level (United Nations Development Programme, 2022). Furthermore, technological advancements, particularly in mobile connectivity and digital platforms, facilitate innovation and outreach, enabling grassroots entrepreneurs to access information, connect with markets, and scale their solutions more efficiently than ever before (Nigerian Communications Commission, 2023). Finally, there is a growing awareness among both the populace and segments of the government regarding environmental issues and the importance of social impact, slowly shifting mindsets towards more sustainable practices and conscious consumption.

Significant Challenges

Despite the compelling drivers, the growth of social innovation and grassroots green entrepreneurship in Nigeria faces numerous formidable challenges. Access to finance remains arguably the most critical impediment. Seed funding, patient capital, and angel investment are severely limited for social and green ventures, which often do not fit traditional risk-return profiles of conventional financiers (PwC Nigeria, 2021). Most commercial banks are hesitant to lend to nascent, impact-driven businesses without strong collateral or established revenue streams, making it difficult for grassroots initiatives to move beyond subsistence levels.

Policy and regulatory gaps further complicate the landscape. Nigeria lacks a specific, comprehensive legal framework that recognizes and supports social enterprises, leading to ambiguity in their registration, taxation, and access to specific incentives (Social Enterprise Academy, 2019). Inconsistent environmental policies, bureaucratic hurdles, and corruption also deter potential green entrepreneurs. There is a widespread lack of capacity and skills at the grassroots level; many aspiring social and green entrepreneurs possess innovative ideas but lack essential business acumen, technical skills in specific green technologies, or knowledge of effective market strategies (British Council, 2018).

Market access and scaling present another significant hurdle. Grassroots initiatives often struggle to reach wider markets beyond their immediate communities, limiting their growth potential and sustainability. Poor branding, inadequate distribution channels, and competition from established, often less sustainable, businesses make scaling difficult. Furthermore, infrastructure deficiencies, including unreliable power supply, poor road networks, and limited internet connectivity, particularly in rural areas, directly impede the operations and expansion of green enterprises that rely on efficient logistics and digital tools (World Bank, 2022).

Finally, cultural and social norms can sometimes present resistance to new ideas or practices, especially those challenging traditional ways of doing things. Issues of trust, community dynamics, and the inherent risks associated with innovation can deter adoption. There is also a notable lack of robust data and measurement on the impact and prevalence of social innovations and green enterprises, making it challenging for policymakers to formulate evidence-based interventions and for investors to assess potential returns (Dalberg Advisors, 2020). Addressing these interwoven challenges is paramount for unlocking the full potential of these transformative sectors.

Impact and Potential for Sustainable Development in Nigeria

Fostering social innovation and grassroots green entrepreneurship carries immense potential to drive sustainable development across Nigeria, yielding multifaceted impacts across economic,

social, and environmental dimensions, directly contributing to the nation's pursuit of the Sustainable Development Goals.

Economic Impact

The economic impact of robust social innovation and grassroots green entrepreneurship development is substantial and far-reaching. These initiatives are significant engines of job creation, particularly for youth and women who are often disproportionately affected by unemployment (UNICEF, 2021). Green enterprises in sectors like waste recycling, renewable energy installation, and sustainable agriculture generate employment opportunities at various skill levels, from technical roles to community outreach positions. This leads directly to income generation and poverty reduction at the household level, enhancing economic stability for vulnerable populations. Furthermore, these ventures contribute to the diversification of the Nigerian economy, moving beyond traditional oil dependence towards a more resilient and sustainable economic base built on local resources and innovative practices. They stimulate the development of new markets and industries (e.g., green technologies, circular economy models), fostering economic dynamism and attracting new forms of investment into hitherto underserved sectors (African Development Bank, 2020).

Social Impact

The social impact of nurturing social innovation and grassroots green entrepreneurship is equally profound. These initiatives directly lead to improved access to basic services, particularly in remote and underserved communities. Examples include the provision of affordable clean energy through solar mini-grids, enhanced sanitation systems via waste-to-resource initiatives, and improved healthcare access through mobile clinics or innovative health-tech solutions (Bill & Melinda Gates Foundation, 2022). They foster enhanced community resilience and empowerment by equipping local populations with the tools and knowledge to solve their own problems, building local agency and self-sufficiency. This also promotes social cohesion and equity, as many social innovations are designed to bridge divides and ensure that marginalized groups participate in and benefit from development (Ford Foundation, 2019). Moreover, these ventures contribute significantly to capacity building and skill development at the local level, training individuals in green technologies, business management, and various vocational skills, thereby enhancing human capital within communities.

Environmental Impact

The environmental benefits derived from robust grassroots green entrepreneurship are at the core of its transformative potential. These ventures directly contribute to waste reduction and recycling through innovative collection, sorting, and processing methods, turning waste into valuable resources (e.g., organic fertilizers, recycled plastics for new products). They promote the conservation of natural resources by advocating for sustainable land use, water management, and the protection of biodiversity, moving away from extractive practices (Nigerian Conservation Foundation, 2023). Crucially, grassroots green entrepreneurship plays a vital role in the mitigation of climate change, particularly through the widespread adoption of renewable energy solutions, reducing reliance on fossil fuels and lowering carbon emissions (International Renewable Energy Agency, 2021). Ultimately, these initiatives promote sustainable consumption and production patterns by offering eco-friendly alternatives and educating communities on the environmental implications of their choices, fostering a more circular and regenerative economy.

Contribution to SDGs

The synergistic impact of social innovation and grassroots green entrepreneurship directly aligns with, and significantly contributes to, Nigeria's progress on numerous United Nations Sustainable Development Goals (SDGs).

1. SDG 1: No Poverty: By creating jobs, generating income, and improving livelihoods at the grassroots, these initiatives directly reduce poverty levels.
2. SDG 2: Zero Hunger: Innovations in sustainable agriculture, such as improved seeds and efficient irrigation, enhance food security.
3. SDG 3: Good Health and Well-being: Clean energy access reduces indoor air pollution, and social innovations in healthcare improve service delivery.
4. SDG 4: Quality Education: Innovative learning models and access to technology in remote areas can improve educational outcomes.
5. SDG 5: Gender Equality: Many grassroots initiatives empower women economically and socially, enhancing their participation in entrepreneurial activities.
6. SDG 6: Clean Water and Sanitation: Social enterprises focused on water purification and waste management contribute to better access and infrastructure.
7. SD 7: Affordable and Clean Energy: Green entrepreneurs are pivotal in deploying solar, hydro, and biomass solutions in off-grid communities.
8. SDG 8: Decent Work and Economic Growth: These ventures create dignified employment opportunities and foster inclusive economic development.
9. SDG 9: Industry, Innovation, and Infrastructure: They drive localized innovation and develop resilient, green infrastructure.
10. SDG 11: Sustainable Cities and Communities: Initiatives in urban waste management, green spaces, and sustainable housing improve urban living.
11. SDG 12: Responsible Consumption and Production: Green businesses promote circular economy principles and sustainable resource use.
12. SDG 13: Climate Action: Renewable energy projects and sustainable land management practices directly contribute to climate change mitigation and adaptation.
13. SDG 17: Partnerships for the Goals: The inherently collaborative nature of these ventures fosters partnerships among diverse stakeholders, crucial for achieving all SDGs.

This clear alignment underscores that investing in social innovation and grassroots green entrepreneurship is not merely an optional development path but a fundamental strategy for Nigeria to achieve its overarching sustainable development objectives.

Position/Policy Implications

Realizing the full potential of social innovation and grassroots green entrepreneurship in Nigeria necessitates a strategic, multi-pronged approach involving concerted efforts from government, private sector, civil society, and international partners.

Policy Opinion

This paper opined that, first step is the development of a comprehensive National Strategy for Social Innovation and Green Entrepreneurship. This strategy must clearly articulate national

priorities, set measurable targets and indicators, and outline specific roles for various government agencies (Federal Ministry of Finance, Budget and National Planning, 2023). Such a strategy will provide a coherent framework for action and investment. Concurrently, it is imperative to strengthen existing regulatory frameworks and introduce new ones that explicitly recognize and support social enterprises and green businesses. This includes creating a legal definition for social enterprises, simplifying registration processes, and ensuring fair taxation policies that acknowledge their dual mission (Law Union & Rock, 2020).

The government must incentivize green investment by offering targeted tax breaks, grants, and subsidies for startups and existing businesses engaged in green technologies and sustainable practices. This can include preferential access to capital for green projects and reduced import duties on green equipment. Furthermore, promoting public procurement from social and green enterprises can create a stable market demand for their products and services. Government ministries, departments, and agencies should be encouraged to prioritize purchasing from businesses with demonstrable social and environmental impact. Finally, integrating social innovation and green entrepreneurship into education and training is crucial. This involves incorporating relevant curricula into primary, secondary, and tertiary education, as well as developing vocational training programs that equip individuals with the skills necessary to identify opportunities and launch sustainable ventures (National Universities Commission, 2024).

Capacity Building and Support Mechanisms

Beyond policy, robust capacity building and support mechanisms are indispensable. It is essential to establish and strengthen incubation and acceleration programs specifically tailored to the unique needs of social and green startups. These programs must offer specialized training in impact measurement, sustainable business models, and environmental compliance, complementing traditional business development support (African Business Angels Network, 2023). Providing technical assistance and mentorship is also vital. This involves connecting aspiring social and green entrepreneurs with experienced mentors, industry experts, and legal/financial advisors who can guide them through the complexities of building sustainable ventures.

Furthermore, efforts to facilitate access to markets are critical for scaling grassroots initiatives. This includes creating dedicated platforms, online marketplaces, and physical networks where green products and social services can reach a wider consumer base. Trade fairs focused on green products and social innovations can also play a role. Finally, the development of robust data and research initiatives is paramount. This involves systematically collecting data on the number of social and green enterprises, their economic, social, and environmental impacts, and the challenges they face. Such data will inform evidence-based policy formulation, track progress, and attract further investment (National Bureau of Statistics, 2023).

Innovative Financing Models

Addressing the pervasive challenge of access to finance requires the widespread adoption of innovative financing models. Nigeria needs to actively promote impact investing, attracting private capital that seeks both financial returns and measurable social and environmental impact. This involves creating an enabling environment for impact investors and showcasing successful social and green ventures (GIIN, 2021). The development of Green Bonds and Social Bonds offers a significant opportunity to fund large-scale green and social projects, providing a mechanism for

both domestic and international investors to contribute to Nigeria's sustainable development goals (FMDQ, 2022).
Furthermore, expanding microfinance and community funds is essential for grassroots initiatives that often require smaller, more flexible capital injections. These funds can be structured to support local cooperatives, women's groups, and youth-led ventures. Lastly, leveraging crowdfunding platforms provides an avenue for smaller-scale projects to raise capital directly from a broad base of individuals, fostering community ownership and participation in funding social and green ventures (AFRICA-X, 2020).

Fostering Collaboration and Partnerships
Sustained progress in social innovation and grassroots green entrepreneurship hinges on fostering strong collaboration and partnerships across all sectors. Promoting Public-Private Partnerships (PPPs) is critical, enabling government agencies to collaborate with private sector entities and civil society organizations in co-designing and implementing sustainable solutions (Infrastructure Concession Regulatory Commission, 2021). This approach combines the government's regulatory power and reach with the private sector's efficiency and resources.

Encouraging cross-sectoral collaboration among different industries and societal actors will lead to more holistic solutions. For example, a partnership between a technology firm, an agricultural cooperative, and a financial institution can create an integrated solution for rural farmers. Finally, international cooperation is vital for learning from global best practices, accessing technical expertise, and securing international funding for large-scale projects and capacity-building initiatives (UNDP Nigeria, 2023). Such partnerships will ensure a comprehensive and resilient ecosystem for social innovation and grassroots green entrepreneurship to thrive.

Conclusion
This paper has argued that social innovation and grassroots green entrepreneurship are not merely desirable, but are indispensable pathways for Nigeria to navigate its complex development challenges and achieve sustainable, inclusive, and resilient growth. The evidence presented demonstrates that these locally driven, impact-focused initiatives are already contributing significantly to economic empowerment, social equity, and environmental stewardship across the nation. They represent a dynamic force for change, capable of addressing issues from poverty and unemployment to climate change and resource depletion, all while fostering community self-reliance.

The comprehensive analysis of the current landscape, drivers, and challenges underscores both the immense opportunities and the critical barriers that must be systematically addressed. While the entrepreneurial spirit and urgent needs within Nigeria provide a fertile ground for these ventures, persistent issues such as limited access to finance, inadequate policy frameworks, and capacity gaps require urgent and concerted action. The detailed recommendations outlined, spanning policy reforms, robust capacity building, innovative financing models, and enhanced multi-stakeholder partnerships, are not merely suggestions but represent actionable strategies to unlock this transformative potential.

Nurturing social innovation and empowering grassroots green entrepreneurship is therefore a strategic imperative for Nigeria. By investing in these areas, the nation can harness its indigenous

creativity and entrepreneurial drive, creating a more sustainable, equitable, and prosperous future for all its citizens. The time for decisive action in championing these powerful agents of change is now.

Abstract
Packaging can be defined as all the activities of designing and producing the container or wrapper of the product. The main objective of the study is to examine the impact of product packaging on consumer buying behavior. Specifically, the study examined the extent to which packaging colour impact on consumer buying behavior. Examine the degree to which packaging material impact on consumer buying behavior and to determine the extent to which package design impact on consumer behavior. Relevant conceptual, theoretical and empirical literature was reviewed. The study adopted survey research design. The research work was carried out in Stanel Bread Awka Anambra State. The population of study is made up of consumers and employees of Stanel Bread Awka, Anambra State. Therefore, the population is unknown. Thus, sample size of 282 respondents was chosen through purposive sampling. The sample comprised of 82 staff and 200 consumers of Stanel Bread Awka,, Anambra State. The major sources of data used for this study was the primary source data. The need to enhance easy comprehension and analysis prompted the use of the frequency distribution table to present the data gathered. The tools used in analyzing the data collected include tables and simple percentages. Z-test is use to test the null hypotheses at 0.05 level of significance. The study revealed that packaging colour, material and design has a significant impact on consumer buying behavior. It has also revealed that elements of packaging are the most important for consumer's purchase decision. For a major part of consumers' attraction was package design, colour and materials are the main visual elements. The study therefore concludes that's product packaging have positive impacts on consumer buying behavior. Amongst recommendations is that: marketing and business units that they should pay proper attention for good packaging. If they accept or introduce the poor packaging then it could be one of the causes of product failure in the market. It is necessary to set the packaging standard and to implement strategy accordingly for better protection and promotion of a product. Product package designer should not sacrifice the strength and effectiveness of the product package for cost as the firm to gain immensely from them. Since colour, design and material are found to have significant impact on consumer buying behavior, the firm should plan better for package development that

would ensure that new package are actually improved upon especially in the area of colour, design and materials.

Keywords: *Product Packaging, Consumer Buying Behavior, Stanel Bread, Anambra State*

Introduction

Packaging of a product has many functions including containment, protection, convenience and communication. Product packaging servers to consolidate of unit loads of shipping, to protect the product inside during the period of shipping, to convey necessary information. Other than these functions packaging is also used in marketing activities. The labels on the product can be used to encourage potential buyers to purchase the product. Companies use attractive colors, logos, symbols and captions to promote that can influence purchase decision (Onyekachi, 2023).

Product is a combination of tangible and intangible goods and services offers to a customer for sale. It is any idea, method, information, service or object created as a result of a process and serves a need or satisfies a want. Consumers are very fond of new products and services which will satisfy their needs and fulfill their demands according to this attitude of consumer's they attract towards any product or services. We can easily identify the consumer's buying behavior towards any product or services by seeing: How the consumer attracts towards any product? Is the given product or service satisfying the consumer's demand and how will the consumers react towards any product/services? What is the perception of the consumers about the product or services offers by a company? How much the product or services is recognizable among the consumers? How much they give preference to the product or services offer by any company (Oladele, Olowookere, Okolugbo & Adegbola, 2023).

There are many things which will increase the product sales. Product is made up from the mixture of different elements: Quality, protect ability, fulfilling the needs of consumer's and also the packaging's which will enhance the product's existence and built a strong image in the consumer's mind.

Packaging plays a vital role in attracting consumers towards any product. Packaging is also used as the promotional tool for the companies and it includes: Color, material, designs & other characteristics. Packaging is the overall package offer by the company to its consumers and stimulates the impulse buying behavior.

Packaging attracts consumers and increases its sale. It also reduces the marketing and advertisement cost of the product.

According to Rundh (2005) package attracts consumer's attention to brand, enhances its image, and influences consumer's perceptions about product. Also, package imparts unique value to products.

In this competitive environment packaging has become an effective tool to capture the consumers purchase intention. Packaging performs the important role for attracting the customers. We can

see the buying intentions of children. The design of the wrapper attracts the children, so organizations' design the wrapper in such a way that it is attractive to their eye.

Packaging is a very important aspect of product marketing strategy that helps to attract the consumer's attention. Rundh (2005) maintains that package appeals consumer's attentiveness towards a certain brand, increases its image, and stimulates consumer's perceptions about product. Furthermore, packaging conveys distinctive value to products (Underwood, 2003; Silayoi, and Speece, 2007), packaging works as an instrument for differentiation, and helps consumers to decide the product from wide range of parallel products, packaging also stimulates customer's buying behavior (Wells, Farley & Armstrong, 2007).

Packaging of product entails designing and constructing the container or wrapper for a product. The container and wrapper may take account of the product's primary container, a less important package that is disposed when the product is about to be used and the shipping package necessary to store, identify and ship the product (Kotler, Wong, Saunders & Armstrong, 2005). Other parts of packaging include the labelling, printed information appearing on or with the package. Packaging in recent times, is seen as an important marketing strategy. Importance of packaging as a strategic tool is seen as it performs many sales tasks and it is used as competitive tool to bring competitive advantage to an organization. Also, packaging is used to attract attention, describe a product, and make sale.

Firms are now realizing the influence of product packaging to ensure immediate consumer recognition of a product, company or brand (Kotler et al, 2005). Packaging plays a vital role in attracting consumers towards any product. Packaging is also used as the promotional tool for the companies and it includes: Color, material, designs & other characteristics. Packaging is the overall package offer by the company to its consumers and stimulates the impulse buying behavior. Packaging attracts consumers and increases its sale. It also reduces the marketing and advertisement cost of the product.

Previous researches show that there is no agreement on overall classification of packaging material and package elements. There is also disagreement regarding the methods of package impact on consumer's buying behavior decision. Several researchers attempt to examine all potential elements of packaging and their effect on consumer's buying decision (Butkeviciene, Stravinskiene, & Rutelione, 2008), however others focus on distinct elements of packaging and their influence on consumer purchasing behavior (Ampuero & Vila, 2006; Madden, Hewett, & Roth, M, 2000). Furthermore, some researchers explore the impact of packaging and its features on consumer's whole purchase decision (Underwood, Klein, & Burke, 2001), whereas, some others – on each step of consumer's decision-making process (Butkeviciene, Stravinskiene, and Rutelione, 2008). Therefore, this study will examine the impact on consumer buying behavior.

Statement of the Problem

Consumers nowadays are bombarded with too many marketing stimuli and clues by different companies in order to attract their attention. In this line, Keller (2008) maintains that consumers are exposed to more than 20,000 product choices within a 30-minute shopping session. This has made consumers to be more sophisticated in terms of their buying behavior. Improved technology and innovations are making consumers to be conscious of the products they are buying especially

aesthetics and others features of the product package. This has made producers to be on their toes as what applies to the consumers today might not apply to them tomorrow necessitating constant changes in the products packages.

Another major challenge that confronts producers today is the varying needs of different consumer groups. What appeal to a particular group of consumers might not appeal another consumer group and this makes the producers to be varying its packaging elements within its attendant cost implication. Against the aforementioned problems, this study examines the impact of product packaging on consumer buying behavior (A Study of Stanel Braed Awka, Anambra State)

Review of Related Literature
Conceptual Review
Packaging
Packaging can be defined as all the activities of designing and producing the container or wrapper of the product. The container is called package. Packaging is also pertains as a container a wrapper for a consumer product that serve as a number of purposes including protection and description of the contents, theft deterrence, and products promotion. Innovation and attractive packaging may actually add value to the product if it needs a consumer need such as portion controlee, recyclability, temper proofing, child proofing, easy open, easy store, easy carry and non-breakability.

However, the first to define packs as the "silent salesman" was Pilditch in 1957, who argued that the pack must come alive at the point of purchase, in order to represent the salesman (Vazquez et al., 2003). About 30 years later, Lewis (1991) expanded further on Pilditch's views, stating that "good packaging is far more than a salesman; it is a flag of recognition and a symbol of values". Given that only a small minority of brands are strong enough to justify the investment that national advertising requires, for the rest, packaging represents one of the most important vehicles for communicating the brand message directly to the target consumer (Nancarrow et al., 1998).

Olayinka and Aminu (2006) see packaging as all activities of designing and producing the container or wrapper for a product. Kotler (2003) defines packaging as all materials products used for the containment, protection, hard delivery and presentation of goods. Packaging is the protecting products for distribution, storage, sale and use, packaging also refers to the process of design evaluation and production of packages. Packaging can be described as a coordinated system of preparing goods for transport, warehousing information and sell. It is fully integrated into government business, institutional, industry, and personal use (Diana, 2005).

Packaging can be defined as an extrinsic element of the product. It is the container for a product (Wells, Farley and Armstrong, 2007). According to Williams (1982), packaging is part of the product which encloses and protects. It is the final stage of production. Packaging helps consumers to choose from a wide range of similar products; and that it also stimulates customers buying behaviour (Wells *et al*, 2007). Product packaging is an essential aspect of projecting a firm's brand's image, which is sometimes designed to convey images of high quality, while at other times signaling affordable price (Urich, Campana and Malkewitz, 2010). In the self-service world today, packaging has become a major communication medium from manufacturer or retailers to consumers (Williams, 1982). It communicates certain quality image to consumers. Packaging

influences consumers' perception for a particular product brand and consumers most times are attracted at first sight to the packaging style of a product (Lifu, 2012).

Packaging is considered as the fifth 'p' of marketing after product, price, promotion and place (Schrawet and Kundu, 2007 in Nayyar, 2012; Ladipo and Rahim, 2013); and as the fifth 'p' of marketing, Kotler (2000) cited in Nayyar (2012) defined packaging as the activities of designing and producing the container or wrapper for a product. This means that companies must monitor and change product packaging on a regular basis to ensure its continuous and increasing appeal to target audiences (Ladipo and Rahim, 2013; Oladele, 2012). Packaging design is therefore, an important issue in the growing use of packaging as a marketing tool for self-service, since 73% of products are sold on a self-service bases at the point of sale (Silayoi and Speece, 2004). Packaging plays a major role when products are purchased; after all, it is the first thing seen before making purchase choices (Kamaladevi, 2010).

The role of packaging as a medium for communication and branding is increasing in competitive markets for FMCG products. Packaging is the jar or a container or a protection for a product. Packaging includes the names and the brand names, brand logos, pictures of the product, different kinds of labels such as ingredients, manufacturing and expiry date, warnings, price, using method of the product, company name, company place etc. and the main function of the packaging is to easily and safely distribute the products. (Neeta & Sudha ,2014).

Producers have to build the applicable changes in product to satisfy the consumers need and differentiate them with their competitors. Innovation in a product measures some important factors for rising potency and effectiveness. (Noorani& Setty,2007). Because everyone want something new after a certain period of time and for this a company always keep changes its strategies and product designs, features, colors and sometime they add more flavors to that product line to engage the consumers towards that particular brand. Another research conducted by (Rundh,2005) he further explains the multifaceted dimensions and try to supply or provide smart tips for establishing a range between promoting tool & promoting supply.

Consumer Buying Behaviour

The consumer's buying behavior is the sum total of the attitudes, preferences and decisions regarding the purchasing of any product or service. The buying behavior of a consumer is the decision processes as well as the actions the consumer takes in buying and using products. Whether or not the consumer realizes it, there is far more that goes into the buying process than simply driving to the store and picking something off the shelf. There are mental and social processes that consumers go through that proceed the actual act of purchasing (Agyeman, 2014).

The topic of consumer behavior has been massively studied and, with the many changes in the market, continues to be studied by marketers and researchers. The areas of particular interest include the reasons behind the decision to purchase, the factors that influence purchasing patterns, and the ways in which cultural shifts are causing buying behavior to change.

Kotler and Keller (2011) point out that understanding how the consumer chooses products and consumers can provide manufacturers with a competitive advantage over competitors. Companies can use this information strategically in order to offer the right products and services at the right

time to the right audiences. The types of consumers buying behavior are determined by the level of involvement in the purchase decision, which is directly influenced by the level of need and the intensity of interest in a particular product. High involvement purchases include pricier items like cars, property, high priced goods, and products that are highly visible to others. Consumers are also more involved in purchases that involve greater risk, whether it is personal, social or economic risk.

Theoretical Framework

The Nicosia Model

In Nicosia (1969) view as cited in Goodhope (2013) a consumer is an individual who purchases, or has the capacity to purchase goods and services offered for sale by marketing institutions in order to satisfy personal or household needs, wants or desires. According to Schiffman and Kanuk (1987), the Nicosia focuses on the relationship between the firm and its potential consumers. The firm communicates with the consumers through its marketing messages (advertising) or inscriptions on the packaging and consumers also communicate with the firm been their purchase responses. The Nicosia model is interactive in design. Nicosia model is divided into four major fields (Schiffman and Kanuk, 1987; Goodhope, 2013) namely, the consumer's attitude based on the firm's message; search and evaluation; the act of purchase; and feedback. These fields are illustrated in a diagram as shown in figure 1.

The first field as depicted in figure 1involves the marketing environment, the marketing strategies like the communication efforts that affect consumer attitudes and consumer characteristics that mediate reception of the firm's promotional messages. The output of this field is an attitude towards the product based on the consumer's behaviour interpretation of the message. The second field which is the search and evaluation deals with the search for relevant information and evaluation of the firms brand in comparison with alternative brands. The output at this stage is motivation to purchase the firm's brand. Even though the model only illustrates a positive response of consumers, evaluation of a product could also lead to rejection of the firm's brand. The third field, which is the Act of purchase, deals with the actual purchase of the brand from a specific retailer based on the motivation gotten from the evaluation in field two. The fourth field which is the feedback stage contains two important types of feedback from the purchase experience. The first feedback is to the firm in form of sales data to indicate either good or bad signals. The second feedback is to the consumer in the form of experience gotten from the use of the product to signal satisfaction or dissatisfaction.

This study draws its assumptions from this model in that; packaging information and attributes are part of communication to consumers which the firms hope could influence consumers to patronize their product. Consumers in turn, are becoming sophisticate in their search for correct information that can aid their buying decisions.

Empirical Review

Oladele, Olowookere, Okolugbo and Adegbola (2023) examined product packaging as a predictive factor of consumer patronage of toothpaste in Ado-Ekiti, Nigeria. A total of 320 questionnaires were administered to respondents who were customers to eight most popular supermarkets through purposive sampling technique. Pearson-moment correlation analysis was used to determine the relationship between packaging information and patronage of toothpaste. Multiple regression was

used to determine the influence of packaging attributes on patronage of toothpaste. The result revealed that among packaging information available on toothpaste products, expiry date, NAFDAC number and nutritional composition had the strongest relationship with patronage. The packaging attributes with highest influence were quantity, quality, and colour. The study recommended that manufacturers should place on their products only relevant information that will influence purchase decision.

In Pakistan, Sadique, Saadat, Muhammad, Amna and Sayed, (2022) examined the impact of product packaging on consumer perception and purchase intention. The purpose of this study is to evaluate the influence of packaging over consumer buying behavior (consumer perception and purchase intention), and to observe how these factors effect consumer's decision of purchasing a product. The objective of this research is to find out those elements behind the success of product packaging. The target population for this research is the different places of the Pakistan. For getting the response 120 quantities questions were distributed and by using of the SPSS software to revile research result interpreting on the correlation ad regression analysis were made. The result shows that show that packaging are important element for the consumer buying behavior and communication information about the product.

Rizwan, Vishnu and Muhammad (2022) examined the impact of product packaging on consumer's buying behavior. The purpose of this research is to examine the essential factors, which are driving the success of a brand. This research also identified the relationship between the dependent and independent variables. This is the primary research and data has been collected through questionnaire and for analysis purpose SPSS software has been used. In this study samples of 150 respondents has been collected and tested the reliability of the model. According to the finding of the research study, it has been observed that the packaging is the most important factor. It is further concluded that the packaging elements like its Colour, Packaging material, Design of Wrapper and innovation are more important factors when consumers making any buying decision. Finally, it has also been concluded that the Packaging is one of the most important and powerful factors, which influences consumer's purchase decision.

Mahera, Sayeda, Sana and Muhammad (2020) examined the impact of product packaging on consumers buying behavior. This is the primary research and data has been collected through questionnaire and for analysis purpose SPSS software has been used. In this study samples of 300 respondents has been collected and tested the reliability of the model. According to the finding of the research study, it has been observed that the packaging is the most important factor. It is further concluded that the packaging elements like its color, Packaging material, Design of Wrapper and innovation are more important factors when consumers making any buying decision. Finally, it has also been concluded that the Packaging is one of the most important and powerful factors, which influences consumer's purchase decision.

Samreenlodhi (2020) carried out research on brand packaging and consumer buying behavior. The intention of this study is to determine that how does the package characteristics (color, size shape and labeling) influence on the consumer buying behavior in perspective of Detergents, soap, shampoo, milk and soft drinks. Research is conducted in Karachi; Pakistan. A structured questionnaire with likert scale is used to collect primary data. The data collected through survey was analyzed by using SPSS. It has been revealed that Packaging is the essential and significant

factor which largely persuades the consumer buying behavior. Package size, that is one of the utmost accessible and easy-to-process product cues to which customer are exposed, can have a significant impact on consumer buying pattern. It has also found that Labeling on the product could help consumers to make choices on the product to purchase and also teach them in what way to use product, its name, and price, content and appropriate information. Minor packaging material or dimension changes to the item do not significantly affect the buying pattern of consumer for products on the retail shelf. It deems that there is a 100% equal connection amongst consumer buying behavior and good quality of material used.

Gap in Literature

The literature reviewed revealed conflicting findings and this shows that the issue at hand is not yet resolved, hence the need to continue research effort in this direction. Similarly, no similar study has been conducted on consumer buying behavior Stanel Bread Awka, Anambra State, hence the need for this research.

Methodology

Research Design

This study adopted the survey research method. The research work was carried out in Stanel Bread Awka Anambra State**.** The researcher selected these areas because Stanel Bread Awka South in Anambra State.

Conclusion

The role of package has changed due to marketing environment and increasing changes in the consumer desires. Companies are interested in packaging as a tool to increase their sales and to reduce promotional costs. A good packaging helps to identify product to the consumers. The producers try to make packing original and in the way that it will satisfy consumers. Packaging is use for marketing communication purposes and they are the important element which influences the buying behavior of the individual. Through verbal and pictorial symbols packaging can inform the potential buyers about the content of product, property, usage, advantages and risks.

The study revealed that packaging colour, material and design has a significant impact on consumer buying behavior. Often the packaging is perceived to be part of the product and it can be difficult for consumers to separate the two. Aspects such as packaging color, material and design can influence how a product is perceived. It has also revealed that elements of packaging are the most important for consumer's purchase decision. For a major part of consumers' attraction was package design, colour and materials are the main visual elements. the study therefore concludes that's product packaging have positive impacts on consumer buying behavior.

Recommendations

The study recommended that the marketing and business units that they should pay proper attention for good packaging. If they accept or introduce the poor packaging then it could be one of the causes of product failure in the market. It is necessary to set the packaging standard and to implement strategy accordingly for better protection and promotion of a product. Product package designer should not sacrifice the strength and effectiveness of the product package for cost as the firm to gain immensely from them. Since colour, design and material are found to have significant impact on consumer buying behavior, the firm should plan better for package development that

would ensure that new package are actually improved upon especially in the area of colour, design and materials.

Abstract
The growing global emphasis on sustainability highlights the urgent need for universities, as centers of knowledge creation and dissemination, to embrace green knowledge utilization as a strategic pathway to resilience and reputation. Nigerian universities, however, demonstrate limited commitment to integrating green knowledge into research, curriculum, campus operations, and community engagement, thereby constraining their competitiveness in global rankings and their capacity to respond to environmental challenges. This study develops a strategic framework for leveraging green knowledge to enhance sustainable resilience and institutional reputation of Nigerian universities. Drawing on literature, case studies, and empirical evidence, the framework emphasizes five strategic pillars — Research and Innovation, curriculum and capacity building, campus sustainability and demonstration projects, industry and community engagement, and funding and international collaboration — as the core domains where green knowledge is generated and applied. Knowledge management and dissemination acts as a cross-cutting enabler, ensuring that what is developed in each pillar is captured, shared, and institutionalized. By channeling these pillars into robust systems of green knowledge utilization, universities can strengthen their adaptability to environmental and economic shocks, improve operational efficiency, and establish themselves as sustainability leaders. The study concluded that leveraging green knowledge not only enhances institutional resilience but also elevates the global visibility and reputation of Nigerian universities. The study therefore recommended the establishment of dedicated green research centers, integration of sustainability across curricula, demonstration projects on campuses, and partnerships with industries and international organizations. Ultimately, the proposed framework positions Nigerian universities to thrive in an era where sustainability, innovation, and resilience are central to global higher education excellence.

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Keywords: *Green knowledge, resilience, reputation, Nigerian universities, sustainability, strategic framework*

Introduction

Universities are universally regarded as engines of knowledge creation, dissemination, and application. In the twenty-first century, however, their mandate extends beyond traditional teaching and research to the urgent demand for sustainability, environmental stewardship, and global competitiveness (Leal Filho et al., 2018). Central to this transformative role is **green knowledge utilization** — the systematic acquisition, integration, and application of knowledge about sustainable technologies, eco-innovation, and environmentally friendly practices to advance institutional development and societal well-being (Dangelico & Pujari, 2010). When effectively leveraged, green knowledge strengthens **institutional resilience** — the capacity of universities to withstand, adapt, and thrive amid environmental, economic, and policy shocks —while simultaneously enhancing their **reputation** as credible global actors in higher education (Sterling et al., 2013).

Despite the global momentum toward sustainability-driven higher education, most **Nigerian universities demonstrate little or no meaningful commitment to green knowledge utilization**. Many campuses are characterized by outdated infrastructure, inefficient energy consumption, poor waste management systems, and a lack of structured policies for embedding sustainability into curricula and research (Okebukola, 2021; Akinsemolu, 2020). For example, renewable energy adoption in Nigerian universities remains minimal, with most institutions heavily reliant on diesel-powered generators, thereby contributing to greenhouse gas emissions and escalating operational costs (Ikuenobe, 2020). Similarly, university research in Nigeria has remained largely disconnected from green technological innovation, resulting in missed opportunities to contribute to national and global sustainability agendas (Sambo, 2019). This weak integration of sustainability practices not only undermines institutional resilience in the face of climate, economic, and infrastructural challenges but also diminishes the international reputation of Nigerian universities compared to their global counterparts (Leal Filho et al., 2022).

Globally, universities are redefining their identity around sustainability benchmarks. Institutions across Europe, North America, and parts of Asia have embraced green campuses, renewable energy projects, eco-friendly curricula, and sustainability rankings as a means of enhancing resilience and global standing (Findler et al., 2019). In contrast, the **absence of a coherent strategic framework** for green knowledge utilization in Nigerian universities has perpetuated structural fragility, poor adaptation to global sustainability trends, and reputational decline in global ranking systems. Nigerian universities' limited engagement with sustainability-oriented innovations undermines their ability to attract international partnerships, research funding, and global recognition (Oguntona et al., 2021).

This study, therefore, seeks to address this pressing gap by developing **a strategic framework for leveraging green knowledge to foster sustainable resilience and reputation of Nigerian universities**. By situating green knowledge utilization at the core of institutional development, the study aspires to reorient universities in Nigeria toward sustainable practices that are not only

environmentally responsive but also strategically aligned with enhancing competitiveness, societal impact, and global relevance. The significance of this inquiry lies in its potential to provide actionable insights into how Nigerian universities can reposition themselves as sustainability-driven institutions that inspire resilience, cultivate credibility, and contribute meaningfully to the attainment of both national development goals and global sustainability targets.

The Concept of Green Knowledge

The concept of **green knowledge** has emerged as an important construct in sustainability discourse, knowledge management, and organizational development. Broadly, green knowledge refers to the collection of ideas, skills, techniques, and practices aimed at minimizing environmental harm, promoting resource efficiency, and advancing sustainable development goals (Chen & Chang, 2013). It encompasses both explicit knowledge (documented strategies, technological innovations, scientific findings) and tacit knowledge (skills, experiences, and values) related to environmental protection and eco-innovation (Tseng et al., 2013).

The utilization of green knowledge is crucial for building institutional resilience and global reputation. For universities, it provides a pathway to reduce ecological footprints, optimize resources, and align with international sustainability rankings (Leal Filho et al., 2019). Green knowledge also enables innovation, allowing institutions to develop eco-friendly curricula, research projects, and community outreach programs that position them as leaders in sustainability education (Findler et al., 2019).

In the Nigerian context, where universities often struggle with infrastructural inefficiency, energy dependence on fossil fuels, and inadequate waste management, leveraging green knowledge represents a strategic opportunity to address both operational challenges and reputational deficits (Akinsemolu, 2020). Without systematic acquisition and utilization of green knowledge, Nigerian universities risk lagging behind global peers in sustainability-driven education and research.

The Concepts of Sustainable Resilience and Reputation

The concepts of **sustainable resilience** and **reputation** have become central in organizational studies, particularly for universities and other knowledge-based institutions. In today's volatile social, economic, and environmental environment, institutions are increasingly expected to demonstrate resilience that is not only adaptive but also sustainable, while simultaneously cultivating a reputation that reflects credibility, responsibility, and long-term value.

Resilience traditionally refers to an organization's capacity to absorb shocks, adapt to disruptions, and recover effectively from crises (Lengnick-Hall et al., 2011). However, the notion of **sustainable resilience** extends beyond short-term recovery; it emphasizes *long-term adaptive capacity, resource efficiency, and the integration of environmental and social sustainability in organizational continuity* (Duchek, 2020). **Hillmann and Guenther (2021)** define sustainable resilience as *the enduring ability of organizations to adapt to continuous challenges and disruptions while safeguarding ecological balance, social systems, and long-term performance.* **Annarelli and Nonino (2016)** argue that resilience becomes sustainable when it integrates proactive learning, green innovation, and stakeholder engagement to ensure future-oriented adaptation.

