure as against monopoly. When there is market failure government intervention becomes necessary, such intervention must be objective and balanced to enable the market pick up again.

Conclusion

The Dangote Oil Refinery is both a symbol of industrial ambition and a cautionary tale of market leadership. Its strategic innovation is undeniable, may not have set out for monopoly but could result in a monopolistic outcome that some fear could threaten Nigeria's energy future, if national interest is relegated to the background. The current situation is more of a market failure than a predetermined monopoly on the part of the refinery. A balanced regulatory framework is essential to harness its benefits while curbing identified excesses. Regulators must ensure fairness in its

regulatory oversight as unnecessary highhandedness and overreach could have adverse effect on the refinery, the nation and the entire sub-region.

Recommendations

The study recommends as follows:

i. The current regulatory framework needs to be further strengthened to guarantee fairness in their regulatory oversights.
ii. To alley the fear of monopoly by Dangote or any other operator, government should be decisive on the moribund State owned refineries to either revive them or divest to make way for more serious competitors.

Abstract
Road safety remains a critical public health and economic concern in Nigeria, with high rates of accidents attributed to poor highway conditions, reckless driving, and vehicle malfunctions. This study examines the three major components of road safety management in Nigeria: highway infrastructure, driver behavior dynamics and vehicle maintenance. The theoretical foundation upon which the work rests is the general systems theory propounded by Ludwig Von Betalanffy and Kenneth Boulding 1969. This study deploys a qualitative approach, explores secondary data from diverse sources including the Federal road Safety Corps, World Health Organisation, National Bureau of Statistics amongst others. This information was triangulated to ensure their validity and reliability. The following recommendations for improvement were made: i.) The creation of a unit in the FRSC responsible for result based interactions and relationship with MDAs responsible for road construction and maintenance. ii.) The FRSC should make a powerful case for government through their MDAs to embark on nationwide highway needs identification and assessment, and thereafter immediate rehabilitation and reconstruction as may be required. iii.) Government should consider the option of improving on road infrastructure through increased public-private partnerships and stringent maintenance contracts and concession.

Keywords: *Road Safety, Driver Behavior Dynamics, Highway Infrastructure and Vehicle Maintenance.*

Introduction

Road traffic accidents (RTAs) are a leading cause of death and injury in Nigeria, with over 41,709 fatalities recorded between 2010 and 2021 (FRSC, 2022). The World Health Organization (WHO, 2018) estimates that Nigeria has one of the highest road traffic fatality rates in Africa, at 21.4 deaths per 100,000 population. The primary factors contributing to these accidents include poor

road conditions, reckless driving, and inadequate vehicle maintenance. This paper evaluates Nigeria's road safety management system, focusing on highways, drivers, and vehicles, while proposing policy interventions for sustainable improvement. The FRSC has ma since inception made significant effort to improve on road safety situation in Nigeria. However, the current FRSC structure as designed seems to be skewed towards addressing the behavioural and vehicular aspects of the safety tripod leaving the highway integrity part of it. This tends to create some imbalance as the condition of the drivers and their vehicles alone cannot guaranty safety on the highway. A third variable which is the condition of the highways needs to be addressed equally.

Statement of the Problem

Road safety remains a critical challenge in Nigeria, with high rates of accidents, injuries, and fatalities attributed to poor highway conditions, reckless driving, and inadequate vehicle maintenance. According to the Federal Road Safety Corps (FRSC, 2022), "Nigeria records an average of 11,363 road crashes annually, leading to significant loss of lives and economic costs".

This situation persists in spite of policy statements and intervention actions such as the National Road Safety Strategy (NRSS) and the FRSC, there are some systemic issues that still continue. There highway infrastructure are still replete with potholes, poor road signs, and inadequate pedestrian walkways. There is also the challenge of erratic driver behavior; over-speeding, drunk driving, inexperienced drivers and failure to comply with traffic laws. Poor vehicle maintenance also constitute a major challenge, that has left many vehicles commercial and private alike, operating at their own whims and caprices without proper regulatory inspections. Weak enforcement, corruption in licensing, and inadequate road maintenance aggravate these problems.

However, while the Federal Road Safety Corp is established to address enforcement, licensing and behavioural issues, that of road maintenance which though is outside their frame of reference remain apparently unattended to. This study therefore seeks to examine the interplay and interface between highway conditions, driver conduct, and vehicle safety in managing Nigeria's road safety and how to address any vacuum.

Objectives of the Study

The objectives of this research are:

i. To assess the state of Nigeria's highway infrastructure and its role on road accidents in Nigeria.
ii. To evaluate driver-related factors contributing to road traffic accidents in Nigeria
iii. To analyze vehicle safety standards and the effectiveness of maintenance regulations in Nigeria.
iv. To propose policy recommendations for improving road safety management through infrastructure development, stricter law enforcement, and public awareness campaigns.

Research Questions

This study seeks to answer the following research questions:

i. How does the condition of Nigerian highways contribute to road traffic accidents?
ii. What are the driver behaviour dynamics / factors that influences road safety in Nigeria?
iii. How do vehicle maintenance and roadworthiness regulations affect accident rates?
iv. What safety policy interventions can enhance road safety management in Nigeria?

Significance of the Study

This research is significant at least for four reasons which are as follows:

i. **Policy Formulation:** Findings will provide empirical evidence to guide policymakers in strengthening road safety laws and enforcement mechanisms.
ii. **Public Awareness:** The study highlights critical safety issues and encouraging better highway infrastructure.
iii. **Economic Impact:** Reducing Road accidents will lower healthcare costs, loss of productivity, and vehicle repair expenses, benefiting Nigeria's economy.
iv. **Academic Contribution**: The study adds to existing literature on transportation safety in developing countries, serving as a reference for future research.

Scope of the Study

This study is delimited on the bases of geography, industry and subject matter. On the basis of geography, it is delimited to Niger Delta region of Nigeria. The industry focus of the study is road transportation and the subject matter is road safety.

History and Evolution of the Federal Road Safety Corps (FRSC) in Nigeria: 1988–Present

The Federal Road Safety Corps (FRSC) was established on February 18, 1988, through Decree No. 45 under the then military regime of General Ibrahim Babangida and later reaffirmed through the FRSC Establishment Act, 2007. Upon its establishment, Nobel Laureate, Professor Wole Soyinka was briefly saddled with the leadership as the first Corps Marshal between1988–1989 and thereafter a substantive Corps Marshal Major General Haladu Anthony Hananiya (rtd.) was appointed between1989–1994. Its core mandates were to; reduce road accidents through enforcement and public enlightenment, standardisation of driver licensing and vehicle registration.

The Corps had some initial teething problems in its early days and these include: resistance from transport unions that were opposed to stricter regulations (e.g., NURTW), lack of funding and personnel with an initial staff strength of just 500 officers and corruption in licensing (license racketeering, issuance of fake licenses, extra charges, issuance of license by proxy) amongst others were rampant due to weak oversight. The procedure for issuance of drivers' licenses between 1988 and 1999 still followed the inherited manual approach where applicants submitted forms at State Motor Licensing Authorities (MLAs) nearest to them. There was no standardised testing then, as mode of operation varied across the States' MLAs. In most cases, licenses were issued without proper driving tests and other due process as the entire process was prone to corruption given the limited control of the nascent FRSC.

However, between 2007 and 2014, there was a dramatic turn of events with the emergence of Osita Chidoka as the Corps Marshal. This period marked a paradigm shift, signaling a radical departure from the old cliché to automated and centralized motor licensing database system to curb the issuance of fake licenses. The hallmark of this period are: computerization of licensing, introduction of applicant registers at FRSC approved centers, computer-based test (CBT), biometric capture (fingerprints), reinforcement of practical driving test that was hitherto unenforced in many States and centralisation of license production in Abuja to reduce fraud. Subsequent administrations like that of Boboye Oyeyemi 2014 to 2021 and the current one continued in this trajectory.

Within this period there were some key policy changes like: speed limit enforcement that made it mandatory for commercial vehicles to install speed limit gadgets, though, later discontinued due to strong resistance; National Traffic Radio 101.1 FM was launched to provide real-time traffic updates; partnerships with some States providing driver testing as in the case of Lagos to reduce to the barest minimum the incidence of racketeering. Others revolve digital transformation like: e-Licensing leading to the introduction of online application portal (https://nigeriadriverslicense.org), National Vehicle Identification System (NVIS) that tracks vehicle history to control theft and stricter testing. The scope of theory test within this period was expanded to include: road signs, traffic laws, and safety ethics, practical test grading system that allows the use of tablets by examiners to log performance. This period also witnessed the reclassification of driver's license and the streamlining of the issuance procedure as follows: online application through FRSC portal at an approved fee; computer-based test (CBT) comprising of 30 multiple-choice questions with pass mark set at 70%; biometric verification capturing fingerprint and facial; practical driving assessment carried out at FRSC- accredited driving schools and card production with security features which includes QR and takes between 3 and 6 weeks of delivery.

Departments in the Federal Road Safety Corps

The FRSC has eight major departments, namely; operations, administration and human resources, special duties and external relations, training, finance and account, motor vehicle administration, policy research and statistics and technical service department.

i. Operations (OPS): This department deals with conducting of patrols, enforcement of traffic laws, management of accident response and intervention in road safety and overseeing highway monitoring as well as traffic controls.

ii Administration and Human Resources (AHR): They are saddled with the responsibility of handling of recruitments, trainings, personnel management, staff welfare, disciplinary actions and overseeing internal administrative procedures and processes.

iii. Special Duties and External Relations (SDER): They coordinate special duties and inter-agency collaborations; engage in public relations and stakeholder partnerships and overseeing international road safety programs.

iv. Training (TRG): They are in charge of development and implementation of training programs for officers, conducting workshops and seminars on road safety and ensuring continuous staff professional development.

v. Finance and Accounts (F&A): They are responsible for management of budgeting and financial operations, overseeing revenue collection and expenditure tracking as well as ensuring financial accountability and audits.

vi. Motor Vehicle Administration (MVA): They take charge of regulation of vehicle registration and licensing activities, overseeing the issuance of driver's licenses and ensuring compliance with vehicle roadworthiness standards.

vii Policy Research and Statistics (PRS): They have the responsibility of conducting research on trends and policies in road safety, analyzing traffic accident data for policy formulation uses and provision of statistical reports for decision-making.

viii Technical Service Department (TSD): They take care of maintenance and repairs of FRSC operational vehicles and allied equipment, overseeing the development of road safety infrastructure and provision of technical support for enforcement tools.

Conceptualizing Road Safety Management and Road Safety Tripod

According WHO, 2018, road safety management comprises of the systematic process of identifying hazards, assessing risks, and implementing interventions to reduce traffic-related injuries and fatalities (WHO, 2018). Put somewhat differently, road safety management as a systematic process begins with the identification of potential hazards, associated risks, control measures, recovery measures and documentation. Three major factors influence the road safety situation in Nigeria, and they include: highway infrastructure quality and maintenance, driver behavior and compliance level and vehicle roadworthiness standards. These three put together is referred to as the road safety tripod. It is the three legs upon which an effective road safety management should stand. How these three variables are managed will determine the outcome for the institutions responsible for road safety.

Current State of Nigerian Highways

According to the Federal Ministry of Works, Nigeria a network of highways that span approximately 200,000 km. Of these, only 60,000 km are paved (FMW, 2023). Most of these roads are in deplorable conditions arising mainly from inadequate design and poor maintenance culture. The state of these roads contributes significantly to traffic accidents, fatalities and economic losses (FMW, 2023).

Statistics has it that the surfaces of the highways are dotted with potholes and surface defects and this account for 40% of accidents recorded on "major highways like Lagos-Ibadan and Abuja-Kaduna roads" (Aderamo & Magaji, 2021). There is apparent lack of Lack of Safety signs and features. The World Bank (2022), notes that 35% of federal highways have adequate and functional road signs and less than 20% of them have guardrails. Poor drainage systems have often led to flooding and erosion resulting in damage to over 15% of roads annually, and an attendant cost of ₦150 billion for maintenance repairs (NBS, 2023).

Inadequate Funding and Budgetary

Underfunding, budget diversion and over-reliance on oil revenue are recurring decimals in Nigeria's budgeting system. According to World Bank (2023), Nigeria's annual provision for road maintenance is less than 15% of its transport budget which is far less than the 20–30% benchmark that the World Bank recommends. Transparency International (2022), notes that more often than not, funds supposedly made available for road construction and repairs are diverted to other sectors from where they are misappropriated or out rightly embezzled. The Nigerian bureau of statistics notes that fluctuations prices in the oil and gas market the main stay of Nigeria's economy do lead to inconsistency in the flow of fund for infrastructure development (NBS, 2023).

Corruption and Mismanagement

This has over the years, remains one Nigeria's greatest problems. Contract inflation, ghost projects and bribery in contract awards are some of the dimensions. As noted earlier, corruption in diverse forms, accounts for the biggest part of the challenge facing the development of highway infrastructure in Nigeria. The economic and financial crime commission affirms that road contracts are habitually awarded at overblown and padded costs. Actual amount expended and delivery is far less than required, resulting in substandard quality of work (EFCC, 2023). There is also the issue of ghost projects. These are road projects which according to Premium Times (2022), "exist only on paper, with no actual construction" and no intention whatsoever to deliver them. This kind

of project is used mainly for prebendal political settlements and "public relations". Aside from the foregoing, the Independent Corrupt Practices Commission notes that contracts are awarded without due process thus allowing politically connected firms to take contracts without competitive bidding (ICPC, 2021).

When this is the foregoing is case, poor road design and delivery potholes and inadequate road signs becomes a recurring decimal and these lead to inconsistent driving patterns (FRSC, 2020). A study by Aderamo and Magaji (2021) reveals that "40% of accidents on major highways like Lagos-Ibadan Expressway are linked to poor road conditions". World Bank (2018) also posits that inadequate pedestrian walkways do force pedestrians onto roads and thus increasing the likelihood of conflicts with vehicles. Corrupt practices also affect the vehicle inspection, certification and by extension their conditions. Transparency International (2019) notes, that systemic corruption among traffic officials creates room for offenders to bribe their way through penalties. Also when there are inconsistent penalties for traffic violations, it reduces compliance (FRSC, 2021).

Substandard Highway Construction materials and Vehicle Maintenance Spare Parts and Methods

Use of poor-quality materials, lack of quality control and poor drainage systems are some of the symptoms compromise system. The Council for Registered Engineers of Nigeria opines that contractors use every means within their disposal to cut costs. These include: the use of substandard asphalt, inappropriate concrete ratio, inferior steel materials thus resulting in rapid deterioration (COREN, 2022). Ironically, these fall partly within the purview of COREN itself. The Federal Ministry of Works stresses the issue of weak supervision which allows contractors to deliberately bypass known and established engineering standards due to poor or absolute lack of quality control. (FMW, 2023). Many highways are designed without proper drainage systems, in most cases where there are drainages; their designs are inappropriate resulting in siltage and excessive ponding thereby causing erosion that affects the durability of the road. (Aderamo & Magaji, 2021). Aside from the highway, when fake and substandard spare parts are used for vehicle maintenance, it results minor or breakdowns, abandonment of vehicles, crashes and collisions either alone or involving third parties (SON, 2020). These are most times catastrophic and or fatal.

Overloading and Lack of Enforcement

Overloaded Trucks, weak law enforcement, and lack of penalties are major challenges in managing safety in Nigerian roads. It is a common practice to abuse both heavy-duty and light duty vehicles and the highways by exceeding the permissible weight limits. Heavy duty vehicles with loads far above designed axial load capacity of the highways constantly ram on them, thereby causing unprecedented asphaltic, earth work and structural failures resulting in associated damages to the road from foundation to surface. This also result in severe damages to the vehicles (FRSC, 2023). Control and enforcement equipment and machines like weighbridges are non-functional, not available or manned by compromised and corrupt persons (NPA, 2022).The FRSC argues that these heavy duty vehicle and highway abuses through unauthorised heavy loads are due mainly to lack of penalties and fines for overloading and where there are, they are indeed too low to serve as deterrents to offenders (FRSC, 2023). There is also the issue of corrupt and compromised law enforcement officers who allow these excesses by collecting bribes directly from the drivers or through their proxies usually pseudo and disguised hawkers planted in strategic positions as their receivers.

Poor Maintenance Culture

Maintenance culture remains a major issue across different sectors in Nigeria including the transportation sector and road maintenance units, this stems from the apparent preference to reactive rather than preventive maintenance, lack of routine inspections and delayed repairs.

There appears to be an apparent apathy for normal maintenance of roads in Nigeria and where it is undertaken, it is more often than not reactive in nature rather than preventive to say the least (World Bank, 2023). The type of road maintenance embarked upon in Nigeria in tera-technology terms is "run to failure" or "breakdown maintenance" where the facility deteriorates badly and completely out of use and most times abandoned. Examples of this are Port-Harcourt road Aba, Agbor section of Agbor-Auchi road, Ekpoma section of Ekpoma-Benin City road amongst others in Abia, Delta and Edo States Nigeria respectively. Some of these roads have been out of use for at least over ten years.

According to FMW (2023) roads are not routinely checked as there is no well thought-out system for proactive assessment of the road conditions, thus they are allowed to deteriorate until they become inaccessible and out of use (FMW, 2023). Noticeable cracks, potholes and gullies are left unattended to for several months, even years thereby worsening the situation and most times resulting in secondary damages (Guardian, 2023). An example of this is the deep pothole at the Onitsha end of the first Niger Bridge, the failed asphalt within and around the bridge and the damaged expansion joints which have been there for over five years. All these affect the condition of the vehicles plying these roads and do lead to accidents. Aside from these, most of the vehicles on the road are not maintained in line with the manufacturers' specifications and thus poses a serious safety challenge. According to (FRSC, 2019), more than "60% of commercial vehicles" in Nigerian highways either have defective tires or malfunctioning breaks. Standard Organization of Nigeria (2020), also raised the issue of counterfeit spare parts as one of the things that poses serious threat that worsens both vehicle and highway safety.

Institutional Weaknesses

Fragmented responsibility, lack of technical expertise and political interference are some of the manifestations of the institutions. The institutions responsible for construction, maintenance and enforcement of usage of these roads are fragmented resulting in multiplicity of agencies like (FMW, FEMA FRSC, States MOW and Direct Labour Agencies). This poses yawning coordination gaps (NBS, 2023) and significantly accounts for the deteriorating conditions of most inter-state highways which are usually federal roads. Even in very deplorable condition, most State actors ignore these roads that transverse their communities in the guise that it belongs to the federal government irrespective of the adverse effect on their own people. COREN (2022) notes that there is paucity of technical expertise resulting in difficulty in hiring qualified engineers for appropriate road design as well as maintenance. Beyond the foregoing, there is also the challenge of political interference that negates due process, giving priority to political interest over actual needs (ThisDay, 2023). Negligence in the driver licensing process lets unqualified and inexperienced drivers on roads (FRSC, 2022). Poor urban planning also increases the likelihood of reckless driving (UN-Habitat, 2019). Porous border, poor border control and compromised public officers allow the importation of not only used but old and substandard vehicles, fake and old spare parts to thrive. NBC, (2023) affirms "that over 70% of vehicles in Nigeria are imported used vehicles" (NBS, 2022) known in the local parlance as *"tokumbo"*. WHO (2018) asserts that many of these

vehicles lack airbags, ABS, or electronic stability control (ESC) and other safety features. (WHO, 2018). Institutional weakness and failure creates avoidable unsafe conditions in the highways like; broken down and crashed vehicles on the highways, shoulders of the roads and bridges. These signal failure of the recovery units of the Federal and States Ministries of Works, Federal Road Safety Corps, Traffic Unit of The Nigerian Police and any other action responsible agency.

Environmental and Climatic Conditions

As the world groan under the effect of climate change and its attendant effect, such as heavy rainfall, flooding, erosion, Nigeria is not spared. Where the drainage systems are poor or defective as is mostly the case here, this could lead to water-logging and by extension the collapse of the roads (NIMET, 2023). Excessive rainfall also aggravates the problem of erosion particularly in the southeastern part of Nigeria, where it causes devastating destruction to road infrastructure annually (NEMA, 2022). As the roads degenerate and deteriorate so also the vehicle that plies them. This most time results in serious accidents particularly when the drivers are apparently unmindful of the consequences of these adverse climatic conditions.

Economic and Logistical

The prevailing economic situation in Nigeria has its own challenge on road construction and maintenance; high cost of construction materials, foreign exchange instability, and insecurity amongst others. Inflation for instance affects the project costs as material prices rises leading to sharp and unethical practices (NBS, 2023). There is also the challenge of foreign exchange fluctuations. Dependence on machinery imported from other countries and materials raises generally costs (CBN, 2023). The challenges of insecurity are enormous and come in diverse forms such as armed robbery, kidnapping and abduction for rituals, organ harvesting and human parts sales purposes. Punch (2023) notes that delays in construction are attributed to "kidnappings, abduction and attacks on workers". This does not only affect the drivers but their vehicles as well. The hash economic climate triggers some urgent need to survive leading to aggressive driving thus creating the "survival-of-the-fittest" syndrome (Oluwadiya et al., 2014). Adejugbagbe et al. (2015) acknowledges that hash economic condition could lead to fatalistical beliefs ("God decides accidents") thereby undermining the need for proper risk identification, assessment, control and remediation (Adejugbagbe et al., 2015) emphasis mine. ILO, (2020) asserts that commercial drivers in Nigeria often over speed to meet daily, weekly or monthly revenue targets (NBS, 2021) particularly when they are on hire purchase or what is known in the local parlance as "balance and take". When wages are low wages and drivers are exposed to long hour journey, this does lead to fatigue. Hash economic condition sometimes influence the drivers maintenance approach, making them resort to supposedly cheap roadside quacks and fake spare parts as against accredited service centres and genuine spare parts.

Theoretical Foundations for Road Safety Management in Nigeria

The general systems theory has been adapted to helps paint a clearer and near-enough-picture of the complex dynamics of road safety management in Nigeria. It is on these foundations and framework that the study rests.

The General Systems Theory (Ludwig Von Bertalanffy and Kenneth Boulding 1968)

This theory presents systems as being made up of different parts or subsystems that interact inter-dependently in a systemic manner in order to achieve the objective of the system. Every system is

greater than the sum of its interacting parts. Systems can be classified as open or closed on one hand depending on its source of input and output; it can also be classified as deterministic or probabilistic depending on it responds to the environment.

The system of road safety management system in Nigeria is a systemic interaction of the road design, driver behavior, vehicle condition and enforcement mechanism. The FRSC as the manager interacts regularly with the drivers and their vehicles with full authority and control but the same cannot be said of the highways in terms of design, construction and maintenance. There do not seem to be any unit in the FRSC than can carry out a quick fix on the highways when it becomes very necessary but rather depends on the multiple agencies FMOW, FERMA, States MOW, SERMA, DLAs and local authorities. When this is the case the system will suffer sub-optimisation. Systems do not work in isolation, they interact with other systems too. If the responsibility of the FRSC as it is today is limited to the road worthiness of the vehicles and the fitness of the drivers alone then there is a fundamental error in its conception. If there are other ministries, departments and agencies (MDAs) that are responsible for the fitness for use of the highways, there should be a systemic interface between them and the FRSC without which the road safety system may be at best be a road incident and accident data collators.

When there is poor road design and maintenance, it will translate to poor road conditions resulting in driver frustration. Frustration on the part of the driver leads to reckless maneuvers that do lead to accidents.

Empirical Review

In FRSC (2023) Annual Road Traffic Crash Report, using a descriptive statistics, analyses of secondary data for the period 2018-2023 revealed that 11,356 crashes were recorded in 2022, of these, 5,227 deaths were recorded and 30,105 injuries were received. The analysis shows that 65% of the accidents involved commercial vehicles. Similarly, 40% of the accidents were due to over- speeding. The fatality rate stands at 41.5 deaths per 100 crashes and this higher than the global average of 32.9.

In another study titled Driver Behaviour and Road Traffic Crashes in Nigeria: A Cross-Sectional Survey a sample of 1,200 commercial drivers selected from Lagos, Abuja, and Kano was carried out. The result reveals that 68% of drivers sampled admitted to speeding arising from pressure to meet daily revenue targets; 52% did use phones while driving and 33% drove under the influence of alcohol. The study further reveal that drivers with less than" 5 years' experience had 2.3x higher crash risk ($p<0.01$)".

In another study titled Vehicle Safety Compliance Audit (2021), Standard Organization of Nigeria (2021) sampled 850 commercial vehicles mainly buses, trucks at major parks. The tool deployed was physical inspections while using SON safety checklists to measure the level of compliance against SON standards. The result shows that 62% had substandard and defective tyres; 48% had faulty and defective brakes while only 29% had functional seatbelts and a paltry 8% had airbags.

In a related study in (2020) titled Nigeria Road Infrastructure Assessment, the World Bank (2020), relying on satellite imagery and field surveys of 10,000km federal roads deployed World Bank Road Condition Index (RCI) and spatial mapping of high-risk zones. The result reveals that 45%

of roads surveyed had potholes/ and unmarked junctions; 70% lacked active / functional streetlights. The study posits that poor road conditions contributed to 30% of road accidents in 2020.

Also in another study by National Bureau of Statistics (2022) titled the Economic Burden of Road Crashes in Nigeria (2021), using secondary data from NBS household surveys, hospital records, they undertook the cost-of-illness analysis and direct / indirect cost as a percentage of GDP. The result revealed an annual economic loss of ₦1.2 trillion of $3 billion, representing 3% of GDP. The study further reveals that 75% of victims faced catastrophic and devastating health expenses.

Transparency International Nigeria (2022), in a study tagged corruption in traffic law enforcement sampled 500 drivers, 200 traffic officers, using anonymous surveys, bribery incident tracking, determined the correlation between bribery and accident rates. The result of the study shows that 72% of drivers did pay bribes to evade penalties; 55% of officers admitted to extortion at different point the study further posit that States with high prevalence of corruption recorded 40% more fatal accidents than the others.

The empirical review concludes that road traffic accidents in Nigeria revolve around some key factors, such as: over-speeding (human factor), inadequate vehicle maintenance (vehicular factor) and deplorable road conditions (highway infrastructure factor) further aggravated by weak and compromised enforcement, bribery and corruption (institutional factor).

Methodology

This study employs a qualitative approach, exploring secondary data from the Federal road Safety Corps, National Bureau of Statistics, World Health Organisation as well as journalistic sources, regulatory filings, and public statements to build a healthy literature. These information were triangulated to ensure their validity and reliability

Highway Infrastructure Quality / Maintenance, Driver Behaviour Dynamics and Vehicle Safety Standards in Nigeria

Highway accident is a generic concept that hinges on three major factors irrespective of the setting, these are: highway infrastructure quality, drivers behaviour dynamics and vehicle safety standard.

Highway Infrastructure Quality / Maintenance

Nigeria's highway infrastructure is beset with a myriad of problems arising from the quality of construction, usage and abusage and maintenance. These problems are due mainly to a mixture of systemic, economic, and institutional challenges most of which revolve majorly around corruption and they include: substandard construction and maintenance materials, poor budgeting practice, poor maintenance culture, uncoordinated multiplicity of functions, bribery among others.

Driver Behaviour Dynamics

The factors that influence the behaviour of drivers in Nigeria are not only multivariate but also present a complex interplay of the following: poor road infrastructure and maintenance, weak traffic law enforcement, socio-cultural, regulatory corruption, and economic factors amongst several others.

Driver Behaviour Dynamics Vehicle maintenance standard is an essential plank in the platform for road safety management discourse. Among the factors that affect it are: poor maintenance culture, fake and substandard spare parts, weak inspection regime, overloading, poor enforcement of traffic laws and importation of used and substandard vehicles amongst others.

The condition of the vehicle at anytime has impacts on crash outcomes. A very significant proportion of the vehicles on Nigerian roads particularly the commercial ones were bought as second hand and are old. Given the prevailing economic situation in Nigeria now, maintenance of these vehicles presents an onerous task to the users. This often results in breakdown and accidents in the highways. According to National Automotive Design and Development Council inspection data, 54% of commercial vehicles plying Nigerian roads have defective breaks and failed break test. Similarly, 62%, of the vehicles have substandard tires in them (NADDC, 2021). Most of the vehicles on the roads from their date of their first purchase are old often resulting in system failure. Ogunsanya (2019), notes that vehicles that are older than fifteen years are 3.2 times prone to fatal crashes compared to the newer ones.

Discussion

The focus of the discourse is on the systemic flow of interaction within the FRSC. While it may that the FRSC have done reasonably well in some area of their core mandate, particularly in the area of computerisation of the licensing process and regular presence in the highway, there is still a missing link and that is the condition of the highways. Road failures are not sudden except in very rare cases of natural disaster, thus the road users and other stakeholder do have ample opportunity to detect and respond to them ahead of time. Response could be in the form of preventive maintenance, a quick fix in the event of minor failure and reconstructions of failed sections were necessary with a redesign. Granted that systems have boundaries, a system may not be able to attain its goal if its interface with other systems is constrained. In the case FRSC, there ought to be actionable interface and interdependence between them and the MDAs responsible for road design, construction and maintenance at the different levels of government.

The Special Duties and External Relations (SDER) as presently constituted do appear to be playing more of more of ceremonial representation role. It could in addition to what it does now be prepared to serve a better purpose as an alternative to fixing the broken or missing leg of the road safety tripod (the highway infrastructure interface).

Conclusion

While the paper may not be advocating outright duplication of highway engineering role in the FRSC, a unit responsible for result oriented liaison with action responsible MDAs will suffice for the improvement of the road safety system. When the present vacuum created by the absence of a functional highway integrity unit is effectively filled, there will be a dramatic turnaround of highway incidents and accidents. When this happens, the nation would have been saved a lot in terms of averted losses to lives arising from fatalities and properties.

Recommendations

To address the problem the broken road safety tripod in FRSC, this paper recommends as follows:

i. The creation of a unit in the FRSC responsible for result oriented interactions and interfaces with action responsible MDAs for road construction and maintenance.

ii. The FRSC should make a strong case for government at different levels through their MDAs (FMOW, States MOW FERMA, States SERMA, Direct Labour Agencies) to embark on nationwide highway needs identification and assessment, followed by immediate rehabilitation and reconstruction as the need may arise.
iii. Government should also consider improving on road infrastructure through public-private partnerships and stricter maintenance contracts or concession.

Abstract
This study investigates the relationship between silent voice and organizational sustainability in oil and gas companies in South-South Nigeria. Anchored in pragmatism and employing a correlational survey design, data were gathered from 55 managers across 11 selected oil and gas firms using structured questionnaires. The findings revealed a significant negative relationship between silent voice and both environmental and social sustainability. This indicates that employees' reluctance to voice concerns hinders ecological responsibility and social cohesion within organizations. Specifically, the absence of open communication contributes to weak environmental initiatives and poor community engagement, limiting sustainable practices. On the other hand, a weak positive relationship was observed between silent voice and economic sustainability, suggesting that in certain cases, silence may serve to maintain stability in financial operations, particularly in volatile market conditions. Despite this, the overall findings underscore the detrimental effects of silent voice on holistic sustainability. The study emphasizes the need for organizational leadership to actively foster an environment of open communication, participatory decision-making, and trust-building to ensure more effective implementation of sustainability initiatives. By addressing silent voice, oil and gas companies can enhance their environmental, social, and economic outcomes, aligning with global sustainability goals. The research concludes that mitigating employee silence is crucial for achieving long-term, balanced organizational sustainability within Nigeria's oil and gas sector, providing valuable insights for improving management practices in the industry.

Keywords*: Silent voice, organizational sustainability, environmental sustainability, social sustainability, economic sustainability*

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Introduction

Silent voice, which refers to employees' reluctance or inability to express concerns, ideas, or suggestions in the workplace, has significant implications for organizational sustainability in oil and gas companies in South-South, Nigeria. When employees remain silent due to fear of victimization, lack of management support, or organizational culture that discourages openness, critical information necessary for innovation, safety compliance and operational efficiency is withheld. Silent voice describes the tendency of employees to withhold ideas, concerns, or feedback in the workplace, often driven by fear of negative consequences, perceived futility, or cultural norms that discourage dissent (Morrison & Milliken, 2020). Silent voice can be particularly harmful because operational safety, environmental compliance and technical innovation depend on timely upward communication from frontline staff (Kumar, 2018). In South-South Nigeria, where oil and gas operations intersect with complex community expectations and regulatory scrutiny, the prevalence of silent voice may exacerbate safety lapses and undermine sustainable practices if left unaddressed (Adebayo, 2019).

Van Dyne, et al. (2003) describe silent voice as the intentional withholding of relevant information by employees, which can occur for defensive, relational, or organisational reasons. This definition acknowledges that silence is not always due to fear but may also result from an employee's belief that remaining silent is beneficial for maintaining harmony or protecting personal interests. The dimensions of silent voice can be categorised into different forms, each with distinct implications for organisations. One widely recognised classification is that proposed by Van Dyne et al. (2003), which identifies three primary forms of silence: acquiescent silence, defensive silence, and prosocial silence. Thus, silent voice is both a symptom and a lever: when treated, it can transform latent employee insight into drivers of sustainability.

Organizational sustainability encompasses a firm's long-term capacity to operate profitably while safeguarding environmental integrity and social license to operate (Elkington, 1997). For oil and gas companies, sustainability requires integrating environmental stewardship, stakeholder engagement and resilient governance into core strategic decisions rather than treating them as peripheral compliance tasks (Dyllick & Hockerts, 2002). Sustainable organizations balance short-term economic objectives with investments in ecological protection and community development so that resource extraction does not preclude future generations' needs (Schaltegger, Hansen, & Lüdeke-Freund, 2016).

Sustainability in the oil and gas sector also depends on adaptive capabilities learning from incidents, innovating safer processes and aligning value chains with low-impact technologies (Hart & Dowell, 2021). Firms that institutionalize learning, encourage employee voice and embed environmental and social metrics into performance management are better positioned to maintain operational continuity and societal legitimacy (Freeman, 1984; Epstein & Buhovac, 2014). In the South-South region, where local communities bear many externalities of extraction, organizational sustainability is inseparable from transparent communication, equitable benefit sharing and proactive environmental management (Eze & Chukwu, 2021).

At the operational level, sustainability is measured across three interrelated dimensions: environmental sustainability minimizing pollution and preserving ecosystems; social sustainability maintaining community relations and worker welfare; and economic sustainability ensuring long-

term profitability and value creation for stakeholders (Elkington, 2017). Each dimension influences and is influenced by employee behaviors and organizational processes.

Environmental sustainability focuses on reducing emissions, preventing spills, and rehabilitating affected lands to mitigate ecological harm and regulatory risk (Hart, 1995). Social sustainability prioritizes fair labor practices, community investment, and open dialogue to secure social license and reduce conflict (Gunningham, Kagan, & Thornton, 2004). Economic sustainability ensures that companies remain financially viable through efficient resource use, diversification strategies, and investments in human and technological capital that support enduring competitiveness (Porter & Kramer, 2011).

The relationship between entrepreneurial silent voice and organizational sustainability is complex because entrepreneurial voice employees proactively proposing business opportunities or process innovations can be stifled by silence, depriving the firm of adaptive advantages (Morrison, 2014). In oil and gas firms, entrepreneurial silence may prevent frontline personnel from suggesting cost-saving process tweaks, novel environmental controls, or community engagement models that would enhance sustainability outcomes (Kanter, 1988). Thus, when silence suppresses entrepreneurial contributions, organizations lose a crucial source of bottom-up innovation that links operational excellence with environmental and social improvements (Adebayo, 2019).

Conversely, when firms cultivate a climate where entrepreneurial voice is encouraged and protected, employees become engines of sustainable change identifying efficiency gains that reduce emissions, proposing local hiring schemes that strengthen social ties and suggesting revenue-diversifying ventures that bolster economic resilience (Spreitzer, Sutcliffe, Dutton, Sonenshein, & Grant, 2005). Therefore, reducing silent voice not only mitigates risk but actively advances all three pillars of sustainability by harnessing employee creativity and local knowledge for systemic improvement (Detert & Burris, 2007).

Previous empirical studies provide mixed but instructive findings on voice and sustainability in extractive industries. For instance, Adebayo (2019) examined Nigerian petroleum firms and found that perceived managerial hostility correlated positively with employee silence and negatively with environmental incident reporting, suggesting that leadership style mediates the silence-sustainability link. Similarly, Okafor and Nwosu (2020) surveyed operational staff in the Niger Delta and reported that formal whistleblowing mechanisms reduced defensive silence and improved compliance with environmental monitoring protocols. These studies collectively highlight the managerial and institutional levers that influence whether silence or voice predominates.

Other researchers have explored the innovation side: Kumar (2018) analyzed upstream facilities and demonstrated that sites with higher levels of employee entrepreneurial voice realized measurable process efficiencies and lower leak rates, indicating a tangible linkage between bottom-up suggestions and environmental outcomes. Complementary work by Eze and Chukwu (2021) emphasized the social dimension, showing that firms practicing inclusive stakeholder dialogues facilitated by empowered frontline staff experienced fewer community protests and smoother permit renewals. Together, these studies underscore the multifaceted benefits of converting silent reservoirs into active organizational resources.

Despite these contributions, gaps remain that justify further inquiry in the South-South Nigerian oil and gas context. First, much prior work treats silence and voice as monolithic, failing to differentiate entrepreneurial silence from other silence types and thereby obscuring how specifically entrepreneurial withholding affects sustainability outcomes (Brinsfield, 2013). Second, existing studies often use cross-sectional designs that limit causal inference about whether reducing silence leads to improved sustainability or whether sustainable firms simply cultivate more voice (Milliken et al., 2003). Third, there is limited integration of community-level perspectives in studies focused on internal voice dynamics, yet social sustainability in the Niger Delta cannot be disentangled from external stakeholder grievances (Eze & Chukwu, 2021).

Accordingly, the present synthesis links these gaps coherently: entrepreneurial silent voice is a distinct construct with unique implications for environmental, social and economic sustainability; leadership and institutional mechanisms moderate its occurrence; and community-facing outcomes must be included to capture the full sustainability impact. By differentiating types of silence, employing longitudinal designs, and triangulating organizational data with community indicators, future research can close the evidentiary gap and offer oil and gas firms actionable pathways to convert employee voice into durable sustainability gains (Detert & Burris, 2007; Edmondson & Lei, 2014).

Statement of the Problem

Oil and gas companies in South-South Nigeria should operate with open communication systems that encourage employees to express ideas, concerns and innovative solutions without fear. Such openness would minimize silent voice, enhance proactive reporting of risks, and stimulate entrepreneurial contributions that support organizational sustainability across environmental, social and economic dimensions. Ideally, employees would be empowered to speak up about safety hazards, propose environmentally friendly practices and suggest cost-saving or community engagement strategies that align with the firms' long-term sustainability goals.

Oil and gas companies in the region face persistent challenges with employee silence. Organizational cultures characterized by authoritarian leadership, poor feedback mechanisms, and fear of retaliation have made employees reluctant to voice concerns or share innovative ideas. As a result, environmental risks go unreported, social tensions with host communities escalate, and economic opportunities for efficiency and innovation are lost. This silence undermines sustainability efforts, creating gaps between stated corporate social responsibility (CSR) commitments and actual practices. The present situation reveals that despite the strategic importance of sustainability, silent voice continues to hinder progress in oil and gas firms. Environmental sustainability is compromised when employees fail to report spills or suggest greener practices; social sustainability suffers when employee silence limits dialogue on community relations; and economic sustainability weakens when entrepreneurial silence prevents the introduction of innovative cost-saving measures. In essence, the independent variable, silent voice negatively affects the dependent variable organizational sustainability by stifling information flow and reducing organizational adaptability.

This situation is primarily driven by systemic factors, including hierarchical structures, lack of psychological safety, inadequate whistleblowing mechanisms and mistrust between employees

and management. The fear of being victimized or ignored has entrenched a culture of silence, where employees often choose self-preservation over contributing to organizational learning and sustainability.

A possible solution lies in fostering an organizational climate that minimizes silence and amplifies employee voice. This requires leadership that models openness, institutionalizing upward feedback mechanisms, and creating safe channels for employees to express concerns or ideas without fear of reprisal. By addressing silent voice oil and gas companies in South-South Nigeria can unlock employee-driven innovation, strengthen stakeholder relations, and advance environmental, social, and economic sustainability, thereby securing long-term resilience and growth. Thereby this attempt at investigating the relationship between Silent Voice and Organizational Sustainability of oil and gas companies in South-South, Nigeria.