In universities, sustainable resilience means building systems and cultures that can withstand environmental, financial, and societal pressures while continually advancing teaching, research, and community service. For Nigerian universities, this involves addressing infrastructural weaknesses, energy challenges, and governance gaps through knowledge-driven, eco-conscious practices (Akinsemolu, 2020).

Reputation is generally understood as the collective perception of an institution's credibility, integrity, and performance held by its stakeholders. In organizational literature, reputation is considered a critical intangible asset that determines trust, legitimacy, and competitiveness (Fombrun & van Riel, 2004). **Fombrun (1996)** defines reputation as *the overall estimation in which an organization is held by its constituents, based on its past actions and future prospects.* **Walker (2010)** views reputation as *stakeholders' collective judgments about a firm's ability to deliver value consistently over time.* In the higher education context, **Dill and Soo (2005)** argue that reputation is a measure of academic quality, research excellence, and social responsibility as perceived by students, employers, government, and the global community.

Reputation in universities is closely tied to sustainability commitments. Institutions that integrate green knowledge, ethical governance, and innovative research gain not only stakeholder trust but also global recognition (Findler et al., 2019). Nigerian universities, however, often face reputational challenges stemming from underfunding, poor sustainability practices, and limited international visibility (Olayiwola, 2021).

Interconnection between Sustainable Resilience and Reputation

The link between sustainable resilience and reputation is both direct and reinforcing. Universities that adopt sustainable resilience strategies such as renewable energy systems, green curricula, and eco-friendly campus management signal long-term stability and responsibility to stakeholders. This, in turn, strengthens their reputation as forward-looking, socially responsible institutions (Leal Filho et al., 2019). Conversely, reputational capital can enhance resilience by attracting partnerships, funding, and talent that equip institutions to adapt to crises and remain competitive. Thus, for Nigerian universities, **leveraging green knowledge is a strategic pathway to achieving both sustainable resilience and enhanced reputation.**

Conceptual Framework

The Conceptual framework (Figure 1) shows how the five **strategic pillars** feed into **Knowledge Management and Dissemination**, which then flows into the ultimate goal of **Enhancing Institutional Resilience and Reputation**. The **Five Strategic Drivers (Pillars)** - Research and Innovation, Curriculum and Capacity Building, Campus Sustainability and Demonstration Projects, Industry and Community Engagement, and Funding and International Collaboration, represent the core domains where Green Knowledge is generated and applied. Knowledge Management and Dissemination acts as a cross-cutting enabler, ensuring that what is developed in each pillar is captured, shared, and institutionalized. All drivers and enablers contribute to the **ultimate goal** of enhancing institutional resilience and reputation of Nigerian universities.

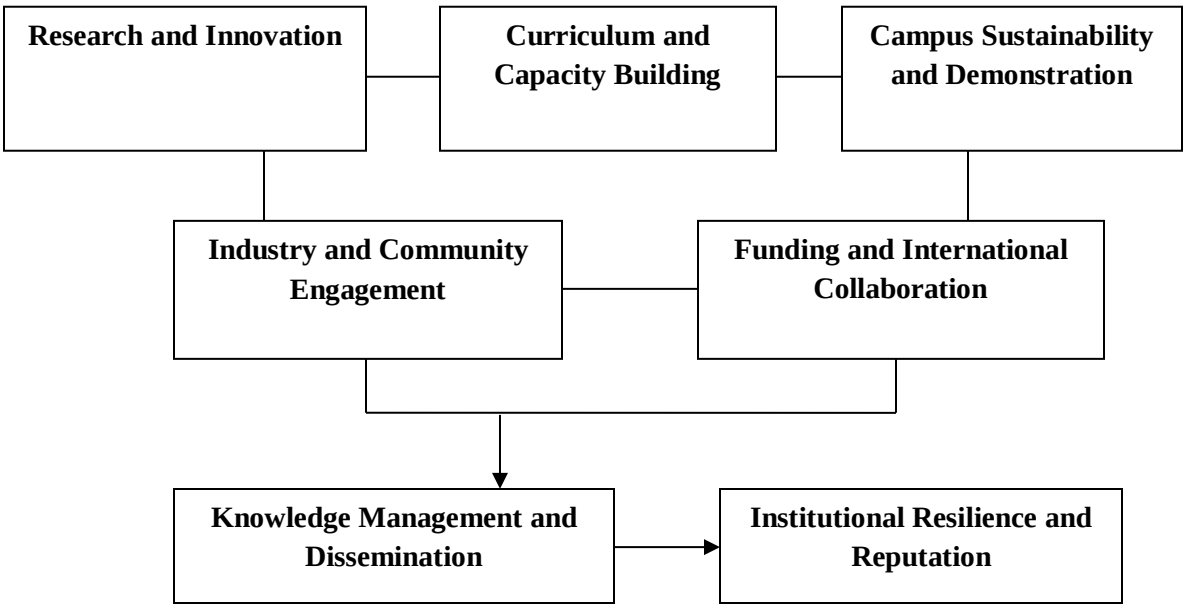

Figure 1: The **Strategic Framework of** Green Knowledge, Sustainable Resilience and Reputation of Nigerian Universities
Source: Conceptualized from Literature

Theoretical Foundation: Knowledge-Based Theory (KBT)
The **Knowledge-Based Theory** posits that knowledge is the most strategically significant resource for organizations, surpassing traditional physical or financial assets in driving sustainable competitive advantage (Grant, 1996). Rooted in the Resource-Based View (RBV), **KBT** emphasizes that organizations achieve long-term success by effectively creating, integrating, and applying knowledge (Nonaka & Takeuchi, 1995). Unlike tangible resources, knowledge is complex, socially embedded, and often tacit, making it difficult for competitors to imitate, thereby providing institutions with a unique basis for differentiation (Spender & Grant, 1996).

In the context of higher education, particularly Nigerian universities, **KBT** provides a compelling lens for analyzing how **green knowledge** can be strategically mobilized to enhance institutional resilience and reputation. Green knowledge, encompassing sustainability research, environmental management practices, and climate-conscious innovations, represents a specialized domain of knowledge that can be leveraged for academic excellence and global competitiveness (Del Giudice & Maggioni, 2014). By embedding this knowledge into curricula, research outputs, community engagement, and campus sustainability projects, universities not only contribute to environmental stewardship but also position themselves as knowledge leaders in sustainable development.

Furthermore, **KBT** explains the importance of **knowledge dissemination and integration** across stakeholders — students, faculty, industry partners, and policymakers. When universities serve as hubs of green knowledge creation and transfer, they strengthen their institutional resilience against external shocks such as energy crises, regulatory demands, and environmental risks (Sirmon &

Hitt, 2009). At the same time, consistent contributions to sustainability-oriented scholarship and innovation enhance global visibility, improve rankings, and build reputational capital.

Thus, **KBT** forms the theoretical foundation for this study by framing **green knowledge as a core intangible resource** that, when effectively managed, underpins the strategic framework for achieving sustainable resilience and reputation in Nigerian universities.

Research and Innovation

Research and Innovation represents a vital pathway through which universities can leverage green knowledge to strengthen sustainability, resilience, and reputation. Central to this approach is the establishment of **green research centers** that prioritize problem-driven inquiries into renewable energy, waste management, sustainable agriculture, and the circular economy. Such centers not only serve as hubs for generating innovative solutions but also facilitate interdisciplinary collaboration, bringing together experts from engineering, environmental science, and social sciences to design technologies that address ecological and socio-economic challenges (El-Kassar & Singh, 2019). In the Nigerian context, universities can significantly contribute to reducing dependence on fossil fuels by conducting applied research on solar, wind, and bioenergy technologies, while also advancing sustainable agricultural practices to mitigate food insecurity (Onyechi et al., 2021).

Another important strategy is **collaborative research and development (R&D)**. Partnerships with industries such as oil and gas, energy firms, and manufacturing companies are crucial for co-developing context-specific green technologies. Collaborative R&D ensures that innovations are not only academically relevant but also practically adaptable to industrial operations, thus fostering a mutual exchange of knowledge and resources (Etzkowitz & Zhou, 2017). For instance, joint projects between universities and energy companies could focus on technologies that reduce carbon emissions, improve energy efficiency, and support Nigeria's energy transition agenda. Such collaborations strengthen the relevance of universities in national development, while positioning them as credible contributors to climate solutions.

Furthermore, the **commercialization of green research through patents and startups** is critical for translating knowledge into societal impact. Universities can institutionalize frameworks for intellectual property (IP) management, ensuring that inventions are patented and deployed as spin-offs or startups. These enterprises can generate revenue for institutions while offering employment opportunities and scalable solutions to environmental challenges (Guerrero et al., 2016). For example, a university-based startup that develops affordable solar-powered water purification systems could simultaneously tackle issues of energy poverty and public health. By fostering entrepreneurship, universities enhance their societal reputation as innovation leaders committed to sustainability. In essence, Research and Innovation enables universities to operationalize green knowledge, linking scholarship to tangible solutions that reinforce resilience and global standing.

Curriculum and Capacity Building

The integration of **curriculum and capacity building** into university systems is a critical strategy for leveraging green knowledge to promote sustainable resilience and reputation. A **green-oriented curriculum** forms the foundation by embedding courses on green technologies, environmental management, and sustainability studies across various faculties. Such integration

ensures that sustainability is not confined to environmental sciences alone but becomes a cross-cutting theme in disciplines such as engineering, business, law, and social sciences (Lozano et al., 2017). For Nigerian universities, embedding sustainability into mainstream programs helps produce graduates with the technical and ethical competencies required to address pressing environmental challenges while aligning with global sustainability agendas such as the United Nations Sustainable Development Goals (SDGs) (United Nations, 2015).

Beyond curriculum integration, **practical training and experiential learning** are essential for equipping students with hands-on expertise. Universities can organize workshops, professional certifications, and field-based projects on areas such as clean energy deployment, eco-design, sustainable agriculture, and carbon management. These initiatives not only strengthen students' employability but also encourage innovation and entrepreneurship in the green sector (Asonitou & Hassall, 2019). For instance, structured training on solar energy systems or waste-to-energy conversion can provide students with industry-relevant competencies that are immediately applicable within Nigeria's evolving energy landscape. Such skill development further reinforces institutional reputation by demonstrating universities' responsiveness to national and global sustainability needs.

Equally important is **interdisciplinary teaching**, which integrates perspectives from science, engineering, business, and social sciences to cultivate graduates capable of delivering holistic green solutions. Addressing complex sustainability challenges such as climate adaptation, energy transition, and waste reduction requires knowledge that transcends disciplinary silos (Stephens et al., 2008). For example, while engineers may design renewable energy systems, business scholars can develop financial models for their commercialization, and social scientists can assess community acceptance. Universities that adopt this interdisciplinary approach foster innovation ecosystems that are resilient, adaptable, and globally competitive.

Thus, by embedding green knowledge into curricula, promoting practical training, and encouraging interdisciplinary teaching, Nigerian universities can strengthen their capacity to produce environmentally conscious leaders and innovators. This transformation not only advances sustainability but also enhances institutional resilience and global reputation.

Campus Sustainability and Demonstration Projects

Campus sustainability and demonstration projects provide universities with visible and practical opportunities to embed green knowledge while simultaneously reducing operational costs and enhancing institutional reputation. **Green campus initiatives** are at the forefront, involving the integration of renewable energy systems, energy-efficient infrastructures, and sustainable resource management practices. For instance, the deployment of solar rooftop panels, biogas plants for organic waste conversion, and rainwater harvesting systems can significantly reduce reliance on non-renewable resources while fostering environmental stewardship among students and staff (Li et al., 2019). Universities adopting energy-efficient buildings and water recycling systems not only minimize ecological footprints but also position themselves as leaders in sustainability transitions, thus strengthening resilience against resource scarcity.

Moreover, universities can transform their campuses into **living laboratories** (living labs), where students, researchers, and industry partners experiment with innovative green technologies in real-

time. This approach creates immersive educational experiences, allowing learners to engage with sustainability beyond theory. For example, monitoring solar microgrids, testing eco-friendly construction materials, or piloting waste-to-energy systems within the campus provides valuable insights into the practicalities of large-scale adoption (Evans et al., 2015). Such demonstration projects also contribute to research outputs, patents, and partnerships, reinforcing the university's reputation as a hub for innovation and sustainable knowledge generation.

Additionally, **resource optimization strategies** on campus can yield both environmental and economic benefits. Practices such as adopting energy-efficient lighting and **Heating, Ventilation, and Air Conditioning systems** (HVAC) systems, recycling e-waste, and promoting smart mobility solutions like electric shuttle buses or bicycle-sharing programs help universities lower their operational expenditures while reducing carbon emissions (Sedlacek, 2013). These measures enhance financial sustainability by cutting utility bills and waste management costs, enabling universities to redirect resources toward research and teaching.

By embedding sustainability into their physical and operational infrastructure, Nigerian universities can create vibrant demonstration models that inspire both internal stakeholders and external communities. Such projects showcase how higher education institutions can lead societal transitions toward green economies while simultaneously building resilience and enhancing reputation at national and global levels.

Industry and Community Engagement

Industry and community engagement plays a critical role in leveraging green knowledge for institutional resilience and societal impact. Universities serve as vital intermediaries in transferring sustainability-oriented innovations to industries and communities, ensuring that research transcends academic boundaries. Through **knowledge transfer partnerships (KTPs)**, higher education institutions can collaborate with industries such as oil and gas, agriculture, and manufacturing to co-develop context-specific sustainable technologies. For instance, sharing research outcomes on renewable energy systems, eco-friendly industrial processes, and waste-to-energy models helps industries adopt greener practices while strengthening the universities' reputation as key contributors to sustainable development (Gallo et al., 2018).

Beyond industry linkages, **community outreach initiatives** are essential in empowering local populations with practical green skills. Universities can organize awareness programs and capacity-building workshops to promote waste recycling, sustainable agriculture, and clean cooking technologies, particularly in underserved rural areas (Okpara et al., 2021). Such initiatives not only contribute to environmental conservation but also improve community livelihoods, fostering trust and mutual collaboration between universities and their host communities. By acting as catalysts for grassroots-level behavioral change, universities strengthen their social relevance and build resilience through positive societal engagement.

Furthermore, universities can play a **policy advisory role** by offering evidence-based insights to government agencies, non-governmental organizations (NGOs), and international bodies. Research-driven policy briefs on issues such as climate change mitigation, renewable energy adoption, and circular economy strategies can guide national and regional decision-making (Sedlacek, 2013). This advisory capacity enhances the visibility of universities in shaping

sustainable development frameworks and positions them as authoritative voices in addressing pressing environmental challenges.

Collectively, these engagement strategies enable universities to extend the impact of their green knowledge utilization beyond academia. By fostering stronger partnerships with industries, empowering communities with sustainable practices, and influencing environmental policymaking, Nigerian universities can enhance institutional resilience and reputation. Such active involvement also ensures that green research translates into tangible societal benefits, reinforcing the university's role as a transformative force in the transition toward a sustainable future.

Funding and International Collaboration

Securing adequate funding and fostering international collaboration are essential strategies for universities seeking to leverage green knowledge for resilience and reputation. Access to financial and intellectual resources enhances the ability of Nigerian universities to invest in innovative research, sustainable campus projects, and community-driven initiatives. By aligning their research with global sustainability agendas, universities can **attract grants** from international organizations such as the United Nations Environment Programme (UNEP), the World Bank, and the European Union (EU). These organizations prioritize funding for projects focused on renewable energy, climate adaptation, and the circular economy, providing universities with both financial support and global visibility (World Bank, 2020; UNEP, 2021).

International collaboration also manifests through **exchange programs and partnerships with global universities**. Such collaborations allow for the transfer of knowledge, expertise, and technology, equipping students and faculty with cutting-edge skills in sustainable development. Joint research projects on topics such as clean energy transitions, carbon reduction technologies, and sustainable agriculture not only broaden academic horizons but also amplify the global relevance of Nigerian universities (Altbach & de Wit, 2018). These partnerships enhance institutional capacity, improve research output, and promote cross-cultural competencies critical for tackling complex environmental challenges.

Additionally, universities can engage in **public-private partnerships (PPP)** to fund green initiatives. Corporations are increasingly investing in sustainability to align with global environmental standards and enhance corporate social responsibility (CSR). Universities can leverage this trend by offering corporations opportunities to co-finance green projects, sponsor research chairs, or establish innovation hubs. In return, industries benefit from access to specialized research outcomes, innovative solutions, and a pool of graduates skilled in green technologies (Agrawal & Cockburn, 2018). Such collaborations create a win-win dynamic that fosters both economic and environmental value.

In essence, funding and international collaboration provide the financial stability, global expertise, and industry linkages necessary for universities to drive sustainable innovation. By strategically pursuing grants, partnerships, and PPPs, Nigerian universities can strengthen their capacity to contribute meaningfully to environmental sustainability, enhance institutional resilience, and build a strong international reputation.

Knowledge Management and Dissemination (KMD)

Knowledge management and dissemination serve as critical enablers for embedding green knowledge within universities and ensuring its transformation into practical outcomes that benefit both academia and society. Universities can develop **digital knowledge platforms**, such as online repositories and open-access databases, to store and share information on renewable energy, waste management, carbon reduction, and other sustainability practices. These platforms enhance accessibility for students, faculty, policymakers, and industry stakeholders, promoting a culture of evidence-based decision-making and innovation (Nonaka & Takeuchi, 1995; Rowley, 2000). By digitizing and centralizing green knowledge, universities also improve transparency, foster interdisciplinary collaboration, and support continuous learning.

Another important mechanism is the **organization of conferences and publications** focused on green innovation. Hosting sustainability-themed academic conferences and publishing research in high-impact journals provides visibility to Nigerian universities in the global academic community. These platforms not only allow for the dissemination of locally relevant solutions but also attract global collaborations and funding. According to Etzkowitz and Leydesdorff's (2000) Triple Helix model, such interactions between academia, industry, and government strengthen innovation ecosystems, which are essential for addressing environmental challenges.

Additionally, **alumni engagement** offers universities a powerful channel for knowledge dissemination. Alumni working in industries such as energy, agriculture, and manufacturing serve as ambassadors of green technologies developed within universities. By leveraging alumni networks, universities can extend the application of research outcomes into real-world contexts, thereby strengthening their societal relevance and institutional reputation (Clark, 2018). Alumni-led mentorship programs and collaborative projects can further bridge the gap between academic research and industry practice.

In essence, effective **KMD** ensure that green knowledge does not remain confined to academic institutions but is actively applied in solving societal and environmental problems. By investing in digital platforms, academic publishing, conferences, and alumni networks, Nigerian universities can amplify the reach and impact of their green innovations. This, in turn, enhances institutional resilience, strengthens international reputation, and positions universities as key drivers of sustainable development.

Institutional Resilience and Reputation

The adoption of green knowledge utilization positions universities as dynamic institutions capable of adapting to global challenges while enhancing their reputation. Globally, **university rankings increasingly integrate sustainability metrics**, such as the Times Higher Education Impact Rankings, which evaluate institutions based on their contributions to the United Nations Sustainable Development Goals (SDGs). Nigerian universities that actively implement green research, campus sustainability projects, and knowledge dissemination can improve their visibility in such indices, thereby enhancing international recognition and competitiveness (Waas et al., 2011; Times Higher Education, 2023). This not only strengthens academic reputation but also makes these universities attractive to international students, staff, and partners.

Institutional resilience is also enhanced through **reduced vulnerability to energy shocks, rising costs, and regulatory pressures**. By embedding renewable energy systems, waste management strategies, and sustainable procurement practices, universities can lower operational costs and ensure continuity in the face of environmental and economic uncertainties (Leal Filho et al., 2019). Moreover, as governments introduce stricter climate-related regulations, universities that proactively adopt green solutions will demonstrate compliance readiness, thereby minimizing risks and positioning themselves as models of institutional adaptability (Elkington, 1997).

In addition, green knowledge utilization strengthens **branding as sustainability leaders**. Universities that project themselves as environmentally responsible attract students who are increasingly sustainability-conscious, researchers seeking collaborative platforms, and donors or investors prioritizing sustainable development (Velazquez et al., 2006). Such branding fosters long-term legitimacy, giving universities a competitive edge both locally and globally. In the Nigerian context, where universities often struggle with reputational challenges due to funding and infrastructural limitations, aligning with sustainability agendas offers a unique opportunity to redefine institutional identity and influence (Adenle, 2020).

Overall, institutional resilience and reputation are mutually reinforcing outcomes of leveraging green knowledge. By aligning sustainability practices with teaching, research, and community engagement, Nigerian universities can achieve long-term adaptability, global recognition, and a strong competitive brand, thereby establishing themselves as pivotal actors in advancing national and international sustainability goals.

Case Studies and Empirical Evidence: How Five the Strategic Pillars Drive Knowledge Management for Institutional Resilience and Reputation

Knowledge Management and Dissemination (KMD) acts as the connective tissue that links research, teaching, campus initiatives, partnerships, and funding into outcomes that enhance institutional resilience and reputation. Effective Knowledge Management and Dissemination transforms fragmented initiatives into a coherent framework, ensuring that green knowledge does not remain siloed but is translated into tangible institutional and societal benefits.

1. Research and Innovation: Empirical evidence shows that research centers dedicated to sustainability significantly expand a university's knowledge base. For instance, the *University of Cape Town* established the African Climate and Development Initiative, which produces interdisciplinary research and disseminates findings to policymakers and industries across Africa (Ziervogel et al., 2016). Knowledge repositories and publications emerging from such initiatives strengthen resilience by equipping universities with evidence-based tools to adapt to environmental and economic shocks while elevating their reputation in global sustainability rankings.

2. Curriculum and Capacity Building: Integrating green-oriented curricula feeds into Knowledge Management and Dissemination by producing graduates who act as knowledge carriers. The ***University of Ibadan's Centre for Sustainable Development*** demonstrates this through its sustainability-focused postgraduate programs, which disseminate green knowledge into diverse sectors of the Nigerian economy (Adenle, 2020). Empirical studies affirm that curricula

aligned with sustainability significantly enhance institutional legitimacy and stakeholder trust (Lozano et al., 2015).

3. Campus Sustainability and Demonstration Projects: Universities that transform their campuses into living labs embed experiential knowledge into their Knowledge Management and Dissemination frameworks. For example, ***Arizona State University*** pioneered solar energy deployment on its campuses, using data-driven case studies as teaching material while disseminating operational lessons globally (Crow & Dabars, 2015). Such initiatives not only reduce operational costs but also brand universities as green leaders, reinforcing resilience and reputation.

4. Industry and Community Engagement: Knowledge transfer partnerships amplify dissemination by bridging academia and practice. The ***University of Nairobi*'s** collaboration with local farmers to develop climate-resilient agriculture demonstrates how co-created knowledge is shared beyond academia, enhancing both community resilience and the university's role as a sustainability hub (Makate et al., 2019). Engaging communities ensures knowledge flows in multiple directions, reinforcing adaptability and institutional trust.

5. Funding and International Collaboration: Access to global funding and exchange programs enriches KMD systems by diversifying knowledge inputs and outputs. For example, through Horizon 2020, several European universities created open-access digital platforms for green innovations, strengthening international reputation and cross-border resilience (European Commission, 2020). In the Nigerian context, partnerships with UNEP and the World Bank can support digital repositories that make universities key knowledge brokers in regional sustainability transitions.

Collectively, these five pillars feed into **KMD**, creating a virtuous cycle where knowledge is generated, stored, shared, and applied. This cycle enhances institutional **resilience** by equipping universities with adaptive capacities and **reputation** by positioning them as sustainability leaders in global academia. Without robust **KMD** structures, the benefits of these pillars remain fragmented and fail to translate into broader legitimacy and recognition.

Summary

The pursuit of sustainable development within Nigerian universities demands more than isolated initiatives; it requires a coherent strategic framework that positions green knowledge as both a driver of resilience and a catalyst for global reputation. Through the **five interlocking pillars** of research and innovation, curriculum and capacity building, campus sustainability, industry and community engagement, and funding and international collaboration, universities can create a dynamic ecosystem where knowledge is not only generated but effectively disseminated and applied.

Research and innovation hubs generate context-specific solutions, while green-oriented curricula and interdisciplinary training equip graduates as ambassadors of sustainability. Campus demonstration projects transform institutions into living laboratories, embedding green practices into daily operations and institutional culture. Partnerships with industry and communities extend the impact of university knowledge into society, while global collaborations and funding networks

expand capacity and legitimacy. At the heart of this framework is **KMD**, which integrates insights, practices, and innovations into accessible platforms, publications, and networks, ensuring knowledge is shared, adopted, and scaled.

By operationalizing these pillars through robust **KMD** systems, Nigerian universities can achieve **institutional resilience**, safeguarding against environmental, economic, and regulatory disruptions, while simultaneously elevating their **reputation** as global leaders in sustainability. This strategic framework therefore positions universities not just as centers of learning, but as transformative agents of green transition, capable of shaping national development, influencing policy, and commanding recognition in the competitive global academic landscape.

Conclusion

Based on the insights drawn from the reviewed literature, this study concludes that **leveraging green knowledge is central to building sustainable resilience and enhancing the global reputation of Nigerian universities**. The evidence underscores that most Nigerian universities have historically shown little or no structured commitment to green knowledge utilization, thereby limiting their competitiveness in global sustainability rankings and weakening their capacity to withstand environmental, economic, and regulatory shocks.

The proposed strategic framework, anchored on **Research and Innovation, Curriculum and Capacity Building, Campus Sustainability and Demonstration Projects, Industry and Community Engagement, and Funding and International Collaboration**, demonstrates that these pillars converge through effective **KMD** to drive resilience and reputation. Universities that embed this framework will not only reduce operational risks and costs but will also position themselves as leaders in sustainability, attract international collaborations, and serve as catalysts for national green transition.

The study therefore affirms that Nigerian universities can no longer remain passive in the global sustainability discourse. To remain resilient, competitive, and reputable, they must actively embrace green knowledge utilization as a strategic imperative that transforms them from traditional centers of learning into **agents of sustainable development and innovation leadership**.

Recommendations

To transform Nigerian universities into hubs of sustainability leadership, capable of building institutional resilience and achieving global recognition, this study proposes the following recommendations.

1. **Institutionalize Green Knowledge Utilization:** Nigerian universities should formally embed green knowledge into their strategic plans, governance structures, and daily operations. Establishing sustainability offices or green innovation councils will help coordinate research, curriculum, and campus initiatives.
2. **Strengthen Research and Innovation Capacity:** Universities should create Green Research Centers focused on renewable energy, waste management, circular economy, and sustainable agriculture. Incentivizing staff and students to publish in high-impact journals and pursue patents will enhance global competitiveness.

3. **Reform Curriculum and Expand Capacity Building:** A green-oriented curriculum should be mainstreamed across all faculties. Interdisciplinary programs that merge science, engineering, management, and social sciences will prepare graduates with holistic skills for sustainability leadership. Practical workshops and certifications in clean energy, eco-design, and carbon management should complement classroom learning.
4. **Adopt Campus Sustainability Projects as Living Labs:** Universities should implement **demonstration projects** such as solar rooftops, water recycling systems, and waste-to-energy plants. These initiatives not only cut costs but also serve as living laboratories where students and researchers engage in real-world sustainability experiments.
5. **Deepen Industry and Community Engagement:** Through knowledge transfer partnerships, universities should support industries in adopting green technologies while promoting sustainable practices in surrounding communities. By positioning themselves as policy advisors, universities can influence government and NGO sustainability policies.
6. **Expand Funding and International Collaboration:** Nigerian universities must aggressively pursue grants from international organizations such as UNEP, the World Bank, and the EU. Building global academic partnerships and engaging in public-private partnerships (PPP) with corporations can provide sustainable funding streams for green projects.
7. **Enhance Knowledge Management and Dissemination:** Universities should develop digital green knowledge repositories, host annual sustainability conferences, and leverage alumni networks in industries for wider dissemination and application of green technologies.
8. **Leverage Green Practices for Resilience and Reputation:** By aligning with global sustainability indices, Nigerian universities can strengthen their international rankings and branding. This positioning will attract more students, researchers, and funding opportunities, ultimately reinforcing resilience and reputation in a competitive academic environment.

The implementation of these recommendations will enhance the sustainable resilience capacity of Nigerian universities, move them beyond rhetoric to green compliant, and make them **agents of sustainable development and innovation leadership**.

Abstract
Nigeria is ranked among countries with rising rate of unemployment. Attempting to mitigate graduate unemployment for the smart economy, higher education institutions now prioritize the topic of employability by deploying various teaching and learning strategies. Experiential learning methods such as field trip, case analysis, research project writing, seminars, internship, and simulations stand out among the learning strategies. However, whether these methods are capable of equipping marketing graduates in Nigeria for the world of work in the smart economy remains a puzzle as there is a growing difficulty among these graduates to secure top marketing positions in corporate organizations. Underpinned by the Experiential Learning Theory and the Competence-Based approach, this study deployed the dual-method research approach, involving newspaper content analysis, and qualitative survey of industry experts to close the identified literature gaps. First, 18 entry-level marketing graduate employability skills were identified with digital marketing skill, communication skill, knowledge of the product, research/data management and negotiation skills emerging as the first five. Furthermore, findings indicate that the experiential learning modes are capable of building the employability skills. The study makes theoretical, practical and social contributions, and provides several directions on how to achieve sustainable development in the smart economy by suggesting ways to deploy quality education to reduce marketing graduate unemployment.

Keyword: *Experiential learning; Marketing graduate; Employability skills; Competence-Based approach; Smart economy*

Introduction

Graduate employability is an issue of great concern to higher education institutions (HEIs) and their stakeholders, especially in transiting economies such as Nigeria. Being a key performance indicator when demonstrating institutional success, it has continued to attract researchers' attention

(Chadha & Tomer, 2017). HEIs recognize that there are concerns around catering effectively for the employment of their graduates and have taken up the challenge (Rosenberg et al., 2012) by prioritizing the topic of employability in strategic agenda (Akkerman et al., 2013). They deploy different teaching and learning strategies which aim to make students employment-ready on graduation. Experiential learning methods such as field trip, case analysis, research project, seminars, internship, and simulations stand out among the learning strategies (Agu et al., 2015; Patiar, 2018; Stoddard, 2009). However, there is still growing concerns about the suitability of graduates for employment (Collet et al, 2015), more especially in the modern and digital-driven global economy, thereby raising doubts about the effectiveness of these teaching methods in meeting employers' need (Heffernan et al., 2020; Gregorio et al., 2019).

Research shows there exists a significant difference between the perception of students and employers regarding employability skills (Chithra & Banumati, 2014), and a disconnection between what employers are seeking and what universities are including in curricula to promote graduates' job readiness (Collet et al., 2015; Patiar, 2018). Thus, scholars have called for a re-examination of the effectiveness of the teaching modes and curricula in Nigerian tertiary institutions (Agu, 2021; Ogwo et al., 2019; Okpara & Agu, 2017), and particularly, management science disciplines. Closing the gap between employers' needs and the quality/type of skills graduates possess remains relevant, especially in developing economies such as Nigeria where graduate unemployment is on the increase (see National Bureau of Statistics, 2018). Preparing the students for the world of work and fitting their skills to the demands of employers becomes imperative (Agu et al., 2015; Suleman, 2018), more so, in a post-pandemic era where employment issues have worsen.

There is no consensus yet among scholars on what constitutes employability and employability skills (Romgens et al., 2019; Suleman, 2016). Scholars proffer different but related explanations on the concepts, and approach employability skills from the multi-dimensional process which is an aspect of the competence-based view (Romgens et al., 2019). Thus, scholars believe that employability skills vary across countries, disciplines and industries (Collet et al., 2015; Yusof et al., 2012). Therefore, arguing from the context- and industry-specific perspectives of employability, this study attempts to conceptualize and explore the relevant entry-level employability skills for marketing graduates in an economy that is transiting to the smart staus, and the roles of various experiential learning modes in developing them.

The specific research questions are: (1) What entry-level skills do employers require of marketing graduates currently in Nigeria? (2) To what extent do universities adopt relevant experiential learning modes (specifically, field trip, case analysis, research project, seminars, internship, and simulations) in teaching/training their marketing students? (3) How effective are the experiential learning modes in building the required employability skills?

The Problem

Although scholars emphasize the need for graduates to possess generic skills - skills which can be used across a large number of different occupations (Gainer, 2002; Kearns, 2001), context-specific skills are very relevant to graduate employability in specific industries (Cheng et al., 2021; Higdon, 2016). Research that identifies employability skills for engineering, law, technical, general business, and agricultural students exist (Buntat et al., 2013; Newbery-Jones, 2015; Yusof et al.,

2012). Studies on marketing graduates in the Western world have also been published (Divan et al., 2019; Gregorio et al., 2019; Heffernan et al., 2020; Saeed & Rasshidi, 2017; Wellman, 2015). However, research focusing on marketing graduates in the context of developing countries (e.g., Nigeria) is largely missing (Abelha et al., 2020). Besides, there is a growing difficulty for marketing graduates in Nigeria to secure top marketing positions in corporate organizations (Agu et al., 2015). Recently, subscription into the marketing discipline by admission-seekers has continued to dwindle across the country (Agu et al., 2017; Agu, 2022). Therefore, there is a need to conceptualize employability in the context of marketing in developing countries and Nigeria in particular.

Furthermore, while experiential learning remains a relevant town-and-gown linking technique which marketing educators adopt (Divan et al., 2019; Kalu & Agu, 2017), no study is known that has explored the effectiveness of its various modes in embedding employability skills in marketing graduates.

Literature Review and Theoretical Framework

Employability and Employability Skills

The concept of employability has not received any universally accepted definition, thus reflecting its varied understandings across key stakeholders of higher education (Sin and Neave, 2016). However, after an extensive review of definitions, Cheng et al. (2021) categorized the definitions into three main groups – those that emphasize the capabilities of individuals; those drawing attention to the relative dimensions of employability; and those emphasizing the "duality of employability". Given the context of this study, Small et al. (2018)'s definition - capacity to be self-reliant in navigating the labour market, utilising knowledge, individual skills and attributes, and adapting them to the employment context, showcasing them to employers, while taking into account external and other constraints, and (Morrison, 2012)'s "employability relates to whether individuals possess the appropriate capabilities, skills and attitudes that employers need" are adopted. Furthermore, employability skills are the set of transferable skills characterized as the higher-order thinking skills and personal attributes that employees need to succeed in a work environment (Dacre-Pool and Sewell, 2007; Tomasson et al., 2019). The top 10 employability skills for undergraduates as identified by employers include oral and written communication, leadership, teamwork, conflict management, initiative, responsibility, decision making, problem solving and critical thinking skills (Drummond and Rosenbluth, 2015; Tomasson et al., 2019). To Fallows and Steven (2000), employability skills include the following abilities: the retrieval and handling of information; communication and presentation; planning and problem solving; and social development and interaction. Being a specialized discipline, marketing graduates are expected to possess other relevant skills which this study hopes to unravel in the context of a developing country.

Experiential Learning Theory and Competence-Based approach

This study would be underpinned by Experiential Learning Theory and the Competence-Based approach. Experiential learning is a process in which an experience is reflected upon and then translated into concepts which in turn become guidelines for new experiences (Newbery-Jones, 2015). The Association for Experiential Education in Behrendth and Franklin (2014) defines experiential learning as a methodology in which educators' direct students to a specific experience, and then guide the students through reflection to increase knowledge, develop skills, clarify values,

and develop people's capacity to contribute to their communities. Various forms of experiential learning exist, for instance, field trip, research project, seminars, internship, case studies, and simulations (Scarce, 1997).

The employability literature focuses on competences that contribute to graduate employability (Montes et al., 2019; Romgens et al., 2019). In this context, employability is viewed from a perspective of competence-development (Boahin & Hofman, 2013; Hennemann & Liefner, 2010; Jackson, 2014). The competence-based approach is a systematic, cognitive, holistic and dynamic view (Sanchez & Heens, 1997), which is open for cognitive elements such as learning (Jorg, 2004). Generally, the competence perspective offers new conceptual dimensions which capture more aspects of a complex and dynamic system/concept (Sanchez, 2010), a characteristic that allows researchers to approach competence-based issued such as graduate employability skills from the multidimensional perspective. A construct is multidimensional when it refers to several distinct but related dimensions treated as a single theoretical construct (Law et al., 1998) in Agu (2020).

Experiential Learning and Employability Skills: Development of Propositions

Generally, research supports the effectiveness of experiential learning in building employability skills (Ayob et al., 2013; Hawtry, 2007; Lee & Caffarella, 1994; Newbery-Jones, 2015; Patiar, 2018; Rodzalan & Saat, 2012; Subramanian & Harun, 2012). However, Howes et al. (2017) argued for more quantitative evidence, but the perceptions of marketing students/graduates in the developing world context are rarely reported in referred journals. Thus, four propositions are proposed: field trip, case analysis, research project, and group seminars, are effective in building marketing graduate employability skills.

Methodology

The study adopted a dual-method research approach, involving newspaper content analysis and qualitative survey. First, a content analysis of major national newspaper advertisements for marketing jobs in the past six months was conducted to identify the skills required of applicants. Secondly, a qualitative study of marketing and human resource managers (employers) of 8 large firms in the country (16 participants in all) was undertaken to validate the newspaper contents and to ascertain their views on the role of experiential learning in building the skills.

The qualitative data were analyzed to identify the key themes on employability skills. Thematic analysis is the data analysis process chosen in this study as it is an accessible, flexible, and increasingly popular method of qualitative data analysis (Djafarova & Foots, 2022). The newspaper contents were analyzed using content and frequency analysis.

Results

First, the research for entry level marketing jobs advertised in the past six months was conducted. The initial online search generated 36 results. However, 16 were discarded for either being out of the Nigerian context or being non-entry level jobs. For instance, some adverts were specifically for top management. The manual paper and pen method of thematic analysis was used since the themes represented in the required skills were obviously stated in the adverts. From the 20 selected adverts, the stroke format of identifying and accounting the frequency was applied. The result identified 18 entry level marketing graduate employability skills which this study grouped into three depending on the frequency of occurrence of the skills in the adverts.

Thus, in an emerging economy that is transiting to a smart economy, Nigerian marketing graduates require these identified employer-sought after skills to be employable and relevant in the modern Nigerian labour market. The skills are categorized as first grade (those scoring between 100% and 70% in the frequency of occurrence), second grade (those scoring between 69% and 50% in the frequency of occurrence), and third grade (those scoring less than 50% in the frequency of occurrence). Table 1 shows the newspaper advertised employability skills and their frequencies as categorized.