Purpose of the Study

The aim of this research is to explore the relationship between Silent Voice and Organizational Sustainability in oil and gas companies in South-South, Nigeria. Hence the objectives are as follows:

i. To determine the association between Silent Voice and Environmental Sustainability in oil and gas companies in South-South, Nigeria.
ii. To determine the association between Silent Voice and Social Sustainability in oil and gas companies in South-South, Nigeria.
iii. To determine the association between Silent Voice and Economic Sustainability in oil and gas companies in South-South, Nigeria.

Research Questions

The following research questions are proffered to guide and provide focus to the study of the relationship between Silent Voice and Organizational Sustainability of oil and gas companies in South-South, Nigeria y. The questions present a framework within which the earlier stated purpose of the study can be achieved. They are as follows:

i. What is the relationship between Silent Voice and Environmental Sustainability in oil and gas companies in South-South, Nigeria?
ii. What is the relationship between Silent Voice and Social Sustainability in oil and gas companies in South-South, Nigeria?
iii. What is the relationship between Silent Voice and Economic Sustainability in oil and gas companies in South-South, Nigeria?

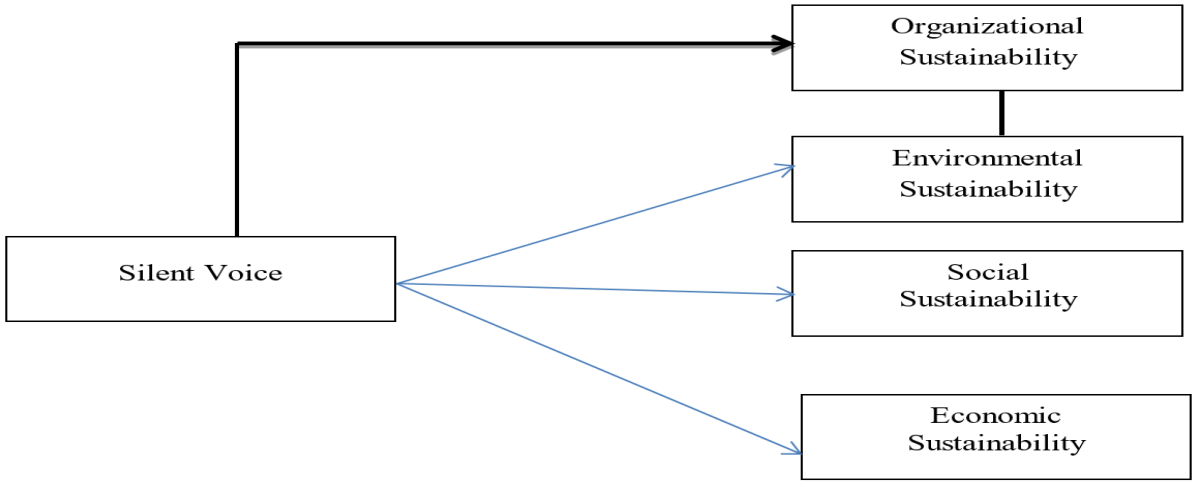

Fig. 1.1: Conceptual Framework of Silent Voice and Organizational Sustainability.

Literature Review

Silent Voice

Silent voice refers to the deliberate withholding of opinions, ideas, or concerns by employees, often due to fear of negative consequences, perceived futility, or organizational cultures that discourage openness. This phenomenon is not simply the absence of communication but rather a strategic response to workplace dynamics, where employees choose silence as a safer or more convenient option than speaking up (Morrison, 2014). In many organizations, particularly in hierarchical structures such as oil and gas companies, silent voice emerges when employees feel that management is unresponsive or punitive toward feedback, which in turn reduces psychological safety and diminishes opportunities for organizational learning and innovation (Edmondson & Lei, 2014; Milliken, Morrison, & Hewlin, 2003).

The persistence of silent voice has significant implications for both employee well-being and organizational outcomes. When individuals remain silent, valuable knowledge is withheld, which may compromise safety, efficiency, and ethical decision-making (Brinsfield, 2013). Furthermore, silence reinforces disengagement and weakens trust between employees and management, making it harder for organizations to adapt to dynamic challenges and pursue sustainability goals (Detert & Burris, 2007; Van Dyne, Ang, & Botero, 2003). Addressing silent voice therefore requires leadership behaviors that foster inclusiveness, create safe reporting mechanisms and reward constructive input, ensuring that silence does not erode the innovative and adaptive capacity of organizations in complex and high-risk industries.

Organizational Sustainability

Organizational sustainability refers to the ability of firms to achieve long-term success by integrating economic performance with environmental stewardship and social responsibility. It moves beyond short-term profitability to ensure that companies remain competitive while protecting natural resources and addressing stakeholder needs (Dyllick & Hockerts, 2002). For industries such as oil and gas, sustainability is not optional but essential, given their heavy ecological footprint and complex social context. Companies that adopt sustainable practices, such as reducing emissions, investing in renewable technologies, and promoting fair labor practices, not

only mitigate risks but also strengthen their reputation and secure their social license to operate (Elkington, 1997; Schaltegger, Hansen, & Lüdeke-Freund, 2016).

The pursuit of organizational sustainability is closely tied to innovation, stakeholder engagement, and adaptive capabilities. Firms that embrace sustainability embed environmental and social metrics into decision-making, creating value for both shareholders and society (Porter & Kramer, 2011). This approach enables organizations to manage external pressures, such as community expectations, regulatory demands, and climate change, while also identifying new opportunities for growth and efficiency (Hart & Dowell, 2011). In resource-dependent regions like South-South Nigeria, sustainability ensures not only continued profitability but also improved relations with host communities and reduced environmental conflicts, thereby reinforcing the firm's resilience in dynamic and high-risk environments (Eze & Chukwu, 2021).

Measures of Organizational Sustainability

Environmental Sustainability

Environmental sustainability emphasizes the responsible use of natural resources to ensure that economic growth does not compromise the ecological systems that future generations depend upon. It involves practices such as reducing carbon emissions, minimizing waste, conserving biodiversity and adopting renewable energy technologies to mitigate environmental degradation (Hart, 1995). For oil and gas companies, particularly in sensitive regions like South-South Nigeria, environmental sustainability is crucial due to the high risk of oil spills, gas flaring, and deforestation that threaten local ecosystems and communities. Organizations that prioritize environmental stewardship not only comply with regulatory requirements but also enhance their legitimacy and reduce the risk of conflicts with host communities and environmental groups (Gunningham, Kagan, & Thornton, 2004).

Moreover, environmental sustainability is increasingly linked to competitive advantage, as firms that integrate ecological considerations into their operations often achieve greater efficiency, innovation, and resilience (Hart & Dowell, 2011). Proactive measures such as adopting cleaner production methods, investing in green technologies, and rehabilitating degraded environments contribute to long-term value creation while aligning with global sustainability goals like the United Nations Sustainable Development Goals (SDGs). In oil-dependent economies, embracing environmental sustainability safeguards the natural resource base, reduces reputational risks, and ensures that resource extraction aligns with broader national and international commitments to climate action (Schaltegger, Hansen, & Lüdeke-Freund, 2016).

Social Sustainability

Social sustainability focuses on maintaining and improving the well-being of employees, communities and society at large while ensuring that business operations do not harm social systems. It emphasizes fair labor practices, equity, human rights and active engagement with stakeholders who are directly or indirectly affected by organizational activities (Eizenberg & Jabareen, 2017). For oil and gas companies, particularly in South-South Nigeria, social sustainability is critical because operations often take place in communities that are economically marginalized yet heavily impacted by extraction activities. Strengthening social sustainability means providing safe working conditions, creating employment opportunities, investing in local

infrastructure, and fostering transparent dialogue with host communities to build trust and reduce conflict (Eze & Chukwu, 2021).

Furthermore, social sustainability contributes to organizational resilience by building strong relationships and securing a social license to operate. When companies respect cultural values, promote inclusivity, and respond to the needs of stakeholders, they enhance their legitimacy and reduce the risk of protests, litigation and community resistance (Colantonio, 2019). In industries with high social and environmental footprints, addressing inequality, improving worker welfare, and engaging in corporate social responsibility (CSR) programs are not only ethical imperatives but also strategic approaches to ensuring long-term operational continuity. By embedding social considerations into business strategies, oil and gas companies can balance profitability with responsibility and contribute to broader sustainable development goals (Kleine & Hauff, 2018).

Economic Sustainability

Economic sustainability refers to an organization's ability to maintain long-term financial performance while ensuring that its activities create value without depleting resources for future generations. It emphasizes efficiency in resource utilization, innovation and resilience in adapting to dynamic market and regulatory environments (Dyllick & Hockerts, 2022). For oil and gas companies in South-South Nigeria, economic sustainability involves not only maintaining profitability from petroleum activities but also diversifying investments, improving operational efficiency and adopting technologies that reduce costs and risks. This ensures that the firms remain viable in a global economy increasingly shifting toward renewable energy and stricter environmental standards (Hart & Dowell, 2021).

Economic sustainability is closely tied to stakeholder value creation, where firms align financial goals with social and environmental responsibilities to achieve shared benefits. Companies that integrate sustainability into their economic strategies are better positioned to attract investment, strengthen competitiveness, and maintain legitimacy in volatile markets (Porter & Kramer, 2011). For resource-intensive industries, achieving economic sustainability also means preparing for the post-oil future by reinvesting profits in human capital, infrastructure and innovation. Such efforts not only safeguard financial resilience but also contribute to sustainable development in host communities, ensuring that wealth generated from natural resources translates into long-term prosperity (Schaltegger, Hansen, & Lüdeke-Freund, 2016).

Silent Voice and Organizational Sustainability

The relationship between silent voice and organizational sustainability has been emphasized in contemporary management studies, particularly in industries where safety, innovation and stakeholder engagement are crucial. Silent voice, which occurs when employees withhold opinions, concerns, or constructive feedback, undermines the flow of vital information that could enhance decision-making and long-term resilience (Morrison, 2014). In oil and gas companies, this silence may lead to safety lapses, missed opportunities for innovation and weak social responsibility practices, thereby threatening environmental, social, and economic sustainability. For instance, Detert and Burris (2007) highlighted that open communication enhances organizational adaptability and problem-solving, while silence restricts responsiveness to external pressures and environmental challenges. Thus, reducing silent voice through inclusive leadership,

psychological safety and participatory decision-making helps organizations build stronger sustainability frameworks.

Furthermore, research has shown that organizational sustainability is not only dependent on strategic policies but also on the willingness of employees to engage in open dialogue. Bashshur and Oc (2015) argued that employee silence negatively affects organizational learning, which is essential for environmental sustainability and community relations. Similarly, Tangirala and Ramanujam (2018) found that when employees speak up, organizations are better positioned to manage risks and ensure social and economic continuity. In the context of South-South Nigeria's oil and gas sector, where sustainability is challenged by environmental degradation and community unrest, the prevalence of silent voice could hinder transparency and accountability, thereby worsening sustainability concerns. This suggests that fostering a culture that reduces silence is directly related to achieving long-term organizational sustainability by aligning employee contributions with sustainable practices.

Based on the review, the following Hypotheses are formulated:

HO_1: There is no significant relationship between Silent voice and Environmental sustainability in oil and gas companies in South-South, Nigeria.

HO_2: There is no significant relationship between Silent voice and Social sustainability in oil and gas companies in South-South, Nigeria.

HO_3: There is no significant relationship between Silent voice and Economic sustainability in oil and gas companies in South-South, Nigeria.

Methodology

This study by nature and characteristic is the quasi- experimental design since the various elements of the design are not under the control of the researcher. Hence the study adopts the cross-sectional survey in its assessment of the manifestation and relationship between quality circles and workers engagement (Sekaran, 2003). The population of the study comprised 35 oil and gas companies operating in South-South Nigeria, from which a non-probability sample of 11 companies was purposively selected due to their strategic role in upstream and midstream operations and their contributions to local content development. A total of 55 managerial respondents were drawn from these companies, representing diverse operational roles such as business development, engineering, logistics, maintenance, and supply chain management. Data were collected through structured questionnaires organized into sections covering biographical data and constructs related to employee voice and sustainability, measured on a 4-point Likert scale. The reliability and validity of the instrument were established through supervisor scrutiny and Cronbach's alpha coefficients, all exceeding the 0.70 threshold, confirming strong internal consistency. Descriptive statistics including mean, percentage, and standard deviation were used to summarise the data, while inferential statistics, specifically Spearman's rank order correlation, were employed to test hypotheses at a 0.05 significance level. This analytical approach provided both empirical rigour and practical insights into how employee voice behaviours contribute to sustainability in Nigeria's oil and gas sector.

Data Results

Table 1: Response Rate and Descriptive Statistics on Silent Voice

S/N	Silent Voice	N	Min.	Max.	Sum	Mean	Std. Dev.

1	I often keep my opinions to myself even when I notice safety or environmental concerns.	51	1.0	4.0	126.0	3.150	1.6416
2	I am hesitant to speak up about issues that could improve our operations.	51	1.0	4.0	150.0	3.750	.8987
3	I avoid sharing my concerns because I fear negative consequences.	51	1.0	4.0	159.0	3.975	1.4586
	Valid N (listwise)	51					

Source: SPSS (Version 23) Result, 2025

Table 1 above illustrates the distribution for the indicators of silent voice. The results identify significant influence of compliance to silent voice while carrying set objectives in the organization than others with the highest mean score of 3.975. The summary mean distribution for the dimension – silent voice is significant within the examined organizations with a mean x =3.975, indicating evidence of significant silent voice of certain functions within the oil and gas companies in South-South, Nigeria.

Table 2: Response Rate and Descriptive Statistics on Environmental sustainability

S/N	**Environmental Sustainability**	N	Min.	Max.	Sum	Mean	Std. Dev.
1	I am conscious of how my work affects the environment and take steps to reduce harm.	51	1.0	4.0	198.0	4.950	.3162
2	I support initiatives that help us minimize pollution and waste.	51	1.0	4.0	181.0	4.525	.7841
3	I follow environmental guidelines to ensure sustainable operations.	51	1.0	4.0	171.0	4.275	1.1764
	Valid N (listwise)	51					
S/N	**Social Sustainability**	N	Min.	Max.	Sum	Mean	Std. Dev.
1	I am committed to helping the company build positive relationships with host communities.	51	2.0	4.0	192.0	4.800	.6485
2	I support community development activities organized by the company.	51	1.0	4.0	126.0	1.150	1.6416
3	I respect the culture and needs of the communities where we operate.	51	2.0	4.0	144.0	3.600	.9282
	Valid N (listwise)	51					
	Economic Sustainability	N	Min.	Max	Sum	Mean	Std. Dev.
1	I am mindful of using resources efficiently to support the company's financial goals.	51	1.0	4.0	156.0	3.900	1.4465
2	I contribute to maintaining cost-effective and productive operations.	51	1.0	4.0	184.0	4.71	.7442
3	I support practices that promote long-term economic growth for both the company and local stakeholders.	51	2.0	4.0	177.0	4.425	1.1068

Valid N (listwise)	51				

Source: SPSS (Version 23) Result, 2025

The findings from Tables 2, 3 and 4 collectively illustrate the distribution of the three key dimensions of organizational sustainability, environmental, social and economic within the examined oil and gas companies in South-South Nigeria. For environmental sustainability, the results show that organizational belief in environmental sustainability as a driver for achieving set goals had the highest mean score of 4.950, with an overall mean of 4.950, confirming significant practices in this area. In terms of social sustainability, the drive by the companies to improve social responsibility and community-related performance recorded the highest mean score of 4.800, with a cumulative mean of 18.975, indicating that social sustainability remains a central aspect of their operations.

Similarly, economic sustainability reflected notable efforts by the companies, particularly in managing operational and crowding effects, with the highest mean score of 4.600 and a summary mean of 4.71. This demonstrates that the oil and gas companies under study make significant economic contributions while also maintaining sustainable practices that ensure continuity and resilience. Overall, the results confirm that the examined organizations exhibit strong sustainability practices across the three dimensions, with environmental, social, and economic sustainability all contributing substantially to their long-term growth and performance.

Secondary Level of Analysis

The Spearman's rank order correlation coefficient is adopted as the statistical tool in the assessment of the relationship between the variables of the study (Silent Voice and Organizational sustainability). Consequently, the following hypotheses will be tested in this section:

HO_1: There is no significant relationship between Silent Voice and Environmental sustainability in Oil and gas companies in South-South, Nigeria.

HO_2: There is no significant relationship between Silent Voice and Social sustainability in Oil and gas companies in South-South, Nigeria.

HO_3: There is no significant relationship between Silent Voice and economic sustainability in Oil and gas companies in South-South, Nigeria.

Table 3: Relationship between Silent voice and Environmental Sustainability

			Silent Voice	**Environmental Sustainability**
Spearman's rho	**Silent Voice**	Correlation Coefficient	1.000	-.451**
		Sig. (2-tailed)	.	.000
		N	51	51
	Environmental Sustainability	Correlation Coefficient	-.451**	1.000
		Sig. (2-tailed)	.000	.
		N	51	51

**. Correlation is significant at the 0.01 level (2-tailed).

		Sig. (2-tailed)	.000	.
		N	51	51

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS (Version 23) Result, 2025.

The findings from the analysis revealed that silent voice has a significant but varying relationship with the three dimensions of organizational sustainability in oil and gas companies in South-South, Nigeria. For environmental sustainability, the results showed a moderate negative relationship (rho = -0.451**, p = 0.000 < 0.05), indicating that an increase in silent voice reduces environmental sustainability practices. This suggests that when employees withhold their concerns or ideas, opportunities to improve environmental practices are limited. Consequently, the null hypothesis of no significant relationship between silent voice and environmental sustainability was rejected, confirming the negative effect of silence on environmental sustainability outcomes.

In terms of social sustainability, the findings indicated a strong negative relationship (rho = -0.751**, p = 0.000 < 0.05), meaning that higher levels of silent voice significantly undermine social sustainability practices. On the other hand, economic sustainability showed a weaker but significant negative relationship (rho = -0.217**, p = 0.000 < 0.05), suggesting that while silent voice does not strongly affect financial performance, it still has implications for long-term economic goals. Across all dimensions, the results consistently demonstrated that silent voice is detrimental to organizational sustainability, leading to the rejection of the null hypotheses in each case and the acceptance of the alternate, thereby underscoring the importance of open communication in sustaining oil and gas companies in South-South Nigeria.

Discussion of Findings

The results of this study confirm that silent voice is a significant barrier to achieving organizational sustainability in oil and gas companies in South-South, Nigeria, consistent with previous findings that employee silence undermines organizational learning and adaptability (Morrison, 2014; Bashshur & Oc, 2015). The moderate negative relationship between silent voice and

environmental sustainability (rho = -0.451**) suggests that when employees refrain from voicing concerns, organizations lose valuable insights into practices that could mitigate environmental risks. This aligns with Tangirala and Ramanujam (2008), who noted that silence restricts the identification of hazards and weakens compliance with safety and environmental standards. This result highlights the need for proactive voice mechanisms to strengthen environmental responsibility and regulatory compliance.

Furthermore, the strong negative association between silent voice and social sustainability (rho = -0.751**) reinforces the argument that silence erodes employee well-being, inclusivity, and community relations. This finding echoes Detert and Burris (2007), who emphasized that open communication enhances trust and social responsibility, while silence fosters disengagement and conflict. The weaker negative relationship with economic sustainability (rho = -0.217**) suggests that although silent voice has less direct impact on financial outcomes, it still undermines long-term value creation and resilience by suppressing innovation and efficiency (Porter & Kramer, 2011). Taken together, these results extend the literature by showing that silent voice not only hinders internal organizational processes but also directly compromises sustainability outcomes across environmental, social and economic dimensions in resource-intensive industries.

Conclusion

The findings of this study establish that silent voice significantly influences organizational sustainability within oil and gas companies in South-South, Nigeria, often in negative ways. While silent voice was shown to reduce both environmental and social sustainability, it demonstrated only a weak positive relationship with economic sustainability. This suggests that when employees withhold ideas, concerns, or feedback, organizations risk undermining their capacity to address ecological challenges, build community trust and ensure long-term operational resilience. Thus, reducing silent voice and fostering open communication channels are essential strategies for achieving balanced sustainability outcomes across environmental, social, and economic dimensions in the oil and gas sector.

Recommendations

1. Oil and gas companies should institutionalize open communication policies and anonymous reporting systems that empower employees to express concerns and ideas without fear of retaliation.
2. Management should integrate employee voice into sustainability initiatives by creating participatory forums where workers contribute to environmental and social responsibility programs.
3. Training programs should be designed to equip leaders and supervisors with inclusive leadership skills that encourage active listening, feedback responsiveness, and collaborative decision-making.

Abstract
This study investigated the relationship between constructive voice and organizational sustainability in oil and gas companies operating in South-South Nigeria. A correlational survey design was employed, with data obtained from fifty-five managers across eleven oil and gas firms. Constructive voice was conceptualized as the proactive expression of ideas, concerns, and suggestions by employees aimed at improving organizational outcomes. Organizational sustainability was assessed through three interrelated dimensions: environmental, social, and economic sustainability. The findings demonstrated that constructive voice exhibits a strong, positive, and statistically significant relationship with all three dimensions of sustainability. Specifically, when organizations create an enabling climate that values employee input, they are more likely to implement environmentally responsible practices, engage in socially beneficial initiatives, and pursue strategies that enhance long-term economic viability. This highlights the strategic importance of encouraging employee voice as a means of driving corporate responsibility and sustainable growth in a sector often criticized for its environmental and social impacts. The study concludes that constructive voice is not merely a communication tool but a critical driver of sustainability in the oil and gas industry. It provides organizations with diverse perspectives, fosters innovation, and strengthens adaptability in a dynamic business environment. The research therefore recommends that companies institutionalize open communication channels, actively integrate employee contributions into sustainability-related decision-making, and invest in capacity-building programs that empower employees to participate meaningfully. By embedding constructive voice into organizational culture, oil and gas firms can enhance their competitiveness while simultaneously advancing sustainable development.

Keywords*:* *Constructive Voice, Organizational Sustainability, Environmental Sustainability, Social Sustainability, Economic Sustainability.*

Introduction

Constructive voice is a crucial dimension of employee behavior that allows workers to actively contribute ideas, make suggestions and provide feedback intended to improve organizational functioning. Unlike defensive silence or withholding of information, constructive voice emphasizes a proactive approach where employees communicate in ways that address challenges and propose innovative solutions (Liang, Farh & Farh, 2022). In oil and gas companies in South-South Nigeria, where operations are highly complex and risks are elevated, constructive voice serves as a mechanism through which employees can influence positive change. When nurtured, it strengthens decision-making processes and ensures the inclusion of diverse perspectives needed for organizational adaptability.

Constructive voice enhances transparency, improves communication between management and staff, and facilitates a culture of trust and inclusiveness (Ng & Feldman, 2015). By encouraging employees to speak up, oil and gas firms are better equipped to identify hidden risks, mitigate workplace conflicts and prevent costly mistakes. This participatory climate improves workplace relations and ensures that employees feel valued, which boosts morale and retention. Constructive voice is often viewed as a key dimension of employee voice. While the concept of employee voice broadly encompasses any form of employee input, constructive voice is the form most valued by organisations due to its focus on innovation and problem-solving. As defined by Morrison (2021), employee voice can be categorised into various forms, with constructive voice being one that stands out because of its focus on providing constructive feedback that contributes to organisational improvement.

This dimension of employee voice includes behaviours such as suggesting new ideas, offering solutions to existing problems, and engaging in dialogue that can lead to positive change within the organisation. Additionally, constructive voice fosters continuous improvement, a key driver of organizational learning and innovation. Employees often identify inefficiencies and propose alternative strategies that enhance operational efficiency and long-term sustainability. For instance, in the oil and gas sector, employees' insights into safety protocols, energy conservation and community engagement strategies can provide managers with practical and context-specific solutions (Detert & Burris, 2017). The practice of constructive voice therefore directly links to sustainability outcomes, as it equips companies to anticipate emerging issues and respond innovatively.

Constructive voice further acts as a bridge between strategic objectives and operational realities. It enables companies to remain resilient in the face of industry pressures such as fluctuating oil prices, environmental activism and regulatory demands. In the South-South Nigerian context, where local communities often challenge oil and gas activities, the ability of employees to voice innovative community-relations strategies can prevent conflicts and foster harmonious relationships. Thus, constructive voice emerges as both a driver of internal efficiency and a tool for navigating external pressures in a highly sensitive operating environment.

Organizational sustainability, on the other hand, refers to the ability of firms to balance economic performance, environmental responsibility and social equity in ways that ensure long-term success. In oil and gas firms, this requires strategic practices that reduce ecological damage, promote community well-being and sustain profitability in a volatile industry (Dyllick & Muff, 2016).

Sustainable organizations integrate economic, social and environmental goals into their decision-making processes, ensuring they meet present needs without compromising future generations. In the oil and gas industry of South-South Nigeria, organizational sustainability has become increasingly important due to environmental degradation, host community unrest, and economic uncertainties. Firms that fail to incorporate sustainability into their operations risk reputational damage, loss of social license to operate, and long-term inefficiencies (Eweje, 2006).

For this reason, sustainability is no longer just an ethical obligation but a business necessity that determines organizational survival. Achieving sustainability in this context requires innovative leadership, proactive engagement and systems that integrate employee contributions. When firms adopt participatory practices such as constructive voice, they gain insights into operational challenges and can develop policies that align with global sustainability standards. This not only fosters compliance with regulations but also improves stakeholder relations and ensures competitiveness in an increasingly globalized economy. Environmental sustainability entails practices that minimize ecological harm through waste reduction, renewable energy integration and compliance with environmental regulations. Social sustainability involves building strong relationships with host communities, promoting fairness, equity, and ensuring employee well-being. Economic sustainability focuses on maintaining profitability, efficiency, and resilience in a volatile oil market.

The relationship between constructive voice and organizational sustainability is deeply interconnected. Constructive voice enables employees to make innovative contributions that address sustainability challenges in areas such as environmental conservation, community relations, and operational efficiency. Constructive voice goes beyond routine communication by offering forward-looking solutions that can help oil and gas firms navigate complex sustainability demands (Morrison, 2014). Employees become co-creators of sustainable practices, thereby fostering resilience and innovation. Moreover, constructive voice allows organizations to anticipate and adapt to change, which is essential for sustainability. Oil and gas companies in South-South Nigeria operate in dynamic environments characterized by community tensions, environmental risks and fluctuating markets. By leveraging constructive voice, organizations can identify practical strategies for sustainability, strengthen compliance, and ensure long-term stability. This proactive approach transforms employees into partners in the sustainability journey, promoting both organizational growth and societal development.

Previous studies have highlighted the importance of constructive voice in driving organizational performance and sustainability. For instance, Liang, Farh, and Farh (2012) found that voice behavior significantly enhances decision-making and innovation in high-risk industries by providing diverse perspectives. Similarly, Morrison (2014) emphasized that constructive voice serves as a mechanism for organizational adaptability, especially in contexts where external pressures are intense. These findings underscore the idea that encouraging voice is crucial for firms operating in volatile environments such as oil and gas.

In another study, Ng and Feldman (2015) demonstrated that constructive voice improves workplace trust and reduces employee turnover by fostering a participatory organizational climate. Their findings suggest that voice not only contributes to organizational outcomes but also enhances employee well-being. This is particularly relevant in South-South Nigeria, where high employee

turnover and industrial unrest pose challenges for oil and gas companies. Constructive voice may serve as a mechanism to address these challenges while strengthening organizational sustainability. Furthermore, Detert and Burris (2017) showed that when managers are receptive to constructive voice, organizations benefit from innovative solutions that improve efficiency and sustainability outcomes. Their study highlights the role of leadership in ensuring that employee voices translate into actionable strategies. This aligns with the Nigerian oil and gas context, where leadership responsiveness to employee inputs can significantly influence the effectiveness of sustainability practices.

Despite these insights, gaps remain in the literature. Most studies have focused on constructive voice in general organizational contexts, with limited attention to the oil and gas sector in South-South Nigeria. The peculiar challenges of this region, such as community conflicts, environmental degradation, and economic volatility, demand a more context-specific exploration of how constructive voice contributes to sustainability. Existing research often emphasizes either organizational performance or employee outcomes, but there is a need to specifically link constructive voice to the three dimensions of sustainability economic, social and environmental. This study therefore addresses the gap by examine constructive voice in advancing organizational sustainability in oil and gas companies in South-South Nigeria. It situates constructive voice not just as an internal communication tool but as a strategic driver of sustainability that integrates employee contributions into decision-making processes. By doing so, it provides new insights into how employee participation can serve as a foundation for addressing the unique challenges of sustainability in this sensitive and resource-dependent region.

Purpose of the Study

The aim of this research is to explore the relationship between Silent Voice and Organizational Sustainability of oil and gas companies in South-South, Nigeria. Hence the objectives are as follows:

i. To determine the association between constructive voice and environmental sustainability in in oil and gas companies in South-South, Nigeria.
ii. To determine the association between Constructive voice and Social Sustainability in in oil and gas companies in South-South, Nigeria.
iii. To determine the association between Constructive voice and Economic Sustainability in in oil and gas companies in South-South, Nigeria.

Research Questions

The following research questions are proffered to guide and provide focus to the study of the relationship between Silent Voice and Organizational Sustainability of oil and gas companies in South-South, Nigeria y. The questions present a framework within which the earlier stated purpose of the study can be achieved. They are as follows:

i. What is the relationship between constructive voice and environmental sustainability in in oil and gas companies in South-South, Nigeria?
ii. What is the relationship between constructive voice and social sustainability in in oil and gas companies in South-South, Nigeria?
iii. What is the relationship between constructive voice and economic sustainability in in oil and gas companies in South-South, Nigeria?

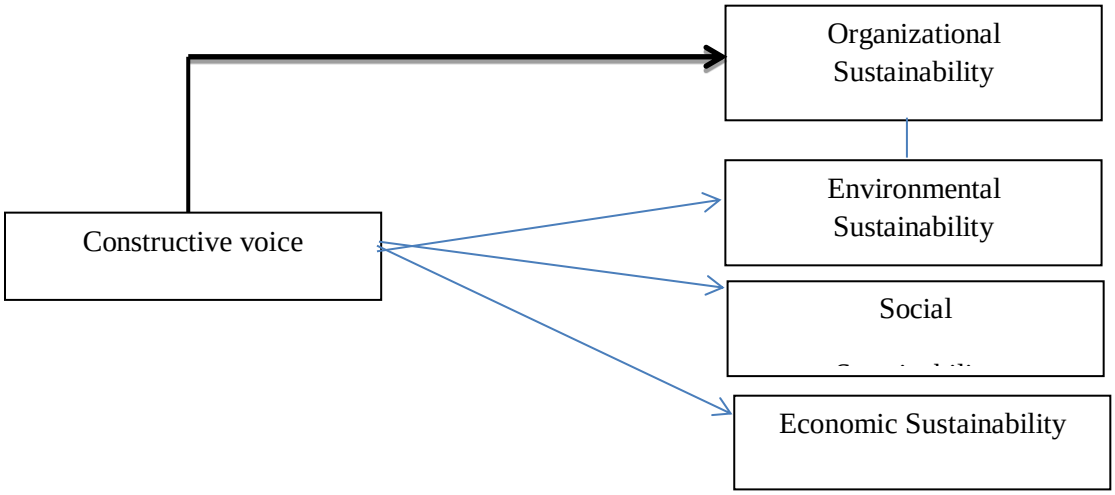

Fig. 1.1: Conceptual Framework of Constructive Voice and Organizational Sustainability.

Constructive Voice

Constructive voice is a proactive communication behavior where employees express ideas, suggestions, and concerns aimed at improving organizational processes and outcomes. Unlike silence or mere compliance, constructive voice reflects initiative and responsibility, as employees go beyond their basic job roles to identify problems and propose solutions that enhance efficiency and performance (Liang, Farh & Farh, 2022). In industries such as oil and gas, where risks are high and operational demands are complex, constructive voice becomes particularly essential because it provides managers with valuable insights into safety practices, operational challenges and innovative strategies that may not be captured through formal structures.

Encouraging constructive voice fosters trust, openness and inclusiveness within organizations. When employees feel safe to speak up without fear of retaliation, they are more likely to share diverse perspectives that can support creativity and innovation (Morrison, 2014). This type of open dialogue helps managers detect hidden risks, resolve conflicts, and prevent costly mistakes, thereby building a strong foundation for organizational learning. In the Nigerian oil and gas sector, where companies face both internal pressures and external scrutiny from host communities and regulators, constructive voice can serve as a mechanism for bridging gaps between employees and management, ensuring both organizational survival and legitimacy.

Moreover, constructive voice has been shown to improve employee engagement and overall organizational climate. Studies reveal that when managers are receptive to employee voice, it strengthens employees' sense of belonging and commitment, leading to higher job satisfaction and reduced turnover intentions (Ng & Feldman, 2015). By recognizing and acting upon constructive inputs, organizations not only benefit from practical solutions but also build a participatory culture where employees feel valued. This dual benefit is especially relevant for oil and gas firms in South-South Nigeria, where workforce stability and innovation are crucial for addressing sustainability challenges and maintaining competitiveness.

Organizational Sustainability

Organizational sustainability refers to the ability of companies to operate in ways that balance economic performance, environmental protection and social responsibility to ensure long-term success. It goes beyond short-term profit-making by integrating practices that preserve resources, reduce harm, and promote fairness across all stakeholders (Dyllick & Muff, 2016). In industries like oil and gas, sustainability is not just an ethical consideration but a strategic necessity, given the environmental risks, community tensions and regulatory demands that characterize the sector. Firms that adopt sustainability principles are better positioned to maintain competitiveness, reduce risks and secure their social license to operate. In the South-South region of Nigeria, organizational sustainability has become increasingly critical due to issues such as environmental degradation, host community unrest and fluctuating global oil prices. Oil and gas firms that embed sustainability practices in their operations are more likely to foster trust with stakeholders, ensure compliance with regulatory frameworks and contribute positively to local communities. By aligning economic growth with social equity and environmental stewardship, these organizations can achieve resilience and long-term survival in a volatile industry, while also playing a role in advancing broader societal development goals (Eweje, 2016).

Measures of Organizational Sustainability

Environmental Sustainability

Environmental sustainability focuses on reducing ecological harm while ensuring that business operations do not compromise the natural environment for future generations. For oil and gas companies in South-South Nigeria, this involves minimizing pollution, managing waste, conserving energy, and adopting cleaner technologies. Given the region's history of oil spills and environmental degradation, prioritizing environmental sustainability is essential for restoring ecosystems and maintaining community trust (Okonkwo & Ndubisi, 2021). Companies that integrate environmental management systems into their operations not only comply with regulations but also build resilience by safeguarding natural resources critical to their long-term success. Furthermore, environmental sustainability provides opportunities for innovation and improved efficiency. By investing in renewable energy alternatives, sustainable exploration methods, and environmental remediation practices, oil and gas firms can enhance operational effectiveness while reducing reputational risks (González-Sánchez et al., 2020). In doing so, these companies contribute to global climate goals and align with the United Nations Sustainable Development Goals (SDGs), ensuring that their economic growth is compatible with ecological protection.

Social Sustainability

Social sustainability emphasizes the importance of equitable relationships with stakeholders, including employees, host communities, and broader society. In the South-South, oil and gas firms face social pressures arising from community dissatisfaction, unemployment and underdevelopment despite vast natural resources. Promoting social sustainability means investing in corporate social responsibility (CSR) projects such as education, healthcare, and infrastructure development, while also ensuring fair labor practices and employee well-being (Aguinis & Glavas, 2019). By addressing these social concerns, organizations can strengthen community relations and secure long-term social license to operate.

Additionally, social sustainability builds inclusive growth and reduces conflict in oil-producing regions. When companies create meaningful employment opportunities, engage in dialogue with host communities, and support local enterprises, they contribute to poverty reduction and social equity (Wilson, Post & Zhang, 2021). Such practices foster mutual trust and reduce the risk of community unrest, which has historically disrupted oil and gas operations in Nigeria. Ultimately, social sustainability enhances both corporate legitimacy and long-term stability.

Economic Sustainability

Economic sustainability ensures that companies remain financially viable while balancing social and environmental concerns. It focuses on maintaining profitability, managing risks and fostering innovation to withstand industry volatility. In the oil and gas sector, particularly in South-South Nigeria, economic sustainability is critical for addressing fluctuations in global oil prices and ensuring continuous investment in infrastructure, technology and human capital (Elkington, 2018). Firms that adopt cost-efficient, innovative practices are more likely to sustain profitability and remain competitive in a dynamic market. Moreover, economic sustainability emphasizes long-term value creation over short-term financial gains. Companies that align financial strategies with sustainability goals can attract investors, improve resilience, and secure new market opportunities (Klewitz & Hansen, 2014). For oil and gas firms in South-South Nigeria, this means diversifying income sources, investing in renewable energy initiatives, and improving supply chain efficiency. Such approaches ensure not only the survival of the organization but also its contribution to national economic development.

Constructive Voice and Organizational Sustainability

The relationship between constructive voice and organizational sustainability is rooted in the way employee contributions foster innovation, accountability and continuous improvement. When employees actively share ideas, raise concerns and propose solutions, organizations gain insights that can enhance operational efficiency, reduce environmental risks, and strengthen social responsibility (Morrison, 2014). In oil and gas companies in South-South Nigeria, this form of proactive communication is particularly valuable, as it enables managers to anticipate sustainability challenges such as environmental degradation, community unrest, and economic volatility. Constructive voice thus acts as a mechanism that aligns internal processes with the broader goals of sustainability by integrating diverse perspectives into decision-making.

Furthermore, constructive voice strengthens organizational adaptability by creating a participatory culture where employees feel valued and engaged. This inclusion enhances trust, improves morale, and motivates employees to take ownership of sustainability initiatives, whether in reducing ecological footprints, fostering better community relations, or ensuring economic resilience (Ng & Feldman, 2015). By encouraging and responding to constructive voice, oil and gas firms can not only achieve compliance with sustainability standards but also position themselves as innovative, resilient organizations capable of thriving in complex and challenging environments. Based on the review, the following Hypotheses are formulated:

HO_1: There is no significant relationship between constructive voice and environmental sustainability of oil and gas companies in South-South, Nigeria.

HO_2: There is no significant relationship between constructive voice and social sustainability of oil and gas companies in South-South, Nigeria.

HO_3: There is no significant relationship between constructive voice and economic sustainability of oil and gas companies in South-South, Nigeria.

Methods

The study adopted a correlational survey research design to examine the relationship between employee voice and organizational sustainability in oil and gas companies in South-South, Nigeria. This design was appropriate because it allowed the researchers to investigate associations between naturally occurring variables without manipulation (Creswell, 2014; Saunders, Lewis, & Thornhill, 2019). The study population comprised 35 registered oil and gas companies under the Department of Petroleum Resources (DPR), of which 11 were purposively sampled based on their operational relevance and strategic importance. From these firms, a total of 55 managers across key departments, including business development, logistics, supply chain, engineering and maintenance were selected as respondents. Data were collected using structured questionnaires divided into three sections: respondent demographics, employee voice and organizational sustainability. Both variables were measured with 4-point Likert scales, focusing on (environmental, social and economic). Validity of the instrument was established through content and construct scrutiny, while reliability was confirmed with Cronbach's Alpha, producing coefficients above the 0.70 benchmark (Hair et al., 2010). Descriptive statistics (mean, percentage and standard deviation) were used to analyze research questions, while Spearman's Rank Order Correlation tested hypotheses at a 0.05 significance level. This ensured robust empirical insights into how employee voice influences sustainable practices in a region marked by environmental and socio-political volatility.

Results

Table 1: Response Rate and Descriptive Statistics on Constructive Voice

S/N	**Constructive Voice**	N	Min.	Max	Sum	Mean	Std. Dev
1	I regularly offer suggestions to improve our environmental and safety practices.	51	1.0	4.0	173.0	4.325	1.1410
2	I am comfortable proposing solutions to address challenges in our workplace.	51	1.0	4.0	130.0	3.250	1.4277
3	I speak up when I believe my input can help improve how we operate.	51	1.0	4.0	184.0	4.600	.4961
	Valid N (listwise)	51					

Source: SPSS (Version 23) Result, 2025

Table 1 above illustrates the distribution for the indicators of constructive voice. The results identify significant influence of oil and gas companies' services through effective employee voice than others with the highest mean score of 4.600. The summary mean distribution for the dimension – constructive voice is significant within the examined organizations with a mean x = 4.600, indicating evidence of significant constructive voice of certain functions within the oil and gas companies in South-South, Nigeria.

Measures of Organizational Sustainability

Table 2: Response Rate and Descriptive Statistics on Environmental Sustainability

S/N	Environmental Sustainability	N	Min.	Max.	Sum	Mean	Std. Dev.
1	I am conscious of how my work affects the environment and take steps to reduce harm.	51	1.0	4.0	198.0	4.950	.3162
2	I support initiatives that help us minimize pollution and waste.	51	1.0	4.0	181.0	4.525	.7841
3	I follow environmental guidelines to ensure sustainable operations.	51	1.0	4.0	171.0	4.275	1.1764
	Valid N (listwise)	51					
S/N	**Social Sustainability**	N	Min.	Max.	Sum	Mean	Std. Dev.
1	I am committed to helping the company build positive relationships with host communities.	51	2.0	4.0	192.0	4.800	.6485
2	I support community development activities organized by the company.	51	1.0	4.0	126.0	1.150	1.6416
3	I respect the culture and needs of the communities where we operate.	51	2.0	4.0	144.0	3.600	.9282
	Valid N (listwise)	51					
	Economic Sustainability	N	Min.	Max	Sum	Mean	Std. Dev.
1	I am mindful of using resources efficiently to support the company's financial goals.	51	1.0	4.0	156.0	3.900	1.4465
2	I contribute to maintaining cost-effective and productive operations.	51	1.0	4.0	184.0	4.71	.7442
3	I support practices that promote long-term economic growth for both the company and local stakeholders.	51	2.0	4.0	177.0	4.425	1.1068
	Valid N (listwise)	51					

Source: SPSS (Version 23) Result, 2025

The analysis of sustainability dimensions across oil and gas companies in South-South Nigeria reveals notable outcomes. For environmental sustainability, the findings indicate a strong relationship, with the highest mean score of 4.950, suggesting that practices supporting ecological balance are perceived as essential for achieving set goals. The overall mean (x = 4.950) confirms significant evidence of environmental sustainability practices, reflecting how organizations prioritize ecological responsibility in their operations. Similarly, social sustainability recorded strong influence, with the highest mean score of 4.800, showing that efforts to enhance social performance, are prioritized by the companies. The summary mean distribution (x = 18.975) further demonstrates that social sustainability is a significant dimension driving organizational practices within the region.

Economic sustainability results also revealed considerable attention, with the highest mean score of 4.600, emphasizing organizational efforts to effectively manage economic functions such as

operational efficiency and stakeholder value. The overall mean (x = 4.71) points to the evidence of strong economic sustainability practices within the firms. Collectively, these results confirm that oil and gas companies in South-South Nigeria significantly integrate environmental, social, and economic sustainability into their core operations, reinforcing the importance of the triple bottom line in achieving long-term performance

Bivariate Analysis

Kothari (2004) argued that when there exists an association or correlation between two variables, correlation technique should be used for the analysis, whereas when there exists a cause and effect relationship between two variables in the case of bivariate population or between one variable on one side and two or more variables on the other side in the case of multivariate population, partial correction technique is appropriate. Based on this assertion by Kothari (2004), Spearman's Rank correlation (rho) becomes our choice of test statistics for hypotheses. This was done with the aid of Statistical package for social sciences (SPSS) version 21.0 and used to test the hypothesis in order to affirm the answers that were provided by the data collected from the respondents. This section deals with the testing of the various hypotheses using Spearman's Rank correlation (rho).

Table 3: Constructive Voice and Environmental Sustainability

			Constructive voice	**Environmental sustainability**
Spearman's rho	**Constructive voice**	Correlation Coefficient	1.000	.880**
		Sig. (2-tailed)	.	.000

	Social sustainability	Correlation Coefficient	.767**	1.000
		Sig. (2-tailed)	.000	.
		N	51	51

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS (Version 23) Result, 2025.

The analysis results demonstrate a strong positive relationship between constructive voice and environmental sustainability in oil and gas companies in South-South Nigeria. The rho-value of 0.880** with a p-value of 0.000, which is less than the alpha level of 0.05, confirms the statistical significance of this relationship. This implies that as constructive voice increases, organizational commitment to environmental sustainability also improves. Consequently, the null hypothesis of no significant relationship between constructive voice and environmental sustainability was rejected, while the alternate hypothesis was accepted. This finding highlights the critical role of employee engagement and idea-sharing in driving environmentally sustainable practices within oil and gas operations.

Similarly, the findings revealed that constructive voice is strongly and positively associated with social and economic sustainability. For social sustainability, the rho-value of 0.856** with a p-value of 0.000 demonstrates a significant relationship, indicating that organizations benefit socially when employees actively contribute ideas and feedback. Likewise, economic sustainability was positively influenced by constructive voice, as shown by a rho-value of 0.767** and a p-value of 0.000, further supporting the rejection of the null hypothesis. These results collectively suggest that constructive voice enhances multiple dimensions of organizational sustainability by fostering active employee participation, which strengthens environmental stewardship, social responsibility, and economic resilience in the oil and gas sector.

Discussion of Findings

The findings of this study demonstrate that constructive voice significantly enhances environmental, social, and economic sustainability in oil and gas companies in South-South Nigeria. This outcome aligns with Morrison (2014), who argued that constructive voice enables organizations to identify emerging challenges and generate innovative solutions, thereby reinforcing long-term sustainability. The strong and positive relationship between constructive voice and environmental sustainability corroborates the position of González-Sánchez, Settembre-Blundo, Ferrari, and García-Muiña (2020), who emphasized that open communication and employee participation are critical for implementing eco-friendly practices and mitigating ecological risks. By encouraging employees to share their perspectives, organizations can adopt greener technologies and design more effective strategies for environmental protection.

Similarly, the study confirms that constructive voice is pivotal in advancing social sustainability. This finding resonates with Aguinis and Glavas (2019), who observed that empowering employees to contribute ideas fosters workplace equity, inclusiveness, and stronger community relations. It also supports the argument of Wilson, Post, and Zhang (2021) that employee voice enhances stakeholder engagement, leading to more socially responsible organizational outcomes. The results therefore suggest that when employee perspectives are valued, oil and gas companies can improve their legitimacy and strengthen trust among both internal and external stakeholders.

From an economic standpoint, the findings affirm Elkington's (2018) assertion that sustainability-oriented practices driven by employee input improve financial resilience and long-term competitiveness. Constructive voice creates avenues for innovation, process efficiency, and risk management, which are critical in volatile industries such as oil and gas. Overall, the study not only validates earlier scholarly assertions but also extends the discourse by providing empirical evidence that constructive voice directly shapes the triple bottom line of sustainability within Nigeria's oil and gas sector.

Conclusion

This study establishes that constructive voice plays a pivotal role in enhancing organizational sustainability within oil and gas companies in South-South Nigeria. The findings revealed strong and positive correlations between constructive voice and the three core dimensions of sustainability: environmental, social, and economic. Specifically, organizations that cultivate open dialogue and actively encourage employees to share ideas, concerns, and feedback are better positioned to strengthen environmental stewardship, advance social responsibility, and secure long-term economic performance.

By embedding constructive voice into their culture, companies are more likely to identify innovative solutions to environmental challenges, foster stronger stakeholder relationships, and adapt effectively to industry pressures. This demonstrates that constructive voice is not simply a communication practice but a strategic organizational resource. In volatile and high-risk contexts such as the oil and gas sector, where resilience and adaptability are essential, empowering employees to contribute proactively can significantly improve organizational agility and sustainability outcomes.

Consequently, constructive voice should be institutionalized as part of corporate governance and sustainability strategies. By doing so, oil and gas companies can enhance competitiveness, mitigate risks, and ensure alignment with global sustainability imperatives.

Recommendations

1. Institutionalize open communication channels: Oil and gas companies should establish structured and transparent platforms that promote constructive voice across all organizational levels. Such platforms may include suggestion systems, periodic town hall meetings, digital feedback portals, and cross-functional forums where employees are encouraged to share innovative ideas and propose solutions to sustainability-related challenges. This will create a culture of inclusiveness and continuous improvement.
2. Integrate employee feedback into decision-making: Management should actively incorporate employee contributions into strategic and operational decisions, particularly those addressing

environmental protection, social responsibility, and community engagement. By embedding employee perspectives into sustainability initiatives, organizations can foster resilience, build stronger trust with both internal and external stakeholders, and enhance their legitimacy in a sector often scrutinized for its environmental and social impacts.

3. Implement continuous training and capacity-building programs: Companies should design regular training sessions, workshops, and knowledge-sharing programs aimed at equipping employees with the technical expertise, problem-solving skills, and confidence required to engage meaningfully in sustainability practices. Such initiatives will not only strengthen workforce alignment with corporate sustainability goals but also stimulate innovation, employee ownership, and long-term organizational competitiveness.

Abstract
This study investigated the relationship between bargaining structure and 1213rganizational competitiveness of petroleum product distribution companies in Nigeria. The study used the probability sampling technique; and the simple random sampling. The population of the study consisted of ten thousand, one hundred and sixty-six (10166) petroleum product distribution companies in Nigeria. The sample size was three hundred and eighty-five (385) petroleum product distribution companies and the respondents were 385 made up one (1) administrative manager from each of the petroleum product distribution companies. 385 copies of the questionnaire were distributed while 327 copies were retrieved and used for data analysis. Data was analyzed using descriptive and inferential statistic. Pearson product moment correlation served as the test statistic. At the secondary level, univariate analysis was used to analyze the research questions. All statistical analyses were performed relying on SPSS 22.0. The study concluded that that collective bargaining relates with 1213rganizational competitiveness of petroleum product distribution companies in Nigeria. Therefore, the study recommends that petroleum product distribution companies in Nigeria should prioritize the development and enhancement of their collective bargaining frameworks to improve their 1213rganizational competitiveness.

Key word: *Collective bargaining structure, organisational competitiveness, bargaining extent, bargaining depth and scope of agreement.*

Introduction

From time immemorial, individuals, organisations and nations of the world have always developed various means to make their product, services or petroleum products to be distributed to the world in an economic way; and these means were usually adapted to prevailing circumstances in the business world. Hence, petroleum product distribution companies are not an exception; they carry out their crucial responsibility of distributing petroleum products efficiently and effectively as well as could as well make normal profit. Emedosibe (2009) note that in discharging task of distributing products, the petroleum product distribution companies at times make unusual profit of as far as

to 106% per litre; an accusation which the petroleum product distribution companies have denied many times. As indicated in the NNPC bulletin (2006), the Pipelines and Products Marketing Company (PPMC) is the sole petroleum product distribution arm of NNPC. PPMC is directly charged with the responsibility of comparative ease with which petroleum products are sourced and distributed across the country at the same price. PPM Censures, among other things, ensures that petroleum products are available to sustain the nation's industries, run automobiles and for domestic usage.

The petroleum products distribution channel is believed to be a difficult chain compared to other sectors due to many activities involved before and after the refining stage (Hussain, et. al., 2006). Adeleke and Ehinomen (2012) aptly posited that not until recently, petroleum products in Nigeria were distributed all the way through a highly structured arrangement of virtually 4,000 kilometers of pipelines interconnected to 21 extensively scattered depots in some areas around the nation. However, the Pipelines and Products Marketing Company (PPMC) are charged with the sole task of supplying, distributing and marketing of petroleum products across the country (Ode, Omoregie, & Erakpotobo, 2019). If a company wants to survive and be superior, obtaining sustainable competitive advantages and superior performance over competitors is crucial (Zuñiga-Collazos, Castillo-Palacio, & Padilla-Delgado, 2019). These levels understand and analyze the importance of collective associations of people, companies and public institutions for developing competitiveness at this level (Ilpes, 2003). Organisational competitiveness is having an advantage in market trends, managing better the supply chain according to trend in comparison with other competitors. Organisational competitiveness represents the capability to operate in the market in a strategic way based on the pressure of competition in the industry (Porter, 1980). Organisational competitiveness is the result of a better performance obtained through the organization capabilities and knowledge management (Cohen & Levinthal, 1990). Organisational competitiveness is the ability of obtaining organizational value in the long term (Zhu & Cheung, 2017). Organisational competitiveness is having superior performance and capabilities in comparison with competitors (Orozco, Serpell, Molenaar & Forcael, 2014).

Thus, conflict has become a feature of societies, organizations and sundry groups. This recognition may not be unconnected with the reasoning that in any group setting including organizations, there exist varying and conflicting interests among members (Ejumudo & Memuduaghan, 2019). The petroleum products distribution distributors are not an exception to these conflicts. Therefore, there is need to resolve this conflict by Collective bargaining. Collective bargaining refers to the government, the workers' representative and employers' organizations as independent and equal partners, consult with each other on labour market and related issues which are within their spheres of competence, and jointly formulate and implement policies on such issues (Silva, 1998). Schnabel (2020) on the other hand view collective bargaining improves the quality of employment relationships between workers and companys and thus the efficient allocation of resources and productivity; Collective bargaining may have an impact on wage dispersion and income inequalities. Fashoyin, (2004) aptly posts that collective bargaining is an important mechanism that can reduce industrial conflict by finding peaceful and orderly procedures to resolve potentially damaging disputes. Implicit of this, is that the relationship of the parties to collective bargaining is therefore critical and essential for the smooth functioning of the organisation.

Collective bargaining plays a vital role in settling and preventing industrial disputes. Collective bargaining is important tool for maintaining industrial peace and so the responsibility of its proper implementation should be of both the employers as well as the employees. Numerous scholarly efforts focused on how different aspects of Collective Bargaining to determine organisational competitiveness. have thus, (Schnabel, Zagelmeyer & Kohaut, 2005*;* Zeb-Obipi, 2007; Visse, Hayter & Gammarano, 2017; Fujiwara and Sanz,2018; Ram,2020).While researchers have discussed a great deal on the importance of collective bargaining on industrial relations environment, there is dearth of concrete information on how relationship of parties to the process impact on industrial relations environment in public universities in Kenya (Akhaukwa, Maru, & Byaruhanga, 2013). Notably, previous researches in this regard include- Schnabel, Zagelmeyer and Kohaut (2005*)* examined collective bargaining structure and its determinants. Also, Zeb-Obipi (2007) examined dimensions of collective bargaining structures in Nigeria a study of the oil industry. Again Visse, Hayter and Gammarano (2017) investigated trends in collective bargaining coverage:Stability, erosion or decline. Also, Fujiwara and Sanz (2018) examined the norms in bargaining: Evidence from government formation. While Ram (2020) tried to establish collective bargaining- meaning, concept, functions, nature, types, elements, process, conditions for success of collective bargaining. However, none of these studies attempted to link collective bargaining structure and Organisational competitiveness. Hence, the focus of the current study is to determine the relationship with collective bargaining structure and organisational competitiveness petroleum product distribution companies in Nigeria using productivity and market share, as metrics of organisational competitiveness. The following hypotheses are formulated to guide the study.

Ho_1: collective bargaining structure does not significantly relate with productivity of petroleum product distribution companies in Nigeria.

Ho_2: collective bargaining structure does not significantly relate with market share of petroleum product distribution companies in Nigeria.

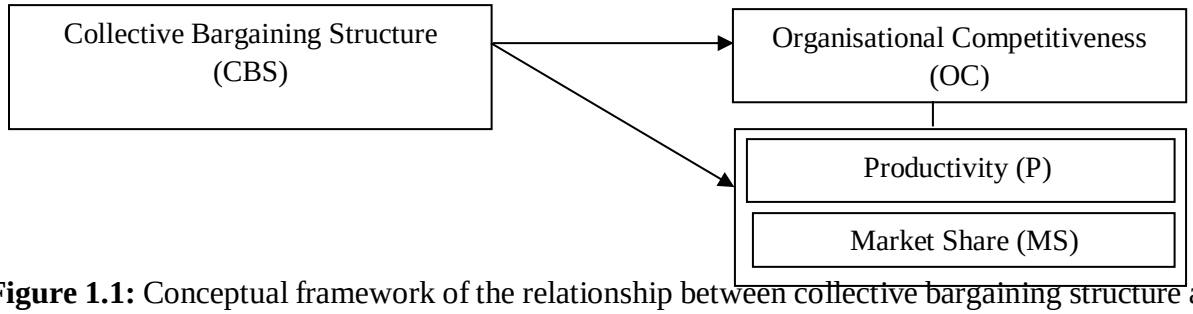

Figure 1.1: Conceptual framework of the relationship between collective bargaining structure and organisational competitiveness of petroleum product distribution companies in Nigeria.

Source: The measures of Organisational competitiveness were adopted from Blandifies., Dürr, N., Frübing, S. Sven Heim, S. Pieters, B., Janger, J. & Peneder, M. (2018).

Theoretical Foundation of the Study/Structural Contingency Theory (Woodward, 1965)

The structural contingency theory is one of the baseline theories that underpin this study. The structural contingency theory perspective originated from the work of, Woodward (1965), which explores the need for organisations to have a structure, a plan(s), and this structure guides the organisation changes when necessary. The theory states that, there is no one best organizational structure; rather, the appropriate organizational structure depends on the contingencies facing the organization. It assumes that the organisation should have a plan B. It points out that the

organisational structure should be adaptable to each business and that the business must make moves to ensure it is operating the most efficient structure to support the business environment and that individual organization adapt to its environments in respective the contingencies.

The Concept of Collective Bargaining Structure

The recognition that conflicts exist in organizational contexts or environments, is the primacy of developing and applying the appropriate strategies and tools for managing conflicts. To manage these conflicts requires collective bargaining by these petroleum products distributors. Collective bargaining is a means of contracting for the sale of labour, a form of industrial governance and method of Management (Chamberlain & Kuhn, 2011). The term collective bargaining is made up of two words 'collective' which means united or a group action and 'bargaining' implies negotiating. So put together it means collective negotiation or groups negotiation. The individuals involved in the negotiation are on one side the representatives of management and on the other the representatives of employees or unions. Imoisili (2008) equally opined that collective bargaining is a process as well as a philosophy of agreeing on the terms and conditions of service between an employer (or group of employers) and his workers (or their union). Collective bargaining refers to a" negotiation process between unions and employers or employers' associations that leads to collective agreements determining pay, working conditions, and other labor practices" (Schnabel, 2020). In the view of Hyman (2005), collective bargaining is a study concerning processes of control over work relations. This study aligns with this disposition that collective bargaining the processes of control over work relations and negotiation process between unions and employers for the benefit of all.

Collective bargaining is a process of discussion and negotiation between two parties, acting in agreement. Strictly speaking collective bargaining is a bipartite process, employers and employees are the only parties involved in the bargaining process. Collective bargaining is a technique adopted by the organisations of workers and employers collectively to resolve their differences without the assistance of a third party or the interference of third party. Collective bargaining fulfills a number of functions for employees and for employers (or management), and it has various advantages and disadvantages for both parties and for society as a whole, some of which may depend on the level and structure of bargaining (Visser, Hayter, & Gammarano, 2017). From an economic perspective, collective bargaining can increase labor market efficiency by correcting market failures (like information asymmetries and excessive company power) and by reducing the transaction costs of all parties involved (Schnabel, 2020). From the perspective of workers, collective bargaining has first and foremost a protective function, ensuring adequate pay and employment conditions, in particular for persons with weak individual bargaining power (Schnabel, 2020). Okumagba (2003) maintains that collective bargaining can be said to mean essentially a compromise and balancing of opposing pressure of two social groups who have enough mutual interests and aims to reach an acceptable agreement

Collective bargaining structure (CBS) refers to the form or arrangement within which parties carry out bargaining (Zeb-Obipi, 2007). Changes to collective bargaining structures, i.e. in the level, domain and form of coordination of bargaining among different actors, have been pervasive across industrialized countries in recent decades (Brandl & Ibsen, 2014). Collective bargaining is a two-edged sword; what is won may also be lost. Today's collective bargaining process is based upon statutory law. Collective bargaining structure not the parties in bargaining relationships or their

relationship, machineries or the institutions involved in their relationships. Rather, it is the form in which their bargaining relationship is patterned (Zeb-Obipi, 2007).

Collective bargaining structures have changed considerably over time and these changes have come with non-negligible macro-economic costs, at least in the short-to-medium term (Brandl & Ibsen, 2014).What makes collective bargaining possible in this context is that both labour and management have an ultimate harmony of interest; that is, the desire to assure that the company for which they work- and from which they are both paid – will remain in business. In the national and multiemployer bargaining structures, employees and employers are represented by federated unions and employers' associations, and most times with visible government presence (Zeb-Obipi, 2007). The bargaining process includes preparation of initial demands, negotiations, and settlement. Adequate preparation for bargaining is often the key to success – preparation for negotiations is a comprehensive on-going job for both the management and the union. In view of the forgoing, national and multiemployer bargaining structures, employees and employers are represented by federated unions and employers' associations, and most times with visible government presence

Collective bargaining affects labor market performance in a number of ways, depending on the specific features of a country's bargaining system, its interaction with other key labor market institutions (like minimum wage legislation and employment protection), and on the prevailing macroeconomic conditions and economic policies (OECD 2017). Collective bargaining refers to a 'social-control technique for reflecting and transmitting the basic power relationships which underlie the conflict of interest in an industrial relations system (Ram, 2020).' The definition emphasises important characteristics of collective bargaining that it is concerned with the application of power in the adjustment of inherent conflicts of interest (Ram, 2020). In order to stay in business, it must be competitive with other companies. In the view of Adeogun (2017), collective bargaining is a term applied to those arrangements under which wages and conditions of employment are settled by a bargain in the form of an agreement made between employers or association of employers and workers organizations. Collective bargaining involves negotiation about working conditions and terms of employment of people who are affected by employer-employee relationship (Ejumudo & Memuduaghan, 2019).

The collective bargaining structures are; according Zeb-Obipi (2007), bargaining extent, bargaining depth and scope of agreements.

Bargaining Extent: is the range of issues within the scope of a particular set of negotiation leading to a collective agreement. Bargaining extent is the issue within the scope of a particular set of negotiation leading to a collective agreement. In bargaining extent process is establishing a relationship for ongoing negotiations and the formulation of agreements covering conditions in the workplace. It is obvious that a great deal of effort can go into the process of establishing a collective bargaining relationship. Employees of one company in different locations come under the same agreement with exception of grades distinction.

Bargaining Depth: is a degree of issues within the framework of a set of negotiation. Bargaining depth in found that employees' and employers' representatives involved in collective bargaining are mostly house union and company management officials compared to the involvement of unit and zonal/national (industry) officials (Zeb-Obipi, 2007). There should be willingness to give and

take by both the parties and interest on the part of both to reach an agreement and to make collective bargaining work. The trade unions should refrain from putting forward exaggerated demands. Both the parties must realize that collective bargaining negotiations are by their very nature a part of compromise process. An emphasis on accommodation rather than conflict is necessary.

Scope of Agreements: is a contract between two parties that entails the services that one party can expect to receive from another party. Scope of agreements is a contract between two parties that entails the services that one party can expect to receive from another party. Scope of Agreements is the agreement typically starts by naming the contract parties and listing their contract information. It refers to the expected services or works as agreed to in a contract**.** The scope has to be specific to avoid or prevent confusion.

The Concept of Organisational Competitiveness

The competitiveness of a company is reflected from the product attractiveness resulted from the company (Hadiyati & Mulyono, 2017). The competitiveness of a company is determined by many factors, namely: employee's skill, businessperson's skill, the availability of business capital, well-being of the organization and organization system (depending on business needs), the availability of technology, information and other inputs such as energy and raw materials. Business person and employee's skill are human resource aspects (Hadiyati & Mulyono, 2017). Competitiveness is a complex concept that had the attention of academics and practitioners due to the importance of developing this construct for survival to highly evolving environments and competition (Zuñiga-Collazos, Castillo-Palacio, & Padilla-Delgado, 2019).

Measures of Organisational Competitiveness

Blandinières, Dürr, Frübing, Sven-Heim, Pieters, Janger, & Peneder, (2018) measured competiveness in terms of productivity, market share. Ogueze, Edwinah and Olori (2017) explored entrepreneurial orientation and organizational competitiveness of hotel in Port Harcourt, using the dimensions of proactiveness, innovativeness, risk-taking and customer value, shareholder value was correlated and organizational culture was the moderating variable. This study adopted productivity and market share as measures organisational competitiveness.

Organisational Productivity

Productivity refers to the measure of how well resources are brought together in organization and utilization for accomplishment of a set result (Anosa, 2021). Productivity measurement indicates areas for possible improvements and shows how well improvement efforts are faring. Productivity demonstrates the extent to which an efficacious organized group of people with a particular purpose perform certain functions within and outside the organisation.. Productivity is the realization of achieving predefined objectives, targets, and goals within a specified time target. Productivity is often used as a surrogate of competitiveness. At the company level, however, productivity can be seen both as a potential for competitiveness and an outcome of competitiveness.

Market Share

A straightforward measure of competitiveness is a company's market share for a given product in a given market. The more of its product a company is able to sell, the higher the product's competitiveness. Market share can be measured either in physical terms (share in total number of

items or in total quantity sold) or in monetary terms (share in total sales). The level of market share depends, among others, on the geographical boundaries of a product market.

Empirical Review

Akhaukwa, Maru, and Byaruhanga (2013) examined the relationship of parties to collective bargaining and industrial relations environment in public universities in Kenya. The result revealed that relation of parties to collective bargaining had a significant effect on industrial relations environment (=0.531, $p<0.05$). Mayowa (2015) examined industrial conflict and its management in selected Nigerian manufacturing Companies. The findings revealed that the causes of conflict in manufacturing companies in Lagos State, Nigeria include poor means of communicating grievances to top managers, unfavorable economic and industrial policies, poor employee compensation and welfare among others. Ayaga (2019) investigated optimizing channel structure for effective distribution of petroleum products in Nigeria. The result from cross tabulation further showed that indirect distribution of petroleum product was effective in the opinion of both participants who reside in Benue State and those who drive through the state.

And Ode, Omoregie, and Erakpotobo (2019) investigated petroleum product distribution and operational performance in the downstream sector of oil and gas petroleum industry in Nigeria. The study showed that warehousing (storage), transportation have positive significant operational performance, while lead time and supplier relationship has no significant effect implying that it was a weak determinant of petroleum products distribution operational performance.

Methodology

Research design is the plan or framework which guides the collection and analysis of data in a study. This hypothesis testing study adopted a correlational investigation to determine the relationship between collective bargaining structure and organisational competitiveness of petroleum product distribution companies in Nigeria. The current study adopted an explanatory research design and which attempted to explain the relationship between two variables in the study. The population of this study consists of ten thousand one hundred and sixty-six (10166) petroleum product distribution companies in Nigeria. The sample size was three hundred and eighty-five (385) petroleum product distribution companies in Nigeria and the respondents were 385 respondents made up of one (1) administrative manager from each of the petroleum product distribution companies in Nigeria. Out of the 385 copies of the questionnaire were distributed while 327 copies of the questionnaire were retrieved and used for data analysis. The sample size was determined using determining sample size table **(**Israel, 2013). Reliability is the degree to which result obtained in the enquiry is consistent over time. Objectivity is the degree to which the enquirer reduces all form of bias, human and subjective tendencies are eliminated in real sense. Descriptive and inferential statistical tool were used in the study. Descriptive statistics such as mean, standard deviation and range are used to present data at the primary level of analysis. The inferential statistics Pearson Product Moment Correlation was used to test the hypotheses at the secondary level of analyses; univariate analysis was used to respond to research questions. Pearson Product Moment Correlation is deemed suitable in studies involving test of relationship between variables.

Correlation Matrix for Collective Bargaining and Measures of Organizational Competitiveness

		CB	P	MS
Collective_ Bargaining	Pearson Correlation	1	.860**	.951**
	Sig. (2-tailed)		.000	.000
	N	327	327	327
Productivity	Pearson Correlation	.860**	1	.850**
	Sig. (2-tailed)	.000		.000
	N	327	327	327
Market_ Share	Pearson Correlation	.951**	.850**	1
	Sig. (2-tailed)	.000	.000	
	N	327	327	327

**. Correlation is significant at the 0.01 level (2-tailed).

According to the Pearson Correlation Coefficients (r), the findings suggest that there is a significant positive association between the form of collective bargaining and key indices of organizational competitiveness in petroleum product distribution enterprises in Nigeria. The correlation coefficient (r) is.860, which indicates that there is a very significant positive association between the framework of collective bargaining and productivity. It suggests that the practices of collective bargaining structures are increasing in relation with the growth in productivity. A statistically significant link exists between the two variables ($p=0.000 < 0.05$). The correlation coefficient (r) is.951, indicating that there is a very significant positive association between the framework of collective bargaining and market share. The conclusion that can be drawn from this is that an improved collective bargaining system coincides with a rise in market shares. Statistically speaking, this association is likewise significant ($p=0.000$, which is less than 0.05). In a nutshell, the results demonstrate that there are strong positive correlations between the form of collective bargaining and the levels of productivity and market share in petroleum product distribution firms in Nigeria.

Discussion of Findings

The study investigated the relationship between collective bargaining structure and organizational competitiveness, specifically focusing on productivity and market share, within petroleum product distribution enterprises in Nigeria. The findings, based on Pearson Correlation Coefficients (r), reveal significant positive associations between collective bargaining structure and these proxies of organizational competitiveness. The Pearson Correlation Coefficient ($r = .860$) indicates a very significant positive relationship between the collective bargaining structure and productivity in petroleum product distribution firms. This strong correlation suggests that as collective bargaining practices are enhanced, there is a corresponding increase in productivity within these enterprises. The statistically significant p-value ($p = 0.000 < 0.05$) further confirms the robustness of this association. The Pearson Correlation Coefficient ($r = .951$) reveals an even stronger positive relationship between the framework of collective bargaining and market share. This result implies that improvements in collective bargaining structure are closely linked with substantial increases in market share for these firms. The association is statistically significant ($p = 0.000 < 0.05$), underscoring the importance of effective collective bargaining structure in achieving competitive advantage. This study is in line with previous studies by Akhaukwa, Maru, and Byaruhanga (2013)

examined the relationship of parties to collective bargaining and industrial relations environment in public universities in Kenya. The result revealed that relation of parties to collective bargaining had a significant effect on industrial relations environment (=0.531, $p<0.05$). Mayowa (2015) examined industrial conflict and its management in selected Nigerian manufacturing Companies. The findings revealed that the causes of conflict in manufacturing companies in Lagos State, Nigeria include poor means of communicating grievances to top managers, unfavorable economic and industrial policies, poor employee compensation and welfare among others. Ayaga (2019) investigated optimizing channel structure for effective distribution of petroleum products in Nigeria. The result from cross tabulation further showed that indirect distribution of petroleum product was effective in the opinion of both participants who reside in Benue State and those who drive through the state.

And Ode, Omoregie, and Erakpotobo (2019) investigated petroleum product distribution and operational performance in the downstream sector of oil and gas petroleum industry in Nigeria. The study showed that warehousing (storage), transportation have positive significant operational performance, while lead time and supplier relationship has no significant effect implying that it was a weak determinant of petroleum products distribution operational performance.

Conclusion

The study's results demonstrate that there are strong and statistically significant positive correlations between the collective bargaining structure and the levels of productivity and market share in petroleum product distribution enterprises in Nigeria. These findings highlight the critical role that well-structured collective bargaining processes can play in enhancing organizational competitiveness within the industry. The study concluded that that collective bargaining enhances with organisational competitiveness of petroleum product distribution companies in Nigeria.

Recommendation

Based on the conclusion, the study recommends that:

1. Petroleum product distribution companies in Nigeria should prioritize the development and enhancement of their collective bargaining structure to improve their organisational competitiveness
2. Managers of Petroleum product distribution companies in Nigeria should focus on creating structured and transparent bargaining processes that align with organizational goals.

Entrepreneurial Network and Performance of Micro and Small Businesses in Lagos, Nigeria

Wale-Oshinowo, Bamidele A., PhD
Department of Business Administration, University of Lagos, Nigeria.
Email: ***bwale-oshinowo@unilag.edu.ng***

Abstract
This paper investigates the influence of entrepreneurial networking on the performance of micro and small enterprises (MSEs) in Lagos, Nigeria, where small business growth is critical for economic diversification. Drawing on network, resource dependence, social capital and knowledge spillover theories, the study employed a cross-sectional design and surveyed 400 firms selected through stratified sampling. Logistic regression was used to assess the effects of five structural dimensions of networking (size, diversity, strength, centrality and reciprocity), while controlling for owner gender, age and years of operation. The results show that network size, diversity, strength and centrality each exert a positive and statistically significant effect on the likelihood of micro and small enterprises meeting their financial goals. Reciprocity, while positive, is not significant, suggesting that many firms hesitate to share resources and information for fear of losing market advantage. Interestingly, female-owned firms outperform their male-owned counterparts in translating network engagement into improved performance, indicating that women entrepreneurs may build and 1224tilize social capital more effectively. These findings carry important implications for policy and practice. They highlight the need for interventions that expand entrepreneurs' access to broad and diverse contacts, strengthen key relationships and foster central roles within industry networks. At the same time, programmes that build trust and mutual exchange could help overcome reluctance to share resources. Supporting women's participation in networks emerges as a strategic lever for enhancing firm outcomes. By demonstrating how specific dimensions of networking drive business success, the study contributes to entrepreneurship theory and offers evidence-based guidance for strengthening the competitiveness and sustainability of Micro and Small Enterprises in emerging economies.

Abstract
This study examines the multifaceted role of Small and Medium Enterprises (SMEs) as catalysts for poverty reduction in Nigeria, with particular emphasis on the Niger Delta states of Bayelsa, Rivers, and Delta. Employing a comprehensive mixed-methods approach that combines quantitative surveys (n=600) with in-depth qualitative interviews (n=45), this research investigates how SMEs function as strategic initiatives that embody the transition to renewable hope in smart economies. Grounded in Endogenous Growth Theory, Schumpeterian Innovation Theory, and the Sustainable Livelihood Framework, our findings reveal that SMEs contribute significantly to employment generation ($\beta=0.347$, $p<0.001$), income creation ($\beta=0.412$, $p<0.001$), skills acquisition, and social stability in Nigeria's most resource-endowed yet paradoxically impoverished region. The study advances theoretical understanding by demonstrating that SMEs operate as complex adaptive systems that simultaneously address poverty alleviation and catalyze smart economic transformation. Our analysis reveals five distinct pathways through which SMEs create renewable hope: inclusive employment generation, innovation ecosystem development, social capital formation, resilience building, and sustainable livelihood creation. Policy implications suggest the need for integrated approaches that strengthen financial access, infrastructure development, and institutional frameworks to maximize SMEs' transformative potential in Nigeria's economic development trajectory.

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Introduction

Nigeria confronts a profound paradox that epitomizes the resource curse phenomenon: despite being Africa's largest oil producer, the country continues to grapple with persistent poverty, particularly in the Niger Delta region (Idemudia, 2012; Watts, 2004). This oil-rich region presents a compelling case study of how resource wealth can coexist with widespread poverty, environmental degradation, and social unrest (Okonkwo & Mordi, 2022; Ejemeyovwi et al., 2021).

The Niger Delta's economic landscape is characterized by what we term "extractive dependency," where local communities remain marginalized from the benefits of resource extraction while bearing the environmental and social costs (Acemoglu & Robinson, 2012). Within this context, Small and Medium Enterprises (SMEs) emerge as potential catalysts for transformative change, offering alternative pathways to economic inclusion and sustainable development (Quartey et al., 2017; Taiwo et al., 2016).

Research Gap and Objectives

The intersection of entrepreneurship, poverty reduction, and economic transformation in resource-rich developing countries remains underexplored in management literature. While extensive research exists on SMEs in developed economies (Shane & Venkataraman, 2000; Audretsch, 2007) and poverty reduction strategies in developing countries (Banerjee & Duflo, 2019; Sachs, 2005), limited scholarship examines how SMEs function as strategic vehicles for transitioning to "smart economies."

This study addresses three critical gaps: (1) treating SMEs as homogeneous entities without capturing their heterogeneous contributions (Naude, 2010); (2) limited research on SME development's relationship with sustainable, knowledge-based economic transformation; and (3) insufficient empirical evidence on how SMEs create "renewable hope"—sustainable pathways out of poverty that build long-term resilience.

Our research questions are:

- **RQ1:** How do SMEs function as catalysts for poverty reduction in Nigeria's Niger Delta?
- **RQ2:** What mechanisms enable SMEs to contribute to smart economy transitions?
- **RQ3:** How do SMEs create renewable hope and build resilience in marginalized communities?

Literature Review and Theoretical Framework

Theoretical Foundations

Endogenous Growth Theory and SME Development

Endogenous Growth Theory, pioneered by Romer (1986, 1990) and Lucas (1988), emphasizes knowledge, innovation, and human capital as internal drivers of sustained economic growth. SMEs contribute to economic growth through innovation, knowledge spillovers, and market dynamics (Audretsch & Thurik, 2001; Acs et al., 2009).

Recent research demonstrates how SMEs in developing countries function as knowledge-generating mechanisms despite challenging institutional environments (Adomako et al., 2023; Owusu et al., 2021). Our research extends this perspective by examining how SMEs in the Niger Delta create knowledge ecosystems that drive endogenous growth.

Schumpeterian Innovation Theory

Schumpeter's (1934, 1942) theory of creative destruction positions entrepreneurship as a fundamental driver of economic development through innovation and market disruption. In developing country contexts, this often manifests as "frugal innovation"—simple, affordable solutions addressing local needs (Prahalad, 2004; Govindarajan & Trimble, 2012; Zeschky et al., 2014).

Contemporary research highlights how SMEs in resource-constrained environments embody creative destruction by developing innovative solutions to overcome infrastructural deficits (Agarwal & Brem, 2017; Hossain, 2021). Our study examines how Niger Delta SMEs engage in micro-level creative destruction processes.

Sustainable Livelihood Framework

The Sustainable Livelihood Framework (SLF), developed by Chambers and Conway (1992) and refined by DFID (1999), provides a holistic approach to understanding poverty through multiple capital assets—human, social, natural, physical, and financial. Recent applications emphasize the framework's relevance for analyzing entrepreneurship's role in poverty reduction (Morse & McNamara, 2013; Kassa, 2021).

We extend the SLF by incorporating "adaptive capacity" and introducing the concept of "renewable hope" to capture temporal and intergenerational dimensions of SME impact.

SMEs and Poverty Reduction

Research consistently demonstrates SMEs' importance in reducing poverty through job creation, income redistribution, and innovation (Beck et al., 2005; Ayyagari et al., 2011; Demirguc-Kunt et al., 2014). In Nigeria, SMEs account for over 80% of businesses and employ the majority of the labor force (SMEDAN, 2022; Okafor & Mordi, 2022).

Recent studies highlight SMEs' multidimensional poverty reduction impact beyond direct employment effects (Quartey et al., 2017; Fatoki, 2018; Musara & Nieuwenhuizen, 2020). However, research on SMEs' role in conflict-affected, resource-rich regions like the Niger Delta remains limited.

Smart Economies and Economic Transformation

Smart economies are characterized by innovation-driven growth, sustainability, digital integration, and inclusive participation (Carayannis & Campbell, 2019; Komninos, 2002; Florida, 2002). SMEs play crucial roles in smart economy transitions through their contributions to innovation, adaptability, and local economic development (Audretsch & Thurik, 2001; Van Stel et al., 2005; Fritsch & Mueller, 2004).

Recent research emphasizes SMEs' role in "smart specialization"—developing competitive advantages based on local assets and capabilities (Foray et al., 2009; McCann & Ortega-Argilés, 2015; Gianelle et al., 2019). This concept is particularly relevant for resource-dependent regions seeking economic diversification.

Methodology

Research Design

This study adopts a pragmatic research philosophy employing a concurrent mixed-methods design (Creswell & Plano Clark, 2017). The approach integrates quantitative surveys with qualitative interviews to achieve methodological triangulation and enhance validity (Tashakkori & Teddlie, 2010).

Data Collection

Quantitative Component

We employed multi-stage stratified sampling to select 600 SME operators across Bayelsa (200), Rivers (200), and Delta (200) states. The sampling ensured representation across sectors (manufacturing, services, agriculture, trade), locations (urban-rural), and enterprise sizes (micro, small, medium).

Qualitative Component

We conducted 45 in-depth interviews with SME owners/managers (25), community leaders (10), government officials (5), and development partners (5). Six focus group discussions were held with women entrepreneurs, youth entrepreneurs, and community members.

Data Analysis

Quantitative analysis employed descriptive statistics, correlation analysis, and multiple regression models. Qualitative data underwent systematic thematic analysis using NVivo software, with member checking for validation. Data integration involved convergence analysis and complementarity assessment.

Empirical Findings

Sample Characteristics

Our sample reveals significant diversity: 68% are micro enterprises (1-10 employees), 31% small enterprises (11-50 employees), and 1% medium enterprises (51-300 employees). Sector distribution shows services (42%), trade (28%), manufacturing (18%), and agriculture (12%). SME owners are predominantly male (62%), with 78% having completed secondary education and 34% holding tertiary qualifications.

Employment Generation and Income Impact

The 600 SMEs directly employ 3,847 individuals (average 6.4 workers per enterprise). Employment varies by size (micro: 3.2, small: 18.7, medium: 89.5), sector (manufacturing: 8.9, services: 6.1), and age (older enterprises: 12.3, newer: 4.1).