Table 1: Entry-Level Marketing Graduate Employability Skills for the Smart Economy

SN.	Category/Skill	Frequency	Percentage
	First Grade:		
	Digital marketing	20	100.00
	Excellent communication	18	90.00
	Product knowledge	15	75.00
	Research	14	70.00
	Negotiation	14	70.00
2.	**Second Grade:**		
	Critical/logical thinking	12	60.00
	Multi-task handling	12	60.00
	Leadership	12	60.00
	Teamwork	10	50.00
	Independence	10	50.00
3.	**Third Grade**		
	Presentation	7	35.00
	Work under pressure	7	35.00
	Relationship management	7	35.00
	Willingness to travel	5	25.00
	Entrepreneurial mindset	5	25.00

Source: Compiled by the authors, 2025.

Table discloses that employers required entry-level marketing graduates to possess first grade employability skills. The first in the group is excellent skill in digital marketing such as proficiency in search engine optimization, social media ads, email and website management, AI-driven tools, Google Analytics, and general computer application. Secondly, marketing graduates require excellent oral and written communication in English and other dialects. Thirdly, knowledge of the product being marketed, followed by research/data management and negotiation skills. These five first grade skills appear indispensable for marketing graduated wishing to be employable in the smart Nigerian economy.

The second-grade skills are critical/logical thinking, ability to handle multiple tasks, leadership, teamwork, and ability to work independently, often with minimal supervision. Marketing graduates need a reasonable level of these skills to be employable and relevant in the highly competitive labour market.

The third-grade skills are ability to make sales presentation confidently, ability to work under pressure and manage pressure, customer relationship management, willingness to travel, and a mindset of entrepreneurship.
These findings align greatly with previous research on employability skills of marketing graduates (Drummond & Rosenbluth, 2015; Tomasson et al., 2019; Fallows & Steven, 2000).

The results on the qualitative interview are presented using sample quotes to buttress the affirmation of the propositions on the usefulness of the experiential learning modes in building the identified employability skills. A random sample of 8 firms was chosen. First, the researchers visited the websites of these firms and sought for the contacts of the marketing and human resource managers. Emails and phone interviews were held on days that were convenient for the participants. The interview protocol was approved by the research and ethics unit of the lead author's institution. Participants were informed of the voluntary and academic nature of the interview and were guided by the questions which aim at addressing the research objectives.

Within the sample units, 8 (50%) were marketing managers and the other 8 (50%) were human resource managers. While 12 (75%) were males, 4 (25%) were females. All the participants had university level education and have been in the company for no fewer than 7 years.

Some of the comments validating the effectiveness of experience learning include:
"With only classroom knowledge, marketing graduates will hardly fit into the category of marketers we require these days. Practical and field-based knowledge such as that derived during industrial attachments, excursions, internships, and research visits might be helpful in equipping the students before graduation," (A male marketing manager).

"Marketing educators should prioritize practical knowledge in their teaching approaches. I encourage them to engage the students in periodic visits to firms and place them on industrial trainings before they graduate. This will enable them to build advance industry experience before graduation," (A male human resource manager).

"I believe strongly in the effectiveness of field trips, practical presentations such as case studies and seminars, project defense and industry expert lectures. These are important in building the marketing graduate for the world of work. It is obvious that some of these approaches are no longer emphasized, but I encourage higher education institutions to adopt these practical methods as they will equip the students better," (A female marketing manager).

"Engaging the students in some of these experiential leaning builds them in advance for the industries. When you see students who passed through industrial trainings, there performance on the job are usually excellent compared with those who do not experience such trainings," (A male marketing manager).

These assertions corroborate previous research on the effectiveness of experiential learning indriving employability skills (Ayob et al., 2013; Hawtry, 2007; Lee & Caffarella, 1994; Newbery-Jones, 2015; Patiar, 2018; Rodzalan & Saat, 2012; Subramanian & Harun, 2012). Based on these, we conclude that:

Field trip, case analysis, research project, and group seminars, are effective in building marketing graduate employability skills. More importantly, industrial attachment or internship stands out from the expressions of the industry experts.

Conclusion

This study aimed at exploring the effectiveness of experiential learning in building marketing graduates' employability skills in the smart economy that is internet-driven. High, middle and low-level skills categorized based on their frequency in 20 marketing entry job adverts were identified with digital marketing skill and excellent communications skills leading in the list of 18 skills.

Industry experts agree that the experiential learning modes such as field trip, case analysis, research project, and group seminars are capable of building the identified skills.

This study contributes to practical and theoretical knowledge. First, it is among the rare studies investigating marketing graduate employability skills in the context of Nigeria, especially for the transiting smart economy. It builds the literature in this area and extends the application of Experiential Learning Theory and the Competence-Based approach in this context. The study provides empirical evidence to support extent research and also answers to the global call for more studies on graduates' employability skills in specific contexts such as marketing, Nigeria and the smart economy.

The study will guide marketing educators and higher education institutions administrators in prioritizing experiential learning going forward. It will guide further policy formulations in curricula development and adjustments.

The study has some limitations which might affect generalizability of the results. It is limited in number of adverts and participants. The findings might be tried in other contexts and samples to further verify and validate the results.

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Green Marketing Signals, Consumer Trust, and the Dynamics of Eco-Friendly Consumption in Nigeria's Transitioning Smart Economy

Nnanna-Ohuonu, Okwudiri PhD
Department of Marketing, Abia State University, Nigeria

&
Njoku, Princewill Osinachi PhD
Department of Marketing, Abia State University, Nigeria

Abstract
The transition toward renewable and smart economies requires an understanding of the behavioural mechanisms that drive eco-friendly consumption. This study investigates the role of green marketing signals in shaping consumer trust and their subsequent influence on eco-friendly consumption within Nigeria's transitioning smart economy. Anchored in signalling theory and the trust-based perspective of consumer behaviour, the study employed a quantitative survey research design targeting urban youth, middle-class professionals, and renewable-adopting households across selected Nigerian cities. Using structural equation modelling (SEM), the results reveal that green marketing signals significantly enhance consumer trust, which in turn positively predicts eco-friendly consumption behaviours. Furthermore, consumer trust was found to mediate the relationship between green marketing signals and eco-friendly consumption, underscoring its pivotal role in Nigeria's sustainability landscape. These findings align with global literature emphasizing the importance of credibility and transparency in fostering pro-environmental behaviours, while also highlighting the contextual nuances of consumer scepticism in emerging markets. The study contributes theoretically by extending signalling theory into a developing economy context and practically by providing insights for policymakers and businesses on designing transparent green marketing campaigns to strengthen trust and drive sustainable consumption. Ultimately, the research underscores the behavioural and marketing strategies necessary for achieving Nigeria's renewable transition within its evolving smart economy framework.

Keywords: *Green marketing signals; Consumer trust; Eco-friendly consumption; Smart economy.*

Introduction

The quest for sustainable development has become a dominant discourse across global economies, with an emphasis on integrating renewable energy and eco-friendly practices into mainstream economic systems. Climate change, environmental degradation, and resource depletion have underscored the urgency of transitioning from fossil-fuel-dependent economies to smart economies that balance growth, innovation, and sustainability (Worakittikul, Saenwerm, and Naruetharadhol, 2024). Nigeria, as Africa's largest economy and most populous nation, is uniquely

positioned within this discourse. The country faces significant challenges, including energy insecurity, infrastructural deficits, and environmental pollution. Yet, it also possesses immense opportunities in renewable energy resources, digital technologies, and a growing consumer base (Agama, Udoh, and George, 2025). Against this backdrop, green marketing signals, consumer trust, and eco-friendly consumption behaviours emerge as crucial elements for Nigeria's strategic transition to a smart economy.

The **Academy of Management Nigeria (TAMN)** conference theme, *"Strategic Initiatives for Transition to Renewable Hope in Smart Economies,"* emphasizes the urgent need for actionable strategies that combine technological, economic, and behavioural shifts. Within this theme, the sub-theme *"green marketing and consumer trust in renewable transition"* becomes highly relevant. Green marketing signals, such as eco-labels, certifications, sustainability messaging, and corporate social responsibility (CSR) initiatives represent a strategic communication approach that organizations use to demonstrate their commitment to sustainability. In markets characterized by scepticism and low trust, such as Nigeria, the ability of these signals to foster consumer confidence is central to driving eco-friendly behaviours.

Green marketing signals are designed to communicate a company's environmental values and practices to consumers (Chen and Chang, 2013). These signals can take many forms, including product packaging with eco-labels, advertisements emphasizing renewable practices, or broader campaigns highlighting sustainable initiatives. In developed economies, such signals have been shown to positively influence consumer trust and encourage sustainable purchasing (Nguyen, Lobo, and Greenland, 2020). However, in Nigeria, the dynamics are more complex. Consumers are increasingly aware of sustainability issues but remain wary of corporate claims due to a history of inconsistent practices and limited regulatory enforcement. This scepticism heightens the importance of consumer trust as a mediating factor between green marketing signals and eco-friendly consumption.

Trust, in this context, can be defined as the willingness of consumers to rely on firms based on the belief that their environmental claims are credible, transparent, and consistent (Chen, 2010). Without trust, even the most sophisticated marketing campaigns may fail to generate the desired behavioural outcomes. Nigeria's socio-cultural landscape, marked by varying levels of environmental literacy and economic disparities, makes the cultivation of trust particularly critical. For instance, urban youth and middle-class professionals are often more receptive to sustainability narratives due to their higher exposure to digital platforms and international discourse. Meanwhile, scepticism remains stronger in other consumer segments that prioritize affordability over sustainability.

Nigeria's transition toward renewable energy and smart economic practices is gaining traction, particularly with increasing investments in solar energy, waste-to-energy solutions, and eco-friendly innovations. However, consumer adoption of eco-friendly products remains limited. This is partly due to affordability constraints and partly due to distrust in the credibility of green claims. Scholars such as Leonidou and Skarmeas (2017) have highlighted how scepticism about environmental claims undermines consumer engagement. In Nigeria, where regulatory systems are often weak, this scepticism is compounded by the prevalence of greenwashing (Delmas and Burbano, 2011). Recent scholars have drawn attention to the transformative potential of digital

technologies in shaping consumer perceptions and marketing practices. Nnanna-Ohuonu, Nwosu, Arachie, Ndum, and Ibrahim (2025) emphasized the disruptive role of digital tools in redefining the marketing landscape of small businesses. These disruptions offer opportunities to improve transparency and accountability, thereby strengthening consumer trust in green initiatives. Similarly, Arachie, Nnanna-Ohuonu, Anagwu, and Okeke (2025) assessed the technological readiness of small businesses for artificial intelligence (AI)-driven transformation, underscoring how readiness for innovation is key to leveraging emerging opportunities in marketing and sustainability.

The role of digital marketing in fostering sustainable SME growth has also been highlighted by Nnanna-Ohuonu, Arachie, Jeff-Anyeneh, and Francis (2025). Their findings reveal that digital adoption enables firms to better communicate with consumers, offering a platform for transparent and verifiable green marketing campaigns. This aligns with global studies demonstrating that green signals backed by credible information reduce consumer scepticism and promote eco-friendly behaviours (Joshi and Rahman, 2015). Thus, within Nigeria's transitioning economy, green marketing signals supported by digital platforms could serve as a catalyst for eco-friendly consumption.

Research Gap

Despite the growing body of literature on green marketing and consumer behaviour, significant gaps remain regarding Nigeria's unique context. Most existing research originates from developed economies, where institutional frameworks and consumer awareness levels differ considerably (Nguyen et al., 2020). While studies within Nigeria and West Africa have examined digital disruption, AI readiness, and digital marketing adoption (Arachie et al., 2025; Nnanna-Ohuonu et al., 2025), few have explicitly explored the intersection of green marketing signals, consumer trust, and eco-friendly consumption. This gap is particularly pressing given the country's urgent need to accelerate renewable transitions as part of its smart economy aspirations.

Furthermore, while prior research has identified trust as a critical mediator in consumer decision-making, little empirical evidence exists on how this dynamic unfolds in Nigeria's transitioning economy. For instance, Nnanna-Ohuonu, Nwafor, and Umetiti (2025) explored the use of AI in quality assurance in the pharmaceutical sector, emphasizing trust in product reliability. Extending this logic to the domain of sustainability, consumer trust in green marketing signals becomes essential for legitimizing eco-friendly claims and encouraging adoption. Similarly, Nnanna-Ohuonu (2025) demonstrated how AI personalizes customer experiences in Nigeria's online grocery retail sector, reinforcing the broader notion that trust and credibility are decisive factors in consumer behaviour. The absence of comprehensive empirical studies on green marketing and trust in Nigeria limits both theoretical development and practical strategy. Without robust insights, firms may continue to rely on generic or imported marketing strategies that fail to resonate with Nigerian consumers. Policymakers, too, may lack evidence-based guidelines for regulating green claims and promoting eco-friendly consumption.

Research Question and Hypotheses

Addressing this research gap, the present study investigates the role of green marketing signals on shaping consumer trust and, subsequently, eco-friendly consumption in Nigeria's transitioning

smart economy. By focusing on the mediating role of trust, the study provides both theoretical clarity and practical guidance.

Research Questions:
The following research questions were raised, in order to guide the study.
1. How do green marketing signals influence consumer trust?
2. How does consumer trust affect eco-friendly consumption behaviours in Nigeria?
3. To what extent does consumer trust mediates the relationship between green marketing signals and eco-friendly consumption?

Research Hypotheses:
The following research hypotheses stated in their null form, were formulated in this study, in order to guide the study.

- **H01:** Green marketing signals do not positively influence consumer trust.
- **H02:** Consumer trust does not positively affect eco-friendly consumption behaviours in Nigeria.
- **H03:** Consumer trust does not mediate the relationship between green marketing signals and eco-friendly consumption.

Literature Review and Theoretical Framework
The growing global demand for sustainable consumption has led to an increased emphasis on the role of green marketing in shaping consumer behaviour. Green marketing, defined as the integration of environmental considerations into marketing strategies, has been identified as an essential driver for eco-friendly consumption across both developed and emerging economies (Joshi and Rahman, 2015). In Nigeria, where environmental challenges such as pollution, energy insecurity, and unsustainable production practices persist, green marketing signals offer a potential pathway to encourage environmentally responsible consumer behaviours (Damian-Okoro, 2025).

Green Marketing Signals and Consumer Trust
Green marketing signals, which include eco-labels, sustainability messaging, CSR initiatives, and certifications, function as communicative tools that firms deploy to demonstrate their environmental responsibility (Chen, 2010; Chen and Chang, 2013). However, the effectiveness of these signals is contingent on consumer trust. Without trust, consumers may perceive such signals as greenwashing, thereby undermining corporate credibility (Delmas and Burbano, 2011). Leonidou and Skarmeas (2017) highlight that consumer scepticism regarding environmental claims can significantly diminish the impact of green marketing campaigns. In Nigeria, where regulatory enforcement is often weak, the risk of consumer scepticism is amplified.

Recent empirical evidence suggests that consumer trust mediates the effectiveness of green marketing orientation on buyer motivations, particularly in fast-moving consumer goods (FMCG) markets. Agama, Udoh, and George (2025) demonstrated that environmental awareness and trust in marketing orientation are pivotal in influencing consumer purchase motivations in emerging markets. Similarly, Worakittikul, Saenwerm, and Naruetharadhol (2024) emphasized the transformative power of eco-symbols, noting their potential to shape perceptions and catalysebehavioural change when credibility is established.

Eco-Friendly Consumption in Emerging Markets

The determinants of eco-friendly consumption in emerging economies such as Nigeria extend beyond affordability to include cultural values, digital exposure, and consumer attitudes (Nguyen, Lobo, and Greenland, 2020). Research by Ayankola, Raji, and Adesanya (2025) underscores the influence of eco-marketing in enhancing consumer support for blue economy products, suggesting parallels in renewable energy adoption. Likewise, Damian-Okoro (2025) revealed that Nigerian consumers increasingly show positive attitudes toward eco-friendly products, but adoption is still hampered by scepticism and cost considerations.

Nnanna-Ohuonu (2025) provided additional insights, noting how inflation and economic pressures shape sustainable consumption trade-offs among academic staff in Nigeria. This indicates that consumer decisions around eco-friendly consumption are shaped not only by marketing strategies but also by socio-economic realities. Further, the role of social media influencers in shaping sustainable brand messaging has been documented as crucial for younger demographics (Nnanna-Ohuonu, 2025), highlighting the significance of digital platforms in amplifying green marketing signals.

Digital Disruption and Technological Readiness

Emerging digital technologies are redefining how green marketing is executed in Nigeria. Nnanna-Ohuonu, Nwosu, Arachie, Ndum, and Ibrahim (2025) emphasized digital disruption as a strategic pathway to success for small businesses, while Nnanna-Ohuonu, Arachie, Jeff-Anyeneh, and Francis (2025) highlighted how digital adoption supports sustainable SME growth. Additionally, Arachie, Nnanna-Ohuonu, Anagwu, and Okeke (2025) noted that technological readiness remains a determinant of how businesses can leverage AI-powered innovations for sustainability-focused transformation. This body of work suggests that Nigeria's digital landscape presents opportunities to strengthen green marketing signals by improving transparency, personalization, and consumer engagement.

Green Manufacturing and Organizational Practices

At the organizational level, sustainable production practices are integral to credible green marketing. Kajang, Ezekiel, and Njar (2025) demonstrated that green manufacturing significantly affects green marketing and broader environmental sustainability in Nigeria. This reinforces Oduro's (2024) findings from a meta-analysis, which showed that eco-innovation enhances SMEs' sustainable performance. Such evidence suggests that firms seeking to communicate green marketing signals credibly must anchor them in substantive practices, not just symbolic messaging.

Theoretical Framework

The theoretical framework for this study is grounded in Signalling Theory (Spence, 1973) and the concept of Green Trust (Chen, 2010). Signalling Theory posits that in markets characterized by information asymmetry, firms use signals to convey unobservable qualities to stakeholders. In this context, green marketing signals, such as eco-labels, certifications, and digital sustainability campaigns, serve as indicators of firms' environmental commitments. However, the credibility of these signals depends on consumer perceptions of authenticity and transparency.

Chen's (2010) framework of green brand equity underscores the centrality of trust, satisfaction, and brand image in building consumer loyalty. When applied to Nigeria's context, trust emerges as a key mediator: green marketing signals influence consumer trust, which in turn shapes eco-friendly consumption. The mediation role is supported by empirical findings that link trust to reduced consumer scepticism and enhanced adoption of eco-friendly products (Chen and Chang, 2013; Leonidou & Skarmeas, 2017).

Building on Agama et al. (2025), who demonstrated the mediating role of environmental awareness in consumer motivations, this study hypothesizes that trust functions as a mediating variable between green marketing signals and eco-friendly consumption. Additionally, the role of digital technologies in enhancing transparency and credibility connects to recent findings on digital disruption (Nnanna-Ohuonu et al., 2025) and technological readiness (Arachie et al., 2025).

Conceptual Framework

The conceptual framework proposes the following relationships:

1. **Green Marketing Signals → Consumer Trust** (based on Signalling Theory).
2. **Consumer Trust → Eco-Friendly Consumption** (based on Green Brand Equity).
3. **Mediating Role of Trust**: Consumer trust mediates the relationship between green marketing signals and eco-friendly consumption.

This integrated model emphasizes that credible green marketing signals, when effectively communicated and supported by digital innovations, foster trust, which ultimately drives eco-friendly consumption in Nigeria's transitioning smart economy.

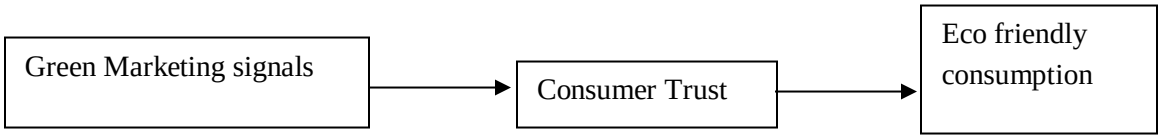

Figure 1: The conceptual framework of the study, as conceptualized by the researchers.

Methodology

This study adopted a quantitative research design with a cross-sectional survey approach. Quantitative design is particularly suitable for testing hypotheses involving causal relationships between constructs such as green marketing signals, consumer trust, and eco-friendly consumption (Creswell & Creswell, 2018). A survey instrument was developed to collect standardized responses, enabling the use of statistical models for hypothesis testing.

Population and Sampling

The target population consisted of Nigerian consumers residing in metropolitan cities such as Lagos, Abuja, and Port Harcourt, where awareness of green marketing practices is relatively high due to exposure to renewable energy products and digital marketing. A stratified random sampling technique was employed to ensure diversity across socio-demographic segments, including age, gender, and income. Following the guidelines of Hair et al. (2019), a minimum of 300 participants was deemed adequate for structural equation modelling (SEM). In this study, 450 questionnaires were distributed, with 372 valid responses retained for analysis, representing a response rate of 82.6%.

Data Collection Instrument
The survey questionnaire included four sections: demographic variables, green marketing signals, consumer trust, and eco-friendly consumption behaviour. Measurement items for green marketing signals were adapted from Chen and Chang (2013), while consumer trust items were drawn from Chen (2010). Eco-friendly consumption was measured using scales from Nguyen, Lobo, and Greenland (2020). Responses were recorded on a five-point Likert scale ranging from "strongly disagree" (1) to "strongly agree" (5).

Validity, Reliability, and Ethical Considerations
Construct validity was ensured through expert review and a pilot study involving 40 respondents. Cronbach's alpha values exceeded the 0.70 threshold for all constructs, indicating internal consistency (Hair et al., 2019). Ethical approval was obtained from a Nigerian university research ethics committee. Participation was voluntary, anonymity was assured, and informed consent was obtained in accordance with ethical standards (APA, 2020).

Data Analysis
Data were analysed using SPSS 27 and AMOS 26. Descriptive statistics were first used to summarize demographic profiles. Confirmatory factor analysis (CFA) was employed to assess construct validity, while structural equation modelling (SEM) tested the hypothesized relationships. The mediation effect of consumer trust was tested using the bootstrapping approach with 5,000 resamples, as recommended by Preacher and Hayes (2008).

Results
Demographic Characteristics
Respondents were predominantly between 18–35 years (52.4%), with 38.7% aged 36–55, and 8.9% above 55. Gender distribution was nearly balanced (51.6% male, 48.4% female). A significant proportion (62.3%) possessed at least a university degree, indicating high literacy levels. Income distribution revealed that 45.8% of respondents fell within middle-income brackets, consistent with the urban focus of the sample.

Measurement Model
The CFA results indicated good fit indices ($\chi^2/df = 2.41$, CFI = 0.951, TLI = 0.943, RMSEA = 0.061). All factor loadings were above 0.70, confirming convergent validity, while AVE values exceeded 0.50 and composite reliability values exceeded 0.80, indicating construct reliability.

Structural Model and Hypothesis Testing
The SEM results demonstrated that green marketing signals significantly influenced consumer trust ($\beta = 0.63$, $p < 0.001$), supporting H1. Consumer trust significantly predicted eco-friendly consumption ($\beta = 0.55$, $p < 0.001$), supporting H2. The indirect effect of green marketing signals on eco-friendly consumption via trust was significant ($\beta = 0.35$, 95% CI [0.21, 0.48]), confirming mediation and supporting H3.

Additional Insights

Descriptive results showed that consumers placed the highest trust in third-party eco-certifications and CSR initiatives, while scepticism was highest toward vague sustainability claims in advertising. Younger respondents (18–35 years) were more responsive to digital green marketing campaigns than older demographics, aligning with findings from Nnanna-Ohuonu (2025) on the influence of social media sustainability messaging.

Discussion

The results provide robust evidence that green marketing signals significantly enhance consumer trust, which in turn drives eco-friendly consumption in Nigeria's transitioning smart economy. This finding is consistent with Chen's (2010) framework of green brand equity, which underscores the role of trust in shaping consumer behaviour. The mediation effect of trust aligns with the conclusions of Agama, Udoh, and George (2025), who identified trust as a mediating variable in buyer motivations for eco-friendly goods in emerging markets.

The results also corroborate prior findings that consumer scepticism remains a major barrier to green adoption (Leonidou & Skarmeas, 2017). In Nigeria, this scepticism is particularly heightened by weak regulatory frameworks and the prevalence of greenwashing (Delmas and Burbano, 2011). Nevertheless, the evidence suggests that credible signals such as eco-certifications and CSR programs are effective in overcoming scepticism. This aligns with Worakittikul, Saenwerm, and Naruetharadhol's (2024) findings on the symbolic power of eco-signals in catalysingbehavioural change.

From a practical perspective, the findings demonstrate the importance of integrating digital disruption into green marketing strategies. Younger consumers' responsiveness to digital signals resonates with Nnanna-Ohuonu, Nwosu, Arachie, Ndum, and Ibrahim's (2025) argument that digital disruption transforms small business marketing landscapes. Similarly, the ability of SMEs to deploy innovative, trustworthy campaigns depends on their technological readiness (Arachie, Nnanna-Ohuonu, Anagwu, & Okeke, 2025) and capacity to engage consumers through credible digital strategies (Nnanna-Ohuonu, Arachie, Jeff-Anyeneh, & Francis, 2025).

Theoretically, this study extends Signalling Theory (Spence, 1973) by empirically demonstrating that in Nigeria's transitioning economy, trust serves as the crucial mechanism through which marketing signals influence behaviour. Moreover, it adds to the green marketing literature by showing that consumer trust mediates the relationship between signals and eco-friendly consumption in emerging markets.

Strengths and Limitations

A major strength of this study lies in its integration of signalling and trust frameworks, supported by empirical data from a large urban Nigerian sample. However, limitations exist. The cross-sectional design limits causal inferences, and the urban sample may not fully represent rural populations with lower exposure to green marketing. Future research should employ longitudinal designs and explore rural-urban differences.

Implications

For practitioners, the findings suggest that firms must prioritize transparency and credible certifications in green marketing campaigns. Policymakers should strengthen regulatory

mechanisms to reduce greenwashing and build consumer confidence. Academically, this study enriches green marketing theory by contextualizing it within Nigeria's smart economy transition.

Conclusion

This study investigated the role of green marketing signals, consumer trust, and eco-friendly consumption in Nigeria's transitioning smart economy. The findings demonstrate that consumer trust is the mediating mechanism through which green marketing signals foster eco-friendly consumption. These insights have significant implications for businesses, policymakers, and scholars. By prioritizing credible signals and building trust, firms can accelerate the adoption of eco-friendly practices, thereby contributing to Nigeria's broader sustainability agenda and alignment with smart economy initiatives.

Table 1: Demographic Characteristics of Respondents (N = 400)

Variable	Category	Frequency (n)	Percentage (%)
Gender	Male	220	55.0
	Female	180	45.0
Age Group	18–24 years	110	27.5
	25–34 years	150	37.5
	35–44 years	90	22.5
	45 years and above	50	12.5
Education Level	Bachelor's Degree	180	45.0
	Master's Degree	130	32.5
	PhD/Doctorate	40	10.0
	Others (Diploma, etc.)	50	12.5
Occupation	Students	120	30.0
	Professionals	160	40.0
	Household Decision-makers	120	30.0

Table 2: Confirmatory Factor Analysis (CFA) Loadings

Construct	Item Code	Factor Loading	AVE	CR
Green Marketing Signals	GMS1	0.82	0.64	0.88
	GMS2	0.79		
	GMS3	0.83		
Consumer Trust	CT1	0.76	0.62	0.85
	CT2	0.81		
	CT3	0.80		
Eco-Friendly Consumption	EFC1	0.84	0.67	0.89
	EFC2	0.82		
	EFC3	0.85		

Note: AVE = Average Variance Extracted; CR = Composite Reliability

Abstract
This study on green marketing strategies and consumer trust in solar energy adoption in Rivers State employs a quantitative research design, using a survey approach to collect data from residential solar energy users and business owners who have adopted solar energy solutions. Three research questions were posed and three hypotheses tested. The population size consist of 5,500, comprising 2,500 residential solar energy users and 3,000 business owners. A sample size of 357 participants was selected using Taro Yamane formula, and a stratified random sampling technique was employed to select participants from the population, dividing them into two strata: residential solar energy users and business owners. Participants were randomly selected from each stratum using a random sampling technique. A structured questionnaire was used to collect data, divided into sections to capture information on demographic characteristics, green marketing strategies, consumer trust, and solar energy adoption. Data were analyzed using descriptive statistics (mean and standard deviation while hypothesis were tested using Pearson Product Moment Correlation (PPMC) at 0.05 significant. The findings from the analysis reveal that green marketing strategies, such as highlighting eco-friendly benefits, promoting environmental responsibility, and creating a green brand identity, significantly influence consumer trust and loyalty towards solar energy products. It was concluded that green marketing strategies influence on consumer trust in solar energy adoption in Rivers State is to a high extent. The study therefore recommends that solar energy marketers should highlight the eco-friendly benefits of their products and services to appeal to consumers who prioritize environmental sustainability.

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Keywords: *Green marketing strategies, consumer trust, green brand identity, eco-friendly benefits, consumer awareness, solar energy adoption.*

Introduction

Increase in ecological issues which has negatively affected the earth, has given rise to consumer concern creating the need towards environmental protection and great demand for green products. Consequently, in an attempt to leverage increased demand for more sustainable goods and services, companies have employed marketing tactics to assure consumers that their products are green. Being green has become an essential strategy for some large businesses in developed countries. Some of them use green issue to expand their markets to developing countries through alliances, licensing, or franchising. Thus b**y** establishing trust through transparent and responsible marketing practices, companies can increase the adoption of solar energy and contribute to a more sustainable future.

Li, Zhu, Li, Li and Ding (2024) therefore posit that the importance of consumer trust in the adoption of solar energy cannot be overstated adding that consumer trust is critical in solar energy adoption in convincing consumers to invest in renewable energy solutions. They maintained that consumer trust is essential in green marketing strategies for solar energy adoption because it lends credibility to environmental claims and influences purchase intentions. When consumers trust a company, they're more likely to believe its environmental claims and purchase its products or services. Green marketing strategies therefore, play a crucial role in building consumer trust in solar energy. In addition, companies must prioritize transparency, honesty, and environmental responsibility to establish trust with their customers.

Nevertheless, with an abundance of sunshine and a growing demand for energy, Nigeria is an ideal location for solar energy adoption. However, despite the vast potential, the adoption of solar energy in Nigeria has been slow, hindered by a lack of consumer trust, limited awareness, and inadequate infrastructure. To address these challenges, solar energy companies in Nigeria must adopt innovative marketing strategies that not only promote the benefits of solar energy but also foster consumer trust and loyalty. However, in Rivers State, Nigeria, where energy demand is high and environmental concerns are pressing, the need for effective green marketing strategies is particularly important. Thu**s**, green marketing is becoming a trend, and many companies have implemented it as a strategy for winning the market. Green marketing, which involves promoting products or services that are environmentally friendly and sustainable, offers a promising solution.

Bello and Hong (2024) postulated that the success of green marketing strategies hinges on the strategic integration of three critical dimensions: establishing a credible green brand identity, communicating the value of eco-friendly benefits, and fostering consumer awareness. Therefore, **c**reating a green brand identity is crucial for solar energy companies in Nigeria to establish a strong market presence. This can be achieved by incorporating eco-friendly branding elements, such as using green colors, leaves, or solar panels in logos and marketing materials. Additionally, publishing annual sustainability reports highlighting environmental achievements and progress towards sustainability goals can also contribute to a strong green brand identity (Ogunsola, 2018). Ultimately, by creating a strong green brand identity, companies can differentiate their brand from competitors, build trust with environmentally conscious consumers, and contribute to a more sustainable future.

Furthermore, promoting consumer awareness is essential in green marketing by encouraging consumers to adopt eco-friendly behaviors and habits. Adeyemi (2017) reiterated that by highlighting the eco-friendly benefits of products or services is crucial in green marketing. He emphasized that solar energy companies in Nigeria, should lead the campaign on the reduction of carbon emissions, energy independence, and cost savings associated with solar energy. To this end, green marketing strategies of companies in developing countries are not yet fully recognized citing Cronin (2011), possibly it is because the attention on the importance of green marketing strategies has been relatively limited compared to its increasing importance as a viable organizational strategy. Rivers State**,** with its high energy demands and environmental concerns, provides a unique context to investigate the impact of green marketing strategies on consumer trust in solar energy adoption.

Statement of the Problem

Ecological challenges such as environmental degradation, global warming, greenhouse effect, pollution, and climate changes which are directly related to industrial manufacturing have continue to affect human's activities. Thus, the importance of renewable energy sources, particularly solar energy, cannot be overstated. In Nigeria, the adoption of solar energy is still in its infancy, despite the country's abundant solar resources (Sambo, 2017). The lack of consumer awareness, high upfront costs, and limited access to financing are some of the major barriers to solar energy adoption in Nigeria (IEA, 2020).

As noted by Ottman (2017), green marketing is not just about slapping a green label on a product, but about creating a genuine emotional connection with consumers. In Rivers State, Nigeria, where energy demand is high and environmental concerns are pressing, the need for effective green marketing strategies is of great significance. Green marketing strategies have emerged as a crucial tool for promoting environmentally friendly products and services. Green marketing strategies can play a crucial role in driving this transformation, but more research is needed to understand their effectiveness in promoting solar energy adoption in Nigeria.

However, there is limited research on how to create this emotional connection in the context of solar energy adoption in Nigeria. Thus, by emphasizing the eco-friendly benefits, creating a strong green brand identity, and promoting consumer awareness of solar energy can potentially enhance consumer trust and drive adoption. Therefore, it is essential to investigate the impact of green marketing strategies on consumer trust in solar energy adoption in Rivers State, Nigerian.

Purpose of the Study

The main purpose of the study is to investigate the influence of green marketing strategies on consumer trust in solar energy adoption in Rivers State, Nigeria. Specifically, the objectives are to:

1. examine the extent to which creating green brand identity on consumer trust in solar energy adoption in Rivers State.
2. find out the extent to which emphasizing eco-friendly benefits on consumer trust in solar energy adoption in Rivers State.
3. ascertain the extent to which Promoting consumer awareness on consumer trust in solar energy adoption in Rivers State.

Research questions

The following research questions are developed to guide this study:

To what extent does creating green brand identity on consumer trust in solar energy adoption in Rivers State?

To what extent does emphasizing eco-friendly benefits on consumer trust in solar energy adoption in Rivers State?

To what extent does promoting consumer awareness on consumer trust in solar energy adoption in Rivers State?

Research Hypothesis

The following hypotheses are formulated and tested at 0.05 level of significance:

Ho_1: there is no significant relationship between creating green brand identity and consumer trust in solar energy adoption in Rivers State.

Ho_2: there is no significant relationship between **e**mphasizing eco-friendly benefits and consumer trust in solar energy adoption in Rivers State.

Ho_3: there is no significant relationship between promoting consumer awareness and consumer trust in solar energy adoption in Rivers State.

Concept of Green Marketing Strategies

According to Polonsky (2011) green marketing refers to all activities designed to generate and facilitate any exchanges intended to satisfy human needs or wants, such that the satisfaction of these needs and wants occurs with the minimal detrimental impact on the natural environment". Green marketing involves the use of environmental issues as a marketing tool to promote products, services, and brands. It is a strategic approach that aims to create a positive impact on the environment while also promoting business interests. The concept of green marketing has gained significant attention in recent years, particularly in developing countries like Nigeria.

However, the failure of some green marketing strategies happens frequently because companies used the environment as an additional promotional dimension without any attempts to analyse, or modify the underlying product itself and its environmental impact (King, 1985 cited in Taboola (2018). On the other hand, the marketers are focused on convincing and seducing the consumer by all means such as more sophisticated packaging with more space for communication, or shifting to materials that is more appealing to the consumers, regardless of its impact on the environment. Moreover, knowledge about the impact of consumption on the environment needs to be enhanced and cooperation deepened at different levels in society. The importance of green marketing strategies in today's business landscape cannot be overstated. With the increasing awareness of environmental issues and the need for sustainable practices, companies are now more than ever, expected to adopt environmentally friendly approaches to marketing.

Finally, the lack of understanding of how green marketing strategies influence consumer trust in solar energy adoption in Nigeria may lead to ineffective marketing campaigns that fail to resonate with consumers, missed opportunities for companies to differentiate themselves and establish a competitive advantage in the market, continued reliance on fossil fuels, exacerbating environmental degradation and climate change, limited economic benefits from the adoption of

solar energy, including job creation and stimulation of local economies. Thus, a comprehensive green branding strategy necessitates the harmonization of three vital dimensions: crafting a compelling green brand identity, showcasing eco-friendly benefits, and cultivating consumer awareness through education and engagement.

Creating a Green Brand Identity

Creating a green brand identity is a multifaceted process that involves more than just marketing and branding. It requires a genuine commitment to sustainability and environmental responsibility that permeates every aspect of the business, including its supply chain (Kotler & Keller, 2016). This means that companies must rethink their business models, sources, and resources to reduce their environmental impact. A key aspect of creating a green brand identity is to focus on reducing rather than adding to offset non-sustainable practices. This involves cutting out unsustainable practices and being transparent about the changes being made (Peattie & Crane, 2015). Companies can also leverage technology to promote sustainability, such as using digital platforms to educate customers about sustainable practices and reduce waste. Additionally, incorporating eco-friendly design elements, such as natural color palettes and minimalistic design, can help to reinforce a brand's commitment to sustainability (Chen, 2016). Ultimately, creating a green brand identity requires a long-term commitment to sustainability and environmental responsibility. Companies must be willing to make significant changes to their business models and practices, and be transparent about their progress. By doing so, companies can build trust with their customers and establish a strong reputation as a sustainable and responsible business (Kotler & Keller, 2016). This dimension involves developing a brand image that is associated with environmental sustainability and eco-friendliness. By creating a strong green brand identity, companies can differentiate their brand from competitors, build trust with environmentally conscious consumers, and contribute to a more sustainable future

Highlighting Eco-Friendly Benefits

Highlighting eco-friendly benefits is a crucial dimension of green branding, as it enables companies to communicate their environmental commitment and values to customers. By emphasizing the eco-friendly benefits of their products or services, companies can create a positive brand image and differentiate themselves from competitors (Chen, 2016). For instance, a company that produces energy-efficient light bulbs can highlight the environmental benefits of using their products, such as reducing energy consumption and carbon emissions. Companies can also use eco-labels and certifications to highlight the eco-friendly benefits of their products. Eco-labels, such as the Energy Star label, provide customers with assurance that a product meets certain environmental standards (Peattie & Crane, 2015). Additionally, companies can use environmental certifications, such as ISO 14001, to demonstrate their commitment to environmental management and sustainability. By highlighting these eco-friendly benefits, companies can increase customer loyalty and drive business growth. According to a study, 75% of customers are more likely to buy from a company that has a strong environmental reputation (Kotler & Keller, 2016). By highlighting their eco-friendly benefits, companies can attract environmentally conscious customers and establish themselves as leaders in sustainability.

Promoting Consumer Awareness Programme

Promoting consumer awareness is a vital dimension of green branding, as it enables companies to educate customers about the environmental benefits of their products or services. By raising

consumer awareness, companies can encourage customers to make environmentally friendly purchasing decisions and foster a sense of shared responsibility for sustainability (Peattie & Crane, 2015). For instance, a company that produces eco-friendly cleaning products can promote consumer awareness by providing information on the environmental impacts of traditional cleaning products and the benefits of switching to eco-friendly alternatives. Companies can use various marketing strategies to promote consumer awareness, including advertising, social media, and in-store promotions. According to a study, social media is an effective platform for promoting consumer awareness, as it enables companies to engage with customers and share information about their environmental initiatives (Kotler & Keller, 2016). Additionally, companies can partner with environmental organizations and NGOs to promote consumer awareness and demonstrate their commitment to sustainability. Finally, promoting consumer awareness is essential for creating a sustainable marketplace and encouraging customers to adopt environmentally friendly behaviors. By educating customers about the environmental benefits of their products or services, companies can empower them to make informed purchasing decisions and drive demand for sustainable products (Chen, 2010). By promoting consumer awareness, companies can not only enhance their brand reputation but also contribute to a more sustainable future. Promoting consumer awareness is essential in green marketing. This can be achieved by:

1. Develop educational content: Create informative blog posts, videos, and social media posts that explain the benefits of solar energy and how it works (Ogunsola, 2018).
2. Host workshops and webinars: Organize workshops and webinars to educate consumers about solar energy, its benefits, and how to install and maintain solar panels (International Renewable Energy Agency, 2020).
3. Partner with influencers and thought leaders: Collaborate with social media influencers, thought leaders, and industry experts to promote solar energy and educate consumers about its benefits (Kotler & Keller, 2016).

Consumer Trust in Solar Energy Adoption

Consumer trust plays a significant role in the adoption of solar energy. Studies have shown that trust is a crucial factor in the decision-making process of consumers when it comes to adopting solar energy systems (Bello & Hong, 2024). When consumers trust the technology, the installation company, and the government's policies supporting solar energy, they are more likely to adopt solar energy. To promote consumer trust and adoption of solar energy, it is essential to address the factors influencing trust. This can be achieved by providing education and training programs for consumers, promoting the benefits of solar energy, and offering incentives and financing options to make solar energy more accessible and affordable. Additionally, governments and policymakers can play a crucial role in promoting consumer trust by implementing policies and regulations that support the development and adoption of solar energy. An effective green marketing strategies play a crucial role in promoting consumer trust and adoption of renewable energy sources. By highlighting the environmental benefits and eco-friendly features of their products or services, companies can create a positive brand image and differentiate themselves from competitors (Chen, 2010). Green marketing strategies can also help to alleviate concerns about climate change, energy security, and sustainability, which are critical factors influencing consumer trust and adoption decisions.

Theoretical Framework

Theory of Reasoned Action

Created by Martin Fishbein and IcekAjzen (1967), the Theory of Reasoned Action centers its analysis on the importance of attitudes in the decision-making process. The core of the theory posits that consumers act on a behavior based on their intention to create or receive a particular outcome. In this analysis, consumers are rational actors who choose to act in their best interests. According to the theory, specificity is critical in the decision-making process. A consumer only takes a specific action when there is an equally specific result expected. From the time the consumer decides to act to the time the action is completed, the consumer retains the ability to change his or her mind and decide on a different course of action. Furthermore, customers evaluate alternatives by comparing various brands and this evaluation is mainly based on the functional and psychological benefits they offer. This implies that an organization needs grasp the benefits customers seek and also find out other brands customers consider. After evaluation is done, the customer is set to decide on his or her choice, and it must be noted that this decision does not necessarily lead to purchasing; hence organizations use different techniques to ensure actual purchase. These techniques pay include flexible payment plans for products and services or discounts or even ability to enter a competition with the purchase (Khosla, 2010). The last stage a consumer goes through is the after buying assessment which enables the buyer to the goods or services they purchased and product features such as brand, price and quality are compared. At this stage customers compare their expectations to the perceived value thus influencing the decision to continue purchasing the good or not. It is worth noting that availability of information on products greatly affects this decision (Maclnnis, 2014). Marketers can learn several lessons from the Theory of Reasoned Action. First, when marketing a product to consumers, marketers must associate a purchase with a positive result, and that result must be specific. For instance a research study by Chen and Chang (2019) showed that consumers' attitudes towards green energy option (e.g., renewable energy sources) and subjective norms (e.g., social norms promoting environmental responsibility) predicted their intentions to choose green energy option.

Empirical Review

The review of related empirical studies showed that no research study is directly related to the present study. However, some were found relevant. Chen, Y. (2016) conducted a study titled "The drivers of green brand equity: Green brand image, green satisfaction, and green trust" to explore the impact of green marketing on consumer behavior. The study employed a survey methodology, using a self-administered questionnaire to collect data from 500 consumers in Taiwan. The sampling technique used was convenience sampling, where participants were recruited through online forums and social media groups. The study found that green marketing strategies can enhance consumer trust and loyalty towards environmentally friendly products. Specifically, the findings revealed that green brand image, green satisfaction, and green trust are significant drivers of green brand equity. The study's results suggest that companies can build strong green brands by creating positive green brand images, delivering satisfactory green experiences, and fostering green trust with their customers.

In yet another study, Li et al. (2024) investigated the relationship between green marketing strategies and consumer trust in solar energy adoption in their study titled "The impact of green marketing on consumer trust in solar energy adoption". The study used a quantitative approach, collecting data through an online survey of 1,000 consumers in China. The sampling technique employed was stratified random sampling, where participants were selected from different age groups and income levels. The study applied structural equation modeling (SEM) to analyze the

data and found that green marketing strategies can increase consumer trust and adoption of solar energy. The findings indicated that green marketing has a positive impact on consumer trust, which in turn influences solar energy adoption. The study's results suggest that companies can promote solar energy adoption by implementing effective green marketing strategies.

Also, Kumar et al. (2019) examined the relationship between green brand equity and consumer trust in solar energy adoption in their study titled "Green brand equity and consumer trust: A study of solar energy adoption". The study employed a mixed-methods approach, combining both qualitative and quantitative data collection and analysis methods. The qualitative data were collected through in-depth interviews with 30 consumers, while the quantitative data were collected through a survey of 300 consumers in India. The sampling technique used was purposive sampling, where participants were selected based on their experience with solar energy products. The study found that green brand equity can enhance consumer trust and loyalty towards solar energy products. The findings revealed that green brand equity has a positive impact on consumer trust, which in turn influences solar energy adoption. The study's results suggest that companies can build strong green brands by creating positive green brand images, delivering satisfactory green experiences, and fostering green trust with their customers.

Methodology

This study on green marketing strategies and consumer trust in solar energy adoption in Rivers State employs a quantitative research design, using a survey approach to collect data from residential solar energy users and business owners who have adopted solar energy solutions. The population size is approximately 5,500, comprising 2,500 residential solar energy users and 3,000 business owners. A sample size of 357 participants was selected using Taro Yamane formula, and a stratified random sampling technique was employed to select participants from the population, dividing them into two strata: residential solar energy users and business owners. Participants were randomly selected from each stratum using a random sampling technique. A structured questionnaire was used to collect data, divided into sections to capture information on demographic characteristics, green marketing strategies, consumer trust, and solar energy adoption. The reliability of the instrument was tested using Cronbach alpha and a correlation coefficient of 0.86 was obtained an indication that the instrument is reliable. The questionnaire was administered through online surveys using Google Forms and in-person interviews with participants. Descriptive statistics and inferential statistics was used to analyze the data, including means, and standard deviations, as well as Pearson Product Moment Correlation (PPMC) to examine the relationship between green marketing strategies and consumer trust on SPSS (Statistical Package for Social Sciences) version 25.0.

Result of Findings

Research Question 1

To what extent does creating green brand identity influence consumer trust in solar energy adoption in Rivers State?

Table 1: Computation of mean responses of creating green brand identity on consumer trust in solar energy adoption in Rivers State.

Items	N	Mean	Std. Deviation	Std. Error Mean
Green brand identity and consumer trust	357	3.8410	.34201	.02322
Company's green brand image influence my trust in their solar energy products	357	3.81	.515	.035
How important is it for you to associate a company's brand with environmental responsibility when considering solar energy adoption.	357	3.86	.376	.026
Company's transparency about its environmental practices and policies affect your trust in their solar energy products.	357	3.83	.412	.028
How likely are you to trust a company's solar energy products if they have a strong green brand reputation.	357	3.87	.457	.031

Source: **SPSS output (Base on questionnaires' data 2025)**

Analysis in table 1 showed that all questionnaire items on creating green brand identity influence consumer trust in solar energy adoption have mean score above the criterion mean of 2.50 indicating an acceptance that creating green brand identity influence consumer trust in solar energy adoption in Rivers State, Nigeria. In summary, with a grand mean of 3.84, the respondents agreed to a very high extent that creating green brand identity influence consumer trust in solar energy adoption in Rivers State. These findings suggest that creating green brand identity have a profound influence on consumer trust on solar energy adoption in Rivers State, highlighting the importance of incorporating environmental responsibility and sustainability into marketing efforts.

Research Question 2

To what extent does emphasizing eco-friendly benefits influence consumer trust in solar energy adoption in Rivers State?

Table 2: Computation of mean responses of emphasizing eco-friendly benefits on consumer trust in solar energy adoption in Rivers State.

Items	N	Mean	Std. Deviation	Std. Error Mean
Eco-friendly benefits and consumer trust	357	3.7327	.30141	.02046
Company's educational content about solar energy influence my trust in their products.	357	3.70	.601	.041
How important is it for you to feel informed about the environmental benefits of solar energy when considering adoption	357	3.87	.457	.031
Company's promotion of solar energy's environmental benefits affect my trust in their products.	357	3.69	.564	.038
How likely are you to trust a company's solar energy products if they provide clear and concise information about the benefits of solar energy	357	3.68	.565	.038

Source: **SPSS output (Base on questionnaires' data 2025)**

The results of the study in analysis 2, indicate a highly positive influence of emphasizing eco-friendly benefits on consumer trust and solar energy adoption in Rivers State. The overall mean score of 2.5 on a 4-point Likert scale suggests a significant influence of emphasizing eco-friendly benefits on consumer trust and solar energy adoption. Notably, with a grand mean of 3.73, indicating a consistently very high level of agreement on the effectiveness of green marketing strategies in promoting solar energy adoption and enhancing consumer trust. These findings suggest that emphasizing eco-friendly benefits as a dimension of green marketing strategies have a profound impact on consumer trust and solar energy adoption in Rivers State.

Research Question 3
To what extent does promoting consumer awareness on consumer trust in solar energy adoption in Rivers State?

Table 3: Computation of mean responses of promoting consumer awareness on consumer trust in solar energy adoption in Rivers State.

Items	N	Mean	Std. Deviation	Std. Error Mean
Consumer awareness and consumer trust	357	3.8164	.32679	.02218
Company's emphasis on the eco-friendly benefits of solar energy influence your trust in their products.	357	3.83	.500	.034
How important is it for you to consider the environmental impact of a company's solar energy products when making a purchasing decision	357	3.86	.339	.023
Company's highlighting of solar energy's carbon reduction benefits affect your trust in their products.	357	3.76	.514	.035
How likely are you to trust a company's solar energy products if they emphasize the eco-friendly benefits of their products.	357	3.87	.457	.031

Source: **SPSS output (Base on questionnaires' data 2025)**

Analysis in table 3 showed that all questionnaire items on promoting consumer awareness on consumer trust in solar energy adoption have mean score above the criterion mean of 2.50 indicating an acceptance that promoting consumer awareness on consumer trust in solar energy adoption in Rivers State. In summary, with a grand mean of 3.81, the respondents agreed to a very high extent that promoting consumer awareness influence consumer trust in solar energy adoption in Rivers State.

Hypothesis 1
There is no significant relationship between creating green brand identity and consumer trust in solar energy adoption in Rivers State.

Table 4: Computation of relationship between creating green brand identity and consumer trust in solar energy adoption in Rivers State.
Correlations

		GREEN BRAND IDENTITY	CONSUMER TRUST
GREEN BRAND IDENTITY	Pearson Correlation	1	.905**
	Sig. (2-tailed)		.000
	N	357	357
CONSUMER TRUST	Pearson Correlation	.905**	1
	Sig. (2-tailed)	.000	
	N	357	357

**. Correlation is significant at the 0.01 level (2-tailed).

Source: *SPSS-generated Output (2025)*

Table 4 shows a correlated result of an analysis on creating green brand identity and consumer trust in solar energy adoption in Rivers State. The result indicates creating green brand identity has a very strong positive correlation with **c**onsumer trust in solar energy adoption **(r = .905)** which is significant given 2-tailed value (PV) = 0.000<0.05. Based on this result, hypothesis (Ho_1) of no significant relationship between creating green brand identity and consumer trust in solar energy adoption in Rivers State is thus rejected.

Hypothesis 2
There is no significant relationship between **e**mphasizing eco-friendly benefits and consumer trust in solar energy adoption in Rivers State

Table 5: Computation of relationship between emphasizing eco-friendly benefits and consumer trust in solar energy adoption in Rivers State.
Correlations

		ECO-FRIENDLY BENEFITS	CONSUMER TRUST
ECO-FRIENDLY BENEFITS	Pearson Correlation	1	.866**
	Sig. (2-tailed)		.000

CONSUMER TRUST	Pearson Correlation	.866**	1
	Sig. (2-tailed)	.000	
	N	357	357

**. Correlation is significant at the 0.01 level (2-tailed).

Source: *SPSS-generated Output (2025)*

Table 5 shows a correlated result of an analysis on **e**mphasizing eco-friendly benefits and consumer trust in solar energy adoption in Rivers State. The result indicates **e**mphasizing eco-friendly benefits has a very strong positive correlation with **c**onsumer trust in solar energy adoption (r **= .**866**)** which is significant given 2-tailed value (PV) = 0.000<0.05. Based on this result, hypothesis (Ho_2) of no significant relationship between **e**mphasizing eco-friendly benefits and consumer trust in solar energy adoption in Rivers State is thus rejected.

Hypothesis 3
There is no significant relationship between promoting consumer awareness and consumer trust in solar energy adoption in Rivers State.

Table 6: Computation of relationship between promoting consumer awareness and consumer trust in solar energy adoption in Rivers State.
Correlations

		CONSUMER AWARENESS	CONSUMER TRUST
CONSUMER AWARENESS	Pearson Correlation	1	.772**
	Sig. (2-tailed)		.000
	N	357	357
CONSUMER TRUST	Pearson Correlation	.772**	1
	Sig. (2-tailed)	.000	
	N	357	357

**. Correlation is significant at the 0.01 level (2-tailed).
Source: *SPSS-generated Output (2025)*

Table 6 shows a correlated result of an analysis on promoting consumer awareness and consumer trust in solar energy adoption in Rivers State. The result indicates promoting consumer awareness has a very strong positive correlation with **c**onsumer trust in solar energy adoption (r **= .**722**)** which is significant given 2-tailed value (PV) = 0.000<0.05. Based on this result, hypothesis (Ho_3) of no significant relationship between promoting consumer awareness and consumer trust in solar energy adoption in Rivers State is thus rejected.

Discussion of Findings
This research which investigates the influence of green marketing strategies on consumer trust in solar energy adoption in Rivers State, Nigeria supports some previous studies conducted in the academic space. The researchers' intention was to determine if creating green brand identity, emphasizing eco-friendly benefits, and promoting consumer awareness will influences consumer trust in solar energy adoption in Rivers State.

Analysis of primary data collected from 357 respondents representing residential solar energy users and business owners who have adopted solar energy solutions, reveals that green marketing strategies significantly influence consumer trust in solar energy adoption in Rivers State. Our findings support, Chen, Y. (2010) found that green marketing strategies can enhance consumer

trust and loyalty towards environmentally friendly products. Specifically, the findings revealed that green brand image, green satisfaction, and green trust are significant drivers of green brand equity.

Moreover, Kotler and Keller, assertion that by highlighting firms' eco-friendly benefits, companies can attract environmentally conscious customers and establish themselves as leaders in sustainability also corroborate our findings. They revealed that a company that produces energy-efficient light bulbs can highlight the environmental benefits of using their products, such as reducing energy consumption and carbon emissions.

In supporting these findings also Li et al. (2024) argued green marketing strategies can increase consumer trust and adoption of solar energy. Their findings indicated that green marketing has a positive impact on consumer trust, which in turn influences solar energy adoption. In a similar finding, Peattie and Crane (2005) reveals that by educating customers about the environmental benefits of their products or services, companies can empower them to make informed purchasing decisions and drive demand for sustainable products and finally, the researcher is of the opinion that **b**y raising consumer awareness, companies can encourage customers to make environmentally friendly purchasing decisions and foster a sense of shared responsibility for sustainability

Conclusion

Study provides insights into the critical role of green marketing strategies in promoting consumer trust and adoption of solar energy. The findings suggest that green marketing strategies, such as highlighting eco-friendly benefits, promoting environmental responsibility, and creating a green brand identity, can significantly influence consumer trust and loyalty towards solar energy products. The study's results also underscore the importance of authenticity, transparency, and environmental responsibility in building trust with consumers.

Recommendations

Based on our findings and conclusion, the study therefore recommends that:

1. Solar energy firms should develop informative content highlighting the benefits and value proposition of solar energy.
2. Solar energy marketers should highlight the eco-friendly benefits of their products and services to appeal to consumers who prioritize environmental sustainability.
3. Solar energy companies should share case studies and testimonials from satisfied customers who have benefited from solar energy adoption to build trust and credibility.

Abstract
Customer satisfaction has been recognized as an emotional connection between a company and its customers focused on effective delivery of products and services. E-commerce is the fastest growing expanse in the worldwide economy, which briefs the distance amid buyers and sellers. E-commerce adoption is a fundamental fragment of a country's economic development and up-to-the-minute day technology. This paper investigated the relationship between e-commerce and customer satisfaction. Drawing on the Contingency Theory and the literature on e-commerce and customer satisfaction, the paper found that, the machinery of logistics values significantly influenced influence customer satisfaction in e-commerce, management level of education, owners or shareholder's' commitment, e-commerce literacy rate remained the most managerial factors, There is a significant and positive correlation between e-commerce and logistics, E-commerce has significant impact on the physical, information and financial flows of supply chains. The study therefore concludes that, there is a significant relationship between e-commerce adoption and customer satisfaction, and recommends that, business should provide the necessary environmental support to strengthen e-commerce growth, and more effort should be put forth to developing e-commerce systems to enhance customer satisfaction in their various sectors.

Key Words: *E-commerce adoption, Contingency theory, Customer satisfaction, Literature review*

Theme: Strategic Initiatives for Transition to Renewable Hope in SMART Economies.

Introduction

Customer satisfaction has been recognized as an emotional connection between a company and its customers focused on effective delivery of products and services. The key element to customer satisfaction is knowledge exchange, so information and communication technologies provide immense opportunities for organizations to exchange knowledge and engage with customers (Abeysekara, 2016).

Organizations rely on an array of technological systems and techniques for improving their services, products and business processes. Rising competition in the global market and rapid advancements in information technology (IT) have forced many organizations to adopt cutting edge technological systems to remain competitive (Amalnik & Ravasan, 2018), one of which is E-commerce

Nowadays, e-commerce is preserved as one of the most dynamic and important sectors of the economy, as well as one of the main factors leading to greater competitiveness (Joong-Kun Cho et al., 2018; Singh & Srivastava, 2019; Wakil et al., 2019). E-commerce is the fastest growing expanse in the worldwide economy, which briefs the distance amid buyers and sellers. E-commerce adoption is a fundamental fragment of a country's economic development and up-to-the-minute day technology. The energetic development of e-commerce is powered not only by swiftly growing internet access but also by rising mobility and popularity of transportable devices. Because of the internet, trade has become as easy and fitting as never before (Lin et al., 2016). Its beneficiary's mare both companies and customers. Almost every firm has the latent to become a successful trader (WTO, 2016). Companies can save on both fixed and variable costs, such as rent, labor and other overheads associated with a physical presence in shopping centers and brick-and-mortar stores.

When online deals and transactions are conducted in different areas or countries by using information and communication technology (ICT), it is called cross-border e-commerce (CBE) (Wang, 2014; Accenture, 2012). E-commerce has been one of the catchwords in recent years. Laudon and Traver (2011) state, E-commerce technology, is different and more influential from other technologies that we have seen in the past century. E-commerce technology develops quickly with the development of Internet and people can enjoy convenient life by using e-commerce. But today many of the new e-commerce companies have failed or are struggling for economic survival, and the failure for many companies in e-commerce can be in part accounted by the neglecting of logistics and supply chain management.

E-commerce has also become associated with solutions and tools such as portals, e-marketplaces, e-auctions or virtual inventory. Logistics and supply chain operations have been affected irrevocably by e-commerce solutions. But the possible major changes could take a lot longer to happen. For companies, the overall goal of e-commerce includes (Yang, 2012): to help companies develop global sales network and logistics infrastructure which support efficient online order fulfillment; to provide enterprises with information and data of various business activities (i.e. online order documentation), production and sales information to solve the difficult problem of collection; to reduce market entry link that help companies open up the market to minimize the circulation of goods; to reduce business cost of sales and minimize the transaction costs of goods;

both for trading and online commodity trading to facilitate negotiations; supports online purchasing

In the early days, low prices and convenience were the driving forces for e-commerce, but today, e-commerce retailers (also known as e-tailers) are catering to every kind of shopping experience, service and product (Charlesworth, 2011). At the moment, it remains the case that as the gross revenue earned from e-commerce is increasing year on year from nascence to critical mass, most transport service providers (TSP) or retailers, particularly multi- and Omni channel retailers, are only starting to realize what this will bring to their retail logistics and physical distribution network infrastructures and what role they can have within. So much as, today e-commerce has become a complementary retail touch point for the traditional brick-and-mortar retail.

Ecommerce saves time because customers can shop 24 hours a day and throughout the year, and at any place in the comfort of their homes. So, through the freedom of choice customers via the Internet can fulfill all their business through a network of investment services and stock trading, consulting and reservations of tickets and Hotel reservations etc. Electronic experiments allow customers to exchange experiences and views among themselves (Charlesworth, 2011).

Ecommerce involves much more than electronically mediated financial transactions between customers and companies. Many commentators talk about e-commerce as all electronically mediated transactions between and company and any third party it deals with. It also requires digital goods for carrying out their transactions. Digital goods are goods that can be delivered over a digital network (Laudon & Laudon, 2013).

In contemporary times, one of the important questions in business has been why some organizations succeeded while others failed. Customer satisfaction has been the most important issue for every organization be it profit or non-profit one. It has been very important for managers to know which factors influence customer satisfaction for them to take appropriate steps to initiate them. However, defining, conceptualizing, and measuring customer satisfaction have not been an easy task. Researchers among themselves have different opinions and definitions of customer satisfaction, which remains to be a contentious issue among organizational researchers (Barney, 1997). The central issue concerns the appropriateness of various approaches to the concept utilization and measurement of customer satisfaction.

Numerous research has been conducted on e-commerce. For example, Kawa and Swiatowiec-Szczepanska (2021) identified the components of logistics value and examine their influence on customer satisfaction in e-commerce. Antwi, and Owusu-Agyeman (2020) investigated the impact of e-commerce on logistics and find out the common general problems and countermeasures and Harsono (2014) examined the impact of e-commerce in supply chain management.

The above empirical studies suggest that there is an association between e-commerce and customer satisfaction. There has not been much research done about e-commerce and customer satisfaction. Thus, the purpose of this paper is to examine the relationship between e-commerce and customer satisfaction.

Review of Relevant Literature

The foregoing section encircles the introduction of the paper and reviewed relevant literature focused on e-commerce and customer satisfaction to set up theoretical and empirical connections.

Theoretical Underpinning

This paper is anchored on contingency theory

Contingency Theory

Contingency theory (CT) is a theory of organizational management, which focuses on elaborate employees training and use of technology for the development and improvement of the organization (Li, 2015). The CT was developed from behavioural theories, which focus on how environmental elements influence the behaviours of an organization in the late 1960s (Otley, 2016). According to Li (2015), the CT describes good leadership (among managers) in the organization to disseminate information within and outside the organization. The CT further explains how managers need to focus on the change and adoption of technologies outside the organization (Hwang & Min, 2013; Li, 2015). This includes OS which is an example of the internal factor determined by the contingencies of the external environment and can reflect degree of environmental uncertainty and TC (Otley, 2016). Similarly, researchers of management information systems generally assume that organizational performance is contingent on several variables such as strategy, adoption of technology, TC or innovation, environmental change, OS, size, task and individual characteristics to influence the performance of organizations (Aremu et al., 2018; Otley, 2016). Moreover, a recent study has demonstrated that better performance is expected when the fit between the stated variables is good (Li, 2015).

The contingency theories are a class of behavioral theories that argued that there is no best method of organizing or leading an organization. It is because a leadership style that is useful in some conditions may not be successful in others. Using the contingency theory of organizational structure helps in developing a framework for the study of organizational design. It is very important to examine some of the contingency factors that might influence the adoption of e-commerce system to fill the gap in literature.

Therefore, in this study we examine the adoption of e-commerce and customer satisfaction. This is because previous research on e-commerce adoption found e-commerce to be significant and can change the basic relationship considerably. Also, the study examines the relationship between e-commerce adoption and customer satisfaction.

The Concept of E-Commerce

E-commerce dates to the invention of the internet. Then, thousands of businesses have taken up abode on websites. The aptitude to use this technology appeared in the late 1970s and allowed businesses to send commercial documentation electronically. The relationship between customer satisfaction and E-commerce is much closer in E-commerce business than in any other industries (Ramanathan 2010). E-commerce orders are continuously small, but the delivery of these orders is somewhat multifaceted, so the scope necessity for the role of le-commerce is much larger, and the service is directly provided to the final customer who always has high expectations on the service level (Ramanathan, George & Ramanathan, 2014).

Many studies show that customers consider performance as an important factor of E-commerce, especially the last mile delivery. And company's capability has significant and positive effects on performance in E-commerce market. Impending e-commerce model should emphasis on monitoring the last mile delivery service quality (Charlesworth, 2011). In line with all mentioned above, the main purpose of this study is to investigate e-commerce adoption and customer satisfaction.

The Concept of Customer Satisfaction

Satisfaction relates to the sensation of preference and happiness with something that comes when the customer obtains something desired. Satisfaction is a rejoinder to the customer's needs (Olivier, 1999) and requirements (Gajewska et al., 2019). Customer satisfaction is preserved also as a state in which expectations are equal to perception of the actual service received (Radziszewska, 2013). Kotler (1994) recognizes satisfaction as the degree to which the perceived product features match customer expectations. Satisfaction is consequently a categorized sensation (Kumar & Petersen, 2006) and is measured (Gajewska et al., 2019).

The customer may be partly satisfied, for example, with some features of the product or service, while at the same time other features may not suit him/her at all. In e-commerce, satisfaction implies gratification with the deal and a sense of understanding of the customer's requirements by the seller and other entities managing these dealings (Karahanna et al., 2013). It is not only restricted to the degree of satisfaction but is also a procedure that can transform under various factors (Nisar &Prabhakar, 2017). Customer satisfaction is very much influenced by customer service and their moods linked with it, in specific listening to the customer and understanding their requirements, keeping agreements and a definite word, quick reactions, professionalism and expertise and honesty (Nisar & Prabhakar, 2017).

Empirical Review

Kawa and Swiatowiec-Szczepanska (2021) branded the machinery of logistics value and surveyed their influence on customer satisfaction in e-commerce. This study explored the moderation effect between those two variables by means of the overall service level in the diverse industries of e-commerce. 592 properly completed questionnaires emanating from telephone and web interviews were analyzed, and Hierarchical linear modeling was used to authenticate the dependances between variables from an organization and industry levels. It was found that the logistics factors designated and defined in the paper in a different way affect the value for the customer. This value is subjective and dynamic.

Antwi and Owusu-Agyeman (2020) studied the impact of e-commerce on logistics and find out the common general problems and countermeasures of Jumia Ghana Logistics Company, using 110 questionnaires administered to both employees and customers of the company by means of simple random techniques. The SPSS and excel were used to analyze data and the results classified e-commerce adoption challenges into three factors:1) Business Factors, 2) Management Factors and 3) External Factors. Some of the environmental factors were; accurate address system, government support and policies, quality transport system etc. the business-related factors were; cost of implications, technological equipment, business ability to provide trust and privacy on transactions, business partner readiness etc. the study also exposed that management level of education, owners or shareholders' commitment, e-commerce literacy rate remained the most

managerial factors. The study likewise exposed positive correlations between e-commerce and logistics.

Harsono (2014) surveyed the impact of e-commerce in supply chain management with a case study on Dell Inc. Data was gotten through Web browsing and e-mail. Findings displayed that e-commerce could have an impact on the physical, information and financial flows of supply chains. This paper constitutes an original and empirical study that would be a contribution to business practitioners and academia.

Theoretical Findings

This study analyzed the substance of e-commerce and customer satisfaction research literature published in academic journals. Through the analysis of empirical literature, the study revealed the research status, problems and main results of e-commerce and customer satisfaction in the past decade. It can be used as a reference for researchers and businesses to promote the research of e-commerce and customer satisfaction.

The following findings were made conspicuous:

1. The machinery of logistics values significantly influenced customer satisfaction in e-commerce.
2. Management level of education, owners or shareholders' commitment, e-commerce literacy rate remained the most managerial factors.
3. There is a significant and positive correlation between e-commerce and logistics.
4. E-commerce has significant impact on the physical, information and financial flows of supply chains

Conclusion

This study investigated the relationship between e-commerce adoption and customer satisfaction. Drawing on the Contingency Theory and the literature on e-commerce and customer satisfaction, the study found that, the machinery of logistics values significantly influenced influence customer satisfaction in e-commerce, management level of education, owners or shareholder's' commitment, e-commerce literacy rate remained the most managerial factors, There is a significant and positive correlation between e-commerce and logistics, E-commerce has significant impact on the physical, information and financial flows of supply chains. The study therefore concludes that, there is a significant relationship between e-commerce adoption and customer satisfaction, and recommends that, business should provide the necessary environmental support to strengthen e-commerce growth, and more effort should be put forth to developing e-commerce systems to enhance customer satisfaction in their various sectors.

Abstract
The importance and necessity of outcomes of marketing research has necessitated adoption of sustainability approach to conserve relevance of these research outcome in the contemporary issues in marketing. The aim of the study is to investigate effect of sustainability approach in marketing research application with main focus on contemporary issues in marketing. The study concluded that based on dynamic marketing landscape, businesses face contemporary challenges that require innovative analysis using marketing research in the development of their activities, any business that want to sustain their activities need to incorporated full outcomes of sustainability that (economic, environmental and social). This paper is an ongoing study to determine sustainability approach in marketing research application: contemporary issues in marketing, more contribution is needed to expand the work especially in literature.

Keyword: *Sustainability, Marketing, Social, Economic, and Environmental*

Introduction

Sustainability has become increasingly relevant in shaping responsible practices as a result of current and growing challenges of the marketing ecosystem (Azmat et al., 2023). The concept of sustainability by Sakalasooriya (2021) has been widely adopted across many disciplines, including marketing (Kemper & Ballantine, 2019). Traditionally, marketing was linked to converting natural resources into products, that consumers used and disposed of leading to significant environmental problems (Azam et al., 2023).It is a good idea to look for methods of shedding light on issues and the activities that follow in order to highlight chiefs after learning about the background of sustainability in history, its relationship to marketing theory and practice, and what promoting entails for the creation of utilization designs. Mulder (2014), expresses concern that there hasn't been a flawless integration of concepts for practical growth and that it frequently depends on the teacher's personal advantage. In addition to differing in knowledge, various civilizations also differ in their attitudes toward and practices related to sustainability concepts.
Businesses confront a variety of difficulties when incorporating sustainability into their marketing strategies. Effective sustainability programs are hampered by problems including gaps in consumer understanding, implementation challenges, ROI measurement, competitive landscape navigation, and regulatory compliance assurance. Innovative strategies that strike a balance between regulatory requirements, competitive pressures, and long-term sustainability goals

including customer trust, true environmental stewardship, and long-term sustainability goals—are needed to address these difficulties.

As sustainability becomes increasingly crucial, stakeholders including consumers, investors, and regulators demand greater environmental (Abbas, 2024) and social responsibilities (Martos-Pedrero et al., 2024), to be a part of marketing strategies. This has paved the way for a company to attract conscious consumers who seek environment friendly products (McCullough & Melton, 2017; Parthiban & Buvaneswari, 2024), enhance relationships with target audiences, reduced costs (Calignano & Mercurio, 2023), and improved operational efficiency through eco-friendly processes and technologies can thus be achieved (Javaid et al.,2022). These aid marketing activities in contemporary period unique especially when applicability is at its peak.

The use of digital technologies and social media has further extended contemporary practices in marketing, since it reaches and influence of long-term marketing campaigns has been effective. Businesses can now communicate directly with customers (Adwan & Altrjman, 2024), promote their sustainability programs, and establish communities based on common values. The research gaps in the literature on sustainability and marketing can be described in two ways. First, research on sustainability and marketing is limited in the business context (Abbas, 2024). The literature on sustainability and marketing tends to focus more on micro- and meso-marketing perspectives than on macro-marketing, such as enterprise systems and industrial aspects that would eventually impact marketing activities.

Second, although sustainability and marketing are two significant research themes, meaningful results based on empirical evidence are lacking (Abdelmeguid et al., 2024). Owing to the absence of an empirical analysis reviewing and investigating existing literature on sustainability and marketing, the scope of research and strategy development is mainly limited to micro- and meso-marketing perspectives (Parthiban & Buvaneswari, 2024).

Moreover, sustainability and marketing are not limited to business-to-consumer relationships, such as the promotion of green marketing to enhance a company's image and profit. Industrial businesses must consider the perspective of macro-marketing for sustainability. Although the valuable insights exist through several contemporary researches, by prior studies, a comprehensive understanding of sustainability approach in marketing research application remains limited. To address this gap, this study proposes an extensive study to investigate sustainability approach in marketing research application: contemporary issues in marketing.

Research Questions

1. What role does social sustainability play in research application in contemporary issues in marketing?
2. What impact does economic sustainability play in research application in contemporary issues in marketing?
3. What role does environmental sustainability play in research application in contemporary issues in marketing?

Research Objectives

1. To determine the role of social sustainability in research application in contemporary issues in marketing
2. To ascertain the role of economic sustainability in research application in contemporary issues in marketing
3. To evaluate role of environmental sustainability in research application in contemporary issues in marketing

Literature Review

Sustainability Approach

Since then, the term sustainability has been defined in numerous ways. According to Charter and colleagues, sustainability means "to maintain or prolong both environmental and human health and simply good management". Van de Kerk and Manuel (2008) suggest that it comprises the depletion of resources, the conservation of nature and other ecological aspects, and the human well-being and quality of life. In fact, sustainability has been given approximately three hundred alternative definitions. According to (Farsi, HosseinianFar, Daneshkhah, & Sedighi, 2017), understanding the sustainability concept is a major matter as it is the basis for sustainability assessment.

The Triple Bottom Line (TBL) of People, Planet and Profit, a term coined by Elkington (1997), has become an influential approach all over the world (Svensson & Wagner, 2015). This model set up the key of long-term strategies for companies making the transition to sustainability, based on three important dimensions of sustainable development: environmental quality, social equity, and economic benefits (Elkington, 1998). The most commonly accepted model to describe sustainability and the TBL is the nested spheres model. Sustainability can be illustrated as the place where the three dimensions overlap. However, one of the limitations of this approach is that it does not show levels of hierarchy between the three dimensions.

Economic Dimension

The economic dimension of TBL – Profit – focuses on the value created by the organisation and goes beyond its financial performance and financial concepts as sales growth, cash-flow, shareholder value, and so on to include the economic and operational business impact on the society (Parthiban & Buvaneswari, 2024). Further, it focuses on the organisation's performance through the efficient management of its strategic capabilities such as core competencies (Muhajir, 2024), shareholder value creation, and marketing orientation. According to Choi and Ng (2011), consumers became more concerned with economic sustainability since the economic downturn in 2008 as it jeopardizes financial stability and, consequently, employment.

Social Dimension

The social dimension – People - encompass the impact of an organisation on the people's welfare, including both employees and community, and addressing issues like education assistance, community interaction, charitable causes, and fair fare practices (Muhajir, 2024). A prevailing topic in this dimension is the increase in Corporate Social Responsibility (CSR) initiatives which has been receiving considerable focus not only on research but also on corporate strategies and operations (Testa, Russo, Cornwell, McDonald & Reich, 2018). A growing body of research

suggests positive relationships between CSR behaviour and consumers' attitudes toward organisations (Testa et al., 2018).

Environmental Dimension

The environmental dimension – Planet – relates to the organisation´s attempts to minimize environmental impact as well as their use of energy and waste production, in order to reduce their ecological footprint. Some evidence that the greening of the marketplace is becoming mainstream is the proliferation of green products, eco-labelling, and ISO 14001 certification. Porritt (2007) and Bansal (2005) argue that the environmental dimension of the TBL is the most important, while the economic and social are secondary because everything else depends on the Earth's resources, limits and systems. In fact, the environmental dimension has received most focus by scholars' research than the social and economic ones (James et al., 2015). Interestingly Little, Lee and Nair (2019), claim for a reshape of this dimension with reference to consumers, redefining it as the impact of the environmental change on human health and well-being resultant from consumption.

Incorporation of sustainability in marketing research has rapidly grown over the last two decades. According to the McKinsey survey, companies have been actively integrating sustainability principles into their businesses to contribute to society and the environment.

This sustainability dominant perspective of businesses specifically emphasizes economic growth concerning market and consumption and technological solutions for environmental and social problems. Sustainability has been on the list of global megatrends since the concept first appeared at the United Nations (UN) conference in 1972, where numerous disciplines raised ethical issues, where numerous from various disciplines raised ethical issues. It has become an imperative research topic with varying interpretations and contrasting viewpoints and is generally associated with a positive moral standing in social understanding and academic discourse.

Although some scholars argue that the UN's concept of sustainability goals is not feasible, scholars and practitioners have recognized the significant role of sustainability as an integrated research field and as an integral component of business strategy. Marketing growth has witnessed the concurrence that the future of business depends on the fundamental and consequential compliance with sustainability. The term "sustainability" is employed extensively across diverse disciplines including engineering, social science, liberal arts, science, and various business sectors (Muhajir, 2024). It provides a long–term future perception focusing on ethical values and principles, which guides harmonious and responsible actions for incorporating environmental, societal, and economic goals. Each discipline defines sustainability based on its contribution to the common goal of a sustainable future. Sustainability has merged with marketing and extends to executive and social issues. It pursues a compound approach and adaption to the varying need for sustainability from both business and academic standpoints in the absence of an appropriate and objective analysis of the interface between sustainability and marketing.