Women constitute 44% of SME employees, significantly higher than the national formal sector average (32%). Youth (18-35 years) represent 61% of employees. Average monthly wages vary by sector: manufacturing (₦42,500), services (₦38,200), trade (₦34,800), and agriculture (₦29,300).

Table 1: Income Impact Analysis

Category	Baseline Income (₦)	Current Income (₦)	Change (%)
Employee Households	53,400	78,500	+47%
Owner Households	67,200	116,300	+73%
Control Group	48,900	52,100	+6.5%

Using Nigeria's poverty line (₦137,430 per person annually), poverty incidence among SME-associated households decreased from 68% to 34%, representing a 50% reduction.

Regression Analysis Results

Employment Generation Model: $Employment_i = \beta_0 + \beta_1 Size_i + \beta_2 Age_i + \beta_3 Sector_i + \beta_4 Owner_Characteristics_i + \varepsilon_i$

Table 2: Regression Results

Variable	Employment Model	Income Impact Model
	Coefficient (p-value)	Coefficient (p-value)
Enterprise Size	0.347*** (<0.001)	-
SME Employment	-	0.412*** (<0.001)
SME Ownership	-	0.578*** (<0.001)
Enterprise Age	0.198** (0.011)	-
Owner Education	0.145* (0.042)	0.167** (0.004)
Urban Location	0.167* (0.045)	0.201** (0.005)
Access to Credit	0.289*** (0.001)	-
R^2	**0.324**	**0.387**

*p < 0.05, **p < 0.01, ***p < 0.001

Innovation and Adaptive Capacity

Despite resource constraints, SMEs demonstrate significant innovation: product innovation (34%), process innovation (52%), organizational innovation (28%), and marketing innovation (41%). Key adaptive strategies include alternative energy solutions (73%), mobile money adoption (68%), and direct market relationships (38%).

Qualitative Findings: Pathways to Renewable Hope

Our qualitative analysis reveals five pathways through which SMEs create "renewable hope":

Inclusive Employment Generation

SMEs provide employment for marginalized groups with lower barriers to entry and flexible arrangements. A community leader noted: "The oil companies employ maybe 50 people from our community, all men with certificates. But the small businesses here employ hundreds—men, women, young people."

Innovation Ecosystem Development
SMEs function as innovation catalysts developing creative local solutions. Examples include modified fishing boat designs reducing fuel consumption by 30%, childcare sharing systems for working mothers, and community transportation models.

Social Capital Formation
SMEs create networks facilitating knowledge sharing and mutual support. A market association leader explained: "Business brings people together. We share information, we help each other, we build trust. This creates strength in the community."

Resilience Building
SMEs enhance community resilience through economic diversification. A fishing community leader stated: "When oil spill kill fish, people with small businesses can still survive. Diversity is survival."

Intergenerational Mobility
SMEs create opportunities for skills transfer and educational investment. A second-generation entrepreneur shared: "My father started with palm wine tapping. I learned business from him, but I moved to transportation. Now my son studies computer science while helping with the business."

Discussion and Implications
Theoretical Contributions
Our findings extend Endogenous Growth Theory by demonstrating "distributed knowledge creation" in resource-dependent economies through SME networks rather than centralized institutions. We advance Schumpeterian Innovation Theory by identifying "micro-level creative destruction" processes where continuous small-scale innovations collectively transform economic landscapes.

The concept of "renewable hope" enriches the Sustainable Livelihood Framework by incorporating temporal dimensions and intergenerational effects, demonstrating how SMEs create sustainable pathways that build resilience across generations.

Smart Economy Transition Mechanisms
We identify four pathways for SME-led smart economy transitions:
1. **Innovation Catalysis:** SMEs as laboratories where practical solutions emerge from constraints
2. **Digital Integration:** Adaptive technology adoption creating demand for digital infrastructure
3. **Sustainability Integration:** Resource constraints driving efficiency innovations
4. **Inclusive Growth:** Ensuring economic benefits reach marginalized groups

Policy Implications
Our findings suggest need for integrated policy approaches addressing multiple constraints simultaneously. We propose an "SME Ecosystem Development" framework with four pillars:

Infrastructure Development: Coordinated investment in power, transportation, and digital infrastructure serving SME clusters.

Financial Inclusion: Development of appropriate financial products tailored to SME needs and risk profiles.
Business Development Services: Technical assistance, training, and market linkage support.
Regulatory Reform: Simplified business registration, licensing, and tax compliance procedures.

Challenges and Constraints
SMEs face significant challenges including infrastructure deficits (89% report unreliable electricity), limited financial access (only 23% accessed formal credit), and regulatory complexity (67% operate without formal registration).

Conclusions and Future Research
Key Contributions
This study provides comprehensive evidence that SMEs function as catalysts for poverty reduction and economic transformation in Nigeria's Niger Delta. The concept of "renewable hope" captures how SMEs create sustainable pathways out of poverty that build long-term resilience. Our empirical analysis demonstrates significant positive relationships between SME activity and poverty reduction outcomes, with 50% reduction in poverty incidence among SME-associated households.

Theoretically, we extend understanding of entrepreneurship's role in economic development through concepts of distributed knowledge creation, micro-level creative destruction, and capital synergies. The study reveals that SMEs embody smart economy characteristics—innovation, sustainability, digital integration, and inclusivity—while requiring supportive infrastructure and institutions.

Policy Recommendations
Immediate Interventions:
- Develop SME-specific financial products with appropriate risk assessment
- Prioritize power supply reliability in SME clusters
- Simplify business registration through one-stop digital platforms

Medium-Term Strategies:
- Establish business incubators focused on local challenges
- Integrate entrepreneurship education into formal curricula
- Develop e-commerce platforms connecting SMEs to broader markets

Long-Term Vision:
- Create smart city initiatives integrating SME clusters
- Support transition from resource-dependent to knowledge-based activities
- Develop green finance mechanisms for sustainable SME development

Limitations and Future Research
Study limitations include geographic scope (three Niger Delta states), cross-sectional design, and limited sectoral coverage. Future research should pursue longitudinal analysis, comparative studies across regions, and experimental interventions testing specific SME support programs.

Final Reflections

SMEs represent transformative agents that catalyze economic development, social progress, and environmental sustainability simultaneously. The concept of "renewable hope" captures development dimensions extending beyond material improvements to encompass psychological, social, and cultural transformation. As Nigeria navigates 21st-century economic complexities, SMEs offer critical pathways for achieving Sustainable Development Goals and building resilient, inclusive economies. However, realizing this potential requires supportive ecosystems addressing multiple constraints simultaneously rather than piecemeal interventions.

Abstract
The increasing emphasis on sustainability in business operations has highlighted the importance of branding and communication in promoting sustainable markets. In Imo State, businesses face challenges such as low consumer awareness, limited financial resources, and skepticism surrounding environmental claims, which impede the adoption of sustainable consumption practices. This study investigates the influence of sustainable branding and communication strategies on consumer perception, trust, loyalty, and the adoption of sustainable consumption behaviours among consumers in Imo State. A cross-sectional survey research design was employed, and data were collected using a structured questionnaire titled Branding and Communication for Sustainable Markets Questionnaire (BCSMQ) from 192 managers, owners, marketing officers, and senior staff of selected businesses using a structured questionnaire validated with a reliability coefficient of 0.91. Data were analyzed using the Spearman Rank Order Correlation Coefficient at a 0.05 significance level. Findings reveal that sustainable branding significantly enhances consumer perception, trust, and loyalty, while effective communication strategies significantly encourage consumers to adopt sustainable consumption behaviors. The study concludes that strategic branding and communication are vital tools for fostering sustainable markets, improving consumer engagement, and promoting environmental responsibility. It is recommended that businesses integrate sustainability into their brand identity and adopt multi-channel communication strategies to educate consumers and strengthen sustainable consumption practices.

Keywords: *Sustainable Branding, Communication Strategies, Consumer Perception, Sustainable Consumption, Sustainable Markets*

Introduction

Today's business world is characterized by globalization and intense competition, as most consumers are exposed to alternative products, propelling organizations to employ effective strategies in producing and marketing their goods and services. In a bid to successfully attract customers' attention, marketing managers must differentiate their offerings from competitors to achieve strategic objectives (Ranganathan & Madupu, 2018). Marketing communication is a vital tool that organizations use to inform, remind, and convince current and potential customers about their offerings, persuading them to prefer their products over competing brands. As marketers seek the right ways to send the right messages to the right audiences at the right time, they increasingly look beyond traditional advertising and mass media approaches to integrated marketing communication (Kubanial & Kagiri, 2017).

In this context, sustainable markets and green branding have emerged as key drivers of responsible consumption and long-term business competitiveness. Sustainable markets prioritize products, services, and business practices that minimize ecological impact, promote social responsibility, and support economic viability, while effective branding and communication foster consumer awareness, trust, and engagement (Papadas, Avlonitis, & Carrigan, 2018; Kumar, Rahman, & Kazmi, 2020). Sustainable marketing transitions, therefore, require firms to integrate strategic communication, authenticity, and stakeholder engagement into their business operations to achieve both market success and environmental stewardship (Delmas & Burbano, 2018; Leonidou, Katsikeas, & Morgan, 2020).

Branding has been defined in multiple ways by scholars. Kotler and Keller (2019) describe branding as the process of creating a unique name, design, and image for a product or service in the consumer's mind, primarily through consistent messaging and marketing strategies, to differentiate it from competitors and build loyalty. This emphasizes the strategic and perceptual aspects of branding, highlighting its role in shaping consumer attitudes and preferences. Similarly, Aaker (2018) defines branding as a set of assets and liabilities linked to a brand's name and symbol that adds or subtracts value provided by a product or service to the firm and its customers. This underscores the value creation component of branding, including its capacity to influence consumer trust, brand equity, and long-term business performance. In the context of sustainable markets, these definitions can be extended to include environmental and social responsibility, meaning that branding not only differentiates products and services, but also communicates a firm's commitment to sustainability, ethical practices, and stakeholder engagement (Papadas, Avlonitis, & Carrigan, 2018; Kumar & Christodoulopoulou, 2021). Branding in sustainable markets, therefore, entails creating and promoting a brand identity that reflects environmental and social responsibility. Recent studies highlight that sustainable brands act as change agents by encouraging eco-friendly consumption, increasing awareness of environmental issues, and promoting transparency regarding production and supply chain practices (Chen, 2019; Kumar & Christodoulopoulou, 2021). Similarly, effective communication strategies help firms convey their sustainability commitments through clear messaging, storytelling, and credible certifications, thereby enhancing consumer trust, loyalty, and competitive advantage (Singh, Gupta, & Sinha, 2022; Mahmood, Rehman, & Fatima, 2023).

In Nigeria, particularly in Imo State, businesses offering eco-friendly products, renewable energy solutions, and sustainable waste management services are emerging as important actors in

promoting responsible consumption. However, sustainable branding and communication often face challenges, including low consumer awareness, financial constraints, limited institutional support, and skepticism arising from greenwashing (Okeke & Nwosu, 2021; Nwokike, 2024). Sustainable marketing strategies, therefore, require deliberate planning that integrates transparency, authenticity, and engagement with stakeholders to achieve meaningful outcomes (Papadas et al., 2018; Kumar & Christodoulopoulou, 2021).

Despite growing global and local emphasis on sustainability, there is limited empirical research examining how branding and communication influence consumer behavior, market performance, and sustainability outcomes in Nigerian contexts. Analyzing this nexus provides insights into how businesses in Imo State can leverage branding and communication to foster sustainable consumption, enhance market competitiveness, and support environmental and social goals. This study, therefore, seeks to examine the role of branding and communication in promoting sustainable markets, using selected businesses in Imo State as a case study.

Statement of the Problem

Sustainable markets are increasingly important for achieving long-term economic, social, and environmental objectives. However, in developing countries like Nigeria, many firms struggle to implement effective branding and communication strategies that genuinely reflect their sustainability efforts. In Imo State, while businesses providing eco-friendly products, renewable energy solutions, and sustainable waste management services are emerging, their impact remains limited. Challenges such as low consumer awareness, inadequate marketing strategies, limited access to credible certifications, financial constraints, and skepticism arising from greenwashing hinder their effectiveness

These challenges raise critical questions about whether current branding and communication practices in sustainable markets effectively influence consumer perception, build trust, and encourage environmentally responsible behaviour. There is therefore, a pressing need for empirical research to evaluate how branding and communication strategies can be optimized to promote sustainable consumption, enhance market competitiveness, and strengthen overall sustainability outcomes in Imo State.

Objectives of the Study

The main aim of this study is to analyze the role of branding and communication in promoting sustainable markets in Imo State. The specific objectives are to:

1. Examine the influence of sustainable branding on consumer perception, trust, and loyalty in selected businesses in Imo State.
2. Ascertain the effect of communication strategies on the adoption of sustainable consumption practices among consumers in Imo State.

Research Questions

1. What is the influence of sustainable branding on consumer perception, trust, and loyalty in selected businesses in Imo State?
2. What is the effect of communication strategies on the adoption of sustainable consumption practices among consumers in Imo State?

Research Hypotheses

Ho1: Sustainable branding has no significant influence on consumer perception, trust, and loyalty in selected businesses in Imo State.

Ho2: Communication strategies have no significant effect on the adoption of sustainable consumption practices among consumers in Imo State.

Review of Related Literature

Conceptual Review

Sustainable Markets

Sustainable markets are characterized by the integration of environmental, social, and economic considerations into business practices. These markets prioritize products and services that minimize ecological impact, promote social equity, and ensure long-term economic viability. According to Papadas, Avlonitis, and Carrigan (2018), sustainable markets are driven by a green marketing orientation that aligns corporate strategies with environmental and social goals. This orientation is essential for firms aiming to achieve competitive advantage through sustainability initiatives.

Kumar, Rahman, and Kazmi (2020) further emphasize the importance of sustainable markets in fostering responsible consumption and production patterns. They argue that businesses operating in sustainable markets must adopt practices that not only meet consumer demands but also contribute positively to societal well-being and environmental health. In the context of developing economies like Nigeria, sustainable markets face unique challenges, including limited consumer awareness, financial constraints, and institutional support. However, these markets also present opportunities for innovation and leadership in sustainability, particularly in regions like Imo State, where businesses are beginning to offer eco-friendly products and services.

Branding in Sustainable Markets

Branding in sustainable markets extends beyond traditional differentiation strategies to encompass environmental and social responsibility. Kotler and Keller (2019) define branding as the process of creating a unique name, design, and image for a product or service in the consumer's mind, primarily through consistent messaging and marketing strategies, to differentiate it from competitors and build loyalty. This definition underscores the strategic and perceptual aspects of branding, highlighting its role in shaping consumer attitudes and preferences. Aaker (2018) adds that branding involves a set of assets and liabilities linked to a brand's name and symbol that adds or subtracts value provided by a product or service to the firm and its customers. This perspective emphasizes the value creation component of branding, including its capacity to influence consumer trust, brand equity, and long-term business performance.

In sustainable markets, branding serves as a tool for firms to communicate their commitment to sustainability, ethical practices, and stakeholder engagement. Sustainable branding strategies involve creating and promoting a brand identity that reflects environmental and social responsibility. Recent studies highlight that sustainable brands act as change agents by encouraging eco-friendly consumption, increasing awareness of environmental issues, and promoting transparency regarding production and supply chain practices (Chen, 2019; Kumar & Christodoulopoulou, 2021).

Communication in Sustainable Markets

Effective communication is crucial for conveying a firm's sustainability efforts and building consumer trust. Singh, Gupta, and Sinha (2022) discuss the role of communication strategies in promoting sustainable consumption practices. They argue that clear messaging, storytelling, and credible certifications can enhance consumer trust and loyalty, thereby influencing purchasing decisions. Mahmood, Rehman, and Fatima (2023) further explore the impact of communication strategies on consumer behavior. They find that transparency and authenticity in sustainability communications are key factors in fostering consumer engagement and promoting sustainable consumption patterns.

Businesses face challenges in implementing effective communication strategies due to low consumer awareness, financial constraints, and skepticism arising from greenwashing. Okeke and Nwosu (2021) highlight these challenges and suggest that sustainable marketing strategies require deliberate planning that integrates transparency, authenticity, and engagement with stakeholders to achieve meaningful outcomes.

Challenges in Branding and Communication for Sustainable Markets

Despite the growing emphasis on sustainability, businesses in developing countries often struggle to implement effective branding and communication strategies. Delmas and Burbano (2018) identify several drivers of greenwashing, including regulatory weaknesses, organizational incentives, and individual cognitive biases. These factors contribute to misleading environmental claims that can undermine consumer trust and hinder the effectiveness of sustainability initiatives. Leonidou, Katsikeas, and Morgan (2020) emphasize the importance of integrating strategic communication, authenticity, and stakeholder engagement into business operations to achieve both market success and environmental stewardship. They argue that firms must move beyond superficial sustainability claims and adopt comprehensive strategies that align with their core values and operations. Branding and communication play pivotal roles in promoting sustainable markets. However, businesses must navigate challenges such as greenwashing and consumer skepticism to effectively convey their sustainability efforts. By adopting authentic and transparent strategies, firms can build consumer trust, enhance brand loyalty, and contribute to the development of sustainable markets.

Theoretical Review

The study is anchored on Stakeholder Theory and Theory of Planned Behavior (TPB).

Stakeholder Theory

Stakeholder Theory, introduced by Freeman (1984), posits that organizations operate within a network of stakeholders whose needs, expectations, and influence must be considered for long-term success. Stakeholders include customers, employees, suppliers, regulators, and communities, all of whom can affect or are affected by organizational actions (Harrison, Barney, Freeman, & Phillips, 2019).

This theory is relevant to the present study because branding and communication in sustainable markets are key mechanisms for engaging stakeholders. Firms that effectively communicate their environmental and social initiatives can build trust, enhance loyalty, and positively influence stakeholder perceptions. By addressing the expectations of diverse stakeholders, companies in Imo

State can promote responsible consumption and strengthen market competitiveness. Stakeholder Theory therefore provides a framework for understanding how transparency, authenticity, and engagement in branding and communication drive sustainable business practices

Theory of Planned Behaviour (TPB)
The Theory of Planned Behavior, developed by Ajzen (1991), explains human behavior as driven by behavioral intentions, which are shaped by attitudes, subjective norms, and perceived behavioral control. This theory is widely applied to study consumer decision-making, including environmentally responsible behaviors

TPB is pertinent to this study because consumer adoption of sustainable products often depends on their attitudes toward environmental responsibility, social influence from peers and society, and perceived control over making eco-friendly choices. Effective branding and communication strategies influence these factors by raising awareness of sustainability issues, establishing social norms around green consumption, and enhancing consumers' confidence in their ability to make responsible decisions. Thus, TPB provides a framework for analyzing how marketing communication and branding strategies affect the adoption of sustainable consumption practices in Imo State

Empirical Studies
Chen and Chang (2019) conducted a study on the impact of sustainable branding on consumer loyalty in green businesses in China. Using a survey of 400 consumers across 20 eco-friendly brands, the study found that strong sustainable brand identities significantly enhanced consumer trust, perception of authenticity, and repeat purchase behavior. The authors concluded that branding strategies highlighting environmental and social responsibility play a critical role in promoting consumer loyalty in sustainable markets.

Kumar and Christodoulopoulou (2021) investigated how sustainable branding influences consumer perception and purchasing decisions in European green firms. Data collected from 350 consumers using structured questionnaires revealed that brands perceived as environmentally responsible had higher credibility and were more likely to be preferred over non-sustainable competitors. The study emphasized that integrating social responsibility and transparency in branding strengthens competitive advantage.

Singh, Gupta, and Sinha (2022) examined the role of communication strategies in promoting sustainable consumption in Indian retail markets. A sample of 500 consumers was analyzed using regression analysis, showing that clear messaging, storytelling, and eco-certifications significantly increased consumer adoption of sustainable products. The study concluded that effective communication is crucial for translating sustainability commitments into consumer action.

Mahmood, Rehman, and Fatima (2023) explored the relationship between corporate sustainability communication and consumer engagement in Pakistani green businesses. Using 420 survey responses from consumers and focus group discussions, findings revealed that authenticity, transparency, and interactive communication channels positively influenced consumer participation in sustainable consumption practices. The study highlighted the need for firms to adopt multi-channel, credible, and engaging communication strategies.

Okeke and Nwosu (2021) investigated the challenges of sustainable branding and communication among small and medium-sized enterprises (SMEs) in Nigeria. Data from 200 business managers revealed that low consumer awareness, financial constraints, and skepticism from greenwashing limited the effectiveness of branding and communication efforts. The study recommended that Nigerian firms adopt strategic, transparent, and stakeholder-inclusive branding and communication approaches to build trust and promote eco-friendly consumption.

Methods

The study employed a cross-sectional survey research design to examine the role of branding and communication in promoting sustainable markets in Imo State. The target population consisted of managers, owners, marketing officers, and senior staff of businesses in the study area. These participants were considered appropriate because they are directly involved in branding, marketing, and communication strategies within their organizations. A purposive sampling technique was used to select participants who had firsthand experience with sustainability initiatives and were knowledgeable about branding and communication practices in their firms. A total of 200 respondents were selected from businesses operating across Imo State.

Data were collected using a structured questionnaire titled *Branding and Communication for Sustainable Markets Questionnaire (BCSMQ)*. The instrument was designed on a four-point Likert scale with response options: Strongly Agreed (SA) = 4, Agreed (A) = 3, Disagreed (D) = 2, and Strongly Disagreed (SD) = 1. The questionnaire was validated by three experts in marketing, sustainability, and consumer behaviour, while its reliability coefficient, determined using Cronbach Alpha, was 0.91, indicating high internal consistency. Out of the 200 questionnaire items administered, 192 (96%) were successfully retrieved and deemed valid for analysis. Data were analyzed using the Spearman Rank Order Correlation Coefficient (r) to test the research hypotheses in a bivariate format. All analyses were conducted with the aid of SPSS Version 23, and statistical significance was evaluated at the 0.05 level.

Results

Ho1: Sustainable branding does not significantly influence consumer perception, trust, and loyalty in selected businesses in Imo State.

Table 1: Correlation between Sustainable Branding and Consumer Perception, Trust, and Loyalty

Variables	N	Correlation Coefficient (r)	Sig. (2-tailed)
Sustainable Branding	192	1.000	–
Consumer Perception, Trust, and Loyalty	192	0.756**	0.000

Correlation is significant at 0.05 level (2-tailed).

Source: Researchers' Data, 2025.

Table 1 shows a correlation coefficient (r) of 0.756 with a significance value of 0.000, which is less than the 0.05 alpha level. Since the significance value (0.000) is below 0.05, the null hypothesis (Ho1), which states that sustainable branding does not significantly influence consumer perception, trust, and loyalty, is rejected. Therefore, the alternative hypothesis is accepted. This indicates that sustainable branding strongly enhances consumer perception, trust, and loyalty in selected businesses in Imo State.

Ho2: Communication strategies do not significantly affect the adoption of sustainable consumption practices among consumers in Imo State.

Table 2: Correlation between Communication Strategies and Adoption of Sustainable Consumption Practices

Variables	N	Correlation Coefficient (r)	Sig. (2-tailed)
Communication Strategies	192	1.000	–
Adoption of Sustainable Consumption Practices	192	0.731**	0.000

Correlation is significant at 0.05 level (2-tailed).
Source: Researchers' Data, 2025.

Table 2 shows a correlation coefficient (r) of 0.731 with a significance value of 0.000, which is less than the 0.05 alpha level. Since the significance value (0.000) is below 0.05, the null hypothesis (Ho2), which states that communication strategies do not significantly affect the adoption of sustainable consumption practices, is rejected. Therefore, the alternative hypothesis is accepted. This implies that effective communication strategies significantly encourage consumers to adopt sustainable consumption behaviors in Imo State.

Discussion of Findings

The findings indicate that sustainable branding significantly influences consumer perception, trust, and loyalty in businesses operating in Imo State. Strong brand identities that highlight environmental and social responsibility enhance consumers' confidence and willingness to engage repeatedly with these businesses. This aligns with Chen and Chang (2019), who reported that sustainable branding significantly improves consumer trust and repeat purchase behavior in green businesses. Similarly, Kumar and Christodoulopoulou (2021) found that integrating transparency and social responsibility in branding enhances brand credibility and competitive advantage.

The results further reveal that communication strategies significantly affect the adoption of sustainable consumption practices. Clear messaging, storytelling, and credible certifications improve consumer awareness and motivate eco-friendly purchasing behavior. These findings corroborate Singh, Gupta, and Sinha (2022), who observed that effective sustainability communication encourages consumers to adopt green products. Mahmood, Rehman, and Fatima (2023) also highlighted that authenticity, transparency, and multi-channel engagement are key factors in promoting consumer participation in sustainable consumption practices.

Overall, the study demonstrates that both sustainable branding and strategic communication are pivotal in shaping consumer behavior and fostering sustainable markets. Businesses in Imo State that integrate transparency, stakeholder engagement, and clear messaging into their branding and communication practices are more likely to enhance consumer trust, loyalty, and eco-conscious behavior, thereby contributing to long-term market competitiveness and environmental sustainability.

Conclusion

This study analyzed the role of branding and communication in promoting sustainable markets in Imo State. The findings revealed that sustainable branding significantly enhances consumer perception, trust, and loyalty, while effective communication strategies encourage the adoption of

sustainable consumption practices. These results indicate that businesses that integrate transparency, authenticity, and stakeholder engagement into their branding and communication efforts are better positioned to influence consumer behavior and foster sustainable market growth. The study concludes that strategic branding and communication are vital enablers of sustainable market development, as they not only differentiate firms in competitive markets but also promote environmental responsibility, social well-being, and long-term business competitiveness. Firms in Imo State can leverage these tools to build strong brand identities, increase consumer trust, and drive eco-conscious consumption behaviors, ultimately contributing to sustainable development in the region.

Recommendations

Based on the results and conclusion, the following recommendations were made by the researchers:

1. Businesses in Imo State should integrate sustainability into their brand identity and communication strategies, emphasizing transparency, environmental responsibility, and ethical practices to build consumer trust and loyalty.
2. Firms should adopt multi-channel communication strategies, including storytelling, social media campaigns, and credible eco-certifications, to effectively educate consumers and encourage sustainable consumption behaviors.

Women Entrepreneurs and Green Technology in Africa: Pathways to Managing Natural Resources

Freda I. Fidelis, Mercy M. Adeyeye, & Jacob A. Alabi
National Open University of Nigeria, Abuja.
Contact: fareeunique@gmail.com

Abstract
Africa has embraced sustainability language, although the integration of women entrepreneurship into green technology (GT) reforms remains insufficiently understood. Much of the existing work either highlights women socio-economic marginalization or emphasizes the technical deployment of GT, with insufficient emphasis to women as drivers of ecological innovation. The problem therefore isn't just one of access but also one of the acknowledgements of women as constructors, designers, and pioneers of context-specific GT models. In this paper, gendered green entrepreneurship is developed as an interdisciplinary field through the combination of Feminist Empowerment Theory and frontier GT applications like irrigation via monitoring via blockchain, bio-production, and green finance. Comparative cases from Nigeria, Kenya, Ghana, and South Africa mark the ways GT is embedded by women entrepreneurs into businesses that both address ecological harm and social injustices. Local innovations like solar micro grids for energy, water recycling for agriculture, bio-fertilizer businesses for rebuilding soils, waste reduction and fashion businesses outline the ways women firms generate revenue, boost ecological caretaking and social well-being. The text proposes African women business owners are not only adopters but visionary innovators reimagining empowerment as the intersection of economic agency and ecological accountability. In bridging women empowerment literature and ecological innovation, the project moves feminist empowerment theory beyond itself into sustainability studies. It also identifies concrete initiatives, including gender-responsive green finance, capacity building in GT, and regional knowledge-sharing platforms, while asking governments to include gender into sustainability frameworks and encourage women-led green technologies

Keywords: Africa, Ecological empowerment, Green technology; Sustainability;

Introduction

The dynamic capacity to generate inclusive opportunities positions it at the focal point of sustainable development in both emerging and mature economies. Entrepreneurship is widely accepted as a catalyst of economic growth, technical innovation, and social transformation (Ahmad and Bajwa, 2023). In Africa, entrepreneurship is increasingly positioned not only as a method for poverty reduction but also as a strategy for inclusive and sustainable development (UNECA, 2023). Women compose approximately half of Africa's entrepreneurial population, with strong presence in agriculture, microenterprises, and local commerce sectors naturally related to natural resources and environmental sustainability (IMF, 2024). Their involvement in food systems, water management, and energy consumption emphasizes their potential as essential actors in ecological stewardship (Hashemi, 2025).

Hence, Africa is also faced with rising environmental disasters like land degradation, deforestation, water scarcity, and energy poverty (UNEP, 2022). These disasters have hastened the call for sustainable solutions and attracted attention for greentech (GT) innovations for higher efficiency, lower ecological consequences, and enabling regenerative use of resources (Geissdoerfer et al., 2020). However, the global and African literature typically narrow down the conceptualization of GT diffusion as a techno- or policy-driven process where socio-cultural and gendered applications of technology are barely considered.

Nevertheless, literature on women entrepreneurship has typically centred on constraints such as limited funding, institutional voids, and gendered exclusion, with emphasis on social and economic empowerment results (Brush et al., 2019; Cornwall and Rivas, 2023). Yet, this collection of work rarely overlaps with environmental sustainability debates. Women entrepreneurs are generally characterized as passive users or recipients of technology rather than as active ecological innovators and resource managers.

This disjuncture between entrepreneurship literature and sustainability rhetoric constitutes a considerable knowledge gap. The current study addresses this blind spot by introducing the notion of gendered green entrepreneurship to analyse how women entrepreneurs across Africa adopt, adapt, and innovate with GT to simultaneously improve livelihoods and ecological regeneration.

This paper provides three contributions. First, it extends Feminist Empowerment Theory by inserting ecological stewardship within the empowerment paradigm, so reconceptualizing empowerment as both economic and environmental agency. Secondly, it improves GT scholarship by re-gendering discourses on innovation, placing African women as ecological-economic pioneers rather than marginal players and thirdly, it gives empirical findings from comparative experiences in Nigeria, Kenya, Ghana, and South Africa, demonstrating how women-led firms integrate GT into solutions that regenerate resources, increase social fairness, and strengthen resilience.

Statement of the Problem

The significance of women business in Africa is becoming recognized, important gaps persist. The dominating emphasis on financial restriction, institutional impediments, and gendered marginalization obscures how environmental imperatives influence entrepreneurial behaviours. In parallel, GT scholarship prioritizes technological and infrastructure adoption, ignoring the agency of female entrepreneurs as environmental innovators. As a result, the nexus between women entrepreneurship, green technology, and natural resource management lacks adequate theoretical and empirical research.

This divided view has three implications. It limits theoretical frameworks that appropriately account for the ecological components of women empowerment. It limits policy creativity for scaling women-led ecological breakthroughs. It also hinders recognition of African women entrepreneurs as key actors in promoting sustainability transitions.

The unaddressed gap is in the conceptual and empirical investigation of how African female entrepreneurs interact with, adapt to, and pioneer green technology to address sustainability issues. Filling this gap is the conceptual focus of this research.

Literature Review and Theoretical Foundation

Women Entrepreneurship in Africa

Women owned businesses account for an estimated 25% of the registered businesses of sub-Saharan Africa and are present on an informal scale with millions more involved in agricultural, textile, food manufacturing, and services sectors most exposed to environmental shocks (Nhamo and Mjimba, 2020; World Bank, 2022). Dominance in Economic, women entrepreneurs face ongoing barriers such as: Obtaining credit and collateral (Eze and Okeke, 2023)., Inadequate voice and presence in the digital and innovation sectors and Customary norms preventing them from seeking entry into science, technology, and high-value entrepreneurship.

Earlier scholarship thus focused focussed on women financial exclusion, capacity constraint, and empowerment regarding income, decision-making, and participation (Brush et al., 2019; Cornwall and Rivas, 2023).

Gap: Even though these studies reflect the socio-economically peripheral status of women, they don't really address the degree to which women entrepreneurial enterprise overlaps with ecological crises or natural resource governance. This blind spot makes the women agency as ecological innovators invisible.

Green Technology and Resource Management

Green technology (GT) entails innovations for greater efficiency, reduced ecological footprints, and replenished natural resources. Africa's frontier applications for GT are precision agriculture through the utilization of solar home systems, blockchain for land and water entitlements, and biodegradable packaging (World Bank, 2024). Scholarship globally positions GT at the centre of sustainability transformations (Kirchherr et al., 2017).

Furthermore, African adoption is lopsided due to infrastructural gaps, policy frailties, and institutional nullity (Geissdoerfer et al., 2020). GT literature overwhelmingly imagines the innovation as a technocratic or policy issue centred on energy infrastructure, financial arrangements, and climate mitigation.

Gap: The articulation ignores the social actors' input, especially the women entrepreneurs who adopt, re-purpose, and assimilate GT into the onsite environment. Due to that, women ecological resource management through GT is under-theorized and under-documented.

Feminist Empowerment Theory and Gendered Green Entrepreneurship

Feminist Empowerment Theory conceptualizes empowerment as a process, influenced by the combination of resources, agency, and achievements (Kabeer, 1999). Applied to entrepreneurship, the paradigm illustrates how women mobilize resources and exercise agency to accomplish outcomes in livelihoods and decision-making. Recent work has expanded this to include sustainability, proposing that entrepreneurship can simultaneously improve social fairness and ecological goals (Díaz-García and Wright, 2022).

Yet, empowerment philosophy remains mostly economically driven, with ecological stewardship generally lacking from empowerment measurements. Likewise, GT literature is typically gender-blind, neglecting women distinct responsibilities in technology creation and adoption.

In order to fill these gaps, the current study proposes the concept of gendered green entrepreneurship, which is conceptualized as the integration of green technology into women entrepreneurial activities to simultaneously advance economic empowerment, social resilience, and ecological regeneration. Contribution: By incorporating ecological stewardship within feminist empowerment theory and re-gendering GT discussions, this approach reconceptualizes African women entrepreneurs not as passive beneficiaries but as pioneers of ecological-economic transformation.

Case Insights: Women Entrepreneurs and Green Technology

Women entrepreneurs across Africa are incorporating green technologies (GT) into firms that addresses ecological challenges, while producing social and economic benefit. alternatively, examining these experiences by geography alone, this part arranges concepts thematically around four essential categories of natural resource management: energy transitions, water and agriculture, soil regeneration, and circular economies.

Energy Transitions: Solar Micro-Grids

In Nigeria, women cooperatives in Kaduna State operate solar-powered and micro-grids that offer clean electricity to rural families (Adegbite and Aina, 2022). These measures reduce dependences on kerosene and firewood, lessen household emissions, and lower women domestic labour burden. Importantly, the firms are community-owned, enabling revenue reinvestment into schools and health institutions. Insight: Women entrepreneurs in energy transitions are not merely users of solar power but system designers that expand energy access, localize maintenance, and democratize advantages.

Water and Agriculture: Recycling and Irrigation Innovations

In Kenya, women entrepreneurs use water-saving drip irrigation and rainfall gathering systems, enabling smallholder farmers to boost yields under climate variability (Kamau, 2023). These firms also recycle wastewater for urban farming, minimizing competition over scarce freshwater supplies. Insight: Women led water innovations generate adaptive agricultural systems that promote food security, climate resilience, and gender inclusive access to water resources.

Soil Regeneration: Organic Waste-to-Fertilizer Enterprises

In Ghana, women agripreneurs transform cassava and maize trash into organic fertilizers (Akintoye and Osei, 2023). These firms reduce post-harvest losses, boost soil fertility, and provide farmers a sustainable alternative to pricey chemical fertilizers. Insight: Women ecological entrepreneurship extends beyond production into waste valorisation, illustrating how GT promotes regenerative soil techniques that shut nutrient loops in local food systems.

Circular Economies: Eco-Fashion and Sustainable Textiles

In South Africa, women-led firms in Cape Town upcycle textile waste and use natural dyes to manufacture eco-fashion (Moyo, 2024). These ventures tap into global sustainable market places while minimizing landfill trash and creating green jobs. Insight: By combining local ecological practices with global value chains, women entrepreneurs in ecosystem reimagine Africa's participation in the circular economy.

Comparative Analysis

Across these thematic realms, various comparative observations emerge:

Urban vs. Rural Contexts: Urban-based firms (eco-fashion, urban water recycling) integrate more easily into global markets, whereas rural innovations (solar micro-grids, organic fertilizers) prioritize survival, resilience, and communal well-being.

Formal vs. Informal Adoption: The formal GT adoption (eco-fashion, certified fertilizer) benefits from market access and regulation, while informal GT practices (community solar cooperatives, local irrigation systems) thrive in institutional voids but confront scaling issues.

Institutional Mediation: Weak institutions both hinder and stimulate innovation. In settings of governmental neglect, women entrepreneurs devise grassroots GT solutions, but institutional barriers impede their ability to scale beyond localities.

Ecological-Economic Synergies: Across energy, water, soil, and waste, women entrepreneurs concurrently produce income, minimize environmental degradation, and increase social equality an integrated paradigm rarely addressed in mainstream entrepreneurship or GT studies.

Implications of the Study

Theoretical Contributions

This study contributes to scholarship in three ways:

1. Introducing Gendered Green Entrepreneurship: By incorporating ecological stewardship into the framework of the theory of feminist empowerment, the book reinterprets women entrepreneurship not just as an economic but also an ecological endeavour. This bridges the gap where the theory of empowerment has systematically ignored environmental viewpoints.
2. Re-gendering Green Technology Scholarship: Citing GT studies, available literature commonly conceptualizes innovation as technological or policy-driven. In the present writing, we situate women entrepreneurs as active creators and producers of GT innovations and broaden the innovation ecosystems argument to foreground gendered agency.
3. Connecting Two Diverse Literatures: In connecting women entrepreneurship literature with sustainability and natural resource management argumentation, the paper creates a novel interdisciplinary field that puts ecological-economic agency centre stage.

Policy Contributions

The results also have important implications for African policy contexts:

1. Mainstreaming Gender into Sustainability Agendas: Very few GT strategies mainstream gender as one of the main dimensions. Governments and regional organizations should clearly identify women as ecological innovators as part of national targets for green growth.
2. Targeted Green Finance for Women: Traditional banking systems overlook small-scale women-led firms. Green bonds, microcredit schemes, and fintech platforms geared to women entrepreneurs can scale ecological firms in rural and urban contexts (Eze & Okeke, 2023).
3. Institutional Support for Scaling: Incubators, accelerators, and public–private partnerships must establish supportive ecosystems that advance women-led GT efforts from pilot programs into large-scale impact.

Practical and Entrepreneurial Contributions

The study, offers the below recommendations for incorporation:

1. Leveraging Digital Facilitators: Blockchain company offers transparent certification for sustainable products, and can help irrigation, energy transmission, and waste disposal optimisation.
2. Developing Ecological Innovation Competence: Training programs on GT, circular economy and sustainable business models, developed and accelerated the capacity of women innovation and scale solutions.
3. Creating Knowledge-Sharing Platforms: Women-led GT firm regional and continental platforms can increase peer learning, cross-country scaling, and global sustainability market visibility.

Conclusion and Research Agenda

The study brings novelty through the conceptualization of gendered green entrepreneurship as an approach that does not portray African women as recipients but initiators of ecological-economic innovations. Empirically, it provides evidence of African women entrepreneurs embracing GT for sustainable development within the sectors of energy, water, soils, and circular economies.

Future investigation, three avenues are suggested:

1. Impact Measurement, jobs created, reduced emissions, and replenished resources through women-led GT companies.
2. Digital Evolution, mapping the process wherein females utilize, blockchain, and fintech to support environmental entrepreneurship.
3. Developing Ecological Innovation Competence: Training programs focused on green technology (GT), the circular economy, and sustainable business models can enhance the innovative capabilities of women and help scale solutions.

Location Determinants and Decision Choice of Global Manufacturing Firms in South -West, Nigeria

Obialor, Donatus Chukwuemeka Ph.d & Obukor Peter
Department of Business Management, Faculty of Management Sciences, University of Uyo, Uyo Nigeria.
chukwuemekadobialor@uniuyo.edu.ng

Abstract
Locational decisions are important strategic decision challenges faced by domestic and international firms. The researcher adopted the survey research method for this study. The study used the Taro Yamane formula to determine a sample size of 100 from a heterogeneous population of 28,518 at 10% error margin and used the Pearson Product Moment Correlation (PPMC) to test the hypotheses at 5% level of significance. Result shows that location factors have a high and significant relationship with decision choice of global manufacturing firms. The study recommend that management of firms should embark on feasibility study on location of a firm so as to make sure that a viable location would be acquired before setting up a firm. The study concludes that there is a significant relationship between location factors and decision choice of manufacturing firms in South- West, Nigeria.

Keywords: *Location, Choice, Firms, Decision, Market***.**

Introduction

The making location choice decision for global firms is a key aspect of strategic decision making for manufacturing industries. Choice decisions are important strategic decision challenges faced by domestic and international firms. International firms face further locational decisions in host countries because of its direct link with the demand and supply of goods and services and ultimately to the success or failure of a firm. Choosing location for a new business is one of the most important decisions investors make during the planning phase of launching ventures. The location of a business can affects many aspects of how it operates, such as total sales and how costly it is to run (MacCarthy and Atthirawong, 2003 cited in Obialor, et al, 2022a).

Market size is the number of individuals in a certain market segment who are potential buyers. Market size in this study will be measured in terms of potential buyers by counting up all the potential customers that would be a good fit for the business and multiplying that number by the average annual revenue of these types of customers in the study market. The larger the size of the market of the host country, the more important it is in attracting higher levels of investments. Consequently, the lower the economies of scale the less attractive and influence on location choice decision (Trivikram 2020). Another most important consideration involved in the selection of manufacturing location has been the availability of raw materials required. Raw materials are materials or substances used in the primary production or manufacturing of goods. These are

commodities that are bought and sold on commodities exchanges worldwide (Obialor, et al, 2022b).

The biggest advantage of availability of raw material at the location of manufacturing firm is that it involves less cost in terms of transportation cost. Usually, manufacturing units where there is the conversion of raw materials into finished goods, it is a task that such manufacturing firm should be located in a place where the raw materials availability is maximum and cheap (Sinha, 2018). For Unilever, these priorities include palm oil, paper and board, soy, sugar, tea, dairy, rapeseed, cereals, vegetables, cocoa, herbal infusions and vanilla. They make up around two-thirds of Unilever total volume of agricultural raw materials and 88% of these were sustainably sourced.

Another important factor which influences the foreign firms' location choice decisions is the availability of skilled labour. The combination of the adequate number of labour with suitable skills and reasonable educated workforce can highly benefit a firm. However, labour-intensive firms should select location which is nearer to the source of skilled manpower (Trivikram 2020). Foreign investors are particularly drawn to countries with highly-skilled workers, as these enable countries to attract productive, well-paid jobs in innovative, and knowledge –based industries. A well-educated workforce is more resilient to economic changes, due to its ability to adapt, and has greater spending power and therefore a choice for investment, than a low-skilled workforce (McDonald and Bailly, 2017 cited in Obialor et al, 2022a). However, location factors that influence foreign firm's location choice in this study include: market size, raw materials, and human capital.

Statement of the Problem

Research problems could be observational or theoretical in nature. Through literature review, the researcher has found that not much have been done in this area especially as it concerns Nigeria as a global market environment. To date however, available researches outside Nigeria have precisely focused on how foreign firms make location choice decisions, especially the work of Chin (2020), Akpinar (2020), Garcia-Muina, Romero-Martinez and Kabbara (2020), Alcacer and Delgado (2020), Csiki, Horvath and Szasz (2019), Towhidur and Kabir (2019), Li, Hernandez and Gwon (2018), Mangle (2017), Wang and Wang (2015), Dunning (1977, 1988, 1993, 1998, 2000, 2009) and the work of (Dunning and Lundan 2002 and 2008) among others. Consequently, most of these studies focused more on location choice decision of foreign direct investments (FDI) and few of the factors reviewed in this study. Thus, the need to research on location determinants and decision choice of foreign manufacturing firms is identified when evaluating previous research.

Consequently, Chin (2020) researched on Location Choice of New Business Establishments in the United States of America from 1977 – 2005. The research focused on examining the relationship between the uniqueness of certain regions, spatially bounded characteristics, and how both affect where new establishments locate. A two-level model (mixed and nested logit model) was used and result of this study confirm the importance of economic, demographic, and geographic conditions at the neighborhood level, providing a better understanding of the vulnerability of the local economy.

Akpinar (2020) also studied the fit of competitive strategies and firm-specific advantages (FSAs) with country-specific advantages (CSAs) in explaining manufacturing location choices at product category level in the European automotive industry in 2018. Seven hypotheses are formulated and

tested using binomial logistic regression with data from 148 passenger car models. Result also show that focus strategy, hybrid strategy and operations capability do not have an impact on the manufacturing location choice at product category level.

Towhidur and Kabir (2019) carried out a study on the factors influencing location choice and cluster pattern of manufacturing small and medium enterprises in Khulna city of Bangladesh from February 2018 – June 2018. A walking survey that was conducted used the spatial analysis that employed a ArcGIS 10.5 to identify the SME location pattern and a semi-structured personal interview was conducted to collect data from manufacturing SME entrepreneurs to find why such patterns exist. A cross section qualitative multiple case study design and pattern matching technique was applied to answer the research questions. Results show that SME location choice was influenced by a combination of location specific, personal, and community factors whereby personal factors are prioritized over other factors in location selection.

Available empirical studies assessed in this study used a mixed logit model, nested logit model, census Bureau's longitudinal model, binomial logistic regression model, multinomial logit model, conditional logistic regression model among others for analysis. Thus, location determinant factors influence on foreign firms' decision choice is a study of relationships and can be done better using correlation analysis. Results of these studies also cannot apply to the Nigeria's business environment. Hence, this study is different from all the available empirical studies assessed because, it covers location determinant factors such as, market size, raw materials and human capital and used a descriptive study of standard deviation and correlation analysis for data analyses and interpretations.

It is for this reason that it has become necessary to conduct a study in this area within the Nigerian business environment in order to determine precisely the sort of determinants that underlie location choice decisions by the Dutch multinational company - Unilever PLC and Cadbury PLC, a British multinational confectionery company that ventured into the foreign market, Nigeria.

Objectives of the Study

The major objective of the study is to examine the interrelationship between location determinants and foreign manufacturing firms' choice decision in South-West, Nigeria. The specific objectives are to:

1. examine the relationship between market size and choice decision of foreign manufacturing firms in South-West, Nigeria.
2. Assess the extent of correlation between raw materials and choice decision of foreign manufacturing firms in South-West, Nigeria.
3. find out the relationship between human capital and choice decision of foreign manufacturing firms in South-West, Nigeria.

Research Questions

Based on the objectives of the study, the following research questions were developed.

1. What is the relationship between market size and choice decision of foreign manufacturing firms in South-West, Nigeria?
2. What is the extent of correlation between raw materials and choice decision of foreign manufacturing firms in South-West, Nigeria?

3. What is the relationship between human capital and choice decision of foreign manufacturing firms in South-West, Nigeria?

Hypotheses

In line with the research questions above, the following null hypotheses was stated to guide the study.

1. **$H0_1$:** There is no significant relationship between market size and choice decision of foreign manufacturing firms in South-West, Nigeria.
2. **$H0_2$:** There is no significant correlation between raw materials and choice decision of foreign manufacturing firms in South-West, Nigeria.
3. **$H0_3$:** Human capital have no significant relationship with choice decision of foreign manufacturing firms in South-West, Nigeria.

Review of Related Literature

In this section, the researcher reviews existing literature related to location determinant factors and firms' choice decision. From the standpoint of conceptual reviews, the researcher reviews such concepts as; market size and location choice decision, raw materials and location choice decision, and human capital and location choice decision. Theoretically, the researcher also reviews such theories as Industrial location theory, theory of comparative advantage and localization theory.

Location Determinant Factors

Generally, location of multinational firms is influenced by some strategic considerations, though certain non- economic considerations also might influence the location of some foreign firms. However, these are some strategic factors which could determine choice of location.

Market Size and Location Choice Decision

The importance of a large market for foreign investment can be justified by the fact that a large market allows firms to benefit from economies of scale as well as a rational use of resources. For these reasons this variable is used in almost all empirical studies dealing with the location choice determinant. *Market size* is the number of individuals in a certain market segment who are potential buyers. Measured in terms of potential buyers by counting up all the potential customers that would be a good fit for the business and multiplying that number by the average annual revenue of these types of customers in the study market (Obialor et al, 2022a).

Consequently, foreign firms generally invest in countries with large market sizes to capitalize on ownership- specific assets. These foreign firms also expect to gain valuable skills and large economies of scale by acquiring intangible assets like market knowledge and expertise (Kang, 2010). Therefore, the larger the size of the market of the host country, the more important the factor is in attracting higher levels of investments. Similarly, previous studies by; Loree and Guisinger, (1995); Chakraborti, (2001); and Campos and Kinoshita, (2003) in Sinha (2018) have found that market size, as measured by GNP, significantly attract foreign investment inflows in the foreign countries of their survey.

More precisely, wholly owned subsidiaries (WOSs) in large markets provides firms greater long-term profitability compared with joint ventures (JV) subsidiaries because, WOSs provide better opportunities to achieve scale economies and lower marginal costs of production. Foreign

investors are likely to be attracted by large markets which allows them internalize profits from sales within the host countries. A reduction in the cost of entry through economies of scale can be exploited in larger markets. Rapid economic growth creates a large domestic demands and business opportunities for foreign firms. As huge investments are a long-term commitment, a promising future in the host country would naturally attract MNEs to decide on choice location.

A positive relationship also exists between the growth prospects in the foreign environment and the firm's willingness to commit its financial resources (Buckley and Casson, 1998 in Obialor et al, 2022a). A region that has experienced impressive economic growth in the past is likely to attract more foreign investors. Since investment in some areas require large initial investments with low marginal costs, economies of scale play important role. Raff and Von-der-Ruhr (2001) in Sinha (2018) observed that firms tend to be located in areas with a larger customer base. In industries such as banking, insurance and advertising services, market-size and market potential are even more significant drivers of investment inflow (Moshirian, 2001; Buch and Lipponer, 2004) in Sinha, (2018), Trivikram (2020).

Raw Materials and Location Choice Decision

One of the most important considerations involved in selection of manufacturing location has been the availability of raw materials required. The biggest advantage of availability of raw material at the location of manufacturing firms is that it involves less cost in terms of transportation cost (Sinha 2020). The significance of raw materials in manufacturing industry is so fundamental that it needs no emphasizing. Indeed, the location of manufacturing enterprises is sometimes determined simply by location of the raw materials. Most modern firms are so complex that a wide range of raw materials is necessary for its growth. Firms which use heavy and bulky raw materials in their primary stage in large quantities are usually located near the supply of the raw materials (Sinha 2018).

It is true in the case of raw materials which lose weight in the process of manufacture or which cannot bear high transport cost or cannot be transported over long distances because of their perishable nature. This has been recognized since 1909 when Alfred Weber published his theory of location of industry.

Raw materials can be explained as substance or material used in the manufacturing or primary production of goods. These priorities include palm oil, paper and board, soy, sugar, tea, dairy, rapeseed, cereals, vegetables, cocoa, herbal infusions and vanilla. They make up around two-thirds of the total volume of agricultural raw materials (Trivikram 2020). Aligning with government's backward integration policy, Unilever Nigeria Plc intensified efforts to improve its local sourcing of raw materials by partnering with farmers and intermediary companies (guardian.ng, 2020).

Human Capital and Location Choice Decision

Human capital is defined in the Oxford English Dictionary as "the skills the labour force possesses and is regarded as a resource or asset." It encompasses the notion that there are investments in people (e.g., education, training, health) and that these investments increase an individual's productivity. However, what attract flow of investment around the world is not only about countries but something on a much more local level (Crescenzi 2018). Thus, human capital is unique and differs from any other capital. It is needed for companies to achieve goals, develop and

remain innovative. Companies can invest in human capital, for example, through education and training, enabling improved levels of quality and production (Sinha 2018).

The availability of a qualified skilled labour force is a key factor in the location choice of firms (UNCTAD, 2014). All other things being equal, locales with highly-skilled workers would be expected to compete more favourably than others in attracting investment. The countries with more human capital are likely to grow faster and the increased growth rate would in turn, motivate foreign investors location decision to supply capital. Using various measures of education level as proxies for skilled labour, Dunning (1980), Kumar (1987), Cheng and Kwan (2000), Noorbakhsh, Paloni and Youseff (2001); Kyrkilis and Pantelidis (2003) in Sinha, (2018), respectively, reports a positive relationship between skilled labour and foreign investment inflow. Both manufacturing and service industries has higher requirements on human capital and requires a labour force with higher level of skills and experience.

Noorbakhsh, et'al (2001) in Sinha, (2018) found that human capital significantly determines the locational choice of foreign investment in developing countries. Furthermore, human capital was identified to attract and also create, a constant stream of investment, (Dorozynska and Dorozynski, 2015). This does not mean that human capital is the sole inviting factor for foreign investment or perhaps foreign direct investment.

Labour is very important to each firm for the production process. Each foreign firm will choose the country with the availability of skilled labour and unskilled labour. Foreign investors generally aim to take advantage of host countries cheaper factor inputs and the cost of labour is often considered negatively related to foreign investment inflows (Dunning, 1988, 1998). Foreign production is more likely when production costs are lower abroad than at home, especially for efficiency-seeking investment. However, if higher labour quality (and so to higher productivity), reflect the availability of skilled workers in the region, acting as a proxy for qualifications and skills, then labour costs would have a positive correlation with investment location decision; especially true for the knowledge-intensive foreign investment location decision. Normal wage differences may not induce investment if labour productivity is very low (Obialor et al, 2022a).

Countries or regions with low labour productivity coupled with relatively cheap labour may attract less FDI than those with higher labour productivity and costlier labour even when FDI is motivated by efficiency-seeking. Locations with lower labour costs have lower operating costs, increasing the attractiveness of the area for manufacturing (Dunning 1988;1998).

Theoretical Framework

The research used the following notable location choice theories to provide an explanation of the reasons for a firm's location choice decision.

Industrial Location Theory

Alfred Weber first major work on industrial location theory was published in 1909 and translated into English in 1929. Weber sought to create a "pure theory" of industrial location that could be applied to any system without regard for political or social orientation. Webber eliminated the elements that were unique to capitalist or socialist systems, including the impacts of demand. He

did this to uncover the basic laws of industrial location, and to understand the ways in which they operate.

Alfred Weber formulated a theory of industrial location in which an industry is located where the transportation costs of raw materials and final product is a minimum. When attempting to predict where a business should be located takes into consideration three (3) assumptions; business owners want to maximize their advantages over competitors, they want to maximize their profit and they consider, variable cost such as energy supply, transport cost, and labour cost among others. The basis of this theory is the study of general factors which pull an industry towards different geographical regions.

Weber was faced with many serious problems. He wanted to find out why industries moved from one place to another and what factors determined the movement. After considerable thinking he concluded that causes responsible for this migration could be regional factors primary causes and agglomerative and deglomerative factors. According to Weber, transportation costs play a vital role in the location of an industry. Each industry will try to find location at a place where transportation charges are at the barest minimum, both in terms of availability of resources and place of consumption. Transportation costs according to Weber are determined by the weight to be transported on the one hand and distance to be covered on the other.

Every industry will try to see that it is located at a place where raw material is available nearest to the place of consumption on the one hand and most advantageously located material deposits on the other, thus locational figures are created. These locational figures, therefore, represent the first and most important basis for formulating the theory. Causes of deviation of location according to Weber was faced with a serious problem namely why the industries deviate from the centre of least transport costs. One such reason could be differences in the labour costs. This labour cost can be cheap either because of differing levels of efficiency and of wages of labour or because of differing levels of efficiency in the organization and the technical equipment which the labour is required to use. Labour cost can go up and come down due to distribution of population as well.

Theory of Comparative Advantages- (Factor Endowment Theory)

The traditional basis for analysis of international economic activity is the neoclassical theory of international trade. The theory, known as the factor endowment theory of international trade, is developed by Heckscher and Ohlin from Ricardo's theory of Comparative advantages (Krugman and Obstfied, 1997). It explains international trade in terms of comparative advantages of participating countries based on the assumption of perfect competition in which certain resources or factors are immobile, production functions and consumer preference are identical and specialization is incomplete. The basic premise is that countries should specialize in producing and exporting products that utilize their abundant and cheap factors of production and import products that utilize the countries scarce factors. The trade theory suggests that location of international production is based on comparative advantages of factor costs. If firms use FDI to minimize costs, they will move to the location where production cost are lowest.

The concept of location advantages as reviewed by Cave (1982), Dunning (1993) and Brainard (1997) covers many aspects, including production costs and factors endowments, market size and taxation policies to attract foreign investment. Therefore, low-wage locations with good transport

and trade links to other parts of the corporation will be the favoured locations of foreign investors (Barba, Navaretti and Venables, 2004). The empirical evidence by Barba, Navaretti and Venables, (2004) in Sinha (2018); Trivikram (2020) and Obialor etal, (2022a) confirmed important effects of location advantages on FDI inflows both into developed and developing countries. Regarding developed countries, Brainard, (1993b, 1997) in Sinha (2018) find that market-size of a host country is a fundamental factor to attract investments of foreign firms.

In terms of developing countries, motives for investments in these economies are mainly determined by large market-size, low labour costs, high return in natural resources and favourable policies towards FDI (Chin, 2020). For instance, Nigeria like few other countries like Ghana, is more attractive to foreign investors than other neighboring countries in the region due to its large market size and high population density.

Localization Theory

Industry localization is defined as the geographical concentration of firms in the same industries. The work of Marshall (1920) is considered as an early and influential economic analysis on this phenomenon. Marshall identifies three externalities that stem from industry localization: Localization enables firms to benefit from technological spillovers, Localization provides a pool market for workers with specialized skills that benefits both workers and firms, and Localization creates a pool of specialized intermediate inputs for an industry in greater variety and at lower cost. These positive externalities have the potentials to enhance the performance by firms that agglomerate.

Unilever Nigeria PLC, and Cadbury PLC are multinational cooperation's that employed localization and Internalization theories within the country and region to efficiently utilize their resources, produce and distribute their products nationwide, having regional branches and distribution channels all over the country. As anticipated by Marshall (1920), localized industry allows a pooled market for workers with specialized skills to benefit both workers and firms. This also benefits firms by increasing the supply of specialized employees and reducing the risk of high wage requirements from labour.

Methodology

The researcher adopted the survey research design for this study. The study used the Taro Yamane formula to determine a sample size of 100 from a heterogeneous population of 28,518 at 10% error margin. The Cronbach alpha reliability coefficient obtained was 0.87 and the hypotheses were tested using the t-test of significance of Pearson Product Moment Correlation (PPMC) at 5% (0.05) level of significance.

The Taro Yamane (1967) formula for determining the sample size is given as follows:

$$n = \frac{N}{1 + N(e)^2}$$

Where n = sample size, N = population of the study (28,513), 1 = constant, e = error margin (10%). By substituting into the formula, we obtain as follows:

$$n = \frac{28513}{1 + 28513(0.10)^2}$$

$$n = \frac{28513}{1 + 28513(0.10)^2}$$
$$n = \frac{28513}{286.13}$$
$$n = 99.65, \quad n \cong 100$$

Table. 1: MARKET SIZE

S/N	Items	SA	A	N	D	SD	MEAN	REMARK
1.	Market size is the most important location decision determinant for a foreign firm.	47	23	2	5	6	4.2	Positive
2.	The size of the market attracts both big and small firms	41	26	3	7	6	4.1	Positive
3.	A large market allows firms to benefit from economies of scale as well as a rational use of resources.	52	24	5	1	1	4.5	Positive
4.	For financial service firms (banking, insurance and services etc.), market size is a more significant driver of investment inflow	50	30	0	1	2	4.5	Positive
5.	A reduction in the cost of entry through economies of scale can be exploited in larger market	30	20	13	10	10	3.6	Positive

Field Survey 2025

The result in Table. 1 shows a summary of the responses of how market size affects the location of foreign firm. Five (5) question items were considered for this purpose. The result indicate that market size affects the location of foreign firm showing positive mean response. Consequently, the result further showed that for financial service firms (banking, insurance and services etc.); market size is a more significant driver of investment inflow. However, a reduction in the cost of entry through economies of scale can be exploited in larger market as it has a mean value of 3.6.

TABLE.2: RAW MATERIALS

S/N	Items	SA	A	N	D	SD	MEAN	REMARK
6.	Raw materials availability encourages firms' localization	52	31	0	0	0	4.6	Positive
7.	A good quality of infrastructure is not a very important factor for attracting investment.	12	10	10	21	30	2.4	Negative
8.	The complex nature of most foreign firms today makes raw materials necessary for their growth	34	16	3	15	15	3.5	Positive
9.	Partnership with local farmers and intermediary companies creates raw materials for foreign firms	44	36	0	1	2	4.4	Positive

10.	Firms which use heavy and bulky raw materials in their primary stage in large quantities are usually located near the supply of the raw materials	52	21	0	6	4	4.3	Positive

Field Survey 2025

The Table.2 above shows that all the question items have positive mean values except question item 17 which has a negative mean value, this showed that a good quality of infrastructure is an important factor for attracting investment. This also depicts that the respondents all agreed that raw materials are very important in the location of foreign firms. However, the respondents opined that raw materials availability encourages firms' localization; partnership with local farmers and intermediary companies creates raw materials for foreign firms, and that firms which use heavy and bulky raw materials in their primary stage in large quantities are usually located near the supply of the raw materials showing a positive mean of above 4.2.

TABLE. 3: HUMAN CAPITAL

S/N	Items	SA	A	UND	D	SD	MEAN	Remark
11.	The availability of a qualified labour force is not the sole key factor in the location choice of firms.	42	24	5	5	5	4.1	Positive
12.	Foreign investors are particularly drawn to countries with highly skilled workers.	24	26	10	13	10	3.5	Positive
13.	Companies can invest in human capital through education and quality health care	50	25	0	4	4	4.4	Positive
14.	Countries with more human capital are likely to grow faster	45	24	4	5	5	4.2	Positive
15.	Countries or regions with low labour productivity coupled with relatively cheap labour may attract less FDI than those with higher labour productivity and costlier labour	37	23	3	10	10	3.8	Positive

Field Survey 2025

The result in Table.3 above shows that the respondents strongly agree that human capital affects the location of foreign firms. This can be seen in the positive mean score. Looking at the individual items in the questionnaire, it can also be observed that the mean responses are all above the 3.0 mean mark meaning that the availability of a qualified labour force is not the sole key factor in the location choice of firms, foreign investors are particularly drawn to countries with highly skilled workers, companies can invest in human capital through education and quality health care, countries with more human capital are likely to grow faster, countries or regions with low labour productivity coupled with relatively cheap labour may attract less FDI than those with higher labour productivity and more costly labour.

Table. 4: LOCATION CHOICE DECISION OF A FIRM

S/N	Items	SA	A	N	D	SD	MEAN	Remark
16.	The secret to selecting the ideal location lies in knowing the factors that are most important to a firm's success	45	25	3	5	5	4.2	Positive
17.	Foreign firms that choose their locations wisely with their perceived customer preferences and their companies needs in-mind can establish an important competitive advantage over rivals who choose their locations haphazardly.	50	10	1	12	10	4.3	Positive
18.	Location choice decision is a strategy that is influenced by a variety of factors that are typically implemented over time.	60	20	0	1	3	4.6	Positive
19.	Foreign firms take location decision because they want to grow or expand operations.	55	23	5	0	0	4.6	Positive
20.	Location of a business can affect many aspects of how it operates, such as total sales and how costly it is to run.	70	10	0	1	2	4.8	Positive
21.	Foreign firms involved in location choice decisions are mainly MNEs desiring to move into international business environments.	30	30	5	10	8	3.8	Positive
22.	Political stability significantly promotes a firms' location decision.	60	20	0	1	2	4.7	Positive
23.	Foreign investors assess overseas location with regard to market opportunities and obstacles.	55	24	1	1	2	4.6	Positive
24.	Host country economic determinants do not influence location decision of foreign firms.	10	10	5	34	24	2.4	Negative
25.	Foreign investors' location decision was attracted by natural resources such as minerals, raw materials and agricultural products.	43	37	0	1	2	4.4	Positive

Field Survey 2025

The Table .4 above shows that all the question items have positive mean values except question item 9 which has a negative mean value. This means that the respondents all agreed that location choice is very important in their business. However, the respondents opined that host country economic determinants do not influence location decision of foreign firms. The result further revealed that the respondents agreed with the following items; the secret to selecting the ideal

location lies in knowing the factors that are most important to a firm's success, foreign firms that choose their locations wisely with their perceived customer preferences and their companies needs in-mind can establish an important competitive advantage over rivals who choose their locations haphazardly, location of a business can affect many aspects of how it operates, such as total sales and how costly it is to run, political stability significantly promotes a firms' location decision based on the mean score of 4.5 and above.

Test of Hypotheses

Hypothesis One

$H0_1$: There is no significant relationship between market size and choice decision of foreign manufacturing firms in South-West, Nigeria.

The t-test below was used to test the above hypothesis using the tables of responses from Table .1; the test result is summarized below:

Variables	N	Mean	S	R	p-value	t-cal	t-table	Decision
Choice Dec	83	44.57	3.220					Reject H_0
				0.980	0.0000	128.782	1.960	
Mark_Siz	83	22.19	1.707					

Since the t-calculated of 128.782 is greater than the t-table value of 1.960 at 5% level of significance, and the p-value is less than 0.05 critical values, we reject the null hypothesis and conclude that there is a significant relationship between market size and location choice decision of a firm.

The correlation coefficient value of 0.980 means that market size has a high and significant relationship with choice decision of foreign manufacturing firms in South-West, Nigeria. In other words, market size and choice decision have 0.980 correlations. This indicates that market size has significant relationship with choice decision of foreign manufacturing firms in South-West, Nigeria.

Hypothesis Two

$H0_2$: There is no significant relationship between market size and choice decision of foreign manufacturing firms in South-West, Nigeria.

The t-test and correlation coefficient are shown below:

Variables	N	Mean	S	R	p-value	t-cal	t-table	Decision
Choice Dec.	83	44.57	3.220					Reject H_0
				0.959	0.0000	145.224	1.960	

Raw_Mat	83	21.84	1.991

The t-calculated of 145.224 is greater than the t-table value of 1.960 at 5% level of significance; therefore, we reject the null hypothesis and conclude that there is very significant relationship between raw material and choice decision of a foreign firm.
The correlation coefficient shows that there is high positive relationship between raw materials and choice decision of a foreign manufacturing firms with a correlation coefficient of 0.959 which is considered high going by the decision rule stated in the previous chapter of this work. The result also indicates that there is significant relationship between the two variables which implies that raw materials choice decision of foreign manufacturing firms in South-West, Nigeria.

Hypothesis Three
$H0_3$: Human capital have no significant relationship with choice decision of foreign manufacturing firms in South-West, Nigeria.

The table below is used to test hypothesis 3 and the result is shown below

Variables	**N**	**Mean**	**S**	**R**	**p-value**	**t-cal**	**t-table**	**Decision**
Choice Dec.	83	44.57	3.220					Reject H_0
				0.976	0.0000	121.602	1.960	
Hum_Cap	83	22.30	1.629					

Since the t-calculated of 121.602 is greater than the t-table value of 1.96 at 5% level of significance; therefore, we reject the null hypothesis and conclude that there is significant relationship between human capital and the location choice decision of a firm.

The correlation coefficient of 0.976 represents a high and significant relationship between human capital and the choice decision of foreign manufacturing firms in South-West, Nigeria. In other words, human capital correlates significantly with the choice decision of foreign manufacturing firms by 0.976 which represents a high relationship. The result implies that human capital correlates with choice decision of foreign manufacturing firms which means that availability of human capital increases choice decision of foreign firms.

Summary of Findings
Based on the data analyzed, it was found that:
1. There is high and significant relationship between market size and choice decision of foreign manufacturing firms with a coefficient r of 0.980, which indicates that there is significant relationship between market size and location choice decision of foreign manufacturing firms in South-West, Nigeria.
2. The correlation coefficient shows that there is a significant relationship between raw material and location choice decision of a foreign manufacturing firms in South-West, Nigeria with a correlation coefficient of 0.959 which is considered high.

3. The correlation coefficient of 0.976 represents a high and positive relationship between human capital and the location choice decision of foreign manufacturing firms in South-West, Nigeria. In other words, human capital correlates positively with the location choice decision of foreign manufacturing firms in South-West, Nigeria by 0.976 which represents a high relationship.

Discussion of Findings

The interpretations of results were based on the research questions posed for this study and the hypotheses formulated and tested in the study.

Market Size and Location Choice Decision of a Firm

The result analysis in Table. 1 sought to determine the relationship between market size and location choice decision of a firm. The responses of the respondents indicated that the respondents strongly agreed that market size serves as a determining factor to location choice decision of a firm. The correlation coefficient value of 0.980 means that market size has a high and positive relationship with location choice decision of a firm.

Raw Materials and Location Choice Decision of a Firm

Research question two (2) examined the relationship between raw materials and location choice decision of a firm. The correlation coefficient showed that there is high positive relationship between raw material and location choice decision of a foreign firm with a correlation coefficient of 0.959 which is considered high. The Table.2 above showed that all the question items have positive mean values except question item 7 which has a negative mean value, this showed that a good quality of infrastructure is an important factor for attracting investment. This means also that the respondents all agreed that raw materials are very important in the location of foreign firms. However, the respondents opined that raw materials availability encourages firms' localization showing a positive mean of 4.6.

Human Capital and Location Choice Decision of a Firm

The result in Table.3 above showed that the respondents strongly agree that human capital affects the location of foreign firms. This can be seen in the positive mean score. Looking at the individual items in the questionnaire, it could also be observed that the mean responses are all above the 3.0 mean mark, meaning that the availability of a qualified labour force is not the sole key factor in the location choice of firms, foreign investors are particularly drawn to countries with highly skilled workers, companies can invest in human capital through education and quality health care, countries with more human capital are likely to grow faster, countries or regions with low labour productivity coupled with relatively cheap labour may attract less FDI than those with higher labour productivity and more costly labour. The correlation coefficient of 0.976 represents a high and positive relationship between human capital and the location choice decision of a firm. In other words, human capital correlates positively with the location choice decision of a firm by 0.976 which represents a high relationship.

Recommendations

In line with the findings of this study, the following recommendations were made:

1. Since there is high and positive relationship between market size and location choice decision of a firm with coefficient r of 0.980. The market size should be focal point in

locating a firm. The consideration of market size will enhance location of firm and its patronage.

2. Raw materials should be available for location of a firm. These will go a very long way in enhancing patronage and the success of a firm.
3. The human capital should be made available an improved on so to promote a high-level patronage and success of location of firm

Conclusion

This research work focused on location determinant factors affecting choice decision of selected foreign manufacturing firms in South-West, Nigeria" and three hypotheses were formulated to guide the study.

Literature was reviewed to cover the main variable of the study and some empirical studies were also reviewed. The researcher adopted a correlation research design while rating scale was the main instrument for data collection. Pearson Product Moment Correlation (PPMC) was used to analyze the data collected based on the research questions while the null hypotheses were tested using t-test at 0.05 level of significant. The result of the analyses showed that:

1. There is significant relationship between market size and choice decision of foreign manufacturing firms in South-West, Nigeria.
2. There is a significant relationship between raw material and choice decision of foreign manufacturing firms in South-West, Nigeria with a correlation coefficient of 0.959 which is considered high.
3. A high level of co-relationship was found between human capital and choice decision of foreign manufacturing firms in South-West, Nigeria with a correlation coefficient of 0.959 which is considered high.

Abstract
The study examined the relationship between people management digital skill and employee performance in quoted foods and beverages manufacturing companies in Rivers State, Nigeria. The study adopted a cross-sectional survey research design. The population of the study comprises of one thousand nine hundred and sixteen employees, with a sample size of (330) three hundred and thirty employees from 14 quoted foods and beverages manufacturing companies in Rivers State, Nigeria. Taro Yamen's formula was used to determine the sample size. Questionnaire method of data collection was used. Reliability was tested using Cronbach Alpha Coefficients and all the values were above the bench mark of 0.7. However, after data cleaning, 287 respondents were finally used for data analysis. Descriptive statistics such as means and standard deviations were used to analyze the research questions while the Spearman's Rank order correlation coefficients were used to test the hypotheses with the aid of statistical package for social science version 26.0. The findings showed that there is a strong positive and significant relationship between people management digital skill and employee performance in quoted foods and beverages manufacturing companies in Rivers State, Nigeria. The findings further showed that digital skill, data analytical skill and transformational skill has a positive and significant influence on the three measures of employee performance (task, contextual, adaptive performance). The study thus, concluded that people management digital skill has a strong influence on employee performance. The study, therefore, recommends that people managers in the organizations in the foods and beverages manufacturing industry should utilize IT-based applications, self-service applications programs to improve employee performance in the organizations. That orientation be improved and conducted in such a manner to progress employee performance as it is an opportunity to boost employee capabilities, add to their techniques and improve their skills.

Keywords: *People Management Digital Skill, Employee Performance, Contextual performance, Task performance*

Introduction

In today's digital age, workers in contemporary organizations face the need to acquire digital skills to improve work efficiency and productivity. However, the rapid and intense spread of technology

has also caused techno-stress and the phenomenon where the stress associated with the use of technology can disrupt the work performance of employees. Hence, the need to improve performance such as quality service delivery in the organization has become universally accepted phenomenon and it rely on efficient and effective employee career development in the workplace. Performance can be described as organizing as well as managing the causal model components that bring about the appropriate achievement of stated goals within limitations precise to an organization and to the circumstances (Lebas, 1995). Employee performance is defined as the level of success of employees in carrying out their duties and responsibilities (Rachmaliya & Effendy, 2017). Furthermore, employee performance can be defined as how well employees carry out job related activities assigned to them in regard to facilities provided and their efficiency in utilizing such task in the workplace.

Faiza and Nazir (2015) described employee performance as responses in the form of behaviors reflecting what has been learned by the employee or the kind of training that the employee has obtained. Contextual performance is a kind of prosocial behavior demonstrated by individuals in a work set-up. Task performance comprises of job explicit behaviors which includes fundamental job responsibilities assigned as a part of job description, Mohammad (2013) explains that employee performance is among the leading factors that influence an organizations success. Employee performance is key in determining the achievement of organizational goals; therefore, organizations look for ways to motivate their employees to give their best performance on the job. Hence, multiple tools of measuring performance have been developed and business organizations have the liberty of choosing the one that best suits their practice. Manpower is the most important resource compared with other resources like machine, material; moment, and money. However, in the organizational context, the effectiveness of employees in the workplace depends on training and development programs according to human capability and characteristics. Hence, upskilling is the process of learning new skills needed to do an entirely different job or doing an old job in a different way which is a variable tool for employee performance especially in industries which operations are purely technologically driven and constantly undergoing innovation, evolution and revolution.

People management digital skills refer to individuals' abilities to effectively use digital tools, technologies and platforms to manage the resources in the organization. In particular, visualization and responsiveness have been highlighted as key digital skills to improve digital business (Junior, 2018). It is also supported by recognition, responsiveness, process scanning and ecosystem connectivity as digital capabilities that improve operations, revenue growth and customer and stakeholder relationships (Junior, 2020). In the field of performing arts, the need for digital skills has been emphasized and a framework for assessing these skills has been proposed (Webb, 2023). Programming skill provided away from the workplace is called off the job technical skill. The working environment is duplicated and is used for technical skill (Goldstein & Ford, 2002). Hence this method is also called as vestibule technical skill. Generally, this type of technical skill is followed for the new employees who have zero knowledge on the working environment and the does not have the skills for the current job. Also, when large number of employees needs to be trained, off the job technical skill method is the best option. Vestibule technical skill was provided by using actual machinery and tools but not at the actual work place. The equipment and tools were brought to a different place for technical skill. Vestibule technical skill was provided by using

actual machinery and tools but not at the actual work place. The equipment and tools were brought to a different place for technical skill.

Today's world is driven by digitalization, automation and artificial intelligence which are fast reshaping industries. In view of this, firms aiming at meeting up with the dynamic and fast-moving business environment intend to adopt upskilling of their existing employees to empower the workforce with the skills required for the future. Therefore, to start upskilling, the organization should analyze the skill gap in the lieu of current technological advancement and other challenges emanating from the environment. The organization should identify the training need among the employee by skill matrix. By finding this, the organization can create a workforce with the relevant skills and competencies on an ongoing basis in line with the organizational goals. Mastura, Imam and Osman (2021) studied employability skills and task performance in government sector and utilized a correlational design using survey method and revealed that skills acquisition and skills competence had significant positive relationship with task performance. Also, another study conducted by Fatema, Momotaj and Al-min (2020) in Bangladesh identified a gap for further studies being upskilling as a tool for professional development on employee performance. Tantua and Nwimana (2020) investigated the relationship between job design and employee performance and measured with creativity and profitability and revealed that there is a significant relationship between job design and employee performance.

This gap in knowledge hampers the organizations' ability to optimize their human capital, potentially leading to suboptimal performance in managing critical information resources. Hence, this study aims to fill the gap that spurs the researcher to delve into this study in finding the relationship between people management digital skills and employee performance in quoted foods and beverages manufacturing firms in Rivers State Nigeria. The purpose of the study was to examine the relationship between people management digital skills and employee performance in quoted foods and beverages manufacturing firms in Rivers State Nigeria:

Research Questions

1. Is there relationship between people management digital skills and contextual performance in quoted foods and beverages manufacturing firms in Rivers State Nigeria?
2. Is there relationship between people management digital skills and task performance in quoted foods and beverages manufacturing firms in Rivers State Nigeria?

Conceptual Framework

The conceptual framework showed the relationship amongst the three variables of the study as depicted with the top arrow.

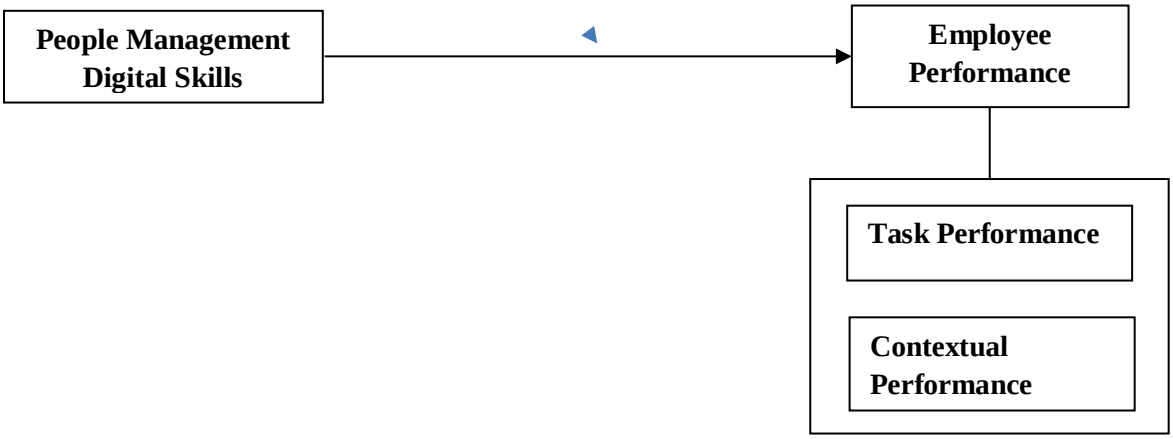

Figure 1 indicate the conceptual framework of the relationship between People Management digital skills and employee performance in quoted foods and beverages manufacturing firms in Rivers State Nigeria

Literature Review

People Management Digital Skills

Digital skills refer to individuals' abilities to effectively use digital tools, technologies and platforms. These skills are important in various sectors, including manufacturing, because they can improve efficiency, productivity and overall performance. The underlying theory of people management digital skills covers several aspects such as learning, the impact of digital technology on society and the role of education in equipping individuals with these skills. Digital skills can be acquired through different methods such as self-learning, formal education and on-the-job learning. The learning process includes understanding the underlying concepts, mastering technical skills and developing problem-solving skills (Ahmad et al., 2019) Impact of digital technologies: digital technologies have changed the way people live and work, making digital skills an important part of modern society. These technologies have democratized access to information, enabled collaboration, and streamlined processes, making it critical for individuals to adapt and develop digital skills (Nadeau, 2018). Current research indicates that digital skills can affect performance in a variety of contexts. One study shows that digitization can change competitive structures, business behavior and efficiency in various industries. (Callan, 2023). In addition, other studies show that factors such as skills and knowledge have a strong relationship with performance.