Sustainability is a natural process in business-related disciplines, especially in marketing, because both company executives and scholars are responsible for a profitable and sustainable future. Subsequently, there have been numerous definitions of sustainability in the marketing field. Although the scope and definition of sustainability are unclear, studies on marketing generally focus on the environmental sector among the three pillars of sustainability (environment, economy, and society. For instance, Iyer and Reczek (2017), argued that sustainability activities in

marketing, as a behavior of green consumers, provide important results based on an understanding of the reality of active green or ethical values regarding concrete purchases. Specifically, they argued that regardless of the broad and diffuse concept of sustainability, consumers are predisposed to purchase sustainable products because their purchasing behavior is constrained by conventional marketing factors such as price, brand, and availability, which enhance sustainable consumption patterns. Hence, the antithesis relationship between marketing and sustainability has been reviewed carefully to identify the significance of one idea compared with the other.

Methodology

The development of knowledge in the field of marketing is growing rapidly. This makes it difficult to stay up-to-date and at the forefront of research, as well as to evaluate the collective evidence in a particular area of marketing research (Leonidou, Katsikeas & Aykol, 2013). Therefore, literature review is more relevant than ever as a research method. Traditional literature reviews often lack rigor and are conducted ad hoc rather than following a specific methodology. Therefore, questions can be raised about the quality and reliability of these types of reviews. This article examines the literature review as a research methodology and offers an overview of the various reviews.

Conclusion

The marketing research on sustainability is impressive in its excellence and in the diversity of coverage, in both the questions posed and the methodologies applied toward answering the questions. The literature shows a lot of "heart," with so many scholars dedicating their intellectual efforts toward such an important realm of investigation (Muhajir, 2024). As delineated, marketing research questions covered both consumer and business domains, trying to understand what both entities are doing, and how they think and operate so as to understand potentially better means of affecting those attitudes and ultimately enhancing more sustainable actions. The dates of the publications are also telling, demonstrating a marked uptick during recent years across the journals of researchers recognizing the importance of the green topics and pursuing those investigative paths.

Numerous articles had highlighted the base motivations of consumers to consider their own immediate, usually economic welfare, perhaps lacking an understanding of the relationship to some ultimate consequences of consumption on the environment, or perhaps less able to empathize with concerns that will unfold in the distance distant time, distant places. While we might wish global citizens simply cared more to do the right thing for our host planet, economic normative behaviors have frequently fallen short of psychological descriptive behaviors, thus instead of fighting an unwinnable fight, perhaps there are other mechanisms that can be effective for leveraging the short-term motivations (Iyer & Reczek, 2017).

Marketers are very good at estimating consumer preferences such as price sensitivities – the purchase data exist and the analyses are rather straightforward. It would not be terribly difficult to begin to assess environmental sensitivities, to wit estimating consumers' (and companies) willingness to pay some additional monetary unit for a feature such as recycled, recyclable, organic, etc. Marketing research can derive precise estimates regarding these tradeoffs, and these trade- offs would be useful in designing programs and marketing communication appeals to encourage and induce more constructive behaviors (again, for both consumers and companies). Finally, another trend in this day and age is the impact of big data and data analytics (Iyer &

Reczek, 2017). It is intriguing to consider the numerous articles on consumers' and managers' perceptions regarding waste, and in particular the business marketing research articles on reversing or enriching the logistics chains. This paper is an ongoing study to determine sustainability approach in marketing research application: contemporary issues in marketing, more contribution is needed to expand the work especially in literature

Abstract
This study examined the influence of dynamic marketing capability (DMC) on profitability of agro-based SMEs in Rivers State. The study used market-sensing capability, opportunity-seizing capability, customer-bonding capability and channel-linking capability as dimensions of DMC. The study adopted an explanatory research design, and collected primary data via cross-sectional survey, using structured questionnaire. The validity and reliability of the instrument were confirmed through exploratory factor analysis and Cronbach's Alpha test respectively. 90 agro-based SMEs constitute the population of the study. A census was taken. Data collected from 77 respondents were found usable for final analyses after data cleaning. The multiple regression analysis served as test statistic, relying on Statistical Package for Social Science (SPSS) version 24.0. The data analyses revealed that DMC has strong positive influence on profitability; with market-sensing capability making the highest contribution. The study concluded that DMC inform profitability of agro-based SMEs in Rivers State; and recommends that agro-based SMEs in Rivers State that seek improved profitability should develop or acquire DMC that enable them sense market conditions, seize market opportunities and develop close-knit relationships with customers and channel partners.

Keywords: *Channel-linking capability, customer-bonding capability, dynamic marketing capability, market-sensing capability, opportunity-seizing capability, profitability*

Introduction

Profitability is a first-order objective of firms. A firm is threatened if it consistently operates at a loss. Thus, profitability is also a key indicator of business health (Ateke & Didia, 2017), and a

measure of a firm's success in acquiring customers and expanding business portfolios. Overall, profitability is an indication that a firm is performing well. However, the high rate of mortality of small and medium scales enterprises (SMEs) in Rivers State suggests that they are not profitable enough to survive the harsh business-scape.

Thompson (2024) posits that a business' ability to generate earnings above its operating costs, leads to increased financial stability, enable reinvestment, attract investors, confer competitive advantage and guarantee survival and growth. That said, literature is replete with contested claims on key determinants of business profitability. Alarussi and Gao (2021) advance liquidity, intangible assets, working capital and company leverage; Gazi et al. (2021) suggests that firm specific (equity to asset ratio, deposit to asset ratio, debt to equity ratio, loan to deposit ratio) and macroeconomic (GDP growth rate) variables determine profitability; while Yüksel et al. (2018) identify interest rate, firm size and economic growth. None of these studies focused on the contribution of dynamic marketing capability (DMC) to profitability of firms.

Thus, this study examined the influence of DMC on profitability of agro-based SMEs in Rivers State. The study suspected that agro-based SMEs could improve their profitability by applying tangible and intangible resources to solve business challenges. This is because prior studies show that DMC improves market presence of firms (Ateke et al., 2025), inform business performance (Ateke & Oluigbo-Moses, 2023; Ateke & Didia, 2017) adaptability (Ateke & Nwulu, 2021), business model innovation (Cirjevskis, 2019) new product development (Walugembe et al., 2017) new market development, among others. Consequently, the study contends that agro-based SMEs in Rivers State can achieve improved profitability if they develop or acquire, and deploy DMC like marketing-sensing, opportunity-seizing, customer-linking and channel-bonding.

Literature Review and Hypotheses Development

Baseline Theory of the Study

This study takes its bearing from dynamic capabilities theory (DCT) which explain how firms achieve competitive advantage in volatile, dynamic and highly disruptive markets (Teece, 2012; Teece & Pisano, 1994). DCT describes capabilities as learned processes and embedded skills that enable a firm produce superior outcomes; and dynamic capabilities as idiosyncratic, firm-specific processes and embedded skills that are rooted in a firm's history (Teece, 2012).

DCT complements resource-based view's position that possession of unique, rare, inimitable, and insubstitutable resources confer competitive advantage (Barney, 1991); by suggesting that it is not the mere possession of resources that is critical to competitive advantage, but expertise in combining resources to create value amidst market turbulence and disturbances. DCT argue that resources are only building blocks for the development of capabilities that involve internal activities and routines that span resources (Teece et al., 1997).

This study adopted DCT as a baseline theory based on its emphasis on learning, combining and recombining resources, and adapting company operations to current and emerging conditions. The current study was designed to establish the influence of DMC on profitability. Profitability is an indicator of business performance; and the provisions of DCT constitute a fine premise to conjecture the plausibility of interaction between the variables. The underlying proposition of DCT that firms can build sustainable competitive advantage by acquiring and utilizing distinctive

competences that enable them modify short-term competitive positions by rapidly sensing shifts in market conditions, and developing and combining new assets while refocusing existing ones, further makes it a cogent baseline theory for the study.

Concept of Dynamic Marketing Capability

DMC represent hard and soft marketing resources that enable firms develop, integrate and release market(ing) knowledge that promote innovativeness and resilience (Bruni & Verona, 2009); adaptability (Ateke & Nwulu, 2021) competitiveness (Hoque et al., 2020; Cirjevskis, 2019). It involve continually evolving productive skills, knowledge, technology and sundry resources with which managers build, integrate and (re)configure marketing capability over time (Helfat & Winter, 2011). Thus, DMC constitute higher-order strategic resources that generate new marketing resources that shape company performance (Teece, 2012). They are meta-capabilities that provide deeper understanding of environmental conditions; and facilitate the orchestration of marketing policies and practices that not only promise, but actually deliver superior outcomes (Ateke & Nwulu, 2021).

DMC is an infant construct developed by Bruni and Verona (2009) as an extension of dynamic capability for marketing-specific applications (Ateke & Nwulu, 2021); and was initially defined as "human capital, social capital and cognition of managers that create, integrate and use market knowledge and marketing resources to respond to, or instigate change (Bruni & Verona, 2009). This view acknowledges DMC as capability that specifically seek to develop, integrate and release market(ing) knowledge; and as a combination of interrelated and complementary sets of resources, competences and routines that amplify firms' capacity to engage in desired marketing activities or respond to market conditions (Kamboj & Rahman, 2015).

Effective delivery of distinctively superior customer value; adept leveraging of resources to sense market conditions and link customers; improved performance in collaborative alliances; and profitability are various ways DMC enhance firms' competitiveness (Konwar et al., 2017). Thus, DMC is anchored on the notion that resources, skills, knowledge and expertise in a firm's repository allows it to renew its competences by retooling or refocusing assets or reconfiguring structures and processes in response to environmental shifts (Ateke & Nwulu, 2021; Takahashi et al., 2016). To earn competitive advantage and achieve healthy business outcomes in today's highly competitive global business arena, firms must develop and adeptly deploy DMC to respond to threats or exploit opportunities more effectively.

DMC is a multidimensional construct consisting market-sensing, customer-linking and channel-bonding capabilities (Day, 1994); customer-oriented capabilities and second-order customer competences (Danneels, 2002, as cited in Ateke & Nwulu, 2021); opportunity sensing, opportunity seizing and resource reconfiguration capabilities (Teece, 2012). Market(ing) research, innovation, customer relationship management, marketing channel management; supply chain management, and marketing communication capabilities (Susanto, 2019; Helfat, & Winter, 2011; Morgan et al., 2009). In this study however, market-sensing capability, customer-linking capability, channel-bonding capability and opportunity seizing capability are adopted as dimensions of DMC because they are capabilities required for success by SMEs.

Market-Sensing Capability

Firms have need to scan their operating environment to identify opportunities (Takahashi et al., 2016) that could be exploited, and threats that must be guarded against. Market-sensing capability therefore, reflects firms' ability to gather and use market intelligence to identify and respond to present and emerging market conditions (Day, 1994). It also encompasses ability to identify changing market conditions and capacity to alter products, processes, practices and strategies to remain relevant in the operating environment.

Anticipating and responding appropriately to market conditions is premised on firms' ability to sense change in market conditions, and to smartly (re)organize marketing operations to achieve sustained growth and robustness; and escape extinction (Ateke & Harry, 2021). Market-sensing capability enhances firms' ability to identify underserved and unsatisfied market segments; ineffective offerings of competitors' or channels through which to route offerings; as well as enable firms identify less price-sensitive customer segments, and offers new insights into "non-price value" that contribute to company success (Alharbi, 2016).

Market-sensing capability is an essential futuristic competence that enable firms bridge information gaps about market conditions (Mama & Onuoha, 2020) and broader environmental awareness (Lindblom et al., 2008). The increased attention to market-sensing capability in recent times is hinged on the notion that awareness of impending environmental shifts enables firms contrive effective responses.

Opportunity-Seizing Capability

Ateke and Nwulu (2021) and Takahashi et al. (2016) view opportunity seizing as the process of assessing, selecting and investing in present and emerging opportunities that promise profitable business growth and sustainability. Firms respond to opportunities by introducing new products, developing new markets or utilizing new channels (Min & Kim, 2022; Wagner et al., 2017). Opportunity-seizing capability thus defines a firms' propensity and dexterity to expertly align operations and make decisions that enable them select appropriate business models and marketing actions aimed at leveraging identified opportunities (Tempelmayr et al., 2019).

Opportunity-seizing capability manifests in the activities companies undertake in their attempt to take advantage of identified opportunities. Popadiuk et al. (2018) states that every decision or action taken by the firm after an opportunity has been detected, is an opportunity-seizing efforts. Thus, to seize an opportunity means to exploit a business opportunity; and opportunity-seizing capability depicts a firm's capacity to refine products, markets and internal processes to achieve economies of scale, efficient orchestration of resources (Ateke & Nwulu, 2021); and expertise in collecting, sharing and using market(ing) intelligence.

The possession of opportunity seizing capability enhances a firm's visibility and reckoning in the market (Ateke et al., 2025; Okwong et al., 2025); enable the creation of superior customer value (Ateke & Didia, 2017); and posture firms to continually contrive and execute appropriate marketing strategies that confer superior performance. Opportunity-seizing capability is also associated with customer acquisition, satisfaction, retention and loyalty. Customers savor variety

and will be favorably disposed to bonding with firms that sense their changing preferences and create new products to satisfy them.

Customer-Bonding Capability

Customer-bonding capability represents the capacity to create and manage close ties with customers. It is a capability that has attracted increased importance, as buyer-seller interfaces continue to transform from traditional adversarial bargaining aimed at achieving best possible benefit from individual transactions, to a focus on closer collaborative relationships based on heightened coordination, participation in joint programmes and close communication (Ateke & Amangala, 2020).

The steady rise in attention to close-knit seller-buyer relationships is sequel to calls by scholars that firms must "develop rapport with customers, focus on customers, bond more intensely with customers, get intimate with customers, know customers, put customers first, own customers or create customers" (Amit & Schoemaker, 1993); which are all anchored on marketing concept as a business philosophy.

Customer-bonding capability constitutes an essential market-based asset that endow firms with a loyal customer-base and improved competitive advantage. Customer retention which results from loyalty is an attraction for businesses because it enhances profitability (Buttle & Ang, 2006) through increased frequency and volume of purchase and referrals. Also, relationship maintenance and customer replacement costs fall, as buyers and sellers learn more about each other. Finally, retained customers are less price-sensitive, hence, may pay higher prices than newly acquired ones (Buttle & Ang, 2006). All these benefits make customer-bonding capability essential to firms. In addition, bonding with customers is central to customer relationship management, even as such bonds serve as exit barriers that tie customers to firms and orchestrate long-term relationship (Wendelin, 2011).

Channel-Linking Capability

Channel-linking capability describes a firm's competences that results in competitive advantage through successful incorporation and management of channel participants (Inan & Kop, 2018). Firms require competent distribution channels that are adaptable to changing customers' needs; resilient enough to deliver channel objectives; and help them stay connected and engaged with customers on different platforms (Ateke et al., 2024). Channel-linking capability enables firms sway channel members to stock and give maximum exposure to their products.

Today's customers have access to a wide array of (product and channel) choices. Hence, they expect more than just products from firms. Indeed, today's customers choose products that satisfy their needs, not only with their features but also with product accessibility, availability and after-sale services (Inan & Kop, 2018). This shift in customer expectation has intensified competition; and has tasked firms to seek increased collaboration with channel intermediaries who are relied upon as partners in delivering customer value. Also, as contributions of various marketing operations to business performance come under scrutiny (Udayana et al., 2021), channel linking capability becomes indispensable to firms due to its link to strong channel relationships that enhance market presence (visibility, accessibility and availability) of products.

Concept of Profitability

Firms have a perennial challenge to ascertain their performance against set standards or performance of rivals. To facilitate this comparison, a set of performance indicators are identified: sales growth, new product success, profitability, market share etc. (Pont & Shaw, 2003). Profitability is the ability of a business to generate revenue in excess of cost of operation. Scholars identify return on assets and return on equity as common indicators of profitability (Ejoh & Iwara, 2014); though anyone of them can be used, depending on the objective of the user.

Profitability is an important concept in business that arrest the interest of managers, shareholders and researchers (Ejoh & Iwara, 2014) since the dawn of commerce. Morgan et al. (2009) affirm that profitability is fundamental to investors and managers because it indicate expected cash flow. It is also a fundamental business goal because long-term survival is linked to capacity to generate profit. Though managers often resort to profitability as a measure of performance, it is relevant to note that performance that enhance profitability is determined by sundry quantitative and qualitative indices.

Profitability or profit potential of a business is often used to determine attractiveness of an investment; or compare the profitability of different investments opportunities (Bahadir et al., 2008). It is also used to measure gains and losses generated in an undertaking, especially in relation to resources invested. In calculating profitability, the benefits from an investment are divided by its costs, and the result expressed as a percentage (Farris et al., 2010). Higher profitability often means that gains from an investment compare favourably to the cost of the investment.

Dynamic Marketing Capability and Profitability

DMC derive from the idea that the accumulation of skills, knowledge and expertise confer on firms, that ability to renew resources and competences by refocusing assets or reconfiguring structures and processes in response to environmental shifts (Takahashi et al., 2016). When adequately harnessed, DMC enable firms deliver superior value to customers (Lindblom et al., 2008), respond appropriately to changing market conditions (Ateke & Nwulu, 2021), exploit new opportunities (Ateke & Oluigbo-Moses, 2023), engage with customers and build strong bonds with collaborators (Teece, 2012).

Sin et al. (2005, as cited in Ateke & Didia, 2017) provides that market sensitivity or sensing, which is a DMC, contribute to continuous learning and knowledge accumulation through continuous intelligence gathering about market conditions. Information discerned from such market intelligence is used to create superior customer value. It is also believed that DMC positively relate to business performance; as several studies linked DMC to business wellness in terms of profitability, market share and new product success (Ateke & Didia, 2017).

DMC drive business performance by conferring competitive advantage that enable quick response to customers' needs, superior value delivery and profitability. Susanto (2019) and Walugembe et al. (2017) adds that DMC enhance brand performance, new product success, new customer acquisition, customer loyalty and financial performance. Kindström et al. (2013) states that oversaturation of markets leads to increase in demand for services that increase product usability, and product customization and maintenance; and that DMC enable firms identify and exploit maintenance, repairs or upgrade opportunities to sustain revenue streams and contribute to profitability. Thus, DMC earn firms a better market position and enable effective investment of

excess resources into economic activities that strengthen business wellness (Krivokapic et al., 2017). Manyuru et al. (2017) and Emel and Yildirim (2016) support this viewing by positing that improved profitability and enviable market position results from DMC.

In the view of Akewushola (2015), DMC drive improved profitability, market value and shareholder wealth; while Oladimeji and Udosen (2019) and Emel and Yildirim (2016) holds that survival, profitability and prosperity of firms; efficient use of resources, exploitation of opportunities, achievement of economies of scale and attainment of preferred market position ensue from DMC. Ateke and Didia (2017) on their part suggest that the achievement of corporate objectives that culminate in increased shareholders' wealth is enabled by DMC.

In view of the foregoing, this study contends that DMC will influence profitability of agro-based SMEs. However, for the purpose of statistical examination and interpretation, the following null hypotheses were formulated:

Ho_1: Market-sensing capability does not significantly influence profitability of agro-based SMEs in Rivers State.
Ho_2: Opportunity-seizing capability does not significantly influence profitability of agro-based SMEs in Rivers State.
Ho_3: Customer-bonding capability does not significantly influence profitability of agro-based SMEs in Rivers State.
Ho_4: Channel-linking capability does not significantly influence profitability of agro-based SMEs in Rivers State.

Methodology

This study examined the influence of DMC on profitability of agro-based SMEs. The study adopted a pragmatist approach which argues that researchers should focus on a research problem; and not be circumscribed to methods, and should use a range of approaches to understand a problem (Creswell & Creswell, 2017). The study upholds the uncertainty and subjectivity of phenomena; and the belief that the physical senses can picture true reflection of reality (realist ontology). The study aligns with the belief that knowledge is concrete, hence transferable (positivist epistemology). Also, the study believes in the deterministic nature of man's interactions with his environment, hence; rely on a quantitative approach to acquire primary data (nomothetic methodology) (Johnson et al., 2007; Creswell & Creswell, 2017).

An explanatory research design was adopted in this study. The study is quasi-experimental in nature. It adopted a quantitative research approach and survey research strategy. The study collected primary data in a cross-sectional survey in a non-contrived setting using structured questionnaire. The population of the study comprised ninety 90 SMEs in agribusiness in Rivers State. The study took a census in lieu of the manageable size of the population and based on the conviction that a larger sample size has a higher likelihood of revealing reality. Purposive sampling was used to arrive at test units because it eases accessibility to respondents (Collis & Hussey, 2009).

The validity of the instrument used in this study was determined through face, content and construct validity. Face validity was ascertained by experts consisting members of the academia

within marketing and measurement and evaluation; and business practitioners with expertise in the subject of the study. Content validity was achieved by ensuring that the measurement scales were derived from literature; and mostly from instruments used by other researchers, with minimal modification. Construct validity was determined via exploratory factor analysis (EFA). Table 1 presents a summary of the test results.

Table 1: Summary of results of test of validity

Variables/Dimensions	Number of Items	Factor Loadings
Dynamic Marketing Capability		
Market-sensing capability	8	0.750
Opportunity-seizing capability	8	0.926
Customer-bonding capability	8	0.779
Channel-linking capability	8	0.985
Profitability	5	0.868

Source: SPSS output of data analysis on DMC and profitability of agro-based SMEs (2025).

Table 1 shows the results of construct validity of the instrument using EFA. The analysis reveal that there is multicollinearity because all the variables have high factor loadings. This means that each of the items effectively measured what they were set to measure.

The reliability of the instrument on the other hand, was determined using the Cronbach's Alpha test of reliability with a threshold of 0.70 set by Nunally (1978). Table 2 provides a summary of the results of the test of reliability.

Table 2: Summary of results of test of reliability

Variables/Dimensions	Number of Items	Cronbach's Alpha Coefficient
Dynamic Marketing Capabilities		
Market-sensing capability	8	0.980
Opportunity-seizing capability	8	0.950
Customer-bonding capability	8	0.970
Channel-linking capability	8	0.935
Profitability	5	0.957

Source: SPSS output of data analysis on DMC and profitability of agro-based SMEs (2025).

Table 2 shows that all the variables in the study have high Cronbach's alpha coefficient that surpassed the minimum threshold of 0.70. The instrument was thus considered reliable; and offered the required standard of precision and clarity. The evidence indicated that the instrument adequately address the concerns of the study, thus admissible; and that the instrument can produce identical results if used at different times and in different contexts by different researchers.

The multiple regression statistic was used to test the direction and magnitude of influence of dimensions of DMC on profitability. The analyses were based on 77 copies of questionnaire, representing 85.56% of the administered questionnaire which were upon retrieval, found to reveal the absence of error cases with permissible (less than 10%) cases of missing values, and treated

using mean imputations. These 77 copies were coded into the SPSS (version 24) software and used for the final analyses of the study.

Results and Interpretation

Table 3: Model Summary of influence of dimensions of DMC on profitability

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.826[a]	.785	.773	2.260

a. Predictors: (Constant), Market-sensing capability, Opportunity-seizing capability, Customer-bonding capability, Channel-linking capability

Source: SPSS output of data analysis on dynamic marketing capabilities and profitability of agro-based SMEs (2025).

Results of the analysis in Table 3 showed a regression coefficient of 0.826, which means that market-sensing, opportunity-seizing, customer-bonding and channel-linking capabilities have very strong positive influence on profitability of agro-based SMEs in Rivers State. The coefficient of determination (R^2) is 0.785. This indicates that approximately 79% of variations in profitability were occasioned by the influence of market-sensing, opportunity-seizing, customer-bonding and channel-linking capabilities, while the remaining 21% may be attributed to variables not included in the model.

Table 4: ANOVA[a] of influence of dimensions DMC on profitability

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	1344.413	4	336.103	65.819	.000[b]
	Residual	367.665	72	5.106		
	Total	1712.078	76			

a. Dependent Variable: Profitability

b. Predictors: (Constant), Channel-linking capability, Market-sensing capability, Customer-bonding capability, Opportunity-seizing capability

Source: SPSS output of data analysis on dynamic marketing capabilities and profitability of agro-based SMEs (2025).

Table 4 shows that market-sensing, opportunity-seizing, customer-bonding and channel-linking capabilities has statistically significant influence on profitability of agro-based SMEs in Rivers State. This is evidenced by the probability value of 0.000, which is less than the critical value of 0.01 F (4, 72) = 65.819, $p < 0.01$, $R^2 = 0.785$.

Table 5: Coefficients[a] of influence of dimensions DMC on profitability

		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std. Error	Beta	T	Sig.
1	(Constant)	.772	1.391		.555	.581
	Market-sensing capability	.293	.055	.526	5.333	.000
	Opportunity-seizing capability	.152	.125	.220	1.220	.006
	Customer-bonding capability	.074	.079	.128	.940	.000
	Channel-linking capability	.075	.160	.104	.466	.003

a. Dependent Variable: Profitability
Source: SPSS output of data analysis on DMC and profitability of agro-based SMEs (2025).

In Table 5, the unstandardized coefficients indicate how profitability varies with variation in market-sensing capability, opportunity-seizing capability, customer-bonding capability and channel-linking capability. Table 5 shows that a unit increase in market-sensing capability results in about 29.3% increase in profitability; a unit increase in opportunity-seizing capability leads to about 15.3% increase in profitability; a unit increase in customer-bonding capability brings about 7.4% increase in profitability; and a unit increase in channel-linking capability produces about 7.5% increase in profitability. Also, the probability values of all the results are < 0.01 which means that the influence of DMC through market-sensing capability, opportunity-seizing capability, customer-bonding capability and channel-linking capability on profitability of agro-based SMEs is statistically significant.

Discussion of Findings

This examen probed the influence of DMC on profitability of agro-based SMEs in Rivers State. The results of the statistical analyses conducted, showed that DMC (market-sensing capability, opportunity-seizing capability, customer-bonding capability and channel-linking capability) has positive and statistically significant influence on profitability of agro-based SMEs. These findings support the view that DMC drive profitability, market value and shareholder wealth (Akewushola, 2015); and enhances survival and prosperity of firms (Thompsom, 2024).

The results also confirm the position that profitability, efficient use of resources, exploitation of market opportunities, achievement of economies of scale and attainment of preferred market position ensue from DMC (Oladimeji & Udosen, 2019; Emel & Yildirim, 2016). Also, the results corroborate the report that DMC facilitate achievement of corporate objectives that culminate to increased shareholders' wealth (Didia & Ateke, 2017).

The findings of the current study align with the notion that DMC firms secure better market position and effectively invest excess resources into economic activities that strengthen business wellness (Krivokapic et al., 2017) and improve their profitability (Manyuru et al., 2017; Emel & Yildirim, 2016). The findings also corroborate reports and positions of previous studies that DMC stimulate business performance by conferring competitive advantage that allow firms to improve their profitability by responding to customer needs and delivering superior value (Min & Kim, 2022; Popadiuk et al., 2018). Also, the findings align with the notion that DMC improve business performance through brand performance, new product success, customer acquisition, customer loyalty and improved financial performance (Susanto, 2019; Walugembe et al., 2017).

Additionally, the current findings are congruent with the view that DMC influence profitability growth via superior customer value delivery (Lindblom et al., 2008), appropriate response to changing market conditions, exploitation of new opportunities, engaging with customers and bonding with channel partners (Teece, 2012). DMC also improve profitability via continuous learning and knowledge accumulation that results in efficient internal processes and superior market knowledge that improve firms' market share and new product success rates (Sin et al., 2005, as cited in Ateke & Didia, 2017).

The current findings substantiate the provisions of scholars that customer-linking capability leads to acquisition, retention and expansion of customers and enhances profitability (Buttle & Ang, 2006) through increased frequency and volume of purchase and referrals. The argument that loyal customers are less price-sensitive (Buttle & Ang, 2006) and that it is cheaper to maintain existing customers than to acquire new one also lends credibility to the contribution of customer-linking capability to profitability.

Furthermore, the current findings cohere with the position of Udayana et al. (2021) that channel-linking capability through the capacity to foster strong channel relationships that promote visibility, accessibility and availability of firms' products contribute to profitability growth; and that of Ateke and Nwulu (2021) that opportunity-seizing capability enhance firms' capacity to exploit opportunities by refining products, markets and internal processes to achieve economies of scale and efficient orchestration of resources, hence, achieve improved profitability.

Conclusion and Recommendations

DMC confer sustainable competitiveness on firms by boosting their ability to acquire, integrate and allocate resources in ways that demonstrate appropriate and adequate response to market conditions. The contemporary operating environment is characterized by increased complexity, volatility and disruptions that present both opportunities and threats. The key to survival and performance differential for firms in this environment is tied to the tangible and intangible resources they possess and adroitly deploy in their efforts to identify and assess current and emerging opportunities; exploit such opportunities; provide superior value and build relationship with customers; orchestrate and manage channels that facilitate value delivery; and transform assets, renew core competences, and develop new value propositions.

This study focused on assessing the influence of DMC on profitability of agro-based SMEs in Rivers State. The findings show that DMC in the form of market-sensing capability, opportunity-seizing capability, customer-linking capability and channel-bonding capability influence profitability of agro-based SMEs in Rivers State. The study concludes that profitability of agro-based SMEs in Rivers State depend on the possession of market-sensing capability, opportunity-seizing capability, customer-linking capability and channel-bonding capability. The study thus recommends that agro-based SMEs in Rivers State that seek improved profitability should develop or acquire DMC that enable them sense market conditions, seize market opportunities and develop close-knit relationships with customers and channel partners.

Contribution to Knowledge

The following are specific noteworthy contributions of this examen to the body of knowledge:

1. An integrated model of DMC with market-sensing capability, opportunity-seizing capability, customer-bonding capability and channel-linking capability as dimensions; by extending the framework of Day (1994) and adding opportunity-seizing capability of the dynamic capability theory of Teece (2012).
2. Marketing-sensing capability, opportunity-seizing capability, customer-bonding capability and channel-linking capability are prevalent DMC among agro-based SMEs in Rivers State.
3. DMC strongly influence profitability agro-based SMEs in Rivers State.
4. Opportunity-seizing capability is the dimension of DMC with the strongest influence on profitability agro-based SMEs in Rivers State.

Abstract
This study examined the relationship between electronic payment and operational efficiency of soft drink distribution companies in Port Harcourt. The objective of the study was to investigate the relationship between electronic payment and measures of operational efficiency (customer service, supplier quality, cost control) of soft drink distribution companies in Port Harcourt. The study adopted a cross-sectional survey design. The population of the study consisted of 37 registered and functional Soft Drink Distribution Companies in Port Harcourt, while the entire population was adopted as sample size using Census Method for sample size determination. Primary data were collected using questionnaire. The data were analyzed using tables, simple percentages, Mean score rating, standard deviation, while the Hypotheses were tested using Spearman's Rank Correlation Coefficient. The findings revealed amongst others that there is a strong and positive relationship between the dimensions of electronic payment and measures of operational efficiency (customer service, supplier quality, cost control) of soft drink distribution companies in Port Harcourt. It was concluded that the use of e-payment has a positive and significant effect on operational efficiency of soft drink distribution companies in Port Harcourt. Based on the findings, it was recommended that; management of organizations should encourage the practice of electronic payment as to promote transparency and credibility in approval of qualified bidders for contracts. All payments should be carried out using electronic payment as this will provide a safe and cheaper means of business transactions and as well as reduce the risk of carrying bulky money to the bank to pay creditors for goods purchased.

Keywords: *Cost control, customer service, E-payment, operational efficiency.*

Introduction

In recent times, the operational efficiency of organizations has received a substantial amount of attention by academics, practitioners in the field of marketing and supply chain management. This is because improved operational efficiency is targeted at reducing waste in time, effort and materials as much as possible, while still producing a high-quality service or product (Berger,

Hunter & Timme, 2013). If firms operate more efficiently, they might expect improved productivity and consequently profitability. According to Kalluru and Bhat (2009), operational efficiency is the proficiency of a corporation to curtail the unwelcome and maximize resource capabilities so as to deliver quality products and services to customers. An organizational operational efficiency depends on factors like skillful and proficient workers, proper technological progression, proper procurement carryout, return to scale of the businesses, supply chain controlling among many others. Relatively, more efficient firms tend to maintain more stability levels in terms of output and operating performance compared to their other industry peers (Mills & Schumann, 2015). Operational efficiency is the ability of an organization to reduce waste in time, effort and materials as much as possible, while still producing a high-quality service or product.

Operational efficiency is a metric that compares a company's profit with the cost required to make that profit. More specifically, operational efficiency compares the input required to sustain a business, including costs, employees and time, with the output gained, including revenue, market differentiation, customer acquisition and customer retention. Firms can achieve operational efficiency by utilizing the best of their workforce, innovation and business operations. Decreased inner costs that result from operational efficiency assist firms to be more effective in profoundly competitive markets, in this manner accomplishing higher profit margins. Improving operational efficiency has direct impact on the organizations profit margins and efficient firms are more cost-effective (Berger, Hunter & Timme, 2013).

E-payment systems have become a pivotal tool in enhancing operational efficiency across various industries. They streamline financial transactions by reducing the time and effort required for processing payments, thereby minimizing human errors and operational delays. Traditional payment methods, such as cash or checks, involve manual handling, reconciliation, and often extended processing times, all of which add to operational costs. E-payment, on the other hand, automates these processes, allowing businesses to conduct transactions instantly or within a very short time frame, enhancing the speed of financial operations.

Moreover, e-payment systems offer real-time tracking and reporting capabilities. Businesses can monitor transactions, balance cash flows, and generate financial reports with minimal manual intervention, which not only improves accuracy but also frees up resources that can be allocated to other operational areas. This is crucial in industries like retail, hospitality, and e-commerce, where high volumes of transactions need to be managed efficiently. The automation provided by e-payment systems leads to a reduction in overhead costs, such as those related to payroll for employees who would otherwise be managing these payments manually (Bátiz-Lazo & Wood, 2021).

Additionally, e-payment systems improve customer satisfaction, which is indirectly linked to operational efficiency. Customers prefer quicker and more secure payment options, and e-payment solutions meet this demand by offering a variety of payment methods such as mobile payments, online banking, and card payments. This flexibility enhances the customer experience, which can lead to repeat business and positive customer reviews. In turn, this drives operational success by ensuring steady revenue streams (Sumanjeet, 2019).

Another aspect of operational efficiency driven by e-payment is the reduction in fraud and security risks. E-payment systems often come with built-in security features such as encryption, two-factor authentication, and fraud detection algorithms. These tools help mitigate risks associated with financial fraud and data breaches, which are costly and disruptive to operations. A reduction in fraud incidents means fewer interruptions in business processes and lower financial losses, contributing to overall operational efficiency (Ozili, 2020).

Literature Review

Concept of Electronic Payment

E-payment system is a form of financial commitment that involves the buyer and the sellers facilitated transactions through the use of electronic platforms. It is a monetary transaction between the buyer and seller by use of electronic systems to perform transactions including mobile payments, internet payments, e-cards, PC banking and e-cash in the supply chain (Munyao & Mononge, 2018). Gundawati (2007), defined e payment as a technology innovation system, used to provide tools for online payment. Electronic payment is also defined as an inter-organization type of information that relates to different transaction systems linking together various associations linking to individual customers. Hascaryani (2013). Electronic payment is considered as an innovative new payment system that many procurement entities choose to use while doing business transactions. E-payment is rapidly growing in the global market and it continues to hold enormous growth potential. It gives the clients the advantage of conducting their transactions anytime and anywhere with reduced costs. Furthermore, it minimizes the real distance between the participants and makes the world appear as a small village with ease of access. The use of e-payment is influenced by its ability to introduce value in a quick, efficient and effective manner (Singh & Punia, 2011).

The concept of an e-payment system encompasses the full gamut of monetary transactions. Everything from the end-user issuing a payment instruction through the final settlement of the transaction is subject to a wide range of methods, technological systems, institutions, procedures, rules, and laws. Trading partners, markets, and governments (Electronic Procurement Services development players) in different nations and time periods have established different sorts of rules, regulations, methods, technology, and arrangements to construct a stable infrastructure for monetary exchange. We typically refer to this set-up as a payment system (Bossone & Massimo, 2016). The electronic payment system refers to an internet-based commercial procedure utilized for the transfer of funds through electronic devices such as personal computers and mobile phones. In the banking sector, these instruments are extensively employed whenever financial transactions occur, particularly in relation to payments and other related methods. According to Manav (2017), several means of electronic payment include the debit card payment system, credit card payment system, online electronic cash system, electronic check system, and smart card-based electronic payment system.

Harland (2021) defines electronic payments as services that employ information and communication technologies (ICT), such as cryptography and telecommunications networks, to facilitate monetary transactions. These services can be further subdivided into cash-like systems like electronic cash, check-like systems like credit cards and debit cards, and hybrid systems like stored-value cards. In order to effectively deploy electronic payment systems, it is imperative to enhance users' awareness, promote their utilization of such systems, and instill confidence in the

security and comprehensiveness of the infrastructure. Additionally, it is essential to ensure the availability of high-quality telecommunication facilities to support these systems. The author additionally proposes that, in order to enhance consumer engagement, it would be beneficial to provide them with the option to select the payment method that incurs the least amount of expenses. It is vital for customers to possess the capability to monitor their account balance. Based on the researcher's results, it is recommended that the design of electronic payment systems prioritize key considerations such as efficiency, security, convenience, cost, flexibility or universality, privacy, reliability, consumer interest, and infrastructure. The research revealed that the utilization of electronic payment methods has a notable impact on enhancing the efficiency of procurement processes.

Manav (2017) notes that the term electronic payment refers to the procedure of making a payment to a business while buying goods or services over the Internet. The phenomenon of electronic commerce is experiencing a significant surge in the consumer sector. The payment process in electronic commerce is typically facilitated using an electronic payment system. The prevalence of electronic payments has witnessed a notable surge, facilitated by the proliferation of electronic transfers, debit cards, credit cards, and other similar payment methods. The advent of novel advancements in electronic commerce has the potential to present a plethora of fresh business prospects in the realm of payment for products and services. The interconnection between electronic payment systems and electronic commerce is evident, as online users are required to make payments for the purchase of goods and services. Payment systems encompass various requirements, such as security, acceptability, ease, cost, anonymity, control, and traceability. This has led researchers to focus less on the technical details of various electronic payment systems and more on the characteristics of the data being transferred across the network. After listing the features, benefits, and drawbacks of each type of electronic payment system, they proceed to compare and contrast them. According to the study's findings, using digital payment methods significantly improves the effectiveness of purchasing procedures. Thompson (2018) stated that e-payment is more convenient comparing to traditional payment methods because it eliminates the security risks associated with a cash payment. E-payment is also known for its great advantage in helping the business organization to reduce transaction costs and transaction time. Thanks to electronic payment, customers no longer need to spend their precious time waiting for their turn to do the transaction; this helps the organization to offer a better service to these customers.