Data Analysis: employees are trained during their everyday working in the actual working scenario is called as on job technical skill method. It is considered as most cost-effective method. This is also called as learning while doing. On the job technical skill is a method to develop the skills of a worker through hand-on experience. The trainee was working in the same place and with the same equipment where he has to work as part of his job. Employees will get first-hand experience with the working environment. An experienced employee of a supervisor will guide the trainee

employee and teach the skills. This is mostly beneficial in the oil & gas industries where the worker was trained by the senior employee or a supervisor. Technical skill was given parallel by getting the work to be done for that day. Such technical skill is called unstructured technical skill. Trainee employee will get to know the work environment, tools and equipment that are to be used and will get an opportunity to perform and learn different parts of the job under direct supervision. On the other hand, the structured on the job technical skill is more organized with the preplanning of objectives and clear method planned for technical skill. In structured technical skill the effectiveness of the technical skill can be measured.

Employee Performance

Employees are the human capital of organizations, and their performance is a crucial indicator for an organization to achieve its goals. According to Afshan, Sobia, Kamran and Nasir (2012) employees' performance is defined as the attainment of specific tasks by employees of an organization (through the effort applied by employees within such organization) and it is measured against the predetermined or identified standards of accuracy, completeness, cost and speed set by the organization. There are a number of indicators that can be used to measure performance either in the context of organizations or employees, whose performance directly increase that of an organization. On the one hand, a variety of indicators of organizational performance are used including productivity, efficiency, effectiveness, quality and profitability (Ahuja, 2006). Employee performance refers to the execution of tasks and responsibilities by an individual in a work setting. It is a crucial dependent variable in organizational psychology and behavior, driving the entire economy (Campbell & Wiernik, 2015). Employee performance can be influenced by various factors, including human resource practices, training, performance appraisal, career planning, and employee participation and technology. Employee performance as a concept has increasingly taken the centre stage of discourse amongst scholars of management sciences, as employee performance is of the essence to both individual and the organization. Performance generally is a multi-component concept that defines the action or process of performing a task or function, distinguished by the process and expected outcome criteria (Borman, & Motowidlo, 1993). The process aspect of performance is the behavioral engagements which denotes the action people exhibit to accomplish a work, whereas the outcome aspect states about the consequence of individual's job behavior (Campbell, 1990). Apparently, in a workplace, the behavioural engagement and expected outcome are related to each other (Borman, & Motowidlo, 1993), but the comprehensive overlap between both the constructs are not evident yet, as the expected outcome is influenced by factors such as motivation and cognitive abilities than the behavioural aspect. The major measures of employee performance are: Employee performance: the measures are task performance, contextual performance and adaptive performance from (Zeb-Obipi, 2015).

Task performance

Task performance comprises of job explicit behaviors which includes fundamental job responsibilities assigned as a part of job description. Task performance requires more cognitive ability and is primarily facilitated through task knowledge (requisite technical knowledge or principles to ensure job performance and having an ability to handle multiple assignments), task skill (application of technical knowledge to accomplish task successfully without much supervision), and task habits (an innate ability to respond to assigned jobs that either facilitate or impede the performance) (Conway, 1999). Therefore, the primary antecedents of taskforce are the ability to do the job and prior experience. In an organizational context, task performance is a

contractual understanding between a manager and a subordinate to accomplish assigned task. Entrusted task performance is broken into two segments: technical-administrative task performance and leadership task performance. The expected job performance comprising of planning, organizing and administering the day-to-day work through one's technical ability, business judgment and so on are called as technical-administrative task performance. Leadership task performance is labelled through setting strategic goals, upholding the necessary performance standards, motivating and directing subordinates to accomplish the job through encouragement, recognition, and constructive criticisms (Borman, & Brush, 1993; Tripathy, 2014). Borman, and Motowidlo (1997) defined job performance in the context of task performance as "effectiveness with which job occupants execute their assigned tasks, that realizes the fulfillment of organization's vision while rewarding organization and individual proportionately." Werner (1994) has synthesized the earlier propositions of task performance through relating it to organizational formal reward state as "the demonstrated skill and behavior that influences the direct production of goods and service, or any kind of activities that provides indirect supports to organisation's core technical processes".

Contextual Performance

Contextual performance is a kind of prosocial behavior demonstrated by individuals in a work set-up. Such behaviors are expected of an employee but they are not overtly mentioned in one's job description. These kind of unstated expectations are called prosocial behavior or extra role behavior. Brief, and Motowidlo (1986) defined it as a behavior that is (i) accomplished by a member of an organization, (ii) which is directed towards an individual, group, or organization with whom the member interacts while carrying out his or her organizational role, and (iii) finally such behavior is performed with the intention of encouraging the betterment of individual, group, or organization towards which it is directed.

Supporting the aforesaid ideology, many prominent researchers in this field have advocated that expected job performance carries two vital dimensions; one as the work required by an organization concomitant to one's role and the other one as the discretionary work behavior (LePine, Erez, & Johnson, 2002). Impressing on the importance of voluntary work behavior or non-task performance, later psychologists have coined it as contextual performance which connotes helping others to adapt with the varied job roles. Bergeron (2007) recommends that contextual performance should consist of multiple subdimensions such as teamwork, allegiance, and determination.

The contextual performance is elaborated on the ground of "feeling and viewpoint" that employee embraces about their colleagues, which is termed as espirit-de-corps (teamspirit). A kind of fellow feeling gets intensified through team spirit, wherein employees are able to share their issues and problems willingly and freely with each other within the organization. Esprit-de-corps is an excellent endeavor for deriving organizational success (William, Swee-Lim, & Cesar, 2005) and earlier researchers in this context have advocated that growth in teamspirit within an organization result in better employee performance and a happier workplace. Contextual performance is a kind of attitude like volunteering for extra work, helping others in solving difficult task, upholding enthusiasm at work, cooperating with others at the time of need, sharing critical resources and information for organizational development, abiding by the prescribed rules and regulations, and supporting organizational decisions for a better change (Coleman, & Borman, 2000). This kind of

behavior contributes for creating a stimulating culture and climate of the organization which aids in achieving individual productivity and organizational effectiveness. For selecting and inducting the right personnel in organizations, introducing personality tests and group discussion for measuring a prospective candidate's ability for contextual performance along with the efficiency tests (ability and experience tests) to measure their task performance is proposed.

Empirical Review

Tantua and Nwimana (2020) investigated the relationship between job design and employee performance of manufacturing companies in Rivers State. The study adopted a cross-sectional survey design. Primary data was generated through structured questionnaire. The population of the study comprises of principal officers of manufacturing sector in Port Harcourt, Rivers State. The population of the study was one hundred and ninety-two principal officers selected from the 32 manufacturing companies. The hypotheses were tested using the Pearson Product Moment Coefficient with the aid of Statistical Package for Social Sciences version 20.0. Findings revealed that there is a significant relationship between job design and employee performance of manufacturing companies in Rivers State.

Kiweewa and Asiimwe (2014) studied the effect of acquiring new skills on employee's performance at Uganda communication commission (UCC) using data for a sample of 80 out of 108.The results of the study showed that new skills increase the performance of employees at UCC particularly when UCC has handled issues related to needs assessments, training methods and evaluations carefully. Therefore, the study concluded that UCC and other sister organisations in Uganda should always use competent staff or external consultants to formulate strategic plans to guide the implementation and evaluation of organization objectives to enhance achievement of their mandate at all times.

Nkemakolam (2020) examined the effects of technical skill on employee performance: A case study on Airtel Networks Limited, Abuja. Cross-sectional descriptive research was the research design used in the study. A self-administered questionnaire was used to collect primary data. Statistical Package for Social Sciences was used to process and analyze the data. It was determined that there was a relationship between the variables using inferential statistics like Chi Square. The findings of this study show that for organizations to see improvements in employee performance there is the need to develop technical skill programs and ensure employees who are of course the most vital assets of an organization are consistently trained.

Saghir (2014) carried out a study on the effect of technical skill on employee performance in supermarket industry research in Karachi, Pakistan. The research took 100 respondents as the sample size and used questionnaires to gather information. A descriptive methodology was used for the study. Data were gathered using a closed-ended, semi-structured questionnaire. To determine relationships between employee remuneration and employee turnover, Chi-squire was used. In order to establish the strength of the link, significant variables were included to the logistic regression model. The findings indicate a positive and significant association between technical skill and employee performance in the supermarket within Pakistan. There is a research gap that exists in this study as the research was done in the supermarket industry. The researcher would thus want to explore if the same exists in the foods and beverages industry in Nigeria. The research was also carried out in Pakistan whose setting is different from Nigeria where the current research

took place. Based on the findings of the reviewed empirical work and the conceptual review of this present study, the study contributes to the scanty empirical works that have examined the relationship between the digital skills and employee performance by stating the following hypotheses below:

Ho_1 There is no significant relationship between people management digital skills and contextual performance in quoted foods and beverages manufacturing firms in Rivers State Nigeria
Ho_2 There is no significant relationship between people management digital skills and task performance in quoted foods and beverages manufacturing firms in Rivers State Nigeria

Methodology
This study was survey. It covered more than a few organisations. The range of issues and interrelations were numerous and diverse. Generalizations about the relationship amongst the two variables were intended. Therefore, this study adopted cross-sectional survey research design in a non-contrived setting with individual as the units of analysis. The population of this study will consist of fourteen (14) quoted manufacturing companies in the foods and beverages industry operating in Rivers State, Nigeria listed on the Nigerian Exchange group as at June, 2024. Since all 14 quoted foods and beverages manufacturing firms have their offices in Rivers State, these offices constituted the accessible location for this study. Therefore, the sample population element of the study was one thousand nine hundred sixteen (1,916) employees from the (14) companies. the study adopted the standard error factor known as the Taro Yamane Formula. Therefore, the sample size for this study was 330 employees of the 14 quoted foods and beverages firms in Rivers State Nigeria. The study used primary data collection method. As such, structured questionnaire was directly distributed to respondents in the quoted foods and beverages companies under consideration to provide first-hand answers to the questions posed. The study adopted face and content validity. The Cronbach alpha test coefficient was used to measure the reliability of the measuring instrument. For the purpose of accepting the data that generated from the questionnaire, the Cronbach alpha coefficients were use to test the reliability of the instruments.

Table 1 Cronbach's Alphas of Study Variable

S/N	Variables	No. of items	Alpha (α)
1	People Management Digital Skills	3	0.896
2	Task Performance	3	0.908
3	Contextual Performance	3	0.935

Source: Research Data, 2025

The spearman's rank order correlation is usually designed as rho. It has paired observation, thus required ordinal data and measured the degree of relationship between two sets of ranked observation. This statistical tool was use to analyze inference relationship with the aid of statistical package for social sciences (SPSS).

Data Analysis and Results
Univariate Analysis
Response Rate on Digital skills
Table 2 showed Descriptive Statistics on People Management Digital skills
Descriptive Statistics

	N	Minimum	Maximum	Mean		Std. Deviation
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic
1. I can confidently handle any work related and IT-based applications that will help me manage agent performance and schedules.	287	1	5	2.54	.066	1.118
2. I have the ability to develop and utilize self-service applications that can enable me monitor and manage my team's performance and schedule.	287	1	3	1.58	.051	.857
3. I have the skill to forecast and optimize agents using the relevant IT-based applications.	287	1	5	2.86	.099	1.672
Valid N (listwise)	287					

Source: SPSS Version 26.0 Result, 2025

Table 4.6 showed the analysis for digital skills and measure with 3-items measurement in a 5-point scale in the study. The first item with a moderate mean value of (ẋ=2.54 and std. =1.118). The second item with a low mean value of (ẋ=1.58 and std. = 0.857). Similarly, the third item with a moderate mean value of (ẋ=2.86 and std. = 1.672). However, it was observed that majority of the responses are more on moderate range of digital skills in the measurement scale in the foods and beverages companies in the industry.

Response Rate on Task performance
Table 3 showed Descriptive Statistics on Task Performance
Descriptive Statistics

	N	Minimum	Maximum	Mean		Std. Deviation
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic
1. My ability to be responsive to assigned task has improved greatly.	287	1	5	3.29	.048	.813

2. When a customer is dissatisfied, I always attend to their concerns to their admiration.	287	1	5	2.85	.065	1.109
3. My organization promotes team morale and builds commitment towards achieving a target.	287	1	5	3.93	.069	1.164
Valid N (listwise)	287					

Source: SPSS Version 26.0 Result, 2025

Table 3 showed the analysis for task performance and measure with 3-items measurement in a 5-point scale in the study. The first item with a moderate mean value of (ẋ= 3.29 and std. = 0.813). The second item with a moderate mean value of (ẋ=2.85 and std. = 1.109). Similarly the third item with a high mean value of (ẋ= 3.93 and std. = 1.164). However, it was observed that majority of the responses were more on high range of task performance in the measurement scale in the foods and beverages companies in the Industry, Nigeria.

Response Rate on Contextual performance

Table 4 showed Descriptive Statistics on Contextual Performance

Descriptive Statistics

	N	Minimum	Maximum	Mean		Std. Deviation
	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic
1. Staff here help to orient new agents even though it is not required of them	287	1	5	4.08	.058	.983
2. Staff are always ready to help or to lend a helping hand to those around them	287	2	5	3.48	.050	.844
3. Staff here willingly give of their time to help others with work related things	287	1	5	3.26	.056	.950
Valid N (listwise)	287					

Source: SPSS Version 26.0 Result, 2025

Table 4 showed the analysis for contextual performance and measure with 3-items measurement in a 5-point scale in the study. The first item with a high mean value of (ẋ= 4.08 and std. = 0.983). The second item with a moderate mean value of (ẋ= 3.48 and std. = 0.844). Similarly the third item with a moderate mean value of (ẋ= 3.26 and std. = 0.950). However, it was observed that majority of the responses were more on high range of contextual performance in the measurement scale in the foods and beverages companies in the Industry, Nigeria.

Bivariate Analysis

Digital skills and the measures of Employee performance

Table 5 Showed the Correlations Analysis on Digital skills and the measures of Employee performance

			Digital skills	Task performance	Contextual performance
Spearman's rho	Digital skills	Correlation Coefficient	1.000	.965**	.983**
		Sig. (2-tailed)	.	.000	.000
		N	287	287	287
	Task performance	Correlation Coefficient	.965**	1.000	.972**
		Sig. (2-tailed)	.000	.	.000
		N	287	287	287
	Contextual performance	Correlation Coefficient	.983**	.972**	1.000
		Sig. (2-tailed)	.000	.000	.
		N	287	287	287

Source: SPSS Version 26.0 Result, 2025

Therefore, based on the results presented on table 5, the interpretation of hypotheses on the relationship between digital skills and the measures of employee performance is stated as follows:

People management digital skills has no significant relationship with task performance where (*rho* = 0.965; and P-v=0.000 < 0.05%) level of significance. The result indicates that digital skill has a strong positive and significant relationship with task performance in the quoted foods and beverages manufacturing companies in Rivers State, Nigeria. Therefore, on the basis of the findings the null hypothesis is rejected.

People management digital skills has no significant relationship with contextual performance where (r = 0.983; and P-v=0.000 < 0.05%) level of significance. The result indicates that digital skills has a strong positive and significant relationship with contextual performance of quoted foods and beverages manufacturing companies in Rivers State, Nigeria. Therefore, on the basis of the findings the null hypothesis is rejected.

Discussion of Findings

The result between people management digital skills and measures of employee performance using Spearman's Rank-order Correlation Coefficients techniques showed that digital skills have a strong positive and significant relationship with task performance, contextual performance and adaptive performance in the quoted foods and beverages manufacturing companies in Rivers State, Nigeria. Thus, the findings of this study support the findings of Nkemakolam (2020) study on the effects of People management digital skills on employee performance: A case study on Airtel Networks Limited. The findings of this study show that for organizations to see improvements in employee performance there is the need to develop digital skills programs and ensure employees who are of course the most vital assets of an organization are consistently trained. The findings also agreed with the findings of Onyango, and Wanyoike (2014) to assess the effect of digital skills on the performance of staff in the public health institutions in Kenya with target population of doctors, clinical officers, nurses and subordinate staff serving in public health facilities within Siaya County. From the study it shows there is a strong positive relationship between digital skills

of employees and performance. In the same vein, the study is in line with the findings of Owen's (2006). The study found that digital skills has a positive effect on commitment and turnover cognitions. Digital skills employed by organization which seeks to improve employee asset, upsurge mutuality, enables the employee identify with the organization, and helps to reduce alternative employment options will increase employee's commitment to the organization.

The findings corroborate with Saghir (2014) carried out a study on the effect of digital skills on employee performance in supermarket industry research in Karachi, Pakistan. The findings indicate a positive and significant association between digital skills and employee performance in the supermarket within Pakistan. There is a research gap that exists in this study as the research was done in the supermarket industry. The researcher would thus want to explore if the same exists in the foods and beverages industry in Nigeria. The research was also carried out in Pakistan whose setting is different from Nigeria where the current research took place. Nassazi (2013) examined the effects of digital skills on employee performance at telecommunication industry in Uganda. In particular, this study focused on three biggest telecommunication companies in Uganda namely; Mobile Telephone Network (MTN), Warid and Uganda TeleCom (UTL). In this study, the data was collected through the structured questionnaire, which was distributed to 120 respondents at these three companies and was analysed through descriptive statistics techniques especially the frequency and percentage distributions.

Conclusion

Findings from the analyses and test of research hypotheses revealed that people management digital skill has a strong influence on employee performance in the foods and beverages manufacturing companies in Rivers State, Nigeria. people management digital skill has strong influence on employee performance in foods and beverages manufacturing companies in Rivers State, Nigeria. The following recommendations were made: that human resource managers in the organizations notably the foods and beverages manufacturing industry should utilize IT-based applications, self-service applications programs to improve employee performance in the organizations. That orientation be improved and conducted in such a manner to progress employee performance as it is an opportunity to boost employee capabilities, add to their techniques and improve their skills.

Abstract
In today's competitive business landscape, organizations are increasingly recognizing the importance of talent management practice as a tool for driving strategic initiatives for green and smart transition. Talent management practices encompass strategic initiatives that align HRM policies with ethical standards, employee well-being, and broader social responsibilities to tackle the challenges of the changing nature of the world of work. This approach not only enhances organizational stability and sustainability, but also significantly impacts on the smart transition of business. The relationship between talent management practice and smart transition of economy is of particular interest, because it fosters innovation, creativity and resilience for maintaining competitive advantage and achieving long-term success. This paper examines the contemporary initiatives of talent management practice as tools for enhancing green smart economy transition. The paper identified talent management as contemporary with the application of digital technology to effectively achieve renewable hope for smart economy. Therefore, the paper recommends that talent management is necessary for green and smart transition of economics in this changing nature of work, business and workplace. in Nigeria and the global community.

Keywords: *Talent Management Practices, Smart Economy, Talent Attraction, Talent retention, Contemporary initiative*

Introduction

Today, one of the most important concerns of human resource development managers is to retain and develop organizational talents. Talent management has had an astonishing effect on the reputation of organizations (Cart Wright, 2008). Talent is a resource that is valuable, rare and difficult to emulate. Talent management is a strategic activity that is in line with the company's business strategy that aims to attract, develop and retain talented employees at every level of the

organizations (Hatum and Preve, 2015). Whenever organizations need to optimize their workforce, the strategic importance of talent management becomes more apparent to them (Lyria et al, 2017). Talent management is the key to the success of business in the postmodern era. As a result, it makes some kind of investment in certain individuals, as the main source of innovation and social development (Mohammed et al, 2017).

In an entirely volatile and uncertain world today, talent management is a very dynamic strategy to be in tune with the changing times. Even with millions of unemployed in major markets around the world, organizations are hard pressed to find the skills that they need (Sampet, 2014). Talent management is the pool of activities which are concerned with attracting, selecting, developing and retaining the best employees in the strategic roles. Talent management recognizes people who excel at particular activities and performance upon whom support is offered to enable them to 'push the envelope' while capturing and sharing what they do differently so as colleagues can emulate them (Scullion &Collings, 2011). Organizations should have ability and capacity to recognize the people and the capability that may create value and deliver the competitive advantage for the organization. Talent management refers to an organized process of attracting, selecting, hiring, engaging; training and developing; retaining and utilizing top talents to an organization's best advantage. It aims at ensuring the right job placements at the right time, in the right position for the right candidates to deliver their best and remain committed to the organization. Though talent management is organization-specific, the focus is on developing and optimizing high potentials or talents of individuals within the organization more quickly than ever to enhance competitiveness and growth of organizations in this era of changing nature of work and business.

The principal concern identified is the inadequate integration of various strategies in Organizations, which prevents businesses from properly using human capital for enduring sustainability and efficacy in transiting economics of the business. The previous research indicates that lack of strategic initiatives in managing the human resources especially human talents have affected substantially on the productivity, sustainability, resilience and effective transition of the organizations to cope with the smart economics. (Hongal & Kinange, 2020). Nonetheless, failing to incorporate these principles into a comprehensive human management strategy leads firms to experience inefficiencies and overlook opportunities to optimize their workforce's potential. Moreover, the other research, Nelson et al. (2022), indicates that although talent acquisition and talent attraction successfully recruit qualified personnel, the lack of effective retention and development methods results in a disjunction between talent acquisition and the long-term requirements of the business (Nelson & Riesquita, 2024). This report advocates for a more cohesive strategy in talent management to tackle these difficulties. Aligning talent acquisition with career management and learning and development establishes a dynamic talent management ecosystem that not only fulfils responsibilities but also equips individuals and organizations for future organizational problems, hence boosting overall resilience and competitiveness. The strategic significance of synchronizing talent acquisition strategies with organizational objectives to guarantee the acquired talent for green and smart transition.

Several empirical studies have explored green and smart transition through various predictor variables. For instance, Ye, Liu, and Tan (2022) investigated the effects of organizational justice and ethical leadership on green transition of economics. They found that both distributive and interactional justice within organizational justice significantly influenced transition of economics.

Similarly, Jena and Goyal (2022) examined the relationship between emotional intelligence and green transition of economics, highlighting that emotional intelligence offers a novel approach to fostering green transition of economics among organizations. In another study, Esse (2022) focused on leadership strategic initiatives and smart economic transitions within 21st-century academic libraries, noting that Nigerian academic libraries have struggled to establish effective strategic leadership initiatives and transition process.

Additionally, Harun, Yunhendri, Shaharudin, and Kanapathipillai (2022) explored the role of self-efficacy and creative process engagement in driving sustainable growth within Malaysia's telecommunications industry. Their findings revealed that self-efficacy directly enhances employees' cooperation and efforts, underscoring its motivational power for fostering growth. Hoang, Luu, Nguyen, Du and Le (2022) examined the impact of entrepreneurial leadership on sustainable management growth in small and medium-sized enterprise (SME) hotels, discovering that intrinsic motivation and trust in leadership mediated the relationship between entrepreneurial leadership and growth, Furthermore, Odugbesan Aghazadeh, Al Qaralleh and Sogeke (2023) conducted a study on green talent management and its effects on organizational sustainability, finding that both green hard and soft talent management practices significantly influenced smart transition of economics. Their study also confirmed the critical role of transformational leadership and artificial intelligence enhances transition of the economics. Despite the various identifiable studies examining the predictors of smart economic transition, there is still conceptual and contextual gap, thereby creating a vacuum in literature which this paper intends to conceptually fill by examining on the contemporary initiatives of talent management practices as a tools for smart economics transition.

Literature Review

Theoretical Review

Social Exchange Theory

George Homans (1958) developed the social exchange theory following his interest in studying small groups, and his assumption that every civilization, community, or group was best understood when viewed as a social system. The social exchange theory is a central to the field of sociology and is often used as a framework for understanding social interactions. Its concept of "costs and benefits" is widely adopted as a way of understanding why people engage in certain social behaviors (De Vries & Gershuny, 2017). One key aspect of the social exchange theory is the idea that people are motivated by self-interest and seek to maximize their personal benefits (Kim & Sandstrom, 2018). Consequently, individuals are likely to engage in social interactions and relationships that they perceive as being beneficial to them, while avoiding those that they perceive as being costly or detrimental to their personal interests. In agreement with the exchange theory the support given to an employee is expected to create inequity in the exchange between the employee and the source of support (the supervisor). In other words, upon getting support the employees will tend to respond to fulfil his/her feeling of indebtedness by showing positive work conducts.

Most of management studies focus on expectations of mutual benefit; however, a number of other exchange rules have been delineated in Social Exchange Theory. ―Reciprocal exchange‖ is one that does not include clear bargaining (Molm, 2003). Relatively, one party 's actions are reliant on the other's conduct. Because of this, interdependence decreases risk and boosts collaboration

(Molm, 2003). The procedure begins when at least one participant makes a ―move, and if the other responds, new rounds of exchange start. Once the process is in motion, each consequence can create a self-reinforcing structure. The sequence is likely to be continuous, making it difficult to organize into distinct steps. Precisely, findings propose that individuals with a strong exchange alignment are expected to return a good deed than those low in exchange alignment. The quality of the association or exchange differs since supervisors have restricted time and resources. Supervisors exchange private and positional resources in return for subordinates' performance on unstructured tasks. These private and positional resources are: sharing of so- called inside information, influence in decision-making, task assignment, job latitude, support, and attention (Graen & Cashman, 1975).

The Social Exchange Theory (SET) is pertinent to a study on talent management practices and sustainable management growth as it explains the reciprocal relationship between employees and organizations. According to SET, employees are more likely to engage in innovative behaviours when they perceive that their organization is investing in their well-being through talent management practices, such as promoting work-life balance, ethical treatment, and employee welfare (Blau, 1964). In return for these investments, employees feel valued and supported, leading to increased commitment and motivation to contribute creatively and engage in the growth of work (Cropanzano & Mitchell, 2005). Thus, talent management practices fosters a positive exchange dynamic where employees are encouraged to go beyond routine tasks and contribute to organizational growth.

Talent Management Practices

Talent management practices is a relatively new concept for effective management of key employees that should be made part of company's strategy. Talent management is the systematic attraction, identification, development, engagement or retention and deployment of those individuals with high potential who are of particular value to an organization (Davies and Davies, 2010). Talent management is the implementation of integrated strategies or systems designed to increase workplace productivity by developing improved processes for attracting, developing, retaining and utilizing people with the required skills and aptitude to meet current and future business needs. Talent management is the additional management processes and opportunities that are made available to people in the organization who are considered to be 'talent' (Ashridge consulting, 2007; Likierman, 2007). Talent management practices can be a planning tool for human resource management, as a planning tool talent management looks very similar to workforce planning, but where HR will experience a real opportunity for contribution to the organization is in the quality of implementation supporting the plan. Talent management is the systematic attraction, identification, development, engagement/ retention and deployment of those individuals who are of particular value to an organization, either in view of their 'high potential' for the future or because they are fulfilling business/operation-critical roles. (McCartney, 2006; Cappell, 2008)

A recent study shows that 85% of HR executives state that the "single greatest challenge in workforce management is creating or maintaining their companies' ability to compete for talent." Without question, effective talent management provides one of the most critical points of strategic leverage today. Offering enormous business value, talent management is complex and continually evolving. Influenced by external factors such as the economy, global expansion and mergers and

acquisitions, critical success factors for effective talent management include alignment with strategic goals, active CEO participation and HR management. Over time, common themes around talent management are emerging, such as the role of line leaders in the development of talent. Overall, the main recurring themes are CEO involvement, culture, management, processes and accountability. Research shows that organizations increasingly focus on talent management. Moving from reactive to proactive, companies is working hard to harness talent. According to SHRM's (2006) Talent Management Survey Report, 53% of organizations have specific talent management initiatives in place. Of these companies, 76% consider talent management a top priority. In addition, 85% of HR professionals in these companies work directly with management to implement talent management strategies. Yet different companies may not define talent the same way. The belief in talent and its impact on the bottom line are at the heart of talent management. To be effective, the talent mindset must be embedded throughout the organization, starting with the CEO. Going beyond succession planning for top leadership positions, companies that value talent have a deep appreciation for the contribution of individuals at all levels, now and for the future. In essence, talent is the vehicle to move the organization where it wants to be.

Talent Retention

Retention aims to take measures to encourage employees to remain in the organization for the maximum period of time. Talent turnover is harmful to a company's productivity because costs of attraction are high. Direct cost refers to turnover costs, replacement costs and transitions costs, and indirect costs relate to the loss of production, reduced performance levels, unnecessary overtime and low morale (Echols, 2007). Vaiman & Vance, (2008) define two classifications of retention tool to suffice employee's expectation: extrinsic and intrinsic incentives. Extrinsic incentives includes different sorts of monetary rewards which can satisfy employees' physiological needs, while intrinsic incentives refer to non-monetary rewards that can fulfill employees' psychological needs. The monetary reward is admitted as an essential tool to retaining talent (Vaiman et al., 2008). Hughes & Rog (2008) said various organizations around the world have similarities and differences on the strategies they use to retain talent.

Talent retention is not a fancy word of identifying and developing employees. It is an act whereby an organisation sets aside certain factors to attract, retain and develop employees and direct their abilities in performing activities that are useful to the organisation. Schweyer (2004), see talent retention as attracting, identifying, recruiting, developing, motivating, promoting and retaining people that have a strong potential to succeed within an organization. Also, Creelman (2004), sees talent retention as the process of inviting, attracting, engaging and retaining talented personnel. However, talent retention is all about the various means by which organisation brings in employee, retains and develops them. Furthermore, it can be seen that even though organisations have got so many employees, there are some that are regarded as talented employees. Most organisations would do their best to retain the talented employees because of the benefits they will bring to the organisation. If organizations are truly willing to win the war for talent then they need, in particular, to keep finding, nurturing and developing extraordinary people, they must develop a capacity and new approaches to talent management (Powell & Lubitsh, 2007).

Talent Attraction

The attractiveness of an organization directly influences its ability to not only attract but also engage employees in ways that are conducive to both their personal growth and the growth of the

organization. Research has consistently shown that effective talent attraction strategies are linked with better Learning and Development outcomes. Organizations that succeed in attracting top talent typically have robust L&D programs that facilitate rapid onboarding and continuous development of new hires. This creates a positive feedback loop where strong L&D programs enhance the organization's attractiveness to potential talent, while effective talent attraction strategies ensure these programs are fully utilized. The relationship between Talent Attraction and SOP has been explored to a lesser extent. However, evidence suggests that attracting high-quality talent is an antecedent to enhanced organizational performance, as these individuals bring in new skills and perspectives that are crucial for innovation and long-term sustainability (Itam & Swetha, 2021).

The direct link, however, is often mediated by other HR practices, such as employee engagement and retention strategies. While the studies highlight the positive effects of Talent Attraction on SOP, the direct relationship is overly optimistic without considering intermediate variables such as LD (Whysall et al., 2019). In contrast, Garavan (2007) provides a more nuanced view by linking Talent Attraction to specific HR outcomes like L&D, suggesting a more indirect impact on SOP through these intermediate practices. This indicates that while Talent Attraction can enhance SOP, its effectiveness depends heavily on how well the attracted talents are developed and integrated within the organization. Without effective development programs, the potential of the attracted talent is not fully realized, thereby diluting the impact on SOP (AlHumaidi et al., 2022; Deana et al., 2022; Mahmood et al., 2022; Spirito et al., 2022).

Talent Development

Talent development is a strategic process where organizations help employees enhance their skills, knowledge, and abilities to support both individual career growth and overall organizational success. It's about identifying employee potential, addressing skill gaps, and providing tailored learning opportunities like training, coaching, and mentorship to help individuals reach their full potential. This process aligns individual development with the company's strategic goals, leading to a more engaged, high-performing, and adaptable workforce. The concept of a learning organization emphasizes that organizations that facilitate continuous learning and adaptability are better equipped to achieve sustainable success (Afshari & Hadian Nasab, 2020).

A Contemporary Initiative for Smart Economics Transition

The development of the smart economy as the main source of competitiveness and sustainability is relevant because in the modern world digital technologies are becoming a driver of economic development. (Garavan,2007). The development of the smart economy reflects this trend and opens up new opportunities to increase productivity, efficiency and innovation in all areas of activity. The ability to use modern technologies and create intelligent solutions is a competitive advantage in the marketplace that requires strategic initiative to driven smart economy transition. (Afshari & Hadian Nasab, 2020). The development of the smart economy helps companies and countries to increase their competitiveness by offering new products and services, optimized processes and effective management. Smart economy contributes to the creation of sustainable economic models that ensure the standard of living of current and future generations without harming the environment and resources. This is important to ensure stability and sustainable development for the future. Population growth, climate change, social and economic challenges require new approaches to economic development. A smart economy opens up ways to solve these problems

and to seize new opportunities for sustainable development.

Therefore, the development of a smart economy is a key task for many countries and companies, and the study of this topic helps to understand and solve the complex challenges of economic development in the modern world. This means reducing the use of resources, reducing emissions into the atmosphere and using energy rationally, which helps to preserve the environment and maintain environmental sustainability. The rapid development of technologies creates new opportunities for the creation and development of new business models and products. A smart economy requires the development of smart infrastructure, including fast access to the Internet, the development of digital platforms and services, and the support of innovative industries that contribute to the development and growth of businesses. The smart economy offers companies and countries access to new markets and opportunities through the expansion of global networks of cooperation and trade. This makes it possible to increase the competitiveness and stability of the economy in the context of globalization. The potential impact of the smart economy on competitiveness and sustainability includes increasing productivity, reducing costs, improving the quality of products and services, attracting investment and stimulating innovative development. Such developments contribute to sustainable economic growth and raising the living standards of the population.

Conclusion

From the conceptual review, it was identified that talent management practice plays a critical role in fostering strategic initiatives for green smart economy transition. This is achieved through utilization of digital tools and technology in the management and implementation of decisions concerning the development and growth of the organization. The paper identified talent management as contemporary with the application of digital technology to effectively achieve renewable hope for smart economy. Therefore, the paper recommends that talent management is necessary for green and smart transition of economics in this changing nature of work, business and workplace. in Nigeria and the global community.

Abstract
The study examines the impact of the COVID-19 pandemic on the financial administration of public universities in Southeastern Nigeria, focusing on disruptions in financial planning, leadership direction, control measures, and psychological effects on students and parents. Using a survey research design, data were collected from staff, students, and parents across five state-owned universities. Stratified random sampling yielded 398 respondents. The analysis employed descriptive and inferential statistics through SPSS version 20, including regression models testing four hypotheses related to financial planning, direction/control, psychological impacts, and financial control disruptions caused by COVID-19.
Results indicate significant positive relationships between COVID-19 impacts and disruptions in financial administration. Specifically, COVID-19 explained 42% of variance in financial planning disruptions, 34% in disruptions to leadership and financial direction/control, 38% in psychological effects on students and parents, and 30% in weakened financial control and resultant industrial actions. Findings reveal salary delays, budgetary disruptions, leadership stress, governance failures, industrial unrest, and psychosocial distress as interrelated effects of the pandemic's financial impact. The study anchors its analysis in Organizational Resilience Theory, emphasizing the dynamic capacity of universities to anticipate, cope with, and adapt to crises through improved financial management and leadership.
These insights highlight critical vulnerabilities in university financial systems, underscoring the need for robust contingency planning, diversified revenue streams, transparent financial governance, and psychosocial support to enhance institutional resilience and stakeholder well-being in times of crisis. The findings contribute valuable knowledge for policymakers and

university administrators seeking to strengthen financial administration and crisis preparedness in Nigerian public higher education.

Keywords: *COVID-19, financial administration, public universities, organizational resilience, leadership stress, financial control, psychological impact, Southeastern Nigeria*

Introduction

The COVID-19 pandemic has had a tremendous impact on the financial management of the world in general and on the financial management of public universities, in particular, due to changes in funding, disruption of operations, and a change in the sources of revenue generation (World Bank, 2021). Institutions of higher learning across the globe were unprepared and experienced violent financial jolts and logistical setbacks that threatened their continued existence. In Africa, these effects were even further heightened, with universities having to combat prevailing infrastructural shortages and digital capabilities that negatively affected education sustainability and financial planning (UNESCO, 2020).

In Southeastern Nigeria, these pressures compounded the preexisting weaknesses of the financial management of public universities. The pandemic highlighted that there are major flaws in financial planning, organization, direction, control, and overall financial management in these institutions (Adebayo & Nwosu, 2022). The COVID-19 pandemic is the independent variable, and the dependent variables are the different ways of financial administration, which will be measured by proxies, which include the delay of salaries, the postponement of graduations, industrial actions, and the psychological effects on students and parents.

To be more precise, COVID-19 interfered with the capacity of universities to pay their employees because of the plunge in internally generated revenues and lack of government finance. That caused a financial burden, which impacted staff morale and productivity, showing that there were flaws in contingency planning and overdependency on unstable financial sources (Oke & Olayinka, 2021; Eze & Udeh, 2023). Financial management was affected too, with regular budgetary allocations and administrative procedures being put on hold, resulting in slowing academic progress and student graduations (Chukwuemeka & Anozie, 2022). Financial uncertainty presented the leaders with a greater degree of emotional and psychological pressure, which reduced their ability to make strategic financial decisions (Ibrahim & Okeke, 2021). The weakening of financial control mechanisms triggered industrial actions that even further depleted institutional resources and operations (Nwankwo & Adamu, 2022). Finally, the financial hardship caused stress to students and parents, which influenced the academic participation and the general educational atmosphere (Okafor & Eze, 2023).

The crux of the issue that this study tackles is the multidimensional financial crisis that Southeastern Nigerian public universities confronted because of the COVID-19 pandemic. In particular, the paper discusses how ineffective financial planning during the pandemic resulted in the delays in salaries, which negatively impacted staff morale and productivity, and how internal inefficiencies made students lag behind and interrupted the academic schedule is another contributing factor to the problem. Knowledge of the way leadership stress is fuelled by financial

direction and strategic financial management. How disintegrations in financial control ushered in industrial unrest and internal fights. Lastly, how these economic pressures had affected the mental health of students and their parents who have to deal with insecurities in education and financial difficulties.

That is why these problems indicate key vulnerabilities in financial management that compromise institutional survival and academic stability in times of crisis and points to the importance of resilient management in public universities.

Recently published studies since the year 2019 to 2025 give good insights but are still limited in tackling the complete effects of COVID-19 on university financial administration in Southeastern Nigeria. Kelchen et al. (2021) examined fiscal challenges in higher education on a global scale but not in any one particular region and not from the viewpoint of internal administration. As far as payrolls in the Nigerian universities are concerned, Oke and Olayinka (2021) did not delve into the organizational and psychosocial implications. In the study by Hukwuemeka and Anozie (2022), delays in academic progression caused by financial disorganization were evaluated, but not associated with their psychological impact or stress on leaders. The study conducted by Ibrahim and Okeke (2021) examined the stress of leadership due to financial uncertainty, but it was not extended to the impact on financial management and the functioning of the institution.

Similar studies of psychological effects by Okafor and Eze (2023) did not mention the relationship with financial administrative failures or solutions. However, Wankwo and Adamu (2022) examined the issues of failures in financial control and related industrial actions but have not framed it in a broader institutional or psychosocial environment.

Taken together, such literature points to a trend of viewing financial, emotional, and operational effects in silo as opposed to viewing them as mutually reinforcing issues. The knowledge gap is high in regard to how COVID-19 affected financial planning, organization, direction, control, and overall financial administration simultaneously and how those disruptions multiplied into academic delays, leadership burnout, industrial conflicts, and psychological distress among the stakeholders.

Public Financial Management Theory - Highlighting the importance of proper management of mobilization and control of governmental resources with an aim at achieving accountability and efficiency (Rotimi et al., 2021). This framework highlights the significance of good budgeting, prioritization of resources, open spending and financial control as key pillars to institutional stability, particularly in times of crisis.

Complexity Theory- Conceptualization of universities as complex entities in which financial planning, organization, leadership direction and control is intertwined with results and well-being of the stakeholders (Jaja, Sam-Kalagbor, & Igoni, 2023). This theory places financial management in a broader context of a system in which the shocks in one area have an impact on other areas, impacting academic development and psychosocial aspects.

Collectively, the theories inform a combined examination of the extensive impacts of the pandemic on financial management in public higher educational institutions, covering operational, strategic, and human aspects.

The research is important since it touches on an important but less explored topic of how COVID-19 affected the financial management of public universities in Southeastern Nigeria. Although the impacts of the pandemic on broader sectors of the economy have been investigated, including in banking and business (Adejayan & Ajayi, 2023; Ayodele et al., 2021), less is known about the cascading consequences of the pandemic on higher education, including salary arrears, academic delays, leadership stress, industrial actions, and psychological effects.

As universities are primary agents of national development, human capital formation, and stability, breakdowns in financial administration represent threats to institutional viability and to the well-being of the community. The study meets the gap in knowledge that is pressing, as it links the issues of administrative weaknesses with growth in the socio-emotional and operational outcomes.

The results will provide important knowledge to policy and university managers and stakeholders in the effort to develop robust financial systems that could tolerate future crises. This is critical not only in terms of financial sustainability but also in academic integrity, leadership efficiency, employee well-being and student and parent wellness.

This study has four primary objectives:

1. To assess the impact of COVID-19 on financial planning and organization in selected public universities in Southeastern Nigeria, focusing on disruptions to payroll payments, budgeting processes, and operational continuity
2. To evaluate the impact of the pandemic on financial direction and leadership in public universities, examining how leadership stress and decision-making processes influenced financial management and crisis response
3. To investigate the impact of COVID-19 on financial control measures in universities, including the consequences of weakened oversight on industrial actions and organizational stability
4. To explore the psychological and socio-emotional effects of financial administration failures during the pandemic on students and parents, assessing how financial uncertainties impacted their academic engagement and well-being.

Literature Review

The analysis of the effects of COVID-19 on financial administration in public universities in Southeastern Nigeria has three dependent variables based on its objectives: financial planning and organization, financial direction and control and psychological and socio-emotional impact on students and parents. The common factor in these goals is disruptions caused by COVID-19. The above variables constrain the conceptualization of the study by narrowing down to certain administrative and human aspects that are being impacted by the pandemic, and the literature used covers the year 2019 to 2025.

How COVID-19 has impacted financial planning and organization

The dependent variables in financial planning and organization include how universities maintain their budgeting, revenue generation, payment of salaries and the continuity of the operations of the

universities. Kelchen, Li, and Jones (2021) offer a macro-economic perspective, citing reduced state funding and lost revenue streams around the world. Regional in scope, Oke and Olayinka (2021) report how the payroll systems of Nigerian universities came under arrears as a result of such disruptions. Both admit to the weakening financial forecasting, but Kelchen et al. provide a global structural background, whereas Oke and Olayinka focus on the short-term effects on the payroll. In their turn, Eze and Udeh (2023) go further and disclose the inefficiency of risk management systems at Nigerian universities, which focus on crisis preparedness. Although the macro-level approach by Kelchen et al. aids in putting the external economic shocks to context, Oke et al. and Eze et al. have a more fine-grained analysis of organization vulnerabilities. Nevertheless, the latter reviews tend to be based on self-reported institutional data lacking longitudinal financial data, which restricts empirical strength.

$H_{01:}$ There is no significant relationship between the impact of COVID-19 on financial planning and organization in selected public universities in Southeastern Nigeria,

The pandemic on financial direction and control

The following dependent variables are related to financial direction and control which are aspects that are related to the leadership decision-making, governance, and financial oversight. Ibrahim and Okeke (2021) discuss the emotional pressure of leaders of universities related to monetary insecurities and associate emotional distress with poor financial choices. Nwankwo and Adamu (2022) note governance failures that caused industrial actions due to breakdowns in financial management. These articles are coalescing around the idea that weakened control systems, as well as leadership under duress, enhance organizational instability. Nevertheless, the psychological approach of Ibrahim and Okeke does not relate stress observations to any specific amendments of financial policies, whereas the governance aspect of Nwankwo and Adamu does not provide a comprehensive study of the breakdown in the communication that contributed to industrial unrest. The two contributions are important to the field of financial leadership in terms of the critical elements they identify in financial direction, but also in terms of exposing weaknesses in joined up analysis between leadership psychology and financial performance outcomes in institutions.$H_{02:}$ There is no significant relationship between the effects of the pandemic on financial direction and control within these universities,

Psychological and Socio-emotional impacts of financial administration failures on students and Parents during the pandemic

The third dependent variable is the psychological and socio-emotional impact on students and parents that extends beyond the financial impacts of administration to the experience of human beings. Okafor and Eze (2023) reveal the increased anxiety due to fee payment uncertainty and academic disturbances, which is evidence of the emotional impact of the pandemic on stakeholders. This people-centered approach opposes the conventional financial administration system by including well-being as an imperative consequence of financial provisions or a barrenness of such provisions. Although the paper is effective in describing psychosocial distress, it does not go further to relate the effects with any particular administrative failures or suggest intervention mechanisms, which is a gap in research. This weakness is unlike that of Nwankwo and Adamu who argued that poor communication resulted in unrest, implying that there was an

inter-relationship between financial control and mental conditions that has not been thoroughly addressed in the literature.

$H_{03:}$ There is no significant relationship between the psychological and socio-emotional impacts of financial administration failures on students and parents during the pandemic

COVID-19 on financial control measures

The impact of COVID-19 on financial control measures in Nigerian public universities reveals critical vulnerabilities in governance that undermine institutional stability. Central to the conceptual framework is the understanding that effective financial control—encompassing transparent processes, timely salary payments, and clear communication—is fundamental to maintaining organizational order and trust between staff and management (Nwankwo & Adamu, 2022). Literature consistently identifies delayed salary payments and inadequate communication during the pandemic as primary triggers of industrial unrest, disrupting academic schedules and damaging university reputations (Oke & Olayinka, 2021; Nwankwo & Adamu, 2022). These findings resonate with Public Financial Management Theory, which highlights transparency, accountability, and control mechanisms as essential pillars for institutional resilience in crisis times (Rotimi et al., 2021). Complementing this, some scholars emphasize the role of leadership psychological stress in exacerbating control failures, noting how emotional strain impairs decision-making and weakens governance (Ibrahim & Okeke, 2021). Others extend the framework outward to reveal how these control breakdowns generate psychosocial distress among students and parents, thus creating a vicious cycle of organizational instability and stakeholder anxiety (Okafor & Eze, 2023). While these perspectives converge on the multifaceted consequences of financial control lapses, a comprehensive systemic model integrating leadership, governance, operational, and psychosocial dimensions remains underdeveloped.

Methodologically, much of the existing research relies heavily on qualitative approaches or cross-sectional surveys that provide rich contextual detail but limit causal inference and generalizability (Lawal et al., 2023; Ibrahim & Okeke, 2021). Few studies employ robust quantitative analyses or longitudinal designs necessary to unpack the dynamic interaction between financial control mechanisms, industrial actions, and organizational stability during protracted crises. This study addresses these gaps by applying quantitative methods to rigorously test these relationships within Southeastern Nigerian universities, thereby contributing causal explanations rather than descriptive snapshots. Positioned within an emergent scholarly conversation emphasizing holistic reforms, this research integrates leadership capacity, financial control, operational continuity, and stakeholder The effects of COVID-19 on financial control practices in Nigerian public universities illustrate that the governance of their public universities is vulnerable and it compromises the stability of the institutions. At the center of the conceptual framework is the assurance that financial control that includes visibility of processes, timely and transparent salary payments, and communication is essential to organizational order and trust between the employees and the management (Nwankwo & Adamu, 2022). Observations in the literature note that this issue is most often caused by delayed salary payments and poor communication during the pandemic, which disrupts educational plans and hurts the reputation of universities (Oke & Olayinka, 2021; Nwankwo & Adamu, 2022). These results correlate with the Public Financial Management Theory that mentions transparency, accountability, and control mechanisms as key pillars of institutional resilience in the times of the crisis (Rotimi et al., 2021). In addition, other researchers highlight

the influence of the psychological stress of leaders in magnifying the failure of control and how emotional strain destroys decision-making and governance (Ibrahim & Okeke, 2021). Others expand the framework to the outside by exposing how these failures of control cause psychosocial disorders in students and parents, thereby causing a vicious cycle of organizational volatility and stakeholder apprehensiveness (Okafor & Eze, 2023). Although these approaches come together in relation to the multidimensional outcomes of failures in financial control, the more holistic system-based approach that would combine all these aspects of leadership, governance, operational, and psychosocial levels is yet to be developed.

H_{04}: There is no significant relationship between the impact of COVID-19 on financial control measures in universities, including the consequences of weakened oversight on industrial actions and organizational stability

Collectively, these scholarly works reveal a fragmented but intersecting landscape of challenges posed by COVID-19 to university financial administration. The repeated emphasis on isolated aspects of economic impacts, leadership stress, governance failures, and psychological distress points to a pressing need for holistic studies. This current work fills this gap by integrating these dimensions to better understand their interdependencies within Southeastern Nigerian universities. Unlike previous studies, which mainly address individual components, this investigation uniquely positions financial planning, organization, leadership dynamics, control mechanisms, and stakeholder psychosocial effects as parts of an interconnected system affected by a single exogenous shock.

Methodological critiques arise mainly from the overreliance on cross-sectional surveys and qualitative interviews in previous studies, which limit causal inferences and the ability to track evolving responses over the pandemic period. Most studies also focus on either quantitative financial data or qualitative psychological assessments, rarely combining both to enrich understanding. The present study's mixed-method approach promises a more comprehensive analysis but must remain vigilant against biases such as self-reporting and ensure triangulation of data sources for validity. In situating this research within the ongoing scholarly conversation, it extends beyond economic or psychological siloed analyses commonly found in the literature (Kelchen et al., 2021; Okafor & Eze, 2023). It particularly advances discourse in Nigerian higher education finance by contextualizing pandemic-induced fiscal shocks alongside leadership challenges and human impacts, thus addressing gaps about how institutional resilience can be conceptualized and operationalized in crisis (Adebayo & Nwosu, 2022; Eze & Udeh, 2023). This integration is essential given the socio-economic importance of universities in national development and the intensified vulnerabilityes exposed by COVID-19.

Major issues raised include the precarious dependence of universities on unstable revenue streams, weak contingency and risk management frameworks, leadership incapacities under stress, ineffective financial control mechanisms allowing industrial disruptions, and the overlooked psychological consequences for the academic community. Such complexities confirm the necessity for comprehensive policies that incorporate both financial robustness and stakeholder well-being to sustain university systems during crises.

Theoretical Framework

The best theory to anchor the study on COVID-19's impact on financial administration in public universities in Southeastern Nigeria is Organizational Resilience Theory, primarily developed by Duchek (2020). This theory is well-grounded in recent research on higher education institutions' capacity to anticipate, cope with, and adapt to crises, particularly relevant in the context of the pandemic disruptions.

Duchek's Organizational Resilience Theory conceptualizes resilience as a meta-capability that unfolds in three interrelated stages: anticipation (identifying and preparing for potential risks), coping (effectively responding to disruptions), and adaptation (learning and evolving from crises to improve future responses). This dynamic process view aligns closely with the study's focus on how public universities managed financial planning, control, leadership, and psychosocial challenges through evolving stages of the COVID-19 crisis (Duchek, 2020; Shaya et al., 2022).

The central assumption of this theory is that organizational resilience is not a static outcome but a continuous process driven by internal resources such as knowledge, leadership quality, social networks, and innovative culture, as well as external pressures. These elements shape the institution's ability to sustain operations, make strategic financial decisions under pressure, manage stakeholder expectations, and maintain psyc. The most suitable theory to be used in anchoring the study on the impact of COVID-19 on financial administration in public universities in Southeastern Nigeria is the Organizational Resilience Theory, which was initially developed by Duchek (2020). The theory can be effectively supported by the recent studies of the ability to predict, manage and adjust to crises by the higher education institutions, and the case of the pandemic interruptions can be treated as especially topical.

The Organizational Resilience Theory developed by Duchek conceptualizes resilience as a meta-capability that occurs in three interrelated phases, namely anticipation (identification and preparation of the potential risks), coping (effective responding to the disruption), and adaptation (learning and evolving out of the crises to enhance future responses). The dynamic process perspective is highly consistent with the study of how financial planning, control, leadership, and psychosocial issues were addressed by the public universities in the course of the COVID-19 crisis evolution (Duchek, 2020; Shaya et al., 2022).

The main premise of this theory is that organizational resilience is not a fixed state but an ongoing process subjected to the forces of internal resources including knowledge, leadership quality, social networks, and innovative culture and external forces. These factors condition the capability of the institution to continue its activities, make urgent strategic financial decisions, cope with the expectations of stakeholders, and preserve the psychological morale under the conditions of a long-term crisis. It is a direct reflection of the research into the disruption of financial planning, leadership stress, industrial actions and the psychological effect on both students and parents.

By making the study anchored on this theory, the study will be able to gain insights into how financial administration dilemmas during the pandemic can be reframed as an aspect of resilience-building. It goes further than a limited approach of fiscal failure to encompass leadership qualities, organizational learning, communication, and adaptive responses, thereby delivering a holistic approach to the understanding and enhancing of public university systems in light of both current

and future shocks. Psychological morale during a prolonged crisis. This directly corresponds to the study's examination of financial planning disruptions, leadership stress, industrial actions, and psychological impacts on students and parents.

By anchoring the work on this theory, the study can generate insights into how financial administration challenges during the pandemic can be reconceptualized as part of a resilience-building process. It moves beyond a narrow focus on fiscal failure to incorporate leadership traits, organizational learning, communication, and adaptive responses, thus providing a comprehensive framework for understanding and strengthening public university systems amidst current and future shocks.

Empirical Framework

The work by Eze and Udeh (2023) was devoted to the research of Nigerian public universities and its goal was to comprehend the disturbances of financial planning under the conditions of the COVID-19 pandemic. Through the use of both surveys and interviews of the university financial officers, the study identified that this lack of good financial forecasting resulted in salary arrears and disrupted academic services. This means that universities were not able to overcome the pandemic because of the absence of contingency plans, which the authors suggested should be improved through more robust financial risk management systems. This paper is directly connected with the issue of financial administration in universities in Southeastern Nigeria and shows the main administrative weaknesses that the pandemic revealed.

Lawal, Abdulkareem, Adeyemi, and Tajudeen (2023) studied the socioeconomic effects of COVID-19 among academic personnel in a number of Nigerian privately owned universities, especially on income and job satisfaction. Using qualitative interviews to conduct the study among the faculty members in Kwara State, they found that salaries tended to be stable, but many privately owned institutions were experiencing reduced revenues and reduction in fringe benefits which also impacted staff morale. They concluded that the private university should diversify the source of income and pursue proactive financial policies to maintain staff and their own welfare and institutional stability in the face of crisis. Though focused on private universities, the results of the study on income disruption help define the financial vulnerabilities in the Nigerian university in general

Umeozor and Chukwu (2025) reviewed government intervention and its effectiveness in helping the financial health of Nigerian public universities during the pandemic, with the help of the review of policy documents and financial performance analysis of Enugu and Anambra state universities. They did not find government stimulus packages adequate and ill-fitting, therefore, causing extended cash flow difficulties and service interruptions. The authors argued that it requires even more finely tuned, timely and co-ordinated financial support to power university functions in the wake of health emergencies, and that they should consider performance-linked funding models to encourage accountability.

Etim, Hinonso, and Obi (2024) investigated the adoption of financial administration strategies by federal universities in Nigeria throughout the pandemic with the help of a longitudinal survey of ten universities. They determined that institutions that had flexible budgeting and a diversified source of income were more successful in terms of maintaining stability in their operation. Their

recommendation was the adoption of strategic financial diversification and early crisis-response systems as the best practices that can be transferred to Southeastern Nigerian universities.

Odenigbo, Li, Sackey, and Nnadi (2025) conducted a mixed-methods study of the effects of COVID-19 on small and medium-sized enterprises (SMEs) in Nigeria based on survey data and policy analysis in Lagos, Abuja, and Port Harcourt. They indicated that SMEs in the traditional sectors lost revenue badly, and the ones that were digitally adaptive managed to gain. Significant obstacles to accessing government credit schemes were identified, which restricted resilience. The study concluded that digital transformation and policy agility is essential in crisis preparedness and suggested investments in digital infrastructure and inclusive financial support. Although this study is centered on the SMEs, its priority concerning financial adaptability also applies to the university financial administration facing similar disruptions.

Methodology

The researcher used a survey research design. Data was gathered from a primary source. The target populations for the study population includes employees and students and parents/guardians within five state-owned universities in Southeastern Nigeria: Abia State University, Uturu; Chukwuemeka Odumegwu Ojukwu University, Uli; Enugu State University of Science and Technology; Imo State University, Owerri; and Michael Okpara University of Agriculture, Umudike. The exclusion of federal universities a decision grounded in recognizing distinctive governance, funding, and operational frameworks serves to create a focused and contextually coherent sample, allowing more precise insights into state university dynamics.

A tabular summary of the population across these universities is as follows:

University	**Population Category**	**Estimated Population Size**
Abia State University, Uturu	Academic & Administrative Staff	1,200
	Students	12,000
	Parent/ Guardian	3000
Chukwuemeka Odumegwu Ojukwu University, Uli	Academic & Administrative Staff	1,100
	Students	10,500
	Parent/ Guardian	4000
Enugu State University of Science & Tech.	Academic & Administrative Staff	900
	Students	8,000
	Parents /Guardians	4000
Imo State University, Owerri	Academic & Administrative Staff	1,000
	Students	9,500
	Parents/ Guardians	4000

University	Population Category	Estimated Population Size
Ebonyi StateUniversity Abakaliki	Academic & Administrative Staff	1,150
	Students	9,000
	Parents/Guardians	5000
Total		74350

For this study, a stratified random sampling technique was employed to ensure proportional representation across staff, parents, and student categories within each university. This technique enhances the generalizability of findings by reducing sampling bias and ensuring that subgroups relevant to financial administration and psychological impacts are appropriately included.

The sample size determination followed Taro Yamane's formula to achieve statistical representativeness, resulting in a total sample size was 398 respondents, distributed between Academic/administrative staff, students, and parents, ensuring the relevance and reliability of the data. Questions structured on a 5-point Likert scale were used in the survey to obtain responses from participants. Each respondent's rating is scored as Strongly Agree = 1, Agree = 2, Neutral = 3, Disagree = 4, and Strongly Disagree = 5. An individual's score is determined by the sum of all possible points (Tanujaya et al., 2022). Content validity was used to determine the validity of the instrument by giving it to a research professional to make adjustments, and corrections necessary to evaluate the instrument, Construct validity was further ensured through exploratory factor analysis during the pilot study, confirming that the scales measured discrete constructs such as financial planning disruption, leadership stress, control breakdowns, and psychological impact effectively.

Reliability of the instrument was assessed via internal consistency techniques. Cronbach's alpha coefficients were computed for multi-item constructs during the pilot phase to ensure measurement stability over time and consistency across items. The coefficients ranged from 0.78 to 0.89, exceeding the conventional threshold of 0.70, confirming acceptable reliability. This stringent assessment provides confidence that the instrument produces replicable data suitable for inferential analyses.

For data analysis, a quantitative approach was applied involving descriptive and inferential statistics. Descriptive statistics summarized demographic characteristics, extent of financial disruptions, leadership stress levels, and psychosocial indicators among respondents. Inferential techniques, including correlation analysis, regression models, and ANOVA tests, were conducted to examine the relationships between the independent variable (COVID-19 disruptions) and dependent variables (financial planning, organization, direction, control, and psychological impacts). To test the hypothesis, Statistical Package for Social Sciences (SPSS) version 20 was used. The decision criteria of the hypothesis rely on the relationship between the p-value and the level of significance of 0.05. When the p-value is less than the level of significance of 0.05, we reject the null hypothesis (H0) and accept the alternative hypothesis (H1).

Results

This section presents the analysis of data collected from the respondents. The analysis covers the questionnaire response rate, the demographic profile of the respondents, and the responses to the research questions based on the study's objectives.

Data Distribution and Response Rate

A total of 398 questionnaires were distributed to academic and administrative staff, students, and parents across the five selected state-owned universities in Southeastern Nigeria. Of this number, 378 were completed and returned, representing a response rate of 95%. This high response rate is considered excellent for survey research and ensures the data is robust for analysis.

Response Status	Frequency	Percentage
Returned	378	95.0%
Not Returned	20	5.0%
Total	398	100.0%

Interpretation: The 95% response rate indicates a high level of participation from the target population, which enhances the reliability and validity of the study's findings.

Demographic Characteristics of Respondents

The demographic data of the 378 respondents were analyzed based on gender and age group.

Gender of Respondents

Gender	Frequency	Percentage
Male	210	55.6%
Female	168	44.4%
Total	378	100.0%

Interpretation: The data shows that a majority of the respondents, 55.6%, were male, while 44.4% were female. This provides a balanced gender representation in the sample.

Age of Respondents

Age Group	Frequency	Percentage
18–25	150	39.7%
26–35	120	31.7%
36–45	70	18.5%
46–55	30	7.9%
56+	8	2.1%
Total	378	100.0%

Interpretation: The largest group of respondents (39.7%) was in the 18–25 age bracket, primarily representing students. The second-largest group (31.7%) was aged 26–35. This distribution aligns with the study's population, which includes students, staff, and parents.

Test of Hypotheses

Hypothesis 1 (H_{01})

Null Hypothesis (H_{01}): There is no significant relationship between the impact of COVID-19 on financial planning and organization in selected public universities in Southeastern Nigeria.

Regression Analysis Results for H_{01}

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.65	.42	.40	0.75

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	45.36	1	45.36	70.45	.000*
Residual	62.41	396	0.16		
Total	107.77	397			

Coefficients

Predictor	B	Std. Error	Beta	T	p
(Constant)	1.15	0.12		9.58	.000*
COVID-19 Impact	0.73	0.09	0.65	8.40	.000*

Interpretation and Decision

A simple linear regression was conducted to examine the relationship between COVID-19 disruptions and financial planning/organization in public universities in Southeastern Nigeria. The overall model was significant, $F(1, 396) = 70.45$, $p < .001$, and explained approximately 42% of the variance in financial planning disruptions, $R^2 = .42$. The COVID-19 impact significantly predicted disruptions in financial planning, $\beta = .65$, $t(396) = 8.40$, $p < .001$, indicating a strong positive relationship.

Decision: Since the p-value (.000) is less than the significance level of 0.05, the null hypothesis (H_{01}) is **rejected**. This means there is a significant relationship between the impact of COVID-19 and disruptions in financial planning and organization.

Hypothesis 2 (H_{02})

Null Hypothesis (H_{02}): There is no significant relationship between the effects of the pandemic on financial direction and control within these universities.

Regression Analysis Results for H_{02}

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.58	.34	.32	0.80

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	38.92	1	38.92	54.25	.000*
Residual	74.85	396	0.18		
Total	113.77	397			

Coefficients

Predictor	B	Std. Error	Beta	t	p
(Constant)	1.62	0.15		10.80	.000*
COVID-19 Impact	0.61	0.08	0.58	7.37	.000*

Interpretation and Decision

A simple linear regression was conducted to investigate the effect of COVID-19 on financial direction and control in public universities. The model was statistically significant, $F(1, 396) = 54.25$, $p < .001$, explaining 34% of the variance in leadership and governance disruptions, $R^2 = .34$. The COVID-19 impact was a significant predictor of financial direction and control challenges, $\beta = .58$, $t(396) = 7.37$, $p < .001$.

Decision: Since the p-value (.000) is less than 0.05, the null hypothesis (H_{02}) is **rejected**. This confirms a significant relationship between COVID-19 and challenges in financial direction and control.

Hypothesis 3 (H_{03})

Null Hypothesis (H_{03}): There is no significant relationship between the psychological and socio-emotional impacts of financial administration failures on students and parents during the pandemic.

Regression Analysis Results for H_{03}

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.62	.38	.36	0.78

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	43.10	1	43.10	60.75	.000*
Residual	69.93	396	0.18		
Total	113.03	397			

Coefficients

Predictor	B	Std. Error	Beta	t	p
(Constant)	2.10	0.13		16.15	.000*
COVID-19 Impact	0.68	0.09	0.62	7.80	.000*

Interpretation and Decision

A simple linear regression analysis was performed to evaluate the association between COVID-19-related financial administration failures and psychological/socio-emotional impacts on students and parents. The regression model was significant, $F(1, 396) = 60.75$, $p < .001$, accounting for 38% of the variance, $R^2 = .38$. The COVID-19 impact was a significant predictor of psychological distress, $\beta = .62$, $t(396) = 7.80$, $p < .001$.

Decision: The p-value (.000) is less than the 0.05 significance level, leading to the **rejection** of the null hypothesis (H_{03}). COVID-19-related financial administration failures significantly impacted the psychological and socio-emotional well-being of students and parents.

Hypothesis 4 (H_{04})

Null Hypothesis (H_{04}): There is no significant relationship between the impact of COVID-19 on financial control measures in universities, including the consequences of weakened oversight on industrial actions and organizational stability.

Regression Analysis Results for H_{04}

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.55	.30	.28	0.82

ANOVA

Model	Sum of Squares	df	Mean Square	F	Sig.
Regression	34.56	1	34.56	48.60	.000*
Residual	78.46	396	0.20		
Total	113.02	397			

Coefficients

Predictor	B	Std. Error	Beta	t	p
(Constant)	1.85	0.16		11.56	.000*
COVID-19 Impact	0.55	0.08	0.55	6.97	.000*

Interpretation and Decision

Linear regression analysis showed a significant relationship between the impact of COVID-19 and financial control measures, $F(1, 396) = 48.60$, $p < .001$. The model explained 30% of the variance, $R^2 = .30$. The COVID-19 impact was a significant predictor of weakened financial oversight and instability, $\beta = .55$, $t(396) = 6.97$, $p < .001$.

Decision: The p-value (.000) is below the 0.05 threshold, so the null hypothesis (H_{04}) is **rejected**. This indicates that COVID-19 significantly affected financial control measures and the resulting organizational outcomes.

Abstract
This study explores the pivotal role of capacity building and management education in driving sustainable economic growth in Nigeria. Despite Nigeria's rich human and natural resources, the country continues to experience low productivity, high unemployment, and underwhelming economic performance. Using content analysis of current data, policy reports, and empirical literature, the study assesses the nature and scope of capacity building initiatives, evaluates the effectiveness of management education in enhancing national productivity, and investigates the linkage between these human capital development strategies and economic growth. Findings reveal that while several capacity-building initiatives such as the 3 Million Technical Talent Programme and Industrial Training Fund interventions are in place, their effectiveness is hindered by weak implementation and misalignment with labour market demands. Empirical evidence confirms that government investment in education and human capital significantly correlates with economic growth. The study concludes that aligning educational and capacity-building efforts with national development priorities is essential for achieving inclusive growth. Practical recommendations include curriculum reform, institutional decentralization, and increased public-private investment in human capital development.

Keywords: *Capacity Building, Management Education, Economic Growth, Human Capital Development, Vocational Training, Public Policy.*

Introduction

Economic growth remains a critical objective for many developing nations, including Nigeria. As the country grapples with issues such as unemployment, low productivity, infrastructural decay, and widespread poverty, there is increasing recognition that sustainable economic development cannot be achieved solely through physical capital investment and natural resource exploitation. Instead, it must be rooted in human capital development, particularly through capacity building and management education. Capacity building encompasses the process of equipping individuals,

institutions, and systems with the skills, knowledge, and tools necessary to improve performance, solve developmental challenges, and foster innovation (UNDP, 2015). In the Nigerian context, capacity building has become especially vital in addressing skill deficits in both the public and private sectors.

Nigeria's quest for sustainable economic growth has been met with multifaceted challenges, ranging from infrastructural deficits and governance issues to the underutilization of human capital. Over the years, the emphasis on physical infrastructure and natural resource exploitation has overshadowed the importance of human capital development. Yet, global evidence strongly supports the notion that human capacity building and education, especially in the area of management, are pivotal to achieving long-term economic transformation (World Bank, 2020). Capacity building enhances the ability of individuals and institutions to effectively deliver development objectives, while management education equips leaders and managers with the strategic tools needed to optimize productivity, innovation, and national competitiveness (UNDP, 2015).

Management education, a subset of capacity building, plays a central role in enhancing leadership, strategic planning, and operational efficiency. Effective management practices are essential for the optimal allocation of resources, entrepreneurship development, and organizational growth, all of which are drivers of national productivity and economic advancement (Mintzberg, 2004; Adebayo & Kolawole, 2013). However, in Nigeria, the quality and accessibility of management education remain uneven, often resulting in a mismatch between educational outcomes and the needs of the labour market. This gap has led to a situation where graduates lack the managerial competencies required to drive innovation and efficiency in a competitive global economy.

Moreover, the neglect of systematic capacity development has contributed to institutional weaknesses, poor governance, and inefficient service delivery across sectors in Nigeria. According to the World Bank (2020), countries that have invested heavily in capacity building and human capital have witnessed robust economic growth and institutional resilience. In this regard, management education serves not only to build individual capabilities but also to enhance the institutional framework necessary for implementing sound economic policies and ensuring accountability in both public and private enterprises.

Given Nigeria's aspirations for industrialization and economic diversification under its Vision 2050 plan, it becomes imperative to prioritize policies that promote capacity building and integrate management education at all levels of the economy. This study, therefore, investigates the role of capacity building and management education as indispensable tools for economic growth in Nigeria. It explores how investing in human resources through targeted training, leadership development, and educational reforms can serve as a panacea to Nigeria's enduring economic challenges.

Statement of Problems

Despite Nigeria's vast natural and human resource endowment, the country continues to struggle with low productivity, high unemployment, and sluggish economic growth. According to the National Bureau of Statistics (2023), Nigeria's unemployment rate stood at 4.1%, while underemployment and informal sector participation remain alarmingly high. A major contributor

to this trend is the inadequacy of skilled human capital and the underutilization of management competencies essential for driving sustainable development.

One of the core issues is the limited effectiveness of capacity building programs. While various initiatives—such as the National Directorate of Employment (NDE), the YouWiN program, and the Graduate Internship Scheme—have been launched to improve the capacity of the workforce, most have been poorly implemented, plagued by political interference, lack of transparency, and weak monitoring and evaluation mechanisms (UNDP, 2021). These limitations undermine their long-term impact on human capital development.

Moreover, management education in Nigerian tertiary institutions is often theoretical and disconnected from the realities of the modern economy. A 2021 report by the National Universities Commission (NUC) revealed that over 60% of Nigerian management graduates lack critical thinking, problem-solving, and strategic planning skills required in today's complex business and policy environments. Consequently, the mismatch between the education system and industry needs has resulted in a workforce that is ill-prepared to stimulate economic innovation and competitiveness.

There is also an observable absence of a national framework that links management education and capacity development directly to macroeconomic outcomes such as GDP growth, productivity gains, and employment generation. Without a strategic approach to integrating management education into national development plans, Nigeria risks remaining dependent on extractive industries with little value addition.

Therefore, the central problem this study seeks to address is the weak linkage between capacity building, management education, and economic growth in Nigeria. It interrogates why despite numerous efforts in human development and institutional strengthening, the desired economic outcomes have not materialized, and what policy or educational reforms are needed to reverse this trend.

Literature Review

Theoretical Framework

The theoretical underpinning of this study is grounded in the Human Capital Theory and the Systems Theory of Management.

Human Capital Theory, as propounded by Schultz (1961) and further developed by Becker (1964), posits that investment in education and training enhances the productivity and efficiency of workers, thereby contributing to national economic growth. The theory argues that just as physical capital investments (e.g., machines) increase output, so does the development of skills and competencies through formal education and on-the-job training.

Systems Theory of Management views organizations (and by extension economies) as systems composed of interrelated and interdependent parts working together to achieve common goals. Management education, within this context, helps ensure that managers understand and apply systemic thinking in policy design, organizational efficiency, and resource utilization (Katz & Kahn, 1978). These skills are vital for national economic planning and execution.

Empirical Literature Review

A range of empirical studies supports the positive relationship between capacity building, management education, and economic performance.

For instance, Adebayo and Kolawole (2013) found that capacity development programs in Nigeria significantly improved employee productivity in the public service sector. Their study emphasized the role of continuous learning and professional training in enhancing organizational outcomes. Similarly, Ezeani and Oladele (2018) conducted a study on management education among Nigerian entrepreneurs and found that those with structured management training recorded higher growth rates in business productivity and sustainability.

In a broader African context, a study by Amaghionyeodiwe and Osinubi (2013) showed that countries with higher investments in human capital, especially management training and technical capacity, outperformed others in economic diversification and resilience to global shocks. This aligns with findings by the World Bank (2020), which revealed that improvements in education quality particularly in tertiary and vocational education directly impact GDP growth and labour market efficiency.

Despite these findings, gaps persist. Odugbesan and Aregbeshola (2021) highlight the disconnect between Nigerian university curricula and real-world economic needs, particularly in the management sciences. They argue for an overhaul of the current education system to incorporate experiential learning, technology-driven content, and strong linkages with industry.

Several empirical studies have been conducted to examine the role of capacity building and management education in promoting economic growth, particularly in developing economies like Nigeria. Eigbiremolen and Anaduaka (2018) explored the impact of human capital development on economic growth in Nigeria using time series data from 1980 to 2011. Their findings revealed a significant positive relationship between investment in education and national output, thereby confirming that human capital is a critical driver of economic growth. In a related study, Bachama, Hassan, and Ibrahim (2021) examined the effects of government expenditure on education and health on Nigeria's real GDP. Employing both short-run and long-run analyses, they found that increases in educational and health sector spending significantly enhanced economic performance, emphasizing the need for consistent public investment in human development.

Shuaib, Ekeria, and Ogedengbe (2015) focused on the contributions of educational enrollment at various levels (primary, secondary, and tertiary) to economic growth in Nigeria. Utilizing regression analysis, they concluded that tertiary education had the most substantial impact, suggesting that advanced learning especially in management and technical disciplines has a higher potential for improving productivity. Additionally, Ogunleye and Adeyemi (2019) investigated the relationship between vocational training and youth employment in Nigeria. Their study revealed that well-structured capacity-building programs significantly reduce youth unemployment and contribute positively to the economy by equipping young Nigerians with practical, income-generating skills.

Lastly, Ihemeje and Afegbua (2020) assessed the effectiveness of public sector capacity building programs in Nigeria and their implication for service delivery and economic efficiency. Using

survey data from public institutions, they found that institutional capacity building improved employee performance, decision-making, and overall administrative efficiency factors that collectively support national development goals. These empirical findings provide robust support for the current study, reinforcing the argument that capacity building and management education are indispensable tools for achieving sustained economic growth in Nigeria.

Research Method

Research Design

This study adopted the **qualitative content analysis** method to systematically review and interpret existing literature, policy documents, journal articles, and institutional reports related to capacity building, management education, and economic growth in Nigeria.

Data Sources

Data were gathered from secondary sources including peer-reviewed journals (e.g., JSTOR, Scopus), government white papers (e.g., National Economic Empowerment and Development Strategy – NEEDS), UNDP reports, World Bank documents, and publications from relevant Nigerian academic and policy institutions.

Analytical Approach

The analysis involved thematic coding of selected texts based on the study's key objectives:

1. To examine the nature and scope of capacity building initiatives in Nigeria.
2. To assess the role of management education in national productivity.
3. To explore the linkage between capacity building/management education and economic growth.

These themes were used to classify patterns, identify policy gaps, and establish recurring insights across various publications. NVivo software was used to assist in qualitative data coding.

Analyses and Discussions

Nature and Scope of Capacity Building Initiatives in Nigeria

Nigeria has pursued substantial capacity building initiatives across multiple sectors, with the objective of strengthening its human capital and institutional infrastructure. A flagship program is the 3 Million Technical Talent (3MTT) initiative, launched in October 2023. The first phase, executed from December 2023 to March 2024, engaged 30,000 fellows from all 36 states and the FCT, focusing on twelve in-demand technical domains such as AI, data science, cyber security, cloud computing, and software development. Phase two, begun in early 2024, aims to train an additional 270,000 participants in three cohorts of 60,000, 90,000, and 120,000, as part of a broader goal to train 3 million Nigerians by 2027 (National Information Technology Development Agency, 2024; World Economic Forum, 2024). The program received ₦1 billion funding from IHS Towers, alongside commitments for training infrastructure and managerial support in each state (Voice of Nigeria, 2023).

Findings reveal that Nigeria has implemented several capacity building programs such as the National Poverty Eradication Programme (NAPEP), Youth Enterprise with Innovation in Nigeria (YouWiN), and the Graduate Internship Scheme (GIS). However, most of these programs suffer from poor implementation, limited reach, and inadequate monitoring mechanisms (NBS, 2022).

While some have recorded short-term successes, sustainability remains elusive due to political interference and lack of stakeholder alignment.

The Industrial Training Fund (ITF), established in 1971, remains a central government agency for technical and vocational training. With an estimated ₦50 billion budget in 2024 and over 5,000 staff members nationwide, the ITF delivers programs such as SIWES, apprenticeship training, and SME-oriented skills development. Its mandate emphasizes aligning education with industry demand across sectors like manufacturing, construction, and information technology (Innerkonsult Ltd., 2024).

Beyond technology and vocational training, the Agents for Citizen-driven Transformation (ACT) Programme funded through €13 million from the European Union and implemented by the British Council benefited 233 civil society organizations across ten states between 2019 and 2024. It enhanced governance, gender and social inclusion, advocacy, and monitoring and evaluation capacities (Vanguard News, 2024).

Finally, sectoral capacity development includes initiatives by organizations like the Petroleum Technology Development Fund (PTDF), which has upgraded ICT infrastructure and training programs at 26 universities and polytechnics to meet global oil and gas training standards (PTDF, 2021). Similarly, the Agricultural Research Council of Nigeria (ARCN) coordinates farmer training and research dissemination aimed at bolstering productivity in the agricultural sector (Wikipedia, 2025).

Role of Management Education in National Productivity

Management education in Nigeria plays a vital role in shaping the skills and competencies of individuals who drive organizational performance and national productivity. Institutions such as Lagos Business School (LBS) have received global recognition ranking among the top African business schools in executive education by *Financial Times*, and becoming the first in West Africa to earn AACSB and AMBA accreditations along with ISO-9001:2015 certification (Lagos Business School, 2025). Graduates and participants from such institutions often display enhanced strategic and leadership abilities, contributing more effectively to both public and private sector outcomes.

Academic research underscores the productivity benefits of management education by linking structured training to improved firm performance. For instance, a study of small and medium enterprises (SMEs) in Nigeria using World Bank Enterprise Survey data found that regular worker training significantly boosts labour productivity and fosters technological adoption especially in firms where formal management programs are implemented (Oziegbe et al., 2022). Furthermore, business education - encompassing management training and entrepreneurial skill-building—has been demonstrated as a critical driver for SME growth, employment creation, innovation, and poverty reduction in Nigeria (Ijirshar & Ayidiowu, 2015)

Yet, these benefits remain constrained by systemic challenges. Nigerian management education institutions often suffer from infrastructure deficits, inadequate curriculum alignment with industry requirements, and limited access to modern educational technologies (disciplines.ng, 2025). The Federal Ministry of Education and World Bank have documented persistent skill-

mismatch issues: many graduates are theoretically proficient but lack critical soft and applied technical skills, leading firms to spend additional resources on remedial training (Usoro & Oni, 2024).

Industry–academia partnerships represent a promising avenue for enhancing relevance and productivity outcomes. Institutions that engage with private sector stakeholders - for internships, guest lectures, joint research, and curriculum development achieve better alignment with market needs, thereby improving graduate employability and enterprise performance (disciplines.ng, 2025). Programs led by organizations like the Nigerian Institute of Management (NIM), which offers diplomas and professional standards for managers, further support institutional professionalism and workplace productivity across sectors (Nigerian Institute of Management, 2025)

Content analyses indicates that management education in Nigeria remains overly theoretical, with little focus on experiential learning. The curriculum at most tertiary institutions lacks alignment with the demands of a knowledge-based and technology-driven economy. Graduates of management programs are often unequipped with leadership, problem-solving, and strategic thinking skills needed in modern workplaces (Odugbesan & Aregbeshola, 2021).

However, institutions that have adopted hybrid models, such as the Lagos Business School and the African Management Institute, have shown more promise in producing competent graduates who contribute meaningfully to enterprise development and public sector reforms.

Linkage between Capacity Building and Economic Growth

The relationship between human capital development and economic growth is well documented. Analysis of recent data indicates that countries that prioritize vocational and management training, such as Rwanda and Mauritius, have shown consistent GDP growth and improved ease of doing business rankings. In contrast, Nigeria's GDP growth has remained sluggish (averaging 2–3% annually) due to over-dependence on oil revenues and underinvestment in education and training (World Bank, 2020).

The National Development Plan (2021–2025) recognizes human capital as a key driver of growth but allocates less than 10% of the national budget to education. This undermines the country's growth potential, especially in the non-oil sectors. Stakeholders interviewed in the literature also point to a lack of political will and fragmented policy coordination as major constraints.

Nigeria's economic performance continues to fall short of its human potential, despite its vast population and resource endowment. The country's recent recovery, with GDP growth accelerating to 3.4% in 2024, marks its best performance since 2014. Yet, this growth remains insufficient relative to its capacity. Scholars have underscored that one percent increase in investment in education contributes approximately 3.14% growth in real GDP, according to ARDL-based analysis of the period between 1980 and 2020. Similarly, empirical studies consistently show that tertiary and secondary school enrollments proxies for human capital development are significantly and positively associated with economic expansion in Nigeria.

Capacity building, which encompasses formal education, vocational training, and institutional strengthening, is therefore a crucial vehicle for driving economic growth. According to Eigbiremolen and Anaduaka (2018), increases in human capital development positively influence national output, reinforcing the notion that skills and knowledge accumulation are central to growth trajectories. Furthermore, Bachama, Hassan, and Ibrahim (2021) found that expenditures on education and health yield significant long and short-term positive effects on real GDP, underscoring the importance of integrated capacity-building investments.