Handayani (2015), identified 4 types of electronic payment and defined them as follows. Electronic cash is where transactions are done via an electronic currency exchange. Prepaid cards, these are repaid cards for a certain amount used by the customer. They involve making entries from unique card numbers on merchant sites. Credit cards are servers that authenticate consumers and verify the bank whether sufficient funds are available before purchasing, the debit card is the customer maintains a positive balance in the bank account and the money deducted by the account when the debit transaction is made, an electronic check is an electronic institution completing the transaction between the buyer's and the seller's bank in the form of an electronic check. Thompson (2018) stated that e payment is more convenient comparing to traditional payment methods because it eliminates the security risks associated with a cash payment. E-payment is also known for its great advantage in helping the business organization to reduce transaction costs and transaction time. Thanks to electronic payment, customers no longer need to spend their precious time waiting for

their turn to do the transaction; this helps the organization to offer a better service to these customers.

Concept of Operational Efficiency

Operational efficiency is the capability of a business to deliver quality commodities to customers in the most cost-effective manner possible. The operating efficiency of a business in relation to the efficient utilization of the assets is reflected in net profit margin. Although a high return margin reflects better performance, a lower margin does not automatically indicate a lower rate of return on assets turnover. Efficiency scores obtained for organization can be used to formulate operational strategy to enable a firm meet its business objectives and goals by enhancing allocation of available resources in order to maximize outputs of the firm (Reid & Sanders, 2007). According to Berger & Mester (2017), statistical based "efficient cost frontier" tactics would measure efficiency more accurately. The operating performance of corporations has long been at the center of academic research and has received a substantial amount of attention. This is primarily due to the fact that operating efficiency is of particular interest for both managers, whose aim is to improve the performance of their financial firms, and policy makers, whose task is to assess the effects of market structure on performance and, therefore, to safeguard the stability of the financial system. If firms operate more efficiently, they might expect improved productivity and consequently profitability. Consequently, the consumer could expect better and fair prices, quality service, better security and reliability of financial structures (Berger, Hunter & Timme, 2013).

In this study, operational efficiency is measured using customer service, supplier quality and cost control (Barasa, Gregory & Okwaro, 2017).

Customer service should be viewed as a tool that facilitates attainment of a competitive advantage (Kotler *et al*, 2009), other than enhancing profitability and improving customer satisfaction (McGuinn, 2009). According to Kotler, *et al.* (2009) organizations must learn to listen to customers concerns. According to Gronroos (2014) technical quality, functional quality and corporate image as significant components of service quality. They must promise what they can deliver (Lovelock, *et al.* 2007), through responding to customers concerns in a short period of time (Zeithmal, *et al.* 2009). Organizations that seek to attain or achieve quality service, must employ customer orientation, customer relationship management, if they want to succeed (Kotler & Keller 2012, McCarthy & PerreaultJr 2008); they should always try to avoid arguing with customers (Nilsson & Sandberg 2010, & Payne 2006).

Quality is defined in many ways but the most important way to define quality is from the customers perceptive. Supplier quality is a supplier's ability to deliver goods or services that will satisfy customers' needs. Supplier quality management is defined as the system in which supplier quality is managed by using a proactive and collaborative approach. It's in an organization's best interest to ensure that its service or material suppliers are providing the highest quality products and services while also conforming to pre-established requirements. This is often accomplished through the use of supplier quality management systems (QMS), which allow companies to monitor supply chains and inspect or audit materials and services at regular intervals. Forker (2019) argues that the impact of supplier quality on an organization's performance is large and direct, and the general understanding is that a firm's quality performance (output) can only be as good as the quality performance of its suppliers (input).

Cost control is the process of decreasing a company's expenses to maximize profits. It involves identifying and removing expenditures that do not provide added value to customers while also optimizing processes to improve efficiency. Cost control typically focuses on generating short-term savings. Cost control is the process used by companies to reduce their costs and increase their profits. Depending on a company's services or products, the strategies can vary. Every decision in the product development process affects cost: design is typically considered to account for 70–80% of the final cost of a project such as an engineering project or the construction of a building. Chartered Institute of Management Accountants (CIMA) (1995), London defined cost control as the achievement of real and permanent reduction in the unit cost of goods manufactured or services rendered without damaging the ability of the product to serve the purpose for which it was intended.

E-payment and Operational Efficiency

Robert, Fredrick and Evans (2023) examined the influence of electronic payments on business efficiency in petrol stations in the Nyanza region of Kenya. This study employed a descriptive study design with a target population of 134 and a sample of 100 employees of petrol stations in the Nyanza region of Kenya. The study used closed-ended Likert scale questionnaires for data collection. The data was analyzed using both descriptive and inferential statistics, where descriptive statistics involved frequencies and percentages. Inferential statistics are based on Pearson correlation and simple linear regression. SPSS software 23 was useful in the analysis. The findings were that electronic payment had a significant influence on business efficiency among petrol stations. The study recommends that petrol stations adopt electronic payment practices to minimize queues during physical payment. Furthermore, electronic payment eases audits and minimizes cases of corruption.

Kabir, Saidin and Ahmi (2015) carried out a study to explore adoption of e-payment systems; a review of literature. It employed meta-analysis technique of research. This study adopted a descriptive research design and correlational study. Both primary and secondary data collection methods were employed. Data for the study was sourced from reports and internet documents. The population for the study was 42 staffs of the organization under study. The entire population was used, and universal sampling technique was applied. Findings showed e-payment systems are important mechanisms which are safer and accessible for offering online payment. It was revealed that during that period it was an opening allow technology to advance in all areas of the world's whole economy improving performance.

H_{O1}: There is no significant relationship between e-payment and customer service of soft drink distribution companies in Port Harcourt.

H_{O2}: There is no significant relationship between e-payment and supplier quality of soft drink distribution companies in Port Harcourt.

H_{O3}: There is no significant relationship between e-payment and cost control of soft drink distribution companies in Port Harcourt.

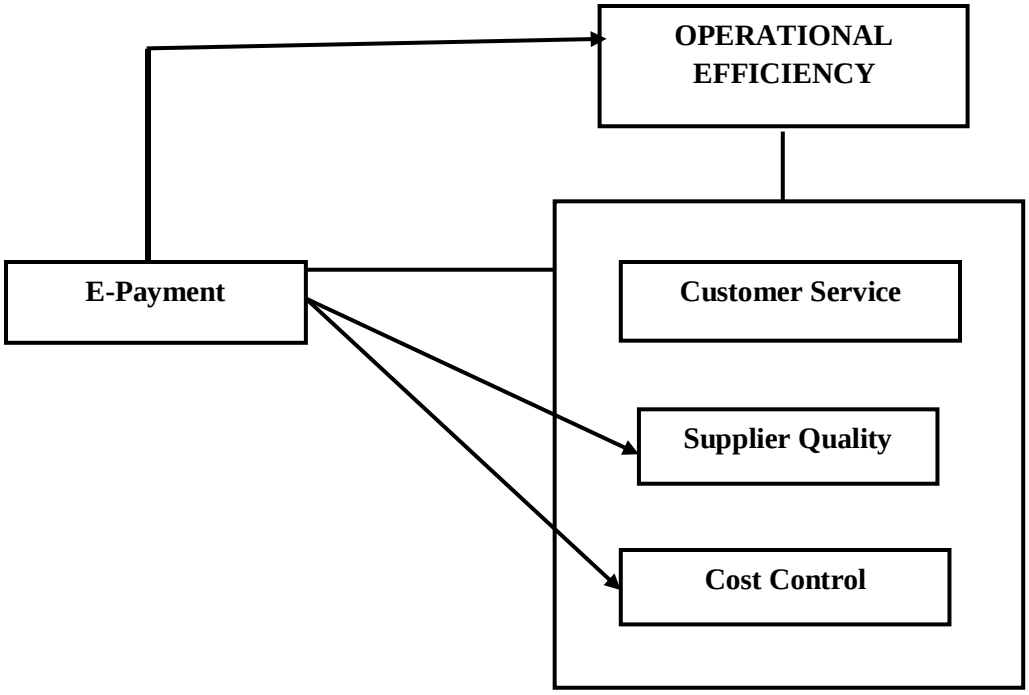

Figure 1: Conceptual Framework showing the relationship between Electronic Payment and Operational Efficiency

Methodology

The focus of this study is to examine the relationship between e-tendering and operational efficiency. The researcher adopted a cross-sectional survey, which is a type of quasi-experimental research design. The target population of this study consisted of 37 registered and functional Soft Drink Distribution Companies in Port Harcourt as obtained from the Yellow Pages Directory (Rivers State Ministry of Commerce and Industry, 2014).

In this study, the entire population (37) was studied as the sample size. The primary source of data was obtained through copies of the questionnaire administered to the management staff of the selected Soft Drink Distribution Company in Port Harcourt, Rivers State. A total of 111 copies of the questionnaire was administered to the 37 Soft Drink Distribution Companies in Port Harcourt. The researcher achieved validity of the data collection instrument, by submitting a drafted copy of the questionnaire to the supervisors who are experts in the field of Marketing. Cronbach alpha was adopted in assessing the reliability of the study instrument, items which return alpha coefficients of 0.7 and above was considered as being suitable and adequate for inclusion in the analysis, while items which return a Cronbach alpha less than 0.7 was considered as unsuitable and unqualified for inclusion in the analysis (Nunally, 1978).Spearman's Rank Correlation was used to test the hypotheses formulated for the study with the aid of the Statistical Package for Social Sciences (SPSS) version 22.

Results and Discussions

Table 1: Questionnaire Administration and Retrieval

Items	Frequency	Percentage (%)
Number of questionnaire administered	111	100
Number of questionnaires returned	94	84.7
Number of questionnaire not returned	17	15.3
Completed but unusable copies of questionnaire	4	3.6
Completed but usable copies of questionnaire	90	81.1

Source: Research Survey (2025)

Table 1 shows that 111 copies questionnaire were administered to the respondents. 94 copies of the questionnaire representing 84.7% were returned, while 17 copies of the questionnaire representing 15.3% were not returned. However, out of the returned copies of the questionnaire, 4 copies of the questionnaire representing 3.6% were not valid, while 90 copies of the questionnaire representing 81.1% were valid and thus forms the basis for the analysis.

Table 1. shows the description of range of correlation (r) values, as well as the correlative level of association

Range of correlation coefficient	Level of correlation
0.80 to 1.00	Very strong positive
0.60 to 0.79	Strong positive
0.40 to 0.59	Moderate positive
0.20 to 0.39	Weak positive
0.00 to 0.19	Very weak positive
-0.00 to -0.80	Very strong negative
-0.79 to -0.60	Strong negative
-0.59 to -0.40	Moderate negative
-0.39 to -0.20	Weak negative
-0.19 to -0.01	Very weak negative

Source: Haldun (2018)

The perfect positive Spearman's rank correlation =1. The perfect negative Spearman's rank correlation = -1. The perfect zero Spearman's rank correlation = 0.

Relationship between e-payment and customer service of soft drink distribution companies in Port Harcourt

H_{01}: There is no significant relationship between e-payment and customer service of soft drink distribution companies in Port Harcourt.

Table 2: Test for Correlation between e-payment and customer service of soft drink distribution companies in Port Harcourt

			E-payment	**Customer Service**
Spearman's rho	**E-payment**	Correlation Coefficient	1.000	.860**
		Sig. (2-tailed)		.000
		N	90	90
	Customer Service	Correlation Coefficient	.860**	1.000
		Sig. (2-tailed)	.000	
		N	90	90

**Correlation is significant at the 0.01 level (2-tailed).

The result as depicted in Table 2 revealed that there is a very strong and positive relationship between e-payment and customer service of soft drink distribution companies in Port Harcourt. The data indicates that e-payment is significantly associated with customer service (where rho=.860 and P<0.05). The finding suggests that e-payment enhances operational efficiency which is measured in terms of customer service. Hence on the basis of the result, the null hypothesis (H_{02}) is rejected and the alternate accepted.

Relationship between e-payment and supplier quality of soft drink distribution companies in Port Harcourt

H_{02}: There is no significant relationship between e-payment and supplier quality of soft drink distribution companies in Port Harcourt.

Table 3: Test for Correlation between e-payment and supplier quality of soft drink distribution companies in Port Harcourt

			E-payment	**Supplier Quality**
Spearman's rho	**E-payment**	Correlation Coefficient	1.000	.460**
		Sig. (2-tailed)		.000
		N	90	90
	Supplier Quality	Correlation Coefficient	.160**	1.000
		Sig. (2-tailed)	.000	
		N	90	90

**Correlation is significant at the 0.01 level (2-tailed).

The result as depicted in Table 3 revealed that there is a moderate and positive relationship between e-payment and supplier quality of soft drink distribution companies in Port Harcourt. The data indicates that e-payment is significantly associated with supplier quality (where rho=.460 and P<0.05). Hence on the basis of the result, the null hypothesis (H_{08}) is rejected and the alternate accepted.

Relationship between e-payment and cost control of soft drink distribution companies in Port Harcourt

H_{03}: There is no significant relationship between e-payment and cost control of soft drink distribution companies in Port Harcourt.

Table 4: Test for Correlation between e-payment and cost control of soft drink distribution companies in Port Harcourt

			E-payment	**Cost Control**
Spearman's rho	**E-payment**	Correlation Coefficient	1.000	.771**
		Sig. (2-tailed)		.000
		N	90	90
	Cost Control	Correlation Coefficient	.771**	1.000
		Sig. (2-tailed)	.000	
		N	90	90

**Correlation is significant at the 0.01 level (2-tailed).

The result as depicted in Table 5 revealed that there is a strong and positive relationship between e-payment and cost control of soft drink distribution companies in Port Harcourt. The data indicates that e-payment is significantly associated with cost control (where rho=.771 and $P<0.05$). Hence on the basis of the result, the null hypothesis (H_{09}) is rejected and the alternate accepted.

Conclusion and Recommendations

Based on the findings, this study concludes that the use of e-payment has a positive and significant effect on operational efficiency of soft drink distribution companies in Port Harcourt. The study also concludes that the use of e- payment plays an important role in enhancing the operational performance of soft drink distribution companies in Port Harcourt. It was revealed that by the use of e-payment, the procedures involved in making payment are reduced making the entire process very efficient and hence improved operational performance.

Based on the findings and conclusions, it is therefore recommended that:

1. Management of organizations should encourage the practice of electronic tendering as to promote transparency and credibility in approval of qualified bidders for contracts. With electronic tendering, management should be able to ensure proper screening of tenders or bidders and give approval to those suppliers that have the capacity to carry out supply without hindrances.
2. All organizations especially those in soft drink distribution sector should automate the practice of invoicing so as to ensure proper stock or inventory management. Similarly, electronic invoicing is very important in tracking of supplies on the way and as well as monitoring and controlling supplies in the organization.
3. All payments should be carried out using electronic payment as this will provide a safe and cheaper means of business transactions and as well as reduce the risk of carrying bulky money to the bank to pay creditors for goods purchased.

Abstract
Tourism entrepreneurship is a complex field involving a multitude of interrelated interactions at various levels. Due to its complexity, comprehensive research reviewing its structure is yet to be conducted. To address this gap, we examined the nature of tourism entrepreneurship and the strategic initiatives that can be adopted to provide renewed hope in the Nigeria's Tourism and Hospitality sector. Providing a more nuanced understanding of the complex field of tourism entrepreneurship, the authors proposed some strategic initiatives that could be adopted in ensuring a renewed response in restoring the desired expectation in the tourism and hospitality sector of Nigeria smart economy. This study makes a valuable theoretical contribution and offered practical contributions to tourism entrepreneurs, practitioners, and policymakers, informing their business operations and the development of policies and programs to support tourism entrepreneurship. Based on the findings obtained from the review of literature, the authors concluded that the adherence and efficient adoption of the proffered strategic initiatives in the tourism and hospitality sector of Nigeria economy will enhance the renewed optimism therefore improving tourism performance and thus recommended that the tourism and hospitality sector of the Nigerian economy should regularly adopt the suggested strategic drives used for the study in other to enhance the activated renewable hope for tourism and hospitality performance.

Key Words: *Tourism entrepreneurship, Renewable optimism and Performance of Tourism and Hospitality Sector*

Introduction

Tourism entrepreneurship has increasingly emerged as a critical driver of economic development, destination competitiveness, and innovation in the global tourism sector. Across both developed and developing economies, entrepreneurs in tourism are seen as catalysts for market sensitivity through product innovation, responsiveness to market trends, and the ability to adapt to dynamic consumer preferences (Thomas *et al.*, 2011; Morrison, 2013). In regions like Southeast Asia and Latin America, entrepreneurial ventures have transformed previously underdeveloped destinations into thriving tourist hotspots through innovation and market-sensitive strategies (Gursoy *et al.*, 2017).

In Africa, tourism remains an underutilized sector despite its vast potential. However, growing attention is being directed toward tourism entrepreneurship as a tool to unlock regional development and diversify economic activities beyond oil and agriculture. Nigeria, particularly its South-South region, is endowed with rich cultural heritage, natural attractions, and historical landmarks. Despite these assets, poor tourism infrastructure, lack of entrepreneurial innovation, and inefficient marketing strategies have hindered the full realization of its tourism potential (Ezeuduji & Nkosi, 2017).

This problem is largely attributed to the low adoption of some strategic initiatives and tourism entrepreneurship principles, including innovativeness, market sensitivity, and adaptability which could help rekindle the hope in the tourism and hospitality sector. Many tourism operators in the region lack the capacity or willingness to innovate their products and services, respond to dynamic market demands, or adapt to technological and environmental changes.

Various interventions have been introduced by government agencies, private stakeholders, and development organizations to promote tourism development in the region. These include policy frameworks such as the Nigerian Tourism Development Master Plan, state-level tourism festivals (e.g., Calabar Carnival), and efforts to improve tourism infrastructure. Additionally, entrepreneurship development programs have been initiated through platforms such as the *National Tourism Development Corporation (NTDC)* and *SMEDAN* to support small tourism enterprises. However, these efforts are often generic, underfunded, or poorly implemented, and they rarely focus on entrepreneurial behavior as a tool for improving marketing efficiency in tourism.

To the best of the authors knowledge few studies to date have reviewed the progress of tourism entrepreneurship research. Only three such reviews have been conducted. Li (2008) examined studies published in hospitality and tourism management journals, with an emphasis on the methodology employed, while Solvoll *et al.* (2015) examined published research and discussed how tourism entrepreneurship relates to mainstream entrepreneurship. Finally, Fu *et al.* (2019) mapped the tourism entrepreneurship literature by identifying the antecedents of entrepreneurship and the outcomes in the context of hospitality and tourism. From the review of relevant literature, it appears that there is paucity of research on tourism entrepreneurship and how the adoption of strategic initiatives and other associated constructs can positively impact the tourism and hospitality sector. Against this backdrop, this paper is designed to literally explore the concept of tourism entrepreneurship and how the adoption of strategic initiatives can enhance the renewable optimism in the Nigeria's tourism and hospitality sector.

Literature Review

Theoretical Framework: Resource-Based View Theory of the Firm (RBV)

The Resource-Based View (RBV) theory emerged from strategic management literature, first introduced by Wernerfelt in (1984) and later developed by Barney in (1991). The RBV fundamentally shifts the focus of competitive advantage from external market positioning to the internal resources of the firm. According to this perspective, a firm's sustained competitive advantage arises from its ability to acquire and utilize resources that are valuable, rare, inimitable, and non-substitutable (VRIN). The RBV proposes that firms with unique internal capabilities and

competencies whether tangible or intangible are better positioned to outperform competitors, particularly in dynamic industries such as tourism.

The core assumptions of the RBV are grounded in the heterogeneity and immobility of firm resources. First, it assumes that firms are fundamentally different in terms of the resources they possess, and second, that these resources are not easily transferable across firms. In the tourism entrepreneurship context, key internal resources include human capital, customer knowledge, innovation capacity, adaptability, and cultural embeddedness. When these resources are strategically deployed, they enable tourism entrepreneurs to create differentiated experiences, reduce operational and marketing costs, and enhance customer retention. This makes the RBV particularly relevant for small tourism firms in emerging economies like South-South Nigeria, where external market support structures may be weak or inconsistent.

A significant strength of the RBV is its ability to explain how internal strategic choices and entrepreneurial capabilities drive firm performance. However, critics of the theory, such as Priem and Butler (2001), argue that RBV is overly inward-looking and fails to adequately consider external environmental factors such as market competition, consumer behavior, or technological change. Others point out that the theory lacks specificity in defining what constitutes a "resource," leading to ambiguity in empirical testing. Moreover, it tends to assume a relatively static environment, which can be unrealistic in the fast-changing tourism industry, where customer preferences and external shocks (e.g., pandemics) demand constant adaptation.

Despite these criticisms, the RBV offers valuable insights for this study. Tourism entrepreneurship depends heavily on intangible assets such as creativity, service innovation, local knowledge, and relationship-building. These resources, when effectively leveraged, contribute to marketing efficiency by reducing the need for costly acquisition campaigns and fostering customer loyalty. Entrepreneurs who develop strategic initiatives and sustain VRIN resources such as culturally rooted storytelling, unique tour experiences, or digital marketing acumen can outperform competitors through cost-effective differentiation and repeat patronage. Thus, RBV provides a theoretical lens for understanding how internal entrepreneurial competencies can drive cost reduction, customer retention, and repeat purchase in tourism ventures. Nonetheless, its relevance to this study lies in its focus on how internal entrepreneurial traits and competencies contribute to renewable hope and optimism in a dynamic tourism and hospitality environment.

Concept of Tourism Entrepreneurship

Tourism development has become a vital element of economic growth and local entrepreneurship in many countries. This growth creates an extensive demand for tourism entrepreneurs, who can offer a wide range of products and services that meet the needs of tourists (Lordkipanidze *et al.*,2005). The sector is highly dynamic due to changes in customer preferences and technological advancements. Specifically, the structural development, transitioning from traditional models to experience-based products, demonstrates the need for entrepreneurship behaviors to remain competitive and embrace innovation to fulfil the shifts in demand of tourists. The change towards experience-based tourism has directed a focus on entrepreneurship in tourism policy, with the aim of increasing innovation and value creation (Solvoll *et al,* 2015). Therefore, the tourism industry is part of the strategy for economic development that can help create a more sustainable economy in less-developed areas (Jóhannesson & Huijbens,2010).

In line with this development, the emergence and development of tourism entrepreneurship as a field of academic study have increased, as it has been regarded as a positive panacea for solving a variety of social, economic and political problems (Carmichael & Morrison, 2011). The field has been extensively investigated by academic scholars from a wide variety of perspectives, viewing in advance the economic benefits to integrate the social climates in which entrepreneurs are embedded (Skokic & Morrison, 2011).

Tourism entrepreneurship refers to the process of creating, developing, and managing businesses or ventures within the tourism industry. It involves identifying opportunities related to travel, hospitality, and leisure, and turning those opportunities into profitable and sustainable businesses. Tourism entrepreneurship involves the innovative and proactive management of tourism ventures with the goal of satisfying market demands while generating economic value. It is characterized by opportunity recognition, innovation, risk-taking, and market sensitivity in the tourism sector (Thomas, *et al* 2011). Furthermore, tourism entrepreneurship is about creating businesses that serve travelers and tourists, offering unique experiences, hospitality, and services that make travel enjoyable and memorable. Entrepreneurship in tourism is not limited to new venture creation but includes improving existing services, developing new tourism products, and enhancing customer experience. They emphasize that tourism entrepreneurship extends beyond starting new businesses to include service enhancement, product innovation, and destination development. This definition underscores innovation and market sensitivity as core tenets, aligning closely with general entrepreneurial theory.

Similarly, Morrison (2013) defines tourism entrepreneurship as "the dynamic process of identifying tourism opportunities, organizing resources, and implementing tourism products and services in response to demand." This perspective focuses on the opportunity-seeking behavior of entrepreneurs and the ability to respond to market dynamics, particularly in fluctuating tourism environments. Morrison also stresses the strategic role of tourism entrepreneurs in value chain development, such as linkages between hospitality, transport, and cultural services.

By contrast, Ateljevic and Page (2009) adopted a more socio-cultural lens, framing tourism entrepreneurship as a tool for local empowerment and sustainable development. They argue that tourism ventures often emerge in response to community needs and are embedded in local cultural, social, and ecological contexts. This shifts the focus from purely profit-driven motives to a triple bottom line (economic, social, and environmental) framework. This view challenges the conventional neoliberal model of entrepreneurship by recognizing the embeddedness of tourism businesses in local realities. Meanwhile, Hall and Rusher (2004) highlight the spatial and structural characteristics of tourism entrepreneurship. According to them, tourism entrepreneurs are often small-scale, family-owned operators who function in seasonally dependent and spatially dispersed markets. These structural constraints, they argue, affect entrepreneurial behavior, including investment decisions, risk-taking, and innovation capacity. Their view highlights the vulnerabilities and contextual limitations of tourism entrepreneurs, especially in rural or developing destinations.

Ratten (2020), on the other hand, places emphasis on the role of technology and innovation in tourism entrepreneurship, particularly in the era of digitalization and smart tourism. She argues that entrepreneurial agility and the adoption of digital tools (e.g., social media, online booking

systems, data analytics) are becoming key success factors for tourism ventures in the 21st century. Ratten's work links entrepreneurial orientation (innovativeness, adaptability, Innovativeness) with competitive advantage and market responsiveness, especially in uncertain or disrupted markets like those affected by the COVID-19 pandemic.

Tourism entrepreneurship is an exciting realm where individuals with a passion for travel and skill for business come together to create and manage ventures within the tourism industry. It involves identifying opportunities and developing innovative ideas to meet the needs and desires of travelers. Think of it as weaving together the threads of adventure, hospitality, and entrepreneurship to craft unique experiences.

Entrepreneurs in the tourism industry are trailblazers who succeed in their endeavors, whether they are launching a boutique, hotel that offers distinctive travel experiences or creating an eco-tourism company that combines adventure with environmental protection. They can create deals that stand out from the competition since they have a solid understanding of the shifting demands and preferences of visitors.

Tourism Entrepreneurship is distinguished by its capacity to identify unrealized potential and capitalize on changing trends. Entrepreneurs who are successful concentrate on innovation, offering distinctive services, creating cutting-edge technology, and creating immersive experiences that make an impression on visitors. They make use of experiential tourism trends like farm-to-table food and eco-friendly activities to connect tourists with local culture and encourage sustainable practices.

Sustainability is a fundamental aspect of tourist entrepreneurship because entrepreneurs understand the need to preserve the environment, cultural heritage, and local communities. For instance, a wildlife refugee that prioritizes teaching and conservation boosts environmental awareness while boosting the local economy.

Dimensions of Tourism Entrepreneurship

Innovativeness

Innovativeness is a fundamental construct in the study of tourism entrepreneurship, reflecting the entrepreneur's capacity to introduce and implement new ideas, products, services, or processes that enhance the tourist experience and create a competitive advantage. In entrepreneurial theory, innovativeness is often discussed as a core element of entrepreneurial orientation, representing the tendency of a firm or individual to support creativity, novelty, and experimentation in business practice (Lumpkin & Dess, 2016). Within the tourism sector, innovativeness is particularly significant because it allows businesses and destinations to differentiate themselves in a highly competitive and dynamic market environment.

Shaw and Williams (2009) define innovativeness as the capacity to create new products, services, or marketing approaches that enrich the tourist experience and make destinations more attractive. According to them, innovation is a strategic tool for achieving distinctiveness in the global tourism industry, where customer expectations are continuously evolving. Their perspective emphasizes that innovativeness does not only concern major breakthroughs but also involves subtle and incremental changes that improve service quality and enhance visitor satisfaction.

Further expanding the concept, Hjalager (2010) introduced a comprehensive framework that categorizes tourism innovation into five key types: product, process, managerial, marketing, and institutional innovations. Product innovation involves the development of new tourism offerings or experiences, while process innovation includes operational changes such as online bookings or digital check-ins. Managerial innovation refers to changes in organizational practices, marketing innovation encompasses new promotional methods like influencer campaigns or immersive storytelling, and institutional innovation addresses regulatory or policy-driven shifts. This classification underscores the multi-dimensional nature of innovativeness and its relevance at different levels of tourism operations.

Ratten (2020) aligns innovativeness in tourism entrepreneurship with the broader trend of technological transformation. She argues that digital innovation through tools such as virtual reality tours, mobile booking apps, artificial intelligence, and data analytics has significantly reshaped how tourism services are marketed and consumed. For Ratten,(2020) tourism entrepreneurs who are digitally innovative are more agile, market-responsive, and capable of sustaining customer loyalty in a digital economy. This view brings to light the growing importance of technological fluency as a driver of innovation in tourism.

Market Sensitivity

Market sensitivity is a critical construct in tourism entrepreneurship, reflecting the entrepreneur's attentiveness and responsiveness to changing market dynamics, customer preferences, and environmental trends. It encompasses an ongoing process of monitoring, interpreting, and acting upon various market signals to align products, services, and strategies with current and anticipated demands. Morrison (2013) defines market sensitivity as the entrepreneur's capacity to remain aware of and respond to market stimuli such as shifts in consumer preferences, seasonal travel patterns, and competitive movements. In essence, it is a dynamic capability that enables tourism entrepreneurs to maintain strategic relevance and marketing efficiency in a fluid and often volatile marketplace.

From a broader marketing perspective, Kotler *et al.* (2017) argue that market sensitivity underpins successful customer-oriented strategies, enabling firms to design offerings that are more aligned with customer expectations. In the tourism industry, where consumer behavior is highly influenced by experiential desires, safety concerns, technological trends, and cultural preferences, market sensitivity allows entrepreneurs to tailor tourism services in a way that enhances customer retention and loyalty. The ability to anticipate these shifts, rather than merely reacting to them, provides a competitive edge and helps firms maintain profitability with greater marketing precision.

Scholars have emphasized the importance of market sensitivity as a core capability in entrepreneurial orientation. Lumpkin and Dess (2016) explain that while Innovation and innovativeness drive opportunity creation, it is market sensitivity that enables entrepreneurs to capitalize on these opportunities effectively. In this sense, market sensitivity serves as the feedback loop that informs innovation, ensuring that new products and services are not only novel but also market-relevant. This is particularly crucial in the tourism sector, where consumer expectations are shaped by rapidly changing global events, media influence, and social trends.

Market sensitivity is a pivotal capability in tourism entrepreneurship, enabling businesses to stay aligned with customer preferences, respond to competitive pressures, and adapt to seasonal or environmental shifts. It drives marketing efficiency by ensuring that promotional activities and service offerings are not only well-targeted but also grounded in current market realities. As part of a broader entrepreneurial orientation, market sensitivity contributes to business agility, strategic decision-making, and sustained customer engagement. In resource-constrained tourism environments, nurturing market-sensitive behaviors among entrepreneurs can significantly enhance destination performance, promote tourism growth, and support regional economic development.

Adaptability

Adaptability is a core attribute of tourism entrepreneurship, reflecting the capacity of individuals or enterprises to modify strategies, operations, and service delivery in response to changing external conditions. In a sector as dynamic and uncertain as tourism, adaptability is not merely an optional quality, it is essential for survival, resilience, and long-term competitiveness. Ratten (2020) defines adaptability as the ability of tourism entrepreneurs to respond proactively to environmental disruptions such as economic downturns, global health crises like COVID-19, technological advancement, or shifts in consumer behavior. This responsiveness enables businesses to sustain operations, retain customer interest, and explore new growth opportunities even under unpredictable circumstances.

Tourism is inherently vulnerable to a wide array of external shocks. Events such as pandemics, terrorism, political instability, natural disasters, and global recessions have historically had significant impacts on tourist flows, spending patterns, and destination appeal. Entrepreneurs who exhibit high adaptability are able to reconfigure their business models, shift their market focus, adopt new technologies, or even pivot into alternative service areas. According to Pizam (2010), the most successful tourism entrepreneurs are those who prepare for uncertainty and build adaptive capacity into their organizational culture. This allows them to maintain service continuity, minimize losses, and seize emergent opportunities during periods of disruption.

Scholars such as Hall and Williams (2008) argue that adaptability in tourism is linked to the concept of resilience, particularly within small and medium-sized enterprises (SMEs) that lack the financial buffers of larger corporations. In their view, adaptive tourism entrepreneurs demonstrate high levels of resourcefulness, learning agility, and operational flexibility. They are quick to identify new market niches, redeploy assets, and form strategic partnerships in response to changing environments. This entrepreneurial agility allows for faster recovery from crises and more sustainable business practices.

During the COVID-19 pandemic, adaptability became an even more visible and measurable entrepreneurial trait. Tourism businesses that survived or even thrived during this period were those that innovated their service offerings such as by offering virtual tours, contactless experiences, flexible booking policies, and enhanced health and safety measures. Ratten (2020) highlights that the pandemic accelerated digital transformation in tourism, and adaptability was critical for entrepreneurs to adopt and integrate digital tools, from e-commerce platforms to mobile

communication technologies. Entrepreneurs who adapted quickly to these new realities were able to maintain customer engagement, even in the absence of physical travel.

Another important dimension of adaptability is its relationship with technological advancement. In the digital age, the rapid pace of innovation in tourism-related technologies from augmented reality to AI-based customer service requires entrepreneurs to maintain a flexible mindset and a willingness to adopt new tools. Buhalis and Amarangana (2015) suggest that smart tourism environments reward businesses that are technologically adaptive, as they are better equipped to deliver personalized services, manage resources efficiently, and stay connected with tech-savvy consumers. Entrepreneurs who resist technological change risk falling behind competitors and losing relevance in digital marketplaces.

In the context of emerging economies, adaptability is particularly crucial due to the frequent instability of political, economic, and infrastructural conditions. Ezeuduji (2015) notes that tourism entrepreneurs in Africa often face challenges such as unreliable electricity, poor transport networks, and fluctuating government policies. Those who are adaptable develop localized coping strategies, such as operating on alternative power sources, forming community-based collaborations, or tailoring services to domestic tourism markets when international travel declines. These forms of localized adaptability not only ensure business continuity but also foster innovation and sustainability.

Adaptability is a vital dimension of tourism entrepreneurship, enabling businesses to remain viable, responsive, and competitive amid constant change. It is rooted in strategic foresight, operational flexibility, and the willingness to embrace innovation. In a tourism landscape marked by volatility and transformation, especially in developing regions like South-South Nigeria, adaptability enhances marketing efficiency by ensuring that services stay relevant, resources are used wisely, and customer trust is maintained. Promoting adaptive capacities among tourism entrepreneurs should therefore be a central focus in tourism policy, education, and enterprise development strategies.

Types of Tourism Entrepreneurship

Accommodation and Hospitality

This type of tourism entrepreneurship involves the establishment and management of accommodation facilities such as hotels, guesthouses, and resorts. Entrepreneurs in this field focus on providing comfortable and enjoyable lodging experiences for tourists. For example, an entrepreneur in the tourism industry may launch a boutique hotel. Gautam (2023) posits that this type of tourism entrepreneurship offers specialized services, stylish décor, and innovative amenities to appeal to discriminating customers seeking a premium and memorable stay.

Food and Beverage

Food and beverage entrepreneurship in tourism revolves around creating dining experiences for travelers. Entrepreneurs in this domain establish restaurants, cafes, food trucks, or specialty food businesses that cater to the culinary preferences of tourists. They aim to offer delicious and diverse cuisine options, ranging from local delicacies to international flavors. An example is an entrepreneur who opens a seafood restaurant in a coastal destination, serving freshly caught seafood dishes to tourists who crave an authentic taste of the local marine cuisine.

Adventure and Outdoor Recreation

In the views of Griggio and Oxenswärdh (2021) adventure and outdoor recreation tourism entrepreneurship focuses on providing exciting and adventurous activities for travelers seeking thrilling experiences. Entrepreneurs in this field create ventures such as adventure tour companies, water sports centers, hiking, and trekking expeditions, or wildlife safaris. They cater to the interests of adventure enthusiasts by offering activities like white-water rafting, zip-lining, mountain biking, or wildlife encounters. For instance, an entrepreneur may establish a company that offers guided rock-climbing trips in picturesque natural landscapes, providing adrenaline-pumping experiences for adventurous travelers.

Cultural and Heritage

Güzel, Ehtiyar and Ryan (2021) are of the view that cultural and heritage tourism entrepreneurship centers around showcasing the local culture, traditions, and historical attractions of a destination. Entrepreneurs in this field create businesses such as guided heritage tours, cultural performances, museums, art galleries, or craft workshops. They aim to preserve and promote the cultural identity of a place while providing educational and enriching experiences for visitors. For example, an entrepreneur may establish a cultural centre that offers interactive workshops on traditional arts and crafts, allowing tourists to engage with the local culture and learn traditional craftsmanship.

Sustainable and Ecotourism

Jaafar, Abdul-Aziz, Maideen, and Mohd (2011) opined that Sustainable and ecotourism entrepreneurship focuses on developing businesses that prioritize environmental conservation and sustainable practices. Entrepreneurs in this realm establish eco-lodges, nature-based tour operators, wildlife conservation initiatives, or sustainable transportation services. They aim to minimize the negative impact on the environment while promoting nature appreciation and conservation. An example is an entrepreneur who started an eco-tour company offering guided hikes in protected areas, emphasizing the importance of preserving natural habitats and educating tourists about sustainable practices.

Specialized and Niche Tourism

Specialized and niche tourism entrepreneurship involves catering to specific interests, hobbies, or target markets within the tourism industry. Entrepreneurs in this category create ventures such as wellness retreats, wine and culinary tours, photography expeditions, adventure sports, or cultural festivals. They focus on providing tailored experiences and catering to the unique needs and preferences of niche segments. For instance, an entrepreneur may establish a company that offers guided bird-watching tours for bird enthusiasts, providing expert guides, specialized equipment, and access to prime bird-watching locations (Jaafar; Rasoolimanesh, & Lonik, 2015)

Nature of Strategic Initiatives / Drive

Strategic management is concerned with the management of strategic analysis and implementation that is identified to change how the organization “does things” in response to internal or external environmental factors (Grundy, 2018; Cooke, 2017). As a result, strategic drives are identified to develop the organizations capabilities and to provide competitive advantage (Al-Ghamdi, 2008).

Most authors agree the methods of identifying strategic objectives work and advise that the issues faced by organizations is not in the formulation but the implementation; the reason argued is that implementation is seen as an operational activity rather than project based.