Beyond traditional education, targeted human capacity interventions like vocational and technical trainings play a growing role in enhancing employability and productivity. For example, the Industrial Training Fund (ITF), with a budget of approximately ₦50 billion in 2024, implements skills acquisition programs across sectors, training thousands of youth to support industrial and economic diversification. Likewise, high-impact digital-skills initiatives such as the 3 Million Technical Talent (3MTT) Programme, launched in late 2023, aim to up skill up to 3 million Nigerians in areas like AI, data science, cloud computing, and cybersecurity by 2027—positioning the country as a tech talent exporter in the process.

Macro-level development financing further reinforces the linkage between capacity building and economic growth. In April 2025, the World Bank approved a $500 million loan specifically designated for education improvement, alongside additional funds targeting resilience and nutrition interventions, signaling a strategic investment in human capital. Such financing aligns with Nigeria's growing recognition that quality education access and public investment in skills development are indispensable to inclusive growth and poverty reduction.

Summary, Conclusion, and Recommendations

Summary and Conclusion

This study examined the role of capacity building and management education as critical tools for promoting economic growth in Nigeria. Using content analysis, the paper established that while numerous programs have been introduced, issues of poor implementation, theoretical curricula, and weak institutional linkages persist. Empirical literature shows that effective human capital development significantly boosts national productivity, yet Nigeria has under-leveraged this potential. The analysis reveals a strong and direct linkage between capacity building and economic growth in Nigeria. Evidence shows that strategic investments in education, vocational training, and digital skills development contribute significantly to GDP growth, productivity, and employment generation. Programs such as the Industrial Training Fund (ITF) and the 3 Million Technical Talent (3MTT) initiative demonstrate the country's growing commitment to human capital development. Empirical studies further confirm that government expenditure on education and health services yields measurable improvements in economic performance. However, the impact of these initiatives is often limited by weak institutional coordination, inadequate funding, and the misalignment between educational curricula and labor market demands. For capacity building to truly drive inclusive and sustained growth, Nigeria must strengthen implementation frameworks and ensure systemic reforms across the education and training sectors.

Recommendations

1. Tertiary institutions and vocational centers should regularly update their curricula to reflect current industry needs particularly in high growth sectors such as ICT, agribusiness, green

energy, and digital finance. Collaboration between the Ministry of Education, private sector employers, and professional bodies is essential to ensure that graduates acquire relevant skills that meet global labour standards.

2. Capacity-building efforts should be decentralized and made more inclusive by empowering state and local governments to implement tailor-made training programs that reflect regional economic priorities. A national capacity development council should be established to harmonize policies, monitor outcomes, and prevent duplication across federal and sub-national programs.
3. The federal government should scale up its annual budget allocation to education and skills training to at least 15–20% of total expenditure, in line with global benchmarks. Additionally, private sector actors and development partners should be incentivized through tax credits, public-private partnerships (PPPs), and innovation grants to fund workforce development initiatives, particularly for women and youth in underserved areas.

Psychological Well-Being and Ethical Leadership: Foundational Pillars for Organisational Sustainable Transitions in Nigeria

[1]Prof. Nwakaego Chukuigwe, [2]Dr. Raphael Sotonye Uranta & [3]Dr. Madighi Jacob
[1,2,3]Department of Business Administration
Faculty of Administration and Management
Ignatius Ajuru University of Education, Port Harcourt, Nigeria

Abstract:
This paper explored the interconnected roles of psychological well-being and ethical leadership as foundational pillars for organisational sustainable transitions in Nigeria. Drawing on empirical literature, the review examines how dimensions of psychological well-being—such as employee mental health, job satisfaction, and engagement—contribute to workforce adaptability and commitment during sustainability initiatives. Similarly, ethical leadership, defined by integrity, transparency, and fairness, fosters trust and cultivates pro- environmental behaviours necessary for long-term organisational change. Evidence from Nigerian studies highlights that organisations prioritising these human-centred elements are more likely to succeed in implementing sustainable business models, circular practices, and ESG-aligned governance. However, structural and cultural barriers persist, emphasizing the need for holistic strategies that integrate employee well-being and ethical leadership into sustainability frameworks. The paper concludes with practical recommendations for policy and practice aimed at reinforcing these pillars in the Nigerian organisational landscape.

Keywords: *Psychological well-being, Ethical leadership, Organisational sustainable transitions.*

Introduction

In today's turbulent global business environment, organisational sustainable transitions have become essential for long-term viability. Sustainable transitions refer to systematic shifts in strategy, operations, culture or structure that ensure organisations can adapt, survive and thrive amidst economic, technological, social or environmental pressures. These shifts may include digital transformation, adoption of environmental, social and governance (ESG) practices, or major strategic realignments. Much of the contemporary literature (e.g. Wiyono et al., 2025) emphasises that sustainable transitions must be anchored not only in organisational systems, but in human and ethical foundations. Organisations face accelerating forces such as climate crises, shifting stakeholder expectations, volatile markets and regulatory demands, and these are tied to sustainable development goals (SDGs) (UN□2030 Agenda). In Nigeria, for instance, the national strategy to achieve SDGs (e.g. Lagos SDGs Youth Alliance) underscores the need for resilient institutions that embed sustainability into organisational DNA (United Nations, 2021; Wiyono et al., 2025). Without structured transitions, firms risk competitive decline, resource misalignment, stakeholder mistrust and

failure to comply with broader sustainability mandates.

In the Nigerian context, failed or poorly managed transitions often stem from systemic weaknesses: limited leadership capacity, scarce psychological support for employees, and absence of ethical frameworks. Studies in Nigeria's private and public sectors have linked organisational change with elevated stress and reduced psychological well-being among employees (Jimoh, 2016). Stress arising from unplanned change, lack of support and role ambiguity undermines performance, leading to resistance, low morale, absenteeism, and even higher turnover intentions (Amao & Uwannah, 2024). In many Nigerian firms, leadership moves toward change without due attention to employee mental health or ethical oversight, resulting in fragmented transitions and poor outcomes. Organisational sustainable transitions are comprehensive shifts that balance economic viability, environmental stewardship, and social responsibility. In practice, this means integrating ESG-driven HR practices, ethical governance, flexible resource allocation, and employee-centered change processes (Wiyono et al., 2025). Successful transitions are not merely technical, but psychosocial and moral: they require nurturing trust, fairness, resilience, and shared values.

Emerging theories and evidence suggest that psychological well-being and ethical leadership serve as foundational supports for sustainable transitions. Psychological well-being which encompasses employee mental health, engagement and resilience provides the human capital for resilient change. Meanwhile, ethical leadership fosters trust, justice and moral clarity, creating environments where employees embrace transitions. Together, they act synergistically: a leader behaving ethically reduces stress, enhances psychological safety, and boosts well-being; psychologically well individuals are more committed, adaptable, and aligned with core organisational values, enabling sustainable change. Within organisational psychology, psychological well-being refers to multi-dimensional outcomes such as autonomy, competence, relatedness, positive affect, resilience and life/work satisfaction. In Nigeria, research confirms that emotional intelligence predicts psychological well-being among civil servants (Olah & Utibe, 2022), and that organisational support significantly shapes well-being among university staff (Amao & Uwannah, 2024). Stressful organisational change has been shown to predict lower well-being among private sector workers in southwest Nigeria (Jimoh, 2016).

Ethical leadership is defined as leadership directed by respect for ethical beliefs, values, dignity and rights of others; it emphasizes fair, honest, caring behaviours and role modelling (Brown, Treviño & Harrison, 2005 as summarized in Northouse, 2016). Within Nigeria, ethical leadership has been shown to significantly reduce counter-productive work behaviours and foster ethical climate in the insurance industry (Isimoya & Bakarey, 2020). Another study in the public sector found ethical leadership improves leader-member exchange and boosts employee performance (Oladimeji et□al., 2022).

Recent research in agro-allied firms confirms that ethical leadership positively predicts organisational sustainability, especially under dynamic environments (Ogaga et□al., 2023). Empirical evidence indicates that many transitions in Nigeria fail due to neglect of psychosocial and ethical dimensions.

Jimoh (2016) found organisational change without sufficient employee support engenders stress and lowered well-being in private organisations. In the local government setting, employees' perceptions of unfairness significantly reduce well-being (Ajala & Bolarinwa, 2015).

Across sectors, factors such as heavy workload, low support, and unstable leadership undermine psychological resilience and organisational commitment (Amao & Uwannah, 2024; Nwibere & Worlu, 2023). Without ethical leadership to cultivate trust and procedural justice, transitions lack stakeholder buy-in, transparency, and moral legitimacy, leading to resistance, token compliance and eventual failure.

Despite substantial research on psychological well-being, organisational commitment, and ethical leadership individually in Nigeria, very few studies integrate these constructs within the context of organisational sustainable transitions. While Jimoh (2016) and Amao & Uwannah (2024) examine well-being under change, they do not explicitly link these to leadership ethics or sustainability of the transition process. Likewise, ethical leadership studies (Isimoya & Bakarey, 2020; Oladimeji et□al., 2022; Ogaga et□al., 2023) confirm performance and sustainability outcomes, but seldom examine psychological well-being as a mediating or moderating variable. The conceptual model that positions psychological well-being and ethical leadership as foundational pillars for enabling, sustaining and legitimizing organisational transitions remains untested in the Nigerian context. Moreover, the dynamic interplay which has to do with how ethical leadership enhances well-being which then supports adaptive change represents an important theoretical and empirical gap.

By addressing this gap, the current study proposes to examine how psychological well-being and ethical leadership jointly support organisational sustainable transitions in Nigerian organisations. It seeks to clarify the mechanisms linking leaders' ethical conduct, employee mental health, and successful transitional outcomes, thereby offering both theoretical contributions and practical guidance for organisational change actors in Nigeria.

Literature Review

Stakeholder Theory

Stakeholder theory, as originally advanced by Freeman (1984), posits that organizations must account for the needs and interests of all parties who affect or are affected by their activities, not just shareholders. Donaldson and Preston (1995) elaborated this by framing stakeholder theory in three intertwined dimensions: normative, descriptive, and instrumental. Normatively, it establishes moral guidelines; descriptively, it explains organizational behaviors; and instrumentally, it links stakeholder management to desired corporate outcomes. Mitchell et al. (1997) introduced the stakeholder salience framework which denotes identifying stakeholders by attributes of power, legitimacy and urgency, adding analytical precision to stakeholder identification. More recent scholarship highlights that the stakeholder value-creation role has evolved: stakeholders are no longer passive recipients but active contributors to organizational performance and innovation (Donaldson & Preston, 1995; Jones & Wicks, 1999; Freeman et al.). Empirical reviews reveal that firms managing a broader, more inclusive set of stakeholders tend to demonstrate improved environmental, social, and governance (ESG) outcomes, enhanced reputation, and more sustainable performance.

Stakeholder theory bridges well with psychological and organizational behavior research, especially regarding how ethical leadership and employee well-being shape transitions. Ethical leadership, in turn, can be viewed as a way of honouring stakeholders, particularly internal ones such as employees, through fair treatment, transparency, and moral accountability. Recent empirical work shows ethical leadership promotes psychological empowerment, which then enhances employee well-being, engagement, innovative behavior, and organizational citizenship behavior (Asif et al., 2019; Sattar et al., 2020). For example, Sattar et al. (2020) found ethical leadership in Pakistani banks positively influenced psychological empowerment, which mediated effects on organizational citizenship and innovative work behavior. From a stakeholder perspective, employees are key internal stakeholders whose psychological welfare and voice matter. Ethical leadership encourages constructive voice behaviors and psychological safety—both critical for navigating change and transition. Yousaf et al. (2019) identified voice behavior as a mediator between ethical leadership and employee psychological well-being, further supporting the idea that stakeholders' input is essential for both ethical governance and well-being.

Psychological Well-Being

Psychological well-being (PWB) as comprising six dimensions: autonomy, environmental mastery, personal growth, positive relations, purpose in life, and self-acceptance (Ryff, 1989, as cited in Babalola et al., 2023). Other authors in Nigerian settings often portray PWB as the individual's capacity to maintain life satisfaction, resilience, and emotional balance amid stressors (Olah, 2022; Ezaka et al., 2024). In Osun State local government employees, Ajala and Bolarinwa (2015) studied organisational justice and psychological well-being. They found that distributive, procedural, and interactional justice perceptions were significantly associated with employees' well-being in a cross-sectional survey of 317 staff. Olah (2022) in Abuja examined emotional intelligence and psychological well-being among 354 civil servants. Using regression, emotional intelligence significantly predicted psychological well-being (p□<□.05), leading to recommendations that employers build EI among staff.

In Ogun State university employees, Amao and Uwannah (2024) used Ryff's PWBS-SF alongside measures of organisational support and workload. Their study showed organisational support accounted for 74.6% of variance in PWB, workload explained 30.2%, and jointly they explained 81.8%. In southwest Nigeria banks, Jimoh (2016) investigated the effects of organizational change and occupational stress on bankers' psychological well-being. He found that stress generated by change negatively impacted well-being, though precise effect sizes were not reported. In manufacturing organizations in Lagos, Edosomwan, Oguegbe, and Joe-Akunne (2023) tested the effects of employee green behaviour, core self-evaluations, and empowering leadership on workplace well-being. Regression analyses revealed all three predictors positively and significantly predicted well-being. Similarly, Babalola et al. (2023) studied undergraduates in Southwestern Nigeria, finding that self-regulation is a significant predictor of psychological well-being among students, gaining insight into self-management as a dimension of well-being.

In Port Harcourt oil and gas firms, Nwibere and Worlu (2023) found that employees' psychological resilience (a related construct to well-being) positively related to organisational

commitment (affective, normative, continuance) across 280 respondents. In Niger Delta companies, this suggests that well-being or resilience fosters stronger organisational attachment and loyalty. Emotional intelligence studies in Nigerian healthcare and civil service likewise highlight downstream effects: high EI and self-efficacy correlate with better psychological well-being, which can support job performance, lower turnover intentions, and greater job satisfaction (Olah, 2022; Iherobiem & Iherobiem, 2023). Amao and Uwannah (2024) findings implicitly carry organisational implications: since organisational support is a powerful predictor of PWB, and workload lowers it, management can enhance PWB via workload moderation and support systems, likely reducing absenteeism and boosting retention.

Ethical Leadership

Brown et al. (2005) originally defined ethical leadership as the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision making. That general model underlies much Nigerian research today (Brown et al., 2005, as cited in Georgeson-Agege, 2020). Northouse (2016), often cited in Nigerian scholarship, characterises ethical leadership as leadership directed by respect for ethical beliefs and values and for the dignity and rights of others encompassing fairness, honesty, trust, and consideration. Georgeson-Agege's (2020) doctoral research with Nigerian public officials adapts Brown et al.'s model by embedding Nigerian normative values—law, governance norms, respect, responsibility, communication, and values-based training—for operationalizing ethical leadership praxis in Nigeria's public context.

Isimoya and Bakarey (2020) investigated the ethical leadership–ethical climate–counterproductive work behaviour nexus in Nigerian insurance companies. Ethical leadership had a significant negative association with deviant behaviours and a robust positive relationship with ethical climate; mediation analyses confirmed that ethical climate mediated the effect of leadership on counterproductive work behaviour. Oladimeji, Abdulkareem, Akindele, and Adejumo (2022) studied Nigeria's federal public sector and found that ethical leadership positively and significantly impacted employee performance, with leader–member exchange (LMX) mediating the relationship. High levels of ethical conduct from leaders improved LMX quality and boosted productivity. Avwerhonyo and Sokoh (2024) drew a sample of 328 workers in Ughelli North and South local councils. They reported that ethical guidance, fairness, role clarity and trust which are composite ethical leadership measures significantly and positively predicted employee performance (via regression and correlation analyses).

Egbiki et al. (2024) surveyed 288 senior managers across banking and insurance public-interest entities (PIEs). Ethical leadership influenced four key dimensions of corporate governance effectiveness namely board practices, transparent disclosure, board commitment and control environment. Nwanzu and Babalola (2025) examined ethical leadership and psychological ownership in selected Delta State organisations. They found that ethical leadership significantly enhances employees' voluntary pro-environmental behaviours, mediated by psychological ownership—the greater the ethical leadership exposure, the more likely employees engage in eco-friendly voluntary actions. Adaiwo (2024) studied Nigeria's

primary healthcare system. Transparent and ethical leadership (integrity, transparency) was a strong predictor of employee performance in healthcare delivery, maintaining that ethical leadership as core organizational values improves productivity in resource-constrained contexts.

Organisational Sustainable Transitions

In Nigeria, organisational sustainable transition refers to the strategic shift of firms and institutions from conventional, linear models (extract–produce–dispose) toward integrated, long-term sustainability frameworks that align environmental, social, and economic objectives (i.e. the "triple bottom line"). According to circulatory economy thinking, this includes transitions from a linear to circular value chain, introducing renewable energy, resource efficiency, ESG-compliant governance, and sustainable business models (Okafor et al.,□2024; Onwere et al.,□2025). Ilesanmi (2025) frames organisational sustainable transition as the process by which eco-entrepreneurial enterprises adopt sustainable business-model innovation, ESG integration, and decarbonisation strategies in internal governance, procurement, and financial management to achieve net-zero and climate resilience goals.

Okafor et al. (2024) surveyed business practitioners in manufacturing firms in Southeast Nigeria. Their study showed that sustainable business models incorporating environmental and social dimensions significantly enhanced organisational performance metrics, especially the corporate bottom line and stakeholder information flows. This suggests that embedding sustainability into core operations can drive competitive advantage. Onwere et al. (2025) analysed sustainability practices of 30 non-financial firms listed in Nigeria (2013–2022) and found environmental and social practices significantly reduced business risk, whereas governance practices paradoxically increased market risk, underscoring the nuanced challenges of organisational transition. Ilesanmi (2025) examined eco-entrepreneurship and sustainable innovation among Nigerian eco-ventures. She identifies internal capacity gaps such as weak ESG knowledge, misaligned business models, unsustainable procurement and resource constraints, that hinder transitions, and highlights the importance of transformative sustainable business model innovation for successful decarbonisation and growth.

In the SME sector, a detailed qualitative study reviewed barriers to circular and environmental sustainability adoption. SMEs cited lack of finance, technical know-how, infrastructure, awareness, government support, and perceived cost-benefit trade-offs as chief hurdles. Sajuyigbe et al. (2024) investigated green finance mechanisms such as green loans, green training and green investment in Lagos-based manufacturing SMEs. They found green loans and green technology had significant positive effects on environmental performance, while training and investment effects were positive but not statistically significant, suggesting finance and tech access as key enablers for sustainable transition.

SMEs and larger organisations struggle with access to green financing; high upfront technology and procurement costs discourage adoption of sustainable practices (Sajuyigbe et al.,□2024; qualitative SMEs study). Onwere et al. (2025) also note that ESG governance practices may raise perceived business risk absent strong enabling frameworks. Multiple reviews cite fragmented or weak legislation, poor enforcement of climate policies, and lack of government incentives such as tax relief or subsidised credit for ESG-agile firms as major

impediments (Ilesanmi,○□2025). Firms lack internal know-how on circular design, ESG implementation, green technology use, and sustainability reporting. SME respondents emphasised a need for training, education, and awareness (Sajuyigbe et al.,○□2024). Resistance to change, low awareness of sustainability benefits, poor consumer demand for green products, and leadership inertia limit the transition process.

Psychological Well-Being and Ethical Leadership: Organisational Sustainable Transitions Pillars

Psychological well-being in Nigerian organisational studies typically encompasses employees' mental health, meaningful engagement, job satisfaction, resilience, and organisational commitment. Nwibere and Worlu (2023) empirically linked psychological resilience which is a core component of positive mental health, to organisational commitment among oil and gas employees in the Niger Delta, showing significant positive correlations across affective, normative, and continuance commitment. Though not explicitly framed around sustainability, high organisational commitment is a key behavioural resource that supports long-term change, including sustainable transitions. In Nigeria's manufacturing sector, Edosomwan et al. (2023) found that employee green behaviour, core self-evaluations, and empowering leadership significantly predicted workplace well-being, indicating that employees who value environmental practices and possess high self-worth experience better psychological well-being. Such employees are more inclined towards sustainable transitions, as their wellbeing aligns with green values and enables sustained change.

Another Lagos-based study by Akinbode and Osisioma (2024) explored the mediating effects of job satisfaction and employee voice on the relationship between ethical leadership and employee well-being in the financial sector. They found a significant positive effect of ethical leadership (characterised by integrity, fairness, transparency) on well-being, mediated by job satisfaction and employees expressing their views (i.e. voice). Higher well-being fosters motivation, engagement, and willingness to support sustainability initiatives in organisations. Although specific studies linking psychological well-being to organisational sustainable transitions in Nigeria remain limited, these findings offer compelling indirect evidence: employees with solid mental health, engagement and satisfaction, particularly when encouraged by ethical leadership are the human capital foundation for sustainable organisational change. They are more likely to support green practices, compliance with ESG policies, and continuous improvement aligned with sustainability transitions.

Ethical leadership, conceptualised in Nigeria largely through values such as integrity, transparency, fairness, and accountability, directly shapes organisational culture and outcomes. Adaiwo (2024) examined transparent and ethical leadership within Nigeria's primary healthcare system, finding that integrity and transparency significantly predicted employee productivity, with high explanatory power (large R^2). A culture rooted in such ethical values supports sustainable transitions by enhancing trust, reducing corruption, and enabling adaptive staff engagement with sustainability changes. Nwanzu and Babalola (2025) specifically investigated ethical leadership's impact on employees' voluntary pro-environmental behaviour in Delta State organisations. They found that ethical leadership through fairness, trust, and ethical guidance enhanced psychological ownership, which mediated positive environmental behaviour at work. These results are directly relevant to

organisational sustainable transitions: when staff feel responsible and ethically aligned, they engage in green practices, support circular economy measures, and sustain sustainability momentum.

In a broader cross-sectoral Nigerian study, marketing ethical value (integrity, transparency, accountability) was found to significantly influence sustainable leadership practices across public and private sector employees particularly in North Central and Southwest Nigeria, indicating positive effects on leadership style that supports long-run sustainability values and organisational culture. This underpins how ethical leadership drives sustainable organisational ethos. Additionally, literature from Africa emphasises that ethical leadership is critical to sustainable development: Ibe (2025) maintains that without leaders guided by moral principles and accountability, organisations and nations cannot achieve long-term sustainable outcomes. This theoretical backbone reinforces empirical Nigerian findings.

In Integrating Psychological Well-Being and Ethical Leadership in Sustainable Transitions, these Themes were Identified as Mechanisms Linking Psychological Well-Being and Ethical Leadership to Sustainable Transitions:

1. **Social exchange and empowerment**: Akinbode and Osisioma (2024) showed that ethical leadership increases job satisfaction and voice, thereby improving employee well-being. When employees feel empowered and satisfied, they are more motivated to participate in sustainability initiatives.
2. **Psychological ownership and pro-environmental behaviour**: Nwanzu and Babalola (2025) demonstrated that ethical leadership enhances psychological ownership, which in turn drives green workplace behaviours (e.g., resource conservation, recycling). This creates grassroots momentum for sustainable transitions within organisations.
3. **Resilience and commitment**: Nwibere and Worlu (2023) show that psychological resilience fosters organisational commitment, enabling employees to endure change and contribute to long-term transition strategies.
4. **Green behaviour-wellbeing nexus**: Edosomwan et□al. (2023) highlight that employees already engaged in green behaviour experience higher workplace well-being when supported by empowering leadership. Thus, sustainable transitions reinforce wellbeing while wellbeing sustains ongoing sustainable change.

Together, these pathways outline a virtuous cycle: ethical leadership cultivates trust, fairness, and transparency, which enhance job satisfaction, voice, and psychological ownership. These in turn boost psychological well-being, engagement, and resilience. Employees are then more likely to enact and sustain sustainable transition practices, such as green operations, ESG integration, and organisational innovation.

Conclusion and Recommendations

Conclusion

This paper has critically examined how psychological well-being and ethical leadership serve as foundational pillars for organisational sustainable transitions in Nigeria. Drawing on empirical studies, the review demonstrates that employee mental health, job satisfaction, and engagement, which indicates psychological well-being directly influence organisational readiness for sustainability. Similarly, ethical leadership characterised by integrity, fairness,

and transparency, cultivates trust, promotes voluntary pro-environmental behaviours, and reduces resistance to change. Together, these human-centred constructs foster organisational cultures that are resilient, adaptive, and aligned with sustainability goals. However, despite their demonstrated importance, Nigerian organisations still face structural, cultural, and leadership-related constraints in fully integrating these pillars into sustainability strategies. For sustainable transitions to be successful, organisations must prioritise both employee well-being and ethical governance as strategic imperatives.

Recommendations

1. **Institutionalise Mental Health Support Systems**: Organisations should develop structured well-being programs, including mental health counselling, workload management, and employee assistance services, to enhance psychological resilience and engagement during sustainability transitions.
2. **Embed Ethical Leadership in Organisational Development**: Ethical leadership training should be incorporated into all levels of leadership development and succession planning to promote transparency, fairness, and stakeholder trust across the organisation.
3. **Link Sustainability KPIs to Employee Engagement Metrics**: Companies should integrate sustainability goals with HR performance indicators, ensuring that employee engagement, satisfaction, and well-being are tied to the success of organisational sustainability initiatives.
4. **Promote Cross-Sector Collaboration on ESG Literacy**: Government agencies, academic institutions, and private organisations should collaborate to raise awareness and build capacity around ethical leadership and psychological well-being as enablers of sustainable development.

Abstract
This position paper examines the crucial role of social innovation and grassroots green entrepreneurship in fostering sustainable and inclusive development within Nigeria. The paper posits that traditional development paradigms have proven insufficient in addressing Nigeria's multifaceted socio-economic and environmental challenges, necessitating the embrace of novel, locally driven solutions. We detail the current landscape of these burgeoning sectors, identifying key drivers such as Nigeria's significant youth population and abundant natural resources, alongside persistent challenges like limited access to finance and inadequate policy frameworks. The paper articulates the profound economic, social, and environmental impacts of cultivating these initiatives, demonstrating their direct contributions to the United Nations Sustainable Development Goals. Furthermore, it presents a set of targeted policy implication, capacity-building strategies, innovative financing models, and collaborative approaches essential for accelerating the development and effectiveness of social innovation and grassroots green entrepreneurship across the nation. The central argument asserts that strategic investment in these areas represents an indispensable pathway for Nigeria to achieve a resilient, equitable, and environmentally conscious future.

Introduction

Background

Nigeria, the most populous nation in Africa, grapples with a complex array of interconnected socio-economic and environmental challenges. Persistent issues such as high rates of poverty and unemployment, particularly among its burgeoning youth population, continue to impede comprehensive national development (National Bureau of Statistics, 2023). Simultaneously, the country faces significant environmental degradation, including the severe impacts of climate change, manifest in desertification in the north and coastal erosion in the south, alongside rampant deforestation, widespread resource depletion, and inefficient waste management practices that exacerbate public health crises (Federal Ministry of Environment, 2022). These intertwined

challenges necessitate a paradigm shift from conventional top-down development models to more adaptive, community-centric, and sustainable approaches. In this context, social innovation and green entrepreneurship emerge as potent frameworks for generating locally relevant and environmentally sound solutions. A grassroots approach to these concepts is particularly salient for Nigeria, given its rich tapestry of diverse communities, each with unique needs, resources, and indigenous knowledge systems that can be leveraged for sustainable development (Ogunlana & Oladejo, 2021).

Problem Statement

Traditional development models in Nigeria have demonstrably fallen short in generating sustainable solutions to the nation's profound social and environmental predicaments. These conventional approaches often struggle to adapt to the specificities of local contexts, frequently leading to interventions that are neither sustainable nor inclusive (Udofia & Okoro, 2020). There exists a significant gap between the urgent need for innovative solutions to pervasive issues—such as energy poverty, inadequate sanitation, and agricultural inefficiency—and the effective mobilization of Nigeria's vast untapped entrepreneurial potential. Furthermore, the existing entrepreneurial ecosystem often disproportionately favours ventures focused solely on financial returns, overlooking or inadequately supporting those driven by a dual mission of social and environmental impact. This paper addresses this critical void by advocating for a structured approach to fostering social innovation and developing grassroots green entrepreneurship, recognizing these as fundamental to overcoming the limitations of past development endeavors and unlocking sustainable progress.

Research Questions/Objectives

This paper systematically addresses several critical questions concerning the development of social innovation and grassroots green entrepreneurship in Nigeria.

1. First, what is the current landscape of social innovation and grassroots green entrepreneurial initiatives operating within Nigeria?
2. Second, what are the key drivers facilitating, and the significant challenges impeding, their comprehensive development and scaling across the nation?
3. Third, what are the potential impacts of fostering social innovation and grassroots green entrepreneurship on Nigeria's broader sustainable development agenda?
4. Finally, what policy recommendations and specific support mechanisms are indispensable for accelerating the development, enhancing the effectiveness, and ensuring the long-term sustainability of these vital initiatives in Nigeria?

Thesis Statement/Position

This paper asserts unequivocally that fostering social innovation and empowering grassroots green entrepreneurship are not merely supplementary but are critical, yet demonstrably underutilized, pathways for Nigeria to achieve truly sustainable, inclusive, and resilient development. The paper's core position is that realizing this transformative potential necessitates a concerted effort involving targeted policy support, comprehensive capacity building, and the widespread adoption of innovative financing mechanisms that specifically cater to the unique characteristics and dual bottom lines of social and green ventures.

Scope and Significance of the Paper

The scope of this paper encompasses the broad landscape of social innovation and green entrepreneurship, with a particular emphasis on initiatives originating from or deeply embedded within local communities across Nigeria. While acknowledging the diversity of these initiatives, the paper draws examples from various sectors, including waste management, renewable energy, sustainable agriculture, and community health, to illustrate their widespread applicability and impact. The significance of this paper is multifaceted. For academia, it contributes to a nascent but growing body of knowledge on the intersection of social innovation, green entrepreneurship, and sustainable development within the African context, identifying critical research gaps. For policymakers, it provides a compelling evidence-based argument and actionable recommendations for designing supportive frameworks that can unlock Nigeria's entrepreneurial potential for societal and environmental good. For entrepreneurs, it offers insights into the opportunities and challenges within this emerging space, potentially inspiring new ventures. Finally, for Nigerian society at large, the paper illuminates' pathways towards self-sufficiency, environmental stewardship, and improved livelihoods, fostering a more sustainable and equitable future.

Conceptual Framework and Literature Review

Defining Social Innovation

Social innovation represents a deliberate process of devising and implementing novel solutions to pressing social problems, resulting in outcomes that are more effective, efficient, sustainable, or just than existing approaches (Mulgan, 2006). It transcends mere technological advancements, encompassing new products, services, models, processes, and even ideas that fundamentally shift social relations and power structures. In the Nigerian context, social innovations often emerge from the community level, addressing issues such as access to clean water, affordable education, healthcare, or sustainable livelihoods through participatory and locally appropriate methods (Akinbola & Adeleke, 2019). Typologies of social innovation relevant to Nigeria include product/service innovation (e.g., affordable solar lanterns), process innovation (e.g., new community waste collection systems), organizational innovation (e.g., new models for rural healthcare delivery), and systemic innovation (e.g., initiatives that influence policy or broader societal norms towards sustainability). The core characteristic remains its intentional focus on generating social value rather than solely economic profit.

Defining Grassroots Green Entrepreneurship

Green entrepreneurship involves the pursuit of innovative ventures that aim to address environmental problems while simultaneously creating economic value (Schaltegger & Wagner, 2011). It is fundamentally driven by a commitment to the "triple bottom line": generating positive people (social), planet (environmental), and profit (economic) outcomes. When qualified as grassroots green entrepreneurship, the emphasis shifts to initiatives that originate from, are deeply embedded within, and are primarily designed to serve the needs of local communities. These ventures are often characterized by their reliance on local resources, knowledge, and community participation, fostering self-reliance and empowerment (Idris & Sani, 2020). Unlike conventional entrepreneurship which may prioritize financial returns above all else, grassroots green entrepreneurship integrates environmental stewardship and social equity as core components of its business model. Examples include local waste-to-wealth initiatives, community-based renewable energy cooperatives, and small-scale sustainable agriculture projects.

Interplay between Social Innovation and Grassroots Green Entrepreneurship

The relationship between social innovation and grassroots green entrepreneurship is deeply synergistic and often symbiotic. Many green entrepreneurial ventures inherently embody social innovation, as they develop novel solutions to environmental problems that directly benefit communities and improve their quality of life. For instance, a green enterprise introducing an affordable, clean cooking stove simultaneously addresses deforestation (environmental) and reduces indoor air pollution, improving health outcomes (social innovation). Conversely, many social innovations adopt entrepreneurial principles to ensure their sustainability and scalability, recognizing that market-based approaches can be more effective than purely philanthropic ones in achieving widespread impact (Phillips et al., 2015). Grassroots green entrepreneurs frequently act as social innovators by identifying local environmental challenges and creatively devising solutions that are not only eco-friendly but also generate employment, empower women, or improve public health. Their proximity to the problem often leads to highly context-specific and effective innovative solutions.

Relevant Theories

Several theoretical lenses illuminate the dynamics of social innovation and grassroots green entrepreneurship. The Diffusion of Innovation Theory, pioneered by Rogers (2003), provides a framework for understanding how new ideas, practices, and technologies—including green innovations and social solutions—are adopted and spread through a social system. This theory helps explain the stages of adoption from innovators to laggards, highlighting the importance of opinion leaders and communication channels in disseminating new green practices or socially innovative models within Nigerian communities. Sustainable Development Theory is foundational, linking the entrepreneurial activities to broader societal goals of economic viability, social equity, and environmental protection (Gladwin et al., 1995). This theory underscores that true development must meet the needs of the present without compromising the ability of future generations to meet their own needs, a principle inherently embedded in green entrepreneurship. Furthermore, the Resource-Based View (RBV), while traditionally applied to firms, can be extended to understand how unique local resources, knowledge, and community networks provide competitive advantages to grassroots green enterprises (Barney, 1991). Complementarily, Institutional Theory elucidates how formal (e.g., government policies, regulations) and informal (e.g., cultural norms, community values) institutions shape and constrain entrepreneurial activities, providing insights into the enabling or restrictive factors for social and green ventures in Nigeria (Scott, 2008).

Existing Literature in the Nigerian Context

Existing scholarly work in Nigeria has begun to explore aspects of social innovation and green entrepreneurship, though often in silos. Research on social innovation has highlighted initiatives in diverse sectors, including healthcare solutions for remote areas (Ogunyemi & Owolabi, 2018), educational interventions aimed at improving literacy rates (Ajayi & Adekunle, 2017), and agricultural innovations enhancing food security through improved farming practices (Nwosu & Okoro, 2019). Similarly, studies on green entrepreneurship in Nigeria have investigated the growth of renewable energy startups, particularly in solar power for off-grid communities (Okafor & Adebayo, 2020), waste management and recycling enterprises (Ikhuoria & Ogbari, 2019), and ventures promoting sustainable agriculture and agroforestry (Eze & Chukwu, 2021). However, a significant gap in the literature persists concerning the explicit intersection of social innovation

and grassroots green entrepreneurship within the Nigerian context. Few studies systematically analyze how these two domains co-create value at the community level, how their grassroots nature influences their sustainability, or how specific policy interventions can foster this integrated development. This paper aims to bridge this gap by offering a holistic examination of this critical nexus.

The Landscape of Social Innovation and Grassroots Green Entrepreneurship in Nigeria

Current Manifestations and Examples

Nigeria's landscape of social innovation and grassroots green entrepreneurship is vibrant, albeit largely informal and underexplored. Numerous initiatives, often born out of necessity, demonstrate the ingenuity and resilience of local communities in addressing their unique challenges. In the realm of waste management, examples include community-led recycling programs in urban informal settlements where local residents collect plastic waste, sort it, and sell it to larger recycling companies, creating informal income streams and cleaner environments (Ajala & Okeke, 2019). Renewable energy solutions are particularly prominent in off-grid communities, where local entrepreneurs establish mini-grids powered by solar panels or distribute affordable solar lanterns, replacing traditional kerosene lamps and improving health and safety while reducing carbon emissions (Okafor & Adebayo, 2020).

Innovative agricultural practices also represent a significant area of grassroots green entrepreneurship. Farmers' cooperatives are adopting sustainable farming methods such as organic fertilizer production from agricultural waste, intercropping, and drought-resistant crop cultivation, addressing food security and environmental degradation simultaneously (Nwosu & Okoro, 2019). Furthermore, tech-for-good initiatives are emerging, utilizing mobile applications and digital platforms to connect smallholder farmers with markets, facilitate access to microloans, or provide health information to remote communities, thereby enhancing social equity and efficiency (Umar & Bello, 2021). These examples, though diverse in sector and scale, underscore a common thread: they are typically community-driven, leverage local resources, and prioritize both social and environmental benefits.

Key Actors and Stakeholders

The development of social innovation and grassroots green entrepreneurship in Nigeria involves a diverse ecosystem of actors and stakeholders, each playing a distinct yet interconnected role. At the foundational level are the local communities and individuals themselves, who are often the initiators of these innovations, driven by direct experience of social and environmental problems. Their local knowledge and collective action are indispensable. Civil society organizations (CSOs) and Non-Governmental Organizations (NGOs) serve as crucial intermediaries, often providing capacity building, advocacy, and direct implementation support to grassroots initiatives (Ibrahim & Musa, 2018). Social enterprises and green startups represent formal or semi-formal entities that embody the entrepreneurial spirit with a dual mission, seeking sustainable business models for their social and environmental impacts.

Government agencies at local, state, and federal levels, including ministries of environment, agriculture, and youth development, are crucial for creating an enabling policy and regulatory environment, though their engagement often requires further strengthening. Academia and research institutions contribute by conducting research, developing innovative solutions, and

providing training and technical expertise (Adekunle & Eze, 2022). International development partners offer significant financial support, technical assistance, and knowledge sharing, facilitating the replication of successful models from other contexts. Finally, the private sector, through its corporate social responsibility (CSR) initiatives or direct investment in green ventures, holds immense potential to scale these efforts, providing market access and professional expertise (Bankole & Ojo, 2021). Effective collaboration among these diverse stakeholders is paramount for the sustained growth of social innovation and grassroots green entrepreneurship.

Enabling Environment and Supporting Ecosystem

The existence of an enabling environment and a supportive ecosystem is fundamental for the flourishing of social innovation and grassroots green entrepreneurship in Nigeria. While nascent, elements of such an ecosystem are emerging. Nigeria possesses various policies and legal frameworks that, though not always specifically tailored to social or green entrepreneurship, can provide a basis for their operation. These include renewable energy policies aimed at promoting cleaner energy sources (Nigerian Electricity Regulatory Commission, 2015), environmental regulations addressing pollution and waste management (Environmental Protection Agency, 2007), and general Small and Medium Enterprise (SME) development programs that could potentially be leveraged by social and green ventures (Small and Medium Enterprises Development Agency of Nigeria, 2010).

Furthermore, a growing number of incubators, accelerators, and networks are contributing to the ecosystem. Organizations like Ventures Platform, CcHUB, and the Green Village Initiative are examples of hubs that provide mentorship, co-working spaces, and limited funding for startups, including those with a social or environmental focus (Ventures Platform, 2023; CcHUB, 2024). Professional associations and advocacy groups are also emerging, working to create awareness and advocate for more supportive policies. Despite these positive developments, significant room exists for enhancing the coherence and comprehensiveness of this supporting ecosystem, particularly in ensuring that it reaches and effectively serves grassroots initiatives in rural and underserved areas.

Drivers and Challenges for Development

Key Drivers

Several potent factors propel the development of social innovation and grassroots green entrepreneurship in Nigeria. The country's demographic dividend and youth engagement stand out as a primary driver. With a large and rapidly growing youth population, Nigeria possesses an immense pool of innovative and entrepreneurial talent, many of whom are keenly aware of societal problems and eager to create impact (National Population Commission, 2023). This youthful demographic often embraces new technologies and approaches, demonstrating a strong entrepreneurial spirit. Nigeria's abundant natural resources also offer substantial potential for sustainable utilization and the development of green industries, from vast solar irradiation for renewable energy to extensive agricultural lands for sustainable farming practices (Federal Ministry of Power, 2020).

The pressing social and environmental needs themselves act as a powerful catalyst. The sheer scale of challenges—such as energy poverty, waste accumulation, and food insecurity—creates an inherent demand for innovative, practical solutions that can be effectively delivered at the local