In the views of Bagheri, Chitsazan, and Koolaji (2020) a strategic initiative is a comprehensive plan that an organization sets out for achieving its strategic goals or long-term visions for improvement. If a goal asks what you want to achieve, a strategic initiative explains how you can achieve it. It's a map route to your destination. For example, a goal for a clothing retailer might be to expand its customer base, and an initiative for accomplishing this could be to raise brand awareness with a social media market campaign targeting new demographics. A strategic initiative can comprise multiple projects, and several strategic initiatives can function together to achieve a larger, more visionary goal. Before executing initiatives, an organization might analyze its current projects to determine how well they align with its strategic goals and remove any projects that can offer no impact on the goals.

A strategic initiative can comprise multiple projects, and several strategic initiatives can function together to achieve a larger, more visionary goal. Before executing initiatives, an organization might analyze its current projects to determine how well they align with its strategic goals and remove any projects that can offer no impact on the goals.

Strategic Initiatives & Renewable Hope in Nigeria's Tourism & Hospitality Sector

Strategic Initiatives refers to planned, long-term efforts (policy, infrastructure, marketing, regulation, public-private partnerships) to transform or grow the tourism & hospitality sector. On the other hand, renewable Hope is a forward-looking optimism based on sustainable, renewable, and inclusive approaches: green / eco-tourism, renewable energy, community involvement, digital innovation, heritage conservation etc.

Why the Adoption of Strategic Initiatives in Nigeria's Tourism and Hospitality Sector

- Under-utilized potential: natural attractions (parks, beaches, natural springs), cultural & heritage sites, festivals, creative industries.
- Challenges: inadequate infrastructure, regulatory bottlenecks, insecure or sometimes negative international perceptions, poor data, funding constraints, environmental degradation.
- Importance: job creation, diversification of economy (less dependence on oil), foreign exchange earnings, domestic tourism growth.

Recent Strategic Initiatives in Nigeria

These are some of the initiatives already underway or proposed, which tie in with the Renewed Hope Agenda / government policy.

Initiative	Objectives / Components	Key Features	Strengths / Early Gains
Destination 2030	Major repositioning of Nigeria as a tourism destination globally; part of the Renewed Hope	Branding (Nigeria Everywhere); selecting flagship sites like Ikogosi Warm Springs; improving access;	Flagship projects visible; raises awareness; begins to change narratives about Nigeria; draws

Initiative	Objectives / Components	Key Features	Strengths / Early Gains
	Cultural & Tourism Agenda.	infrastructure investment; combining federal & state efforts.	private sector partners.
D30 Data Project	Build a comprehensive tourism & creative economy database; use real data to drive policy & investment.	Grant-funded; real-time insights; policy decisions, investor attractiveness.	Helps reduce guesswork; better targeting; transparency; maybe reduces risk for investors.
Creative Tourism Infrastructure Company (CTICo)	Using PPPs to drive infrastructure modernization in tourism & creative economy.	Restoring key sites (Obudu Resort, Yankari Game Reserve); building creative cities; arenas for major events.	Infrastructure is a key bottleneck; improved sites can change tourist perceptions and experience; job creation.
NIHOTOUR Renovation & Capacity Building	Upgrading training facilities; improving professional capacity in hospitality & tourism training.	Renovated Lagos Zonal Office; better facilities; helping to raise standards.	Human capital strengthened; better service delivery; helps to match global expectations.
Policy & Regulatory Reforms; Stakeholder Collaboration	Harmonizing regulations; reducing multiple taxation; improving ease of doing business; better inter-agency coordination; state-level coordination.	Council of Tourism Commissioners; aligning NIHOTOUR & NTDA roles; tax reforms; better legal frameworks.	Makes operations easier; encourages investment; less bureaucratic friction; more accountability.
Sustainability / Green Tourism Push	Embracing environment-friendly principles; renewable energy; community-based tourism; conservation; waste & water management.	NATOP urging FG to adopt sustainable tourism; suggestions to adopt renewables like solar & wind; eco-conscious marketing.	Taps new tourist segments; reduces long-term costs; good for branding; supports resilience (e.g. in face of climate change).

Renewable Hope: Sustainable & Forward-Looking Components

These are the dimensions in which hope is renewable i.e. sustainable, regenerative, inclusive, resilient.

1. **Environmental Sustainability / Green Tourism**

- Use of renewable energy: solar panels, off-grid solutions for remote tourist sites.
- Water conservation, waste recycling, ecosystem protection (parks, reserves, natural landscapes).
- Ensuring that tourism development does not degrade the natural capital that draws tourists in.

2. **Cultural & Heritage Conservation / Creative Economy**
- Leveraging Nigeria's rich cultures, festivals, heritage sites as tourism assets.
- Storytelling, indigenous arts/crafts, music, food as part of tourist experience.
- Protecting heritage against erosion, loss, commodification.

3. **Community Participation & Benefit Sharing**
- Involving local communities in planning & operations: homestays, guide services, local crafts.
- Ensuring local employment; capacity building in hospitality among locals.
- Ensuring the economic benefits flow to grassroots, not only to large players.

4. **Digital Innovation and Data-Driven Planning**
- Use data platforms (e.g. D30) for destination planning, forecasting, marketing.
- Digital marketing, virtual tours, booking platforms, apps.
- Using tech to improve visitor experience, safety, information, transport coordination.

5. **Public-Private Partnerships & Investment Mobilization**
- PPPs to build necessary infrastructure: roads, airports, resorts, connectivity.
- Mobilizing both domestic and foreign investment.
- Financial innovations (grants, impact investment, tourism bonds etc.).

6. **Policy, Regulation, Governance Reforms**
- Harmonizing overlapping institutions/regulations.
- Streamlining visa regimes, ease of travel.
- Removing multiple taxation, improving governance & transparency.

7. **Resilience & Diversification**
- Covid-19 and similar shocks show need to diversify product offerings: wellness tourism, ecotourism, adventure tourism etc.
- Focus not just on international tourists but boosting domestic tourism.
- Risk management: environmental risks, insecurity, infrastructure failures.

Challenges & Risks

Bagheri, Chitsazan, and Koolaji (2020) posits that even with these initiatives, Nigeria faces significant hurdles. Any strategic plan must anticipate & mitigate these challenges which are:

- Infrastructure deficits: bad roads to many attractions, poor electricity supply, weak connectivity (internet, transport).
- Funding gaps & resource limitations.
- Security concerns in certain regions.
- Negative international perceptions / soft-power issues.
- Environmental degradation & lack of regulatory enforcement.
- Data scarcity; weak measurement; monitoring & evaluation.
- Fragmented institutional arrangements; federal vs state conflicts; overlapping mandates.
- Climate change risks: coastal erosion, desertification, flooding etc.

Strategies for Amplifying Renewable Hope

What could be done, or should be emphasized, to ensure the positive potential is realized.

- Set up Tourism Satellite Accounts **(TSA)** to measure real economic contributions. (Already part of government plans) incentivize renewable energy systems (solar, micro-grids) for remote resorts and parks.

- Foster eco-certification of hotels and tourist operators to appeal to eco-conscious travelers.
- Improve accessibility & infrastructure for remote / under-visited sites: better roads, flights, public transport.
- Improve visa facilitation & border experience for incoming tourists.
- Invest in skills training via institutes like NIHOTOUR; integrate sustainability, hospitality, marketing, foreign languages etc.
- Encourage domestic tourism: package weekend-getaways, heritage trails, wellness retreats aimed at Nigerians.
- Support marketing & branding (soft power): story-telling, culture diplomacy, Nigeria Everywhere brand.
- Promote community-based tourism models: homestays, tours operated by locals etc., so that benefits are broadly shared.
- Encourage private sector innovation: hotel chains, ecotour lodges, use of tech, apps etc.
- Ensure environmental protection & conservation: enforce protected area policies; balance development with sustainability.

Metrics & Monitoring: Measuring Success

To ensure strategic initiatives are effective, there is need for good metrics & monitoring. The metrics for measuring success after the adoption of specific strategic drives are

- Tourist arrivals (both domestic & international)
- Tourism revenue / foreign exchange earnings
- Number of jobs created in tourism & hospitality
- Investment levels mobilized (both public & private)
- Infrastructure improvement indicators (roads, connectivity, utilities)
- Environmental indicators: carbon footprint, energy/water usage, waste management, protected area status
- Visitor satisfaction / service quality indices
- Brand visibility metrics (media coverage, perception surveys)
- Inclusive impact: how much local communities' benefit, local employment, income distribution

Linking to Broader National Agendas

- Nigeria's **Renewed Hope Agenda** under President Tinubu: economic diversification; employment; international competitiveness. Many tourism/hospitality initiatives are part of that agenda.
- Sustainable Development Goals (SDGs): responsible consumption, life on land, climate action, decent work etc. Tourism can contribute positively here if well managed.
- Regional integration & foreign tourism: better visa regimes; marketing Nigeria to African neighbors and diaspora.

Conclusion

This paper has ornately discussed the concept of tourism entrepreneurship and how the adoption of certain strategic initiatives can enhance the needed rekindled optimism in the smart Nigeria's tourism and hospitality sector. The process of planning, establishing, and running new businesses within the tourist sector is referred to as tourism entrepreneurship. It is essential for promoting innovation, economic expansion, and job creation. Tourism entrepreneurs display traits like

innovation, flexibility, and a love for their business. They aid in the creation of distinctive tourism goods, services, and experiences through their entrepreneurial initiatives, which meet the changing demands of tourists.

There is genuine renewable hope with strong natural, cultural, creative resources, and growing political will. But the translation of strategic plans into visible outcomes requires consistent implementation, adequate funding, strong institutions, and stakeholder alignment.

Sustainability must be core not as an afterthought. Innovation (digital, green, community) will distinguish those destinations/operators that succeed. The path ahead is challenging but with well-crafted strategies, Nigeria can unlock much more of its tourism & hospitality potential.

Abstract
The growing environmental challenges caused by unsustainable consumption patterns have heightened the global call for eco-friendly consumption. This study investigated behavioral insights as critical drivers for promoting sustainable consumer choices. Drawing on behavioral economics, psychology, and sustainability studies, the research explored how cognitive biases, social norms, incentives, and nudging strategies influence consumer decision-making towards environmentally friendly products and practices. Using a mixed-methods approach that combines survey data, focus group discussions, and empirical reviews, the study highlights key determinants such as environmental awareness, perceived behavioral control, cultural values, and trust in eco-labels. Findings reveal that while most consumers express positive attitudes toward eco-friendly products, actual purchasing behavior is often hindered by price sensitivity, limited availability, and lack of accurate information. The study emphasized that behavioral interventions—such as framing, default options, social comparisons, and targeted communication—significantly enhance the likelihood of eco-friendly consumption. It concluded that integrating behavioral insights into policy design, corporate strategies, and consumer education can bridge the attitude-behavior gap and foster sustainable consumption practices. The research contributed to knowledge by providing evidence-based recommendations for policymakers, businesses, and sustainability advocates seeking to accelerate the transition towards greener economies.

Keywords: *Behavioral insights; eco-friendly consumption; sustainable consumer behavior; environmental awareness; green marketing; nudging strategies; sustainable development.*

Introduction

Unsustainable consumption patterns remain a critical driver of global environmental degradation. Encouraging eco-friendly consumption requires more than awareness campaigns—it demands behavioral insights that address the psychological and social factors influencing consumer choices. Global environmental challenges such as climate change, deforestation, loss of biodiversity, and resource depletion have been exacerbated by unsustainable patterns of consumption and production (Chatzidakis et al, 2016). According to the United Nations Environment Programme (UNEP, 2022), household consumption is responsible for over 60% of global greenhouse gas emissions and nearly 80% of water use, positioning consumer behavior as a major driver of environmental degradation. Eco-friendly consumption—defined as the adoption of products, services, and practices that minimize negative environmental impacts—has gained increasing global relevance (Stern, 2000). Eco-friendly consumption, which involves purchasing and using products and services with minimal environmental impact, has gained increasing attention among scholars, policymakers, and businesses. However, while consumers often express positive attitudes toward sustainability, actual purchasing and consumption behavior rarely align with these attitudes. This phenomenon, known as the **attitude–behavior gap**, underscores the need for innovative approaches to foster sustainable consumption. Consumers are progressively aware of the consequences of their choices, and many express positive attitudes toward sustainability.. Traditional strategies such as awareness campaigns, eco-labeling, and price incentives have not been sufficient to bridge this gap (Jackson,2005). Recent insights from behavioral economics and psychology suggest that consumer decisions are shaped less by rational deliberation and more by cognitive biases, heuristics, social norms, and contextual cues (Hartman and Apaolaza-Ibanez, 2012). For example, framing eco-friendly choices as the "default option" or highlighting peer behavior can significantly influence consumer adoption of green practices. These **behavioral insights** hold potential as powerful tools to reshape consumer patterns and promote eco-friendly consumption.

Statement of the Problem.

Despite heightened environmental awareness, the transition toward eco-friendly consumption remains limited. Consumers frequently prioritize convenience, price, and availability over sustainability, creating a mismatch between pro-environmental attitudes and actual behavior (World Bank,2015). For instance, many individuals acknowledge the benefits of reusable packaging or energy-efficient appliances but fail to adopt them due to perceived higher costs or lack of accessibility. Traditional approaches, such as awareness campaigns and product labeling, have proven insufficient in closing this gap. This problem raises a critical question: **What behavioral insights can effectively promote eco-friendly consumption?** Research in behavioral economics and psychology suggests that consumers' decisions are not always rational but are influenced by cognitive biases, heuristics, social norms, and contextual cues. Yet, limited studies in developing economies—where environmental awareness is rising but structural barriers persist—have explored how these behavioral insights can be strategically applied to encourage eco-friendly consumption (Balmer and Greyser,2006). Although environmental awareness has increased globally, the transition toward eco-friendly consumption remains limited. Consumers often face barriers such as (Pomering and Johnson,2009):

i. **Price sensitivity**: Eco-friendly products are often perceived as more expensive**.**

ii. **Limited availability and accessibility**: Sustainable options are not always readily available.
iii. **Information gaps**: Many consumers are uncertain about the authenticity of eco-labels and green claims.
iv. **Behavioral inertia**: Even when consumers intend to adopt eco-friendly practices, habitual behaviors and convenience often outweigh sustainability considerations.

These challenges reveal that consumers' purchasing and usage decisions are influenced not only by awareness and intention but also by behavioral and contextual factors. Despite the growing recognition of behavioral insights as a solution, empirical studies—especially in developing economies—remain limited. This creates a critical knowledge gap on how behavioral insights can effectively promote eco-friendly consumption and bridge the attitude–behavior gap.

Objectives of the Study.

The main objective of this study was to investigate how behavioral insights can be applied to promote eco-friendly consumption. The specific objectives were to:

i. examine the role of nudging and green marketing strategies in shaping eco-friendly consumer behavior.
ii. identify the socio-cultural and economic factors influencing eco-friendly consumption.
iii. assess the effectiveness of behavioral interventions (e.g., framing, default options, social comparisons) in encouraging sustainable consumption.
iv. explore the barriers hindering consumers from translating environmental awareness into eco-friendly consumption.
v. provide evidence-based recommendations for policymakers, businesses, and sustainability advocates on promoting eco-friendly consumption.

Research Questions.

This study sought to answer the following research questions:

i. How do nudging and green marketing strategies influence eco-friendly consumption?
ii. What socio-cultural and economic factors affect consumers' adoption of eco-friendly practices?
iii. To what extent are behavioral interventions effective in bridging the gap between environmental attitudes and actual consumption behavior?
iv. What barriers limit consumers from adopting eco-friendly consumption despite awareness?
v. What strategies can policymakers and businesses adopt to promote eco-friendly consumption through behavioral insights.

Research Hypotheses.

The hypotheses of the study are:

H01: Nudging and green marketing strategies have no significant influence on eco-friendly consumption.

H02: Socio-cultural and economic factors do not significantly affect eco-friendly consumption.

H03: Behavioral interventions (framing, defaults, and social comparisons) do not significantly promote eco-friendly consumption.

H04: Barriers such as price sensitivity and limited accessibility do not significantly hinder eco-friendly consumption.

Significance of the Study

This study is significant for several reasons. First, it advances academic knowledge by integrating theories of behavioral economics, consumer psychology, and sustainability studies to explain eco-friendly consumption. Second, it provides evidence-based strategies for policymakers to design effective interventions—such as nudging, default options, and social comparisons—that can shift consumer choices toward sustainability. Third, it offers practical recommendations for businesses to align their green marketing strategies with consumer behavior, thereby enhancing both environmental and marketing performance. Lastly, the study supports the achievement of the United Nations Sustainable Development Goals (SDGs), particularly Goal 12**: Responsible Consumption and Production**, by providing insights into how consumer behavior can be reshaped toward sustainability

Justification of the Study.

Previous research has primarily emphasized environmental awareness, pricing, and eco-labeling as determinants of sustainable consumption. However, these approaches have not adequately explained why consumers fail to act sustainably despite positive attitudes. This study is justified by its focus on **behavioral insights**, which offer innovative, low-cost, and scalable approaches to promoting eco-friendly consumption. By addressing the psychological and social drivers of consumer behavior, the study provides fresh perspectives for academia, policymakers, and businesses seeking to achieve sustainable development.

Literature Review.

Conceptual Review.

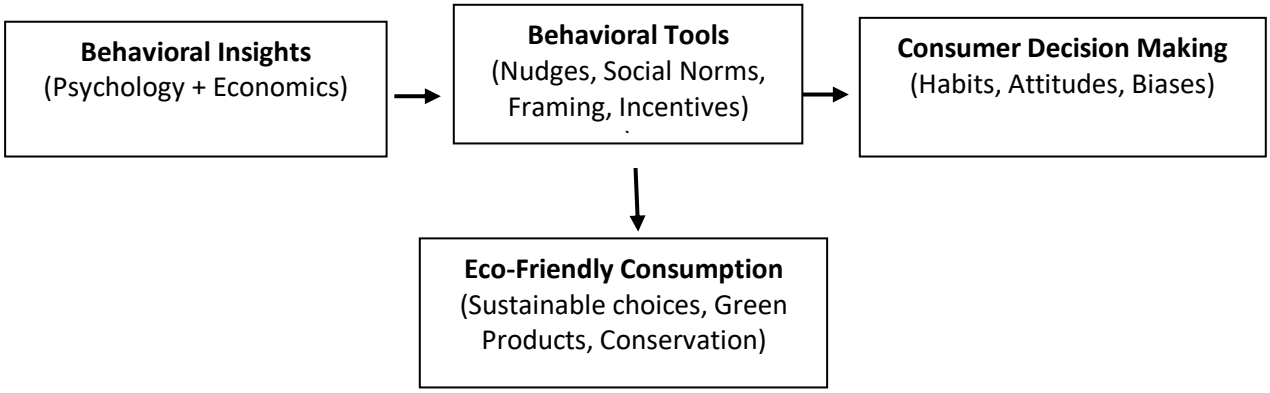

Figure 1;: CONCEPTUAL FRAMEWORK LINKING BEHAVIORAL INSIGHTS TO ECO-FRIENDLY CONSUMPTION

Source : Researcher's Conceptualization, 2025

Concept of Eco-Friendly Consumption.

Eco-friendly consumption refers to consumer practices that minimize negative impacts on the environment through the purchase, usage, and disposal of products and services. It encompasses activities such as choosing energy-efficient appliances, reducing waste, recycling, supporting eco-labeled products, and embracing sustainable lifestyles (Peattie & Crane, 2005). Eco-friendly

consumption is not only about individual choices but also about collective responsibility in achieving sustainable development.

Behavioral Insights in Consumer Decision-Making.

Behavioral insights draw from behavioral economics, psychology, and decision science to explain how people make choices. Unlike traditional economic models that assume consumers act rationally, behavioral insights acknowledge that decisions are often influenced by **cognitive biases, heuristics, and social norms** (Sunstein & Thaler, 2008). The key behavioral drivers include:

i. **Cognitive biases**: Mental shortcuts that influence decision-making, such as loss aversion and present bias.
ii. **Nudging strategies**: Subtle changes in choice architecture, such as making eco-friendly products the default option.
iii. **Social norms**: The influence of peer behavior and community expectations on sustainable consumption.
iv. **Framing effects**: Presenting eco-friendly choices in a way that highlights their benefits or consequences**.**

The Attitude–Behavior Gap in Sustainable Consumption

A major challenge in eco-friendly consumption is the gap between consumers' pro-environmental attitudes and their actual behaviors (White et al, 2019). While many consumers express willingness to buy green products, their actions are often hindered **by price sensitivity, availability, lack of trust in eco-labels, and habitual behaviors.** Behavioral insights offer potential solutions to bridge this gap by addressing the psychological and contextual factors behind decision-making.

Theoretical Framework.

Several theories provide foundations for understanding how behavioral insights can promote eco-friendly consumption:

Theory of Planned Behavior (TPB) – Ajzen (1991).

This theory suggests that behavior is driven by intention, which is influenced by attitudes, subjective norms, and perceived behavioral control. In eco-friendly consumption, a consumer's belief in their ability to make sustainable choices strongly predicts their behavior.

Nudge Theory – Thaler & Sunstein (2008); Zinkhan & Carlson (1995).

This theory proposes that individuals can be influenced toward better decisions through subtle changes in the decision environment. Examples include setting eco-friendly products as defaults, using reminders, or highlighting peer comparisons.

Social Norms Theory – Singh et al (2012).

Emphasizes that individuals' behaviors are shaped by perceptions of what others around them are doing. For instance, consumers are more likely to adopt recycling if they believe it is a common community practice.

Value-Belief-Norm (VBN) Theory – Stern (2000).

This theory explains that pro-environmental behavior arises when individuals' values and environmental beliefs trigger personal norms that encourage sustainable actions. Together, these

theories provide a multi-dimensional lens for analyzing eco-friendly consumption: **attitudinal, social, normative, and behavioral factors.**

Empirical Review

Behavioral Insights and Sustainable Consumption.

Studies have demonstrated the effectiveness of behavioral interventions in promoting eco-friendly behaviors. For example, Belz and Peattie (2012) showed that providing households with feedback on their energy consumption relative to neighbors significantly reduced energy use. Similarly, Ottman (2011) highlighted how nudges, such as labeling and framing, influence consumers' willingness to choose eco-friendly products.

Socio-Cultural and Economic Influences

Research by Aaker (1996) revealed that cultural values, environmental concern, and socio-economic status significantly influence green product adoption in emerging markets. In Nigeria, Okoro and Agu (2019) found that while consumers express high concern for the environment, economic factors such as cost and limited product availability constrain eco-friendly consumption.

Barriers to Eco-Friendly Consumption

Multiple studies identify price premiums, lack of trust in eco-labels, and insufficient product information as key barriers (Young et al., 2010). For instance, Nguyen et al. (2020) reported that despite growing environmental awareness in Southeast Asia, consumers hesitate to purchase green products due to skepticism about their authenticity and higher prices.

Nudging and Green Marketing Strategies

Empirical evidence supports the role of nudging and green marketing in shaping consumption. UNEP (2008) found that when green energy was offered as the default option in Germany, consumer adoption rates rose dramatically compared to when it was an opt-in choice. In retail settings, Nguyen et al (2020) showed that clear eco-labeling and product framing increased consumer preference for eco-friendly products.

Summary of Literature and Research Gap

The reviewed literature establishes that while consumers are increasingly aware of environmental issues, significant barriers prevent them from translating awareness into consistent eco-friendly behaviors. Behavioral insights—such as nudging, framing, and social norm interventions—have shown promise in influencing sustainable consumption. However, most empirical studies have been conducted in developed economies, with limited attention to **developing countries such as Nigeria**, where cultural, economic, and infrastructural barriers are unique. This gap underscores the need for more context-specific research that examines how behavioral insights can effectively promote eco-friendly consumption in such settings.

Research Methodology.

The study adopted a **mixed-methods research design**, combining both quantitative and qualitative approaches. The quantitative approach (survey) provides measurable insights into consumer attitudes and behaviors, while the qualitative approach (focus group discussions and interviews) captures deeper perspectives on behavioral influences and eco-friendly consumption. This design allows for triangulation, enhancing the validity and reliability of

findings. The target population consists of consumers within selected urban centers, who engage in daily purchase and consumption of goods and services. These include households, students, working professionals, and business owners who are potential or actual adopters of eco-friendly products and practices. The population is very large (approaching infinity)**.** Due to the constraints that are associated with in studying the entire population, samples were taken using applicable sampling techniques. The sample size of the study was calculated according to Cochran (1975) formula which is used in social sciences in determining the sample size, calculated as follows:

$$n = \frac{Z^2}{d2}$$

The estimation of the proportion of eco-friendly consumers is computed as:

- Confidence level = 95% → Z=1.96Z = 1.96Z=1.96
- Expected proportion (ppp) = 0.5 (since no prior estimate is available)
- Margin of error (eee) = 0.05

n=(1.96)2·(0.5)(0.5)(0.05)2n = \frac{(1.96)^2 \cdot (0.5)(0.5)}{(0.05)^2}n=(0.05)2(1.96)2·(0.5)(0.5) n=3.8516·0.250.0025=0.96040.0025=385.16n = \frac{3.8516 \cdot 0.25}{0.0025} = \frac{0.9604}{0.0025} = 385.16n=0.00253.8016·0.25 =0.00250.9604=385.16. The required sample size is **385 respondents**. A **multistage sampling technique** was employed: **Purposive sampling was used** to select specific urban areas with access to eco-friendly products, **stratified random sampling** was used to categorize respondents based on demographics (e.g., age, gender, occupation) while **Simple random sampling** within each stratum was used to ensure fair representation. For qualitative data**, three focus group discussions (FGDs)** (8–10 participants each) and **5 key informant interviews** with policymakers, marketers, and environmental advocates were conducted. The study relied on both **primary data** collected through structured questionnaires, FGDs, and interviews and **secondary data** drawn from journals, textbooks, reports from UNEP, UNDP, World Bank, and previous empirical studies on behavioral insights and eco-friendly consumption. A structured questionnaire with both closed-ended and Likert-scale items were used to measure variables such as environmental awareness, trust in eco-labels, perceived behavioral control, price sensitivity, and influence of nudges/social norms. Semi-structured interview questions were used for policymakers, marketers, and sustainability advocates. **Focus Group Guide** was used to explore collective views on barriers and behavioral motivators for eco-friendly consumption. The research instruments were subjected **to expert review** by scholars in consumer behavior and environmental studies. A pilot test was conducted with 20 respondents, and necessary modifications were made. Reliability of the questionnaire was tested using **Cronbach's Alpha**, with a threshold of **0.70 and above** considered acceptable**.** Trained research assistants administered the questionnaires through physical distribution and online platforms (e.g., Google Forms). Interviews and focus group discussions (FGDs) were conducted face-to-face and recorded with consent, and later transcribed for analysis. Descriptive statistics (mean, frequency, percentages) were used to summarize consumer characteristics. Inferential statistics such as simple **regression analysis** was used to test the hypotheses on relationships between behavioral insights and eco-friendly consumption. Content analysis (qualitative data) was used to identify recurring themes, patterns, and narratives from FGDs and interviews. The study adhered to ethical research standards by seeking **informed consent** from all participants, ensuring **anonymity and confidentiality** of responses, allowing

respondents the **right to withdraw** at any stage and using collected data strictly for academic purposes.

Data Presentation, Analysis and Interpretation.

Data were gathered through structured questionnaires, focus group discussions, and interviews. Out of 385 questionnaires distributed, 276 were returned, representing a **92% response rate**. Qualitative responses from FGDs and interviews were analyzed thematically to complement the quantitative findings.

Use of criterion mean in answering research question.

The five points Likert Scale in the study was rated as under-listed;

Strongly Agree(SA) =5 points
Agree (A) =4 points
Undecided (U) = 3 points
Disagree (D) =2 points
Strongly disagree (SD) =1 point
Total = 15 points
Number of responses = 5
Mean cut-off point = 15 / 5 = 3.0

The mean, 3.0, was used as a criterion for accepting or not accepting the item statements of the questionnaire in order to answer the research question(Nwankwo,2011). The rule is that any item statement with mean score of 3.0 and above is accepted as a true statement and any statement with mean score less than 3.0 is unaccepted

Research question 1: To what extent have Nudging and Green marketing strategies exerted influence on eco-friendly consumptions?

Table 2.: Mean score(x) of respondents on the influence of nudging and green marketing strategies on eco-friendly consumptions.

Item statements 1, 2, 3, and 4 recorded mean scores of 3.0, and above showing significant factors that encourage consumers' eco-friendly consumption.

Test of Hypotheses.

H01: Nudging and green marketing strategies have no significant influence on eco-friendly consumptions.

Table 7: Influence of nudging and green marketing strategies on eco-friendly consumptions.

Coefficients						
		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std.Error	Beta	t- value	Sig.
1	Constant)	2.143	0.185		15.648	.000
	Nudging/Green Mkt.	0.609	0.033	0.588	17.311	.000
	R	0.798				
	R^2	0.636				
	Adjusted R^2	0.527				
	F – Statistics	16.285				

Dependent Variable: Eco-friendly consumption (version 25 of SPSS computation).

Source: Field Survey, 2025.

Table 7 shows the influence of nudging and green marketing strategies on eco-friendly consumptions. From the simple regression analysis table, nudging/green marketing strategies were found to be statistically significant at 1% and positively related to eco-friendly consumptions. This implies that an increase in nudging/green marketing strategies will translate to a corresponding increase in eco-friendly consumptions..This assertion is at the 99% confidence level. The R^2 value of 0.636 shows that 64% of variations in eco-friendly consumptions were accounted for by nudging/green marketing strategies. The remaining 36% was due to some other extraneous factors that were not included in the model. Similarly, the f-statistics value of 16.285 indicates that the model specification was correct while significant at 1%. Therefore, the null hypothesis that nudging and green marketing strategies have no significant influence on eco-friendly

consumptions is rejected .This result means that nudging and green marketing strategies have significant influence on eco-friendly consumptions.

H02: Socio-cultural and economic factors do not significantly affect eco-friendly consumption.

Table 8: Influence of socio-cultural and economic factors on eco-friendly consumption

Coefficients						
		Unstandardized Coefficients		Standardized Coefficients

	Behavioral Interventions.	0.626	0.180	0.667	6.700	.000
	R	0.812				

R^2	0.659
Adjusted R^2	0.552
F – Statistics	17.211

Dependent Variable: Eco-friendly consumption (version 25 of SPSS computation).
Source: Field Survey, 2025

Table 9 shows the influence of behavioural interventions on eco-friendly consumption. From the simple regression analysis table, behavioural interventions were found to be statistically significant at 1% and positively related to eco-friendly consumption. This implies that an increase in behavioural interventions will translate to a corresponding increase in eco-friendly consumption. This assertion is at the 99% confidence level. The R^2 value of 0.659 shows that 66% of variations in eco-friendly consumption was accounted for by behavioural interventions. The remaining 34% was due to some other extraneous factors that were not included in the model. Similarly, the f-statistics value of 17.211 indicates that the model specification was correct while significant at 1%. Therefore, the null hypothesis that behavioral interventions do not significantly affect eco-friendly consumption is rejected .This result means that behavioral interventions do significantly affect eco-friendly consumption.

H04: Barriers such as price sensitivity and limited accessibility do not significantly hinder eco-friendly consumption.

Table 10: Influence of price sensitivity/limited accessibility on eco-friendly consumption

Coefficients						
		Unstandardized Coefficients		Standardized Coefficients		
Model		B	Std.Error	Beta	t- value	Sig.

	Price sensibility/Access.	.0.667	0.189	0.685	7.132	.000
	R	0.865				
	R^2	0.748				
	Adjusted R^2	0.6.74				
	F – Statistics	17.374				

Dependent Variable: Eco-friendly consumption (version 25 of SPSS computation).
Source: Field Survey, 2025

Table 10 shows the influence of price sensibility/limited accessibility on eco-friendly consumption. From the simple regression analysis table, price sensibility/limited accessibility were found to be statistically significant at 1% and positively related to eco-friendly consumption. This implies that an increase in price sensibility/limited accessibility will translate to a corresponding increase in eco-friendly consumption. This assertion is at the 99% confidence level. The R^2 value

of 0.748 shows that 75% of variations in eco-friendly consumption was accounted for by price sensibility/limited accessibility. The remaining 25% was due to some other extraneous factors that were not included in the model. Similarly, the f-statistics value of 17.374 indicates that the model specification was correct while significant at 1%. Therefore, the null hypothesis that price sensibility/limited accessibility do not significantly affect eco-friendly consumption is rejected .This result means that price sensibility/limited accessibility do significantly affect eco-friendly consumption.

Qualitative Insights from FGDs and Interviews.

i) Many participants expressed **skepticism about eco-labels**, suggesting a need for stronger regulation and certification.
ii) Policymakers acknowledged that while **awareness campaigns exist**, they often lack **behavioral framing** that motivates action.
iii) Business owners highlighted tha**t price reduction and incentives** are critical to encourage consumer adoption of eco-friendly products.

Discussion of Findings

The results confirm that **behavioral insights (nudging, framing, and social norms)** significantly influence eco-friendly consumption, supporting findings by Thaler & Sunstein (2008) and Leonidou & Ribeiro (2014). The **attitude–behavior gap** remains evident: while most respondents express environmental concern, fewer translate it into consistent eco-friendly behavior. **Barriers such as high cost, lack of trust, and limited accessibility** are consistent with previous findings by Young et al. (2010) and Nguyen et al. (2020). The study demonstrates that combining **behavioral interventions with supportive policies** can effectively promote sustainable consumption.

Summary of Findings.

This study investigated the role of behavioral insights in promoting eco-friendly consumption, with a focus on how nudge and green marketing strategies, socio-cultural factors, behavioral interventions and barriers influence consumer decisions. The major findings are:

i. A majority of respondents (82%) are aware of the environmental benefits of eco-friendly consumption, yet only 45% consistently adopt such practices, confirming the **attitude–behavior gap.**
ii. Nudging strategies, framing effects, and social norms significantly influence eco-friendly consumption. For instance, 68% of respondents were more likely to choose eco-friendly products when set as the **default option**, while 61% admitted being influenced by peer behavior.
iii. Socio-economic conditions, cultural values, and financial constraints significantly shape eco-friendly consumption. Price sensitivity (72%) and product availability (63%) remain the most critical barriers.
iv. Regression analysis confirmed that **behavioral interventions** (framing, defaults, and social comparisons) significantly improve eco-friendly consumption, thereby reducing the attitude–behavior gap.
v. High product cost, limited accessibility, and lack of trust in eco-labels are major obstacles.

Qualitative insights further revealed skepticism toward green marketing claims and weak policy enforcement.

Conclusion.

The study concludes that behavioral insights offer powerful tools for promoting eco-friendly consumption. While environmental awareness is relatively high, actual behavior remains limited due to economic, social, and psychological barriers. Nudges, framing, and social norm interventions can bridge the attitude–behavior gap, but they must be supported by policy frameworks, business strategies, and consumer education. Therefore**, eco-friendly consumption cannot be achieved through awareness campaigns alone**; it requires the integration of behavioral insights into policies, green marketing, and community-driven interventions to foster sustainable lifestyles.

Recommendations.

Based on the findings, the study makes the following recommendations:

i). Governments should introduce **behavioral policy tools** (e.g., default green options, eco-tax incentives) to encourage sustainable consumption.

ii). Strengthen regulation of eco-labels to enhance **consumer trust** and reduce skepticism about green claims.

iii). Firms should integrate **behavioral marketing strategies**, such as framing eco-friendly products in terms of cost savings and health benefits.

iv). Businesses should reduce the **price barrier** by offering affordable eco-friendly alternatives and leveraging bulk production to reduce costs.

v). Awareness campaigns should go beyond information sharing and incorporate **behavioral framing** that emphasizes social comparisons (e.g., "8 out of 10 households recycle").

ii). Promote community-led sustainability programs that reinforce **social norms** around eco-friendly practices.

vi) Improve the **availability and accessibility** of eco-friendly products through retail partnerships and local distribution networks.

Contributions to Knowledge.

This study contributes to knowledge by:

i. Demonstrating empirically that **behavioral insights significantly shape eco-friendly consumption**, particularly through nudging and framing strategies.

ii. Highlighting the **persistent attitude–behavior gap** in sustainability and identifying behavioral interventions that can close this gap.

iii. Providing **context-specific evidence** from a developing economy, where economic and infrastructural barriers uniquely influence consumer decisions.

iv. Offering a **multi-stakeholder framework**—involving policymakers, businesses, and consumers—for promoting eco-friendly consumption through behavioral insights.

Suggestions for Further Studies.

Future research should:

i. Explore the **long-term effects** of nudging strategies on eco-friendly consumption to determine whether behavior change is sustainable.

ii. Conduct **experimental studies** to test the effectiveness of specific behavioral interventions (e.g., defaults vs. social comparisons) in real-world settings.

Strategic Business Initiatives: An Evaluation of Green Technology, Innovation and Entrepreneurship for Smart Economies in Nigeria

Okoh, Patrick Ogudu[1] & Ahamefula, Joy Chinwe[2]
[1]Department of Marketing, Michael Okpara University of Agriculture, Umudike
[2]Department of Marketing, Dr Ogbonnaya Onu Polytechnic, Aba
Correspondence Editor: Okoh, Patrick Ogudu, Email: patokoh4u@yahoo,com. 08033260309

Abstract
This exploratory study made used of quantitative approach for purpose. The problem was that there were no efficient services before the use of CBT centres in conducting JAMB exams in Nigeria. The objective was drawing relationship between Smart Economies and Green Technology, Innovation and Entrepreneurship for rendering efficient services by the CBT centres to JAMB exams candidates in Nigeria. The under-pinning theory is the Mark Casson's Economic Theory on the ability of the entrepreneur to manage available economic resources. The quantitative approach was the use of inferential tests, while the descriptive approach was the use of frequencies and percentages. The population comprised of 112 Chief Executive Officers (CEOs) of the Joint Admission and Matriculation Board (JAMB) Computer Based Test (CBT) Centres in South East, Nigeria. The sample size was the 19 CBT centres in Abia State based on convenience sampling method. The primary source of data collections was used in the research investigations. The data were analyzed using tables, correlation and multiple regression models to determine the level of association between criterion and predictors variables using coefficients. The findings were that all identified and tested variables were positively related and statistically significant to the study at 1% level. Also, the green process by CBT centres have brought efficient costs reduction and comfort for the candidates. The conclusion was that green technology, innovation and entrepreneurship could serve as solutions to achieving Smart Economies in Nigeria. We recommended that this study be replicated in all the political zones in Nigeria for sustainable economic growth and development.

Keywords: *Strategic Initiatives, Smart Economies, Green Technology, Innovation, Entrepreneurship.*

Introduction

The need for the adoption of green technology, innovative and entrepreneurship Nigeria entrepreneurs and the prospective development will speed up Smart economies for renewable hope in Nigeria economic growth and sustainability. These strategic business initiatives are deemed necessary because the consumer of today requires goods and services that offer maximum satisfaction at the exclusion of alternative product (Suntsova, 2025). The demand nature of the consumer exists because of the presence of varieties of similar products of which only choice can differentiate.

To satisfy this ever increasing demand of the consumer, the marketers ought to present good/services of green technology, purely innovative and grounded with the essence of entrepreneurship. The combination of this trio Smart economic agents could produce tremendous result in economic growth and sustainability in Nigeria.

Leveraging advanced technologies and data analysis in the context of smart economics in Nigeria is a very urgent task for administrative and management scientists because the porous Nigerian economy needs efficient production to reduce cost.

The study tends to draw the relationship between Smart Economies and green technology, innovation and entrepreneurship and evaluating the identified variables as specified adoptable drivers of smart economics in Nigeria.

This study is anchored on Resource Based Theory (RBT) because entrepreneurship utilizes the available resources in order to achieve set objectives. The review in literatures, methodology results and discussions will throw more light to this discourse.

Problem Statement

Presently, the porous Nigeria economy has subjected consumers to high cost of goods/services, a situation that needs efficient production to reduce costs. However, the environment, society and government have failed to provide adequate opportunities to encourage smart economics development through facilitating innovation and entrepreneurship to make green technology more accessible. Most firms in Nigeria industrial sectors are not completely green, innovativeness in line with the essence of entrepreneurships (Onwubiko, 2025). The major reasons for difficulties in adopting innovation and green technology for Smart economy, and to carry out data analytics are on the society, environment and government that are not providing the opportunities to solve many economic problems with persisting high inflation rates.

Objective of the Study

The main objective is to evaluate the relevant drivers of Smart economics in JAMB CBT centres for efficient services to the customers.

The specific objectives were:

i. To examine the adoption of green tech in business to achieve Smart economies in Nigeria.
ii. To find out how the application of innovation effectively enhance Smart economies.
iii. To ascertain the need of entrepreneurship in achieving Smart Economies in Nigeria.

Research Questions

i. What is the contribution of Green Tech in achieving Smart economies in Nigeria?
ii. How can innovation in economic production effectively enhance Smart economies?
iii. What is the place of entrepreneursjip in achieving Smart economies in Nigeria?

Research Hypotheses

Taken X_1 = Smart Economics.
X_2 = Green Technology, Innovation and Entrepreneurship.
H_0: X_1 = (There is no significant influence between X_1 and X_2).

Ha: X_2 = (There is a significant influence between X_1 and X_2).

Scope of Study

The scope of this study is Nigeria with specific attention to the South East Nigeria.

Significance of Study

The world economy is becoming fast in changing the consumer behaviour digital technology has made the literate to learn and relearn new things and unlearn some perceptions. To the entrepreneurs, investing in local innovation and process products for export market using green technology will be of comparative advantage to Nigeria. To the society, promotion of home grown development, using native security to protect installed energy street lights, mast vandalizing and digital communication equipments in the localities, will install environmental friendliness. To the governments, there should be cross pollination of ideas in small businesses initiates across national boundaries with priorities to innovation and artificial intelligence adoption to enhance development. The government, stimulate entrepreneurship, innovation and adoption of green technology in small and medium (SMEs) businesses.

Conceptual Framework

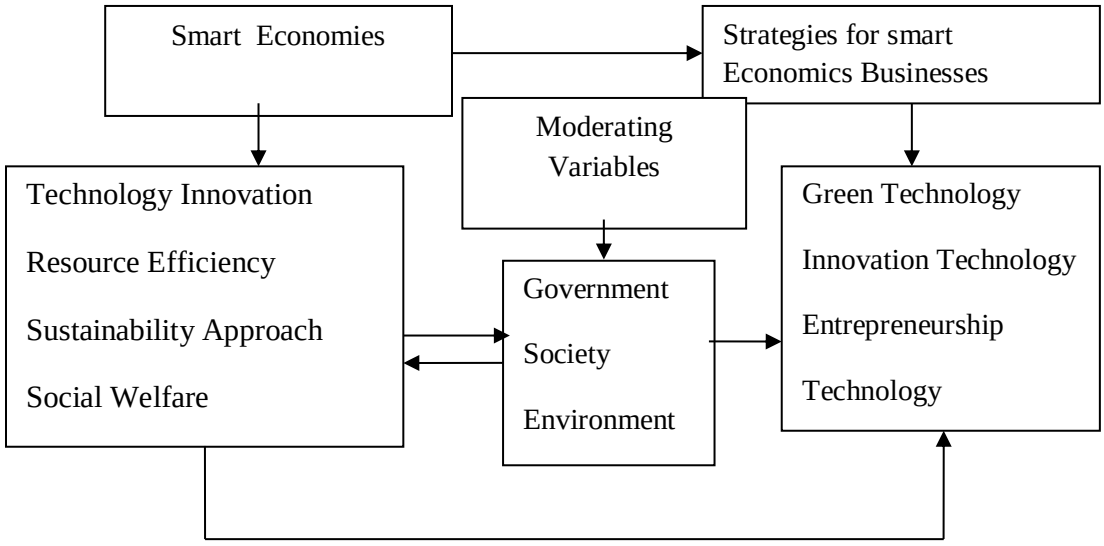

Fig 1: Conceptual Framework of Strategic Business Initiatives for Smart economies in Nigeria

Source: Authors Conceptualization, 2025.

Concept and Meaning

The context of the operation of Smart Economies is of vital task to Nigeria economic development and as such requires the formation of green technology approach, innovation technology and entrepreneurship mode styles that will suit Nigeria prospective developments in technologies to achieve Smart economies as renewable hope for Nigeria.

Smart Economies:
Smart economics can be explained as an economy with all efforts focused on the stimulation of innovation technologies, green technology and entrepreneurship for economy growth and social change (Researchgate, 2025). Because of the influence of technology in Smart economies, Jakarta (2022 and Suntsova, 2025) opined that Smart economies is an embodiment of technological innovation, resource efficiency, economic sustainability and highly social welfare for the country. Suntsova added that Smart economies is an economic system leveraging these factors to improve the quality of life of the citizens.

Smart economies encompasses knowledge innovation, technology, entrepreneurship and green business to transform ideas into valuable good and services (Scribd, 2025). This emphasizes the use of Smart technologies like Artificial Intelligence (AI), the Internet of Things (IOT) which allows creation of automated productions that significantly reduces initial costs for future benefits; and Block Chains to optimize processes, manage resources and create new business methods.

Such business methods include technological innovation (TI), Resource Efficiency (RF), Sustainability Approach (SA), Social Welfare (SW), Knowledge Innovation (KI) and Collaboration and Integration (CI).

- **Technological Innovation (TI):** The use of new technologies and digital transformation to drive productivity, efficiency and competitiveness in product, process and costs.
- **Resource Efficiency (RF):** Focusing in optimism the use of energy, materials, human and water to minimize waste and environmental impact.
- **Sustainability Approach (SA):** Entails the principles of sustainability to ensure long-term goal in economic and environmental viability.
- **Social welfare (SW):** This aims at improving the overall quality of life for citizens through better access to education, healthcare, and other essential services.
- **Knowledge and Innovation (KI):** For fostering learning, culture, research and development aimed at driving innovation and entrepreneurship; and
- **Collaboration and Integration (CI):** The duo encourages collaboration between customers, businesses and research agencies to improve change.

In essence, Smart Economy is all about the use of technology and Smart practices to create a more efficient, sustainable and inclusive economic system that benefits all members of the society.

Smart Economy includes; adaptive, digital, Information and behavioural economies with respect to the study. The adaptive economy lays emphasis on resilience, innovation and abilities to adjust strategies and structure in set plans to achieve set goals and objective. It is an economic approach that responds to changes in economic shocks, like charges in market size, technology, competition etc. The digital economy is the aspect of prospective application of technologies in the digital transformation of businesses into a homogenous smart economy, such as computer aided design (CAD) , product data management (PDM), 3D printers, automated process contract system, etc. The information economy is used by entrepreneurs to create portals for enquiries and possible purchase. Examples are Big Data Management, Cyber modeling, Horizontal and Vertical system integration, Cloud technologies, etc. Behavioural economy looks into areas where psychological and sociological attributes come to play with personality traits, norms, tradition, culture, ruralism

and urbanism, etc; as considerations for the business and demand nature of the customers. It also incorporate the adoption of products, the purchase, use and disposal of the products by the consumer.

Green Technology

The consideration of the impacts of climate change and depletion of natural resources formed the idea upon which green technology was considered and adopted. So the ability of entrepreneurs to attract, entertain, satisfy and retain customers depends most largely on technology infrastructure (Ihemeye, 2016). Therefore by embracing green technology in products and market offers, marketers will improve service delivery to customers by Smart economies.

Green technology tends to describe the use of technology and science to create products in an environmentally friendly process that is related to clean tech and environmental technology (Jark, 2025). Jark defined Green technology as environmentally friendly technologies designed to reduce negative impacts on the planet through sustainable practices and innovation JAMB examination candidates are now provided with waiting halls before and after the examinations. This can also be termed as clean energy production, use of alternative fields, and technologies that are not harmful to the society.

The goal of green technology is to protect the environment, repair damaged environment in the past and conserve the Earth's national resources. Solar power is currently the most efficient source of power energy in successful green technologies that is cheaper than fossil fuels in Nigeria (Jark, 2025). Accordingly to Guelfo (2025), the ultimate objective of green technologies is to promote regeneration the environment and leverage Earth's natural resources in a sustainable manner. To achieve this, social justice, equity and openness and ethical facets such as negative impacts on communities and ecosystems need considerations. This ethical approach may prevent damage to the environmental, local culture and dissatisfaction to the consumers. The presence of green technology regenerate businesses for profits, shape technological landscape and remain in forefront in redeeming environment challenges for Smart economies.

Innovation

The meaningful identification and positive exploitation of opportunities for acquiring and retaining profitable customers for firm's growth requires risk management, valuation and leveraging of resources which seem incomplete without the organization's firm belief in and the application of innovation (Morris, 2011), in idea, practice or project that are perceived by the individual as new.

The introduction of new things, ideas or ways of doing things, which are yet to be carried out by anyone or that seem unique is seen as innovation (Aliu, 2010). Innovation refers to the economic application of new ideas that are transformed to commercial value (Cherroun, 2014). Sunday and Akpan (2015) opined that innovation means making new products and offering new services, or adding new value to existing ones. So researchers averred that innovation implies newness. Newness in the sense of explaining activities leading to slight, moderate or significant changes in an existing or freshly introduced products process or marketing strategy or organizational practice (Agu, et al, 2020). Notably, the use of CBT centres has to an extent reduced examinations malpractices and the release of acceptable tests results to candidates.

In order to exceed customers' expectations, companies most times make some frantic moves as a necessity by placing great emphasis on voices of the customers, internal knowledge development and organizational process and capabilities (Priest, et al; 2013; Anyanwu, 2013). This is paramount to identifying appropriate customers to target through innovation, and to design and communicate attractive offerings that will satisfy consumers better than competition (Anyanwu, 2013).

The thought of aliening innovation to customer satisfaction leads to defining innovation as the process of bringing new product, technology and service to target market, create new demand and substitute old products (UNIDO, 2020). The innovative organizations for Smart economies should approach innovation more frequently than an average accelerator, thereby expanding from societal norms, belief, tradition, values etc (Morris et al, 2011) and routine standards of business as usual and therefore have the tendency to apply and support new ideas, experiments, creative services/products like green technology or advanced technological processes that meet consumer expectation profitably.

Entrepreneurship

Entrepreneurship is as old as human race and was made known at the time when the need for exchange ensured. Entrepreneurship is indigenous as to rural, traditional and cultural origin to every profession (Agbaeze, 2025) and also the pathway to riches as powerful tool for reducing poverty in Nigeria. Agbaeze added that it has the prospect to attract monetary reward and platforms for new ideas and inspire innovation. The exchange of goods and services between buyer and seller motivated entrepreneurship that sought economic emancipation and leadership through innovation and creative responses to gaps in need among various segments of the society (Uzoma, 1991).

The act of entrepreneurship originated in history as human creative thinking, a sparked-up idea of Fire as a spark and has led to the creation of Artificial Intelligence and Space travel we have today (Onwubiko, 2025). Onwubiko maintained that ideas remain dominant until they are ignited (cultivated as mindset possibilities in people that cause them to become tired and bored with business-as-usual as a challenge to the status quo) fuelled by passion, and nurtured along the pathway of mission and vision.

Entrepreneurship stands out as both a source for extra income and a solution to unemployment. It inspires the economic growth and development and increase national Gross Domestic Product (GDP), social technological and human capital developmental impact in Nigeria.

The foremost classical economists and entrepreneurial theorists like Jean-Baptiste, Joseph Schumpeters and Richard Cantillon saw entrepreneur as the fourth factor of production and coordinator of the three other factors – Land, Capital and Labour with a view of making profits (Agbaeze, 2025; Onwubiko, 2025). However, entrepreneurship is traceable to Marco Polo (a Venetian Merchant explorer) who was a go-between producers and consumers in the Far East.

The economies of every nation is majorly driven by entrepreneurship as men and women are seen engaged in one business activity or the other. Entrepreneurship was propagated by Joseph Schumpeters in 1776 and was given a name by Richard Cantillion 1940. A lot of scholars have shared the views about entrepreneurship with some definitions as the gap Filler (Uzoma 1991) as opportunist (Ikhole et al; 2010) and as profiterer (Iwueke et al; 2018, Agbaeze, 2025).

Entrepreneurship is the process of creating new product with value through social risk that may attract rewards in monetary and personal satisfaction. It could occur out of investment opportunities in an environment with more efficient processes, development and management of new or existing business venture, notwithstanding the inevitable risks and possibility of compromising the anticipated profits. Entrepreneurship mostly got rooted in wealth creation by providing value offerings uniquely by individuals, families, companies etc to improve standard of living in a nation.

The marketing challenges, as well as administrative techniques and technologies that drive digital technology innovation are part of performing functions of the entrepreneur to identify opportunities or gaps in the market place (Neuman, 2020). This makes the attitude of entrepreneurship to be innovative, flexible and responsive, and thereby providing sophisticated and efficient management of the enterprise. The service charges in CBTs are affordable to the JAMB examination applicants. Because of JAMB rules, costs are managed effectively for applicants' comforts. In a formal parlance, entrepreneurship starts with venture creation, registration of business name, recruitment, production, marketing and rendering services etc; with the aim of achieving economic growth that can bring renewable hope for Nigeria.

Theories of the Study

1) The Mark Casson's Economic Theory (CET) states that the demand for Entrepreneurship, emanates from demand for change. Casson opined that Entrepreneurship and economic growth take place when the economic conditions are favourable and conducive for the entrepreneur, society and government. This theory holds that taxation and industrial policies, sources of finance and raw materials, infrastructures availability, investment and marketing opportunities, market information, technology and environment are major factors that can encourage or discourage Smart economic businesses.

2) Joseph Schumpeter's Innovation Theory (SIT) is of the fact that innovation, foresight and creativity are the three major characteristics as fundamental phenomenon and decisive factors for the process of economic development by the entrepreneur. Schumpeters claims that there must be innovativeness in new product creation, new product and new market developments, new sources of raw materials and re-engineering of firms for Smart economics to be sustained.

3) The Resource Based Theory (RBT) focuses on the pattern by which Entrepreneurship utilizes the available resources in order to achieve the set objectives. RBT explains that the reasons why some firms perform better than competitors are based on the comparative advantage in resources applications better than competitors. Resources vary from firm to firm; therefore there is no equality in competition of firm's resources holding. This theory holds that it is the ability of the firm that has the capacity and competences to combine these resources in the appropriate mix or blend will excel above competition in a given market environment in Smart economies.

Empirical Studies

Suntsova (2022) investigated Smart Economy and Digital Transformation of Business in the concept of industry 4.0 and 5.0. The research design was the use of grouping, system analysis, synthesis and analysis, forecasting, etc. it was a qualitatively new definition and structuring of the

Smart economy. The population was 19 industries considered in the digital transformation of businesses in Smart economy. The object of the study was the relationship between economic entities in the Smart economy and their digital transformation in conditions of the industry 4.0 and 5.0. One of the most problematic areas is the establishing of the effects of digital transformations in the conditions of the industry 4.0 and 5.0. The findings indicated a significant potential for the use of digital technologies in business and also a significant economic effect of their use, which requires further improvements. The conclusion is that the economic sectors experience the fastest growth in spending on digital transformation. It is recommended that digital transformation of business in Smart economy should provide double-digital growth and significant economic advantages to the economic agents.

Jark (2025) investigated digital transformation businesses in Smart economy using green technology approach. The study was based on a survey of 1400 senior executives in many countries of the world of which 736 are company executives, indicated that the contribution of Internet of a Thing (IOT) as agent of green technology to global production in 2030 could actualize us $14.2 trillion. This expected result will be because of potential increase due to digitalization of financial and business processes. Green technology increase production digitized systems and allows significant duration of production cycle.

Nwosu, et al; (2025), studied innovation technology and the results of manufacturing companies in Nigeria. The findings were that product innovation and technology innovation are statistically significant and have influence on the manufacturing output of SMEs in Nigeria. The enhancing factors include strategic planning and marketing capabilities that independently influence firm performances in sales, income and profitability.

Okoh and Oko (2024) researched on impact of advancing technology innovation strategies and noted that high-tech firms' marketing strategies should include; principles, skillful, measures and tactical abilities that differs from competing firms. These strategies should be unique and new products for new profitability at the long run. Innovation technology of new-to-market product was expected to achieve large sales turnover at maturity stage of PLC before the innovation spills out to competitors.

Igwe (2018) studied enhancing productivity in Nigeria: From subsistence to transformational Entrepreneurship. The study was a qualitative design that make use of journals and internet materials. The problem was that Nigeria is in a cross roads of a momentous transition into diversified economy. The challenges existing include corruption, inequality, suffocating economic environment, insecurity and ethno-religious crises. The major findings were commercial agriculture, internet of opportunities and technology entrepreneurship. One of the recommendations was the need to have a multidimensional approach to entrepreneurship talent, innovation, fostering financial access and training to foster entrepreneurial ecosystem with less constrained growth potentials.

Methodology

The research used exploratory survey that made use of quantitative approach. A convenience sampling method (Okeke et al; 2022) was used by adopting respondents in Abia State as population

and Aba as sampling element. The analytical tool was E-view version 12 software. This research design was adopted based on the similar nature of business within the geographical coverage.

Population: The population comprised 112 CEOs of JAMB CBT centres in South East, Nigeria.

Table 3.1: CBT Centers in South East, Nigeria.

STATES	CBT CENTRES	PERCENTAGES (%)
Abia	19	17
Anambea	31	28
Ebonyi	12	11
Enugh	27	24
Imo	23	20
TOTAL	**112**	**100**

Sample size: The sample size was determined convenience as 19 CBT CEOs in Aba for costs and logistics conveniences.

Data collection: Questionnaires were the sources of collecting data for investigation.

Table 3.2: Questionnaire distribution of the respondents

Town	No Administrated	%	No Retrieved	%
Aba	11	62	9	60
Umuahia	4	22	3	19
Umunneochi	1	6	1	7
Okoko Item	1	6	1	7
Arochukwu	1	6	1	7
Total	**19**	**100**	**15**	**100**

Validation: The questionnaire was vetted by experts in Marketing and Administration to ensure completeness in content and construct validity.

Reliability: The questionnaire was tested for reliability and internal consistency check on each of the construct to ensure that each construct of the model produces same result when applied to the same situation at different time.

Table 3: Reliability Statistics

Cronbach's Alpha	No of items
80	**4**

Source: SPSS software result, 2025.

Model Specification:

A multrariate analysis model was adopted thus:

SM = F (Gt, It, Ent) . . . . . (i)

SE = $\beta_0 + Gt_1\,\beta_1$ + $It_2\,\beta_2$ + Ent3β_3 + U_t . . . . . (ii)

Where: SE = Smart Economies

Gt	=	Green technology
It	=	Innovation technology
Ent	=	Entrepreneurship
β_0	=	Intercept
$\beta_1 - \beta_3$	=	Coefficients
U_t	=	Error term

Results

Data Analysis

The data analysis was executed by using both the descriptive statistics for frequencies, and percentages and the inferential statistics for correlation and regression analysis to determine the nature and degree of the relationship between the dependent and independent variables. The software package for inferential test was Econometrics view (E-view) version 12. The results were interpreted at a 5 percent error rate.

Descriptive Statistics

The demographic profile of the respondents is presented in table 4.1 below. This table shows for gender, male = 5(30%), and female = 10 (70%). Relative to age, 26-35 years = 3(20%), 36-45years = 6(40%) and Above 45years = 6 (40%). With regard to education, HND/Bsc = 9(60%) and Postgraduate Degree = 6 (40%). On experiences on the job, less than 10 years = 6 (40%), 11 – 20 years = 6 (40%) and above 21 years = 3 (20%). The entire respondents = 15 (100%) practice green technology, innovative practices and are in entrepreneurship management.

Table 4:1 Descriptive statistics of the respondents' characteristics

Variables	Categories	Frequencies	Percentages
Gender	Male	5	30
Age	26-35 years	10	70
	36-45 years	3	20
	Above 45 years	6	40
Education	HND/Bsc	6	40
	Postgraduate	9	60
General	Practice of green tech,	6	40
	Innovation and entrepreneurship	15	100

Source: Authors' Field survey, 2025.

Table 4.2 Analysis of opinions of respondents based on the green tech, innovation and entrepreneurship in JAMB CBT centres.

Variables	SA[5]	A[4]	N[3]	DA[2]	SD[1]
Green Technology	39	3	3	–	–
Innovation	21	18	3	–	3
Entrepreneurship	24	21	–	–	–
Total	**84**	**42**	**6**	–	**3**

Source: Authors compilation, 2025.

Table 4.3 The correlation matrix of the independent variables

Variables	Green Tech	Innovation	Entrepreneurship
Green Tech	1.000		
Innovation	0.667	1.000	
Entrepreneurship	0.385	0.599	1.000

Source: E-view Version 12.

Table 4.3 shows that the independent variables were normally distributed at 95% confidence level with two standard deviations (2 tailed) of the mean at 5% (0.005) level of significance. This result implies that the collected data were reliable and fit for the conducted regression analysis.

Table 4.4 Correlation relationship of the independents on the dependent variables In Smart Economies.

Pearson Correlation	Variables	Smart Economics
Correlation	Green Tech	0.650*
Values	Innovation	0.433*
	Entrepreneurship	0.403*

* Correlation is significant at the 0.05 level (2-tailed).

The correlation between the independent variables and the dependent variables is such that when one variable is acting, other remain constant throught the period of action. (Osual, 2015). Therefore the correlation between green tech and Smart economies is very strong (65%), innovation is poor (43%) and entrepreneurship is also poor (40%). The fact remains that all the independent variables have positive correlation with the dependent variable and are justified, but may depend on the subject of study.

Table 4.5 Model summary of the correlation and regression analysis of the Variables.

Variables	Parameter	Coefficient	Sta error	t-Statistics	Prob.
Constant	β_0	1.726316	1.0054801	1.716907	0.1140

The table 4.5 shows the interaction between green tech, innovation and entrepreneurship with Smart Economics. The model summary explains that $R^2 = 0.940$ and R^2 adj = 0.938 which is very close, meaning that the model is justified. With F-stat = 26.89215 and greater than t-stat = 1.716907, at Prob (f-stat) = 0.001, meaning that there is goodness of Fit of the regression model adopted in the study. The Durbin Watson statistics = 2.022735 indicating positive correlation of the independent variables and the dependent variable with statistically significant at 1% probability level.

Discussions

The findings have given supports to driving Smart economics in Nigeria by some major determinants as tested hypothetical and proved relevant to this study. The results of the hypotheses tests are presented thus:

Hypothesis 1 ($H_1 = 0.639$): The result shows that green technology positively drive Smart economies and it is statistically significant at 1% level. This evidence means that green tech is good strategic business initiative to apply n entrepreneurship for economic growth. So the more business practices are green, the more consumers are attracted and possibly retained. JAMB examination candidates are offered security, awaiting halls and connivances during and after examinations. This idea is supported by Allais et, al. (2025) who averred that green technology advancement, perhaps in computers, office machines and accessories reduces impact on geographical distances, relative to Smart business. In addition, Ihemeje (2016) posits that embracing green technology in products and market offering do improve service delivery to customers for smart economies operations.

Hypothesis 2 ($H_2 = 0.808$): This result implies that innovation is positively related to smart economies and it is statistically significant at 1% level. So the more firms are innovative in their practices, the consumer choices are widened for purchases and satisfaction. Computerization has reduced examination malpractices and as such candidates results are justified and released in time. Successful business initiatives like the innovations in technologies according to Jakarta Smart City (2022) attain resource efficiency, sustainability and high social welfare. In addition, Research Gate (2025) stated that embracing innovation technology and digital transformation drive productivity, efficiency and competitiveness in product, process and costs. Therefore Agbaeze (2025) assured that innovation could result to improve on a unique product as a transformation through digital tools to preserve customs, traditions and culture in using modern media approaches to drive smart economies.

Hypothesis 3 ($H_3 = 0.160$). This result revealed that entrepreneurship drives the economy of any nation and as such, it is positively related to Smart economies and statistically significant at 1% level. Entrepreneurship is a pathway to riches, economic growth, and a powerful tool for reducing poverty. JAMB examination fees are affordable because costs are managed efficiently to the candidates' comforts. Entrepreneurship as claims by Neumana, 2020) brings unquantiable

contributions to national economies, environmental friendliness, job creation in the market place for social change and societal wellbeing. Supported, Apostol et, al; (2025) emphasized that entrepreneurship supports solutions in ideas and vision about business gains at relevance to economic development.

Conclusion

The central issue in Smart economies is to meet the needs of the consumers satisfactorily without compromising the demands of future generations and the profitability of the producers. The use of green technology, innovation and entrepreneurship as strategic business initiatives to drive smart economies are relevant tools and as such a good option. The variables were positively correlated and statistically significant at a point that their application in business could facilitate fast, efficiency and seamless relationship between businesses and individuals in the geographical environment. It is believed that the application of green tech, innovation and entrepreneurship in Nigerian economic context will spur smart economies as a prospect to attracting monetary reward provided platforms as good ideas that inspire entrepreneurs to efficient productivities for the renewable economics hope for Nigeria.

Recommendations

Based on the findings, the following recommendations are proffered:

1. That driving smart economies should be researched on firms bases to discover how the variables are adopted by firms as strategy for growth.
2. To carry further studies on strategic initiatives for Smart economies using other determinants.
3. To study the marketing-mix implications in running smart economies in Nigeria.

Limitation

This study has some limitations. Firstly, the sampling unit is CBT centres in Abia State, and the present finding cannot be generalized to cover all the JAMB CBT centres in Nigeria. Secondly, the sample size was small (n = 19), conducted on convenience sampling techniques, a non-probability sampling methods. Thirdly, this study was dominantly conducted on services firms only not including physical product production.

https://orcid.org/0000-0002-2108-7489

Abstract
This study presents the One Kindred One Business Initiative (OKOBI) as an indigenous Africapitalist approach to boosting women's entrepreneurial empowerment in Imo State, South-East Nigeria. OKOBI leverages kinship and familial ties to form group-owned businesses. It not only empowers women economically, but it also positions them as leaders. Applying the Economics of Place theory, the research evaluated OKOBI's effectiveness in supporting women entrepreneurs. A survey of 54 community leaders from all 27 Local Government Areas of Imo State produced significant findings. First, OKOBI is positively linked to women entrepreneurs ($r = 0.681$, $p < 0.05$. Second, it has a positive relationship with women economic empowerment ($r = 0.568$, $p < 0.05$ affirming women economic roles. The study concludes that OKOBI's culturally grounded, group-owned enterprise model offers a promising route to inclusive development and shared prosperity. The researchers therefore advised policymakers to institutionalize the OKOBI model to boost women's economic involvement. This, in turn, will drive grassroot economic development from bottom up. Furthermore, it will promote sustainable, equitable women entrepreneurship across Nigeria and Africa in general.

Key Words*: Women, Entrepreneurship, OKOBI, Empowerment, SouthEast Nigeria.*
JEL: O15, O17, O55

Introduction

In the global pursuit of inclusive development, empowering women's entrepreneurship is both an economic necessity and an ethical imperative. Women entrepreneurs are increasingly leading diverse sectors, with global activity among women rising significantly from 6.1% (2001–2005) to 10.4% (2021–2023), especially in startups. Between 2019 and 2023, women-owned businesses grew nearly twice as fast as those owned by men. This rise not only reflects statistical progress but also highlights the broader impact of diverse leadership in driving innovation and better outcomes (Nicole Findlay, 2025). Though researchers such as Budig, (2006), Hughes, (2006), Hundley, (2001), and Robinson & Sexton, (1994) argue that women entrepreneurs earn a lower income than their male counterparts.

Given this, there are body of research on women entrepreneurship with various outcomes. While Udovičić & Slavica (2025); Haque et al. (2025) argue about the existence of structural inequalities that limit women entrepreneurs' access to finance, Pradeep (2025) believes that women entrepreneurs still drive economic empowerment, especially in sustainable industries. They

contribute to the socio-economic development of the society (Manzoor et al. 2022). Furthermore, it has been found that informal, small-scale entrepreneurship empowers and enhances women gender roles and access to resources and agency (Henderson & Ross, 2025). Though the negative impact of socio-cultural norms and traditional gender biases seems to exert challenges to women entrepreneurship. Though the embediment of women entrepreneurship within family systems challenges these norms (Jennings & Brush 2013). These challenges include financial constraints, negative attitude, and illiteracy (Shaharuddin & Manaf, 2024) as they inhibit the marketability of their products most time.

Some researchers agree with the positive impact of feminist ideologies, especially pragmatic feminism as an entrepreneurial support system for disadvantaged women (Bhatt & Garikipati, 2024). Also, the role of training in building self-esteem for women entrepreneurs, particularly the young ones, cannot be overemphasised (Chalayonnavin, 2024). It increases their confidence level. Making them more self-reliant with a stronger sense of purpose.

The interplay of gender dynamics and institutional formal and informal logics gives a better lens view in understanding women entrepreneurship (Ejaz et al., 2023). This has made empowering women entrepreneurs through home-based businesses (HBBs) and SMEs an effective strategy for their economic contribution to their ecosystem (Ma'ruf et al., 2024).

Furthermore, psychological factors influence women's decisions either to pursue or avoid entrepreneurship (Peris-Delcampo et al., 2023). While Wilson & Tagg, (2010) found minimal differences between male and female entrepreneurs, Fay & Williams, (1993) demonstrated that women entrepreneurs with only a high school education were less likely to have financial access than equivalently educated men.

For developing economies like Nigeria, rich in human capital but marked by stark gender inequalities, unlocking women's potential is essential for driving growth, social justice, and sustainable progress (Bullough et al., 2022; De Vita et al., 2014; Sultana, 2012). Despite Nigeria's vibrant entrepreneurial culture, women remain marginalised in formal economic sectors, limited by restricted access to credit, patriarchal norms, and exclusion from mainstream development frameworks. These barriers are worsened in rural and peri-urban areas, where weak government presence and fragile markets make conventional top-down solutions ineffective. This situation calls for culturally grounded alternatives that leverage local social capital to promote empowerment from within.

This study examines the One Kindred One Business Initiative (OKOBI), a locally owned enterprise model rooted in Igbo socio-cultural traditions of Southeast Nigeria. OKOBI challenges neoliberal individualism by utilising kinship ties (Umunna), shared ownership, and collective responsibility. Philosophically based on Africapitalism, an "economic philosophy that embodies the private sector's commitment to the economic transformation of Africa through long-term investments that create both economic prosperity and social wealth"
(Amaeshi & Idemudia, 2015). It rethinks capitalism through an ethical perspective, valuing community well-being over profit. Its core principle embodies Ubuntu, "*umuntu ngumuntu ngabantu*" (Mabovula, 2011; Mangaliso, 2001). It promotes interconnectedness, compassion, and mutual upliftment. OKOBI revitalises kinship structures as drivers of economic participation. It

creates inclusive pathways for the marginalised and vulnerable groups, including women who are traditionally excluded from formal entrepreneurship.

OKOBI strategically shifts women from caregiving roles to leaders and co-owners of collective enterprises. It implements Africapitalism values such as shared prosperity, local identity, and solidarity-driven capital mobilisation. It leverages them to break down structural barriers.

Theoretically, this study employs the Economics of Place (Markusen & Schrock, 2009), which asserts that sustainable development must align with local socio-cultural and geographic realities. This perspective portrays OKOBI as a gender-transformative approach that combines economic growth with cultural ethics and communal governance. It achieves this by leveraging indigenous social capital to build resilience, especially where formal institutions are weak.

OKOBI advances decolonial discourse by promoting African epistemologies as legitimate development frameworks (Chilisa, 2024; Mbigi, 2005). It transforms kinship groups into business incubators, forming joint ventures in agriculture, retail, and manufacturing to redistribute economic power to women. This collective approach challenges Western-centric individualism (Iwuoha & Uzodimma, 2024). It demonstrates how culturally resonant models can create socially accepted platforms for women's economic participation. OKOBI serves as a formalised model for fair prosperity, blending Africapitalism's moral economy with grassroots entrepreneurial innovation.

Objectives of the Study

The objectives are to determine how (i) OKOBI promotes the creation of new women entrepreneurs and (ii) how OKOBI economically empowers women entrepreneurs. These objectives address critical gaps in decolonial development practices and gender-inclusive policies. To achieve these goals, this research answered the key question - "how does OKOBI, grounded in communal African values, serve as a sustainable vehicle for economic empowerment in Southeast Nigeria?"

Based on the above goal, two null hypotheses were tested:

i. **Ho_1**: OKOBI does not significantly create new women entrepreneurs.
ii. **Ho_2**: OKOBI does not significantly empower women entrepreneurs economically,

Methodology

Using the survey research method to collect data across all 27 Local Government Areas (LGAs) of Imo State, representing Southeast Nigeria's socio-economic diversity. Purposive sampling targeting 54 key stakeholders, including Chairmen of Traditional Rulers, Women Leaders, Youth Presidents, and Community leaders, who are key figures in OKOBI's community integration, was employed. Data collection involved structured questionnaires, with a 100% response rate, supplemented by secondary sources. Validity was ensured through expert review, and a pilot test confirmed reliability at Cronbach's $\alpha = 0.82$.

The data were analysed using descriptive statistics - mean, standard deviation, and Spearman's Rank Correlation to test the hypotheses at significance, $p<0.05$. While the focus was on Imo State,

the findings will have broader implications for similar regions across Africa. This research offers actionable insights for policymakers, development practitioners, and communities aiming to leverage cultural capital to promote gender-transformative entrepreneurship.

Data Presentation & Analysis/Discussion of Results

All 54 questionnaire copies distributed to the respondents were properly completed and returned. There was therefore a 100% return rate.

Research Question 1:

How does OKOBI create women entrepreneurs?

Table 1: Respondents' responses on OKOBI Creating Women entrepreneurs

Q/No.	Item	SA	A	UN	D	SD	N	Mean	Std. Dev.
3	OKOBI empowers women like me to see entrepreneurship as a fulfilling career path, even over traditional "dream jobs" that might offer less autonomy	15	13	9	5	12	54	3.26	0.362
4	The increasing visibility of women-led OKOBI enterprises in my community encourages more women to pursue entrepreneurship and reduces societal resistance	17	11	7	5	14	87	3.22	0.461

Field Survey (2025)

Table 1 above indicates that respondents agreed with the fact that OKOBI is creating fulfilled women entrepreneurs in the various communities, with a mean score of 3.26 and a standard deviation of 0.362. Furthermore, OKOBI is encouraging and creating more women entrepreneurs, as the result shows a mean score of 3.22 and a standard deviation of 0.461.

Research Question 2:

Does OKOBI economically empower women entrepreneurs?

Table 2: Respondents' responses on OKOBI and Women Entrepreneurs Economic Empowerment

Q/No	Item	SA	A	UN	D	SD	N	Mean	Std. Dev.
1	OKOBI is perceived as a credible pathway for women's economic independence	13	14	10	5	12	54	3.2	0.331
2	OKOBI has directly enabled me to access financial resources to start or expand my business	15	12	9	7	11	54	3.24	0.281

Field Survey (2025)

From Table 2 above, it is obvious that respondents agreed to the fact that OKOBI is a credible pathway to women's economic independence in their various communities, with a mean score of 3.2 and a standard deviation of 0.331. However, with a mean score of 3.24 and a standard deviation

of 0.281, it is glaring that OKOBI assists women entrepreneurs to have direct access to finance, either to start a business or to expand an existing one.

Testing of Hypotheses

Ho_1: OKOBI does not positively and significantly create women entrepreneurs.

Table 3: Correlation analysis between OKOBI and the creation of women entrepreneurs.

Item	Mean	Standard Deviation	Correlation Coefficient	P-value
OKOBI	3.26	0.362	0.681	0.001
Creation of women entrepreneurs	3.22	0.461		

SPSS Correlation Analysis Output (2025).

The output from Table 3 above showed a p-value of 0.001 and a correlation coefficient of 0.681. The p-value is less than 0.05, which is the level of significance. Therefore, we reject the null hypothesis and accept the alternative hypothesis. This implies that OKOBI positively and significantly creates women entrepreneurs in Southeast Nigeria.

Ho_2: OKOBI does not positively and significantly empower women entrepreneurs economically.

Table 4: Correlation analysis between OKOBI and economic empowerment of women entrepreneurs

Item	Mean	Standard Deviation	Correlation Coefficient	P-value
OKOBI	3.2	0.331	0.568	0.001
Women entrepreneurs' economic empowerment	3.24	0.281		

SPSS Correlation Analysis Output (2025).

Table 4 above presents the correlation analysis between OKOBI and economic empowerment of women entrepreneurs in Southeast Nigeria. The result shows a p-value of 0.001 and a correlation coefficient of 0.568. The p-value is less than the 0.05 level of significance. Therefore, we reject the null hypothesis and accept the alternative hypothesis. This is an indication that OKOBI positively and significantly empowers women entrepreneurs economically in South East Nigeria.

Findings

After the data analysis, the study finds that:

1. OKOBI positively and significantly creates women entrepreneurs.
2. OKOBI positively and significantly empowers women entrepreneurs.

Discussion of Findings

Given that with OKOBI, women get involved in fulfilling dream jobs in their various communities, as indicated in Table 1, it is an indication that OKOBI resonates as not only a sound economic policy but also as a mechanism for the creation of more women entrepreneurs in the communities in Southeast Nigeria. This makes it a bottom-up approach to shared prosperity. Table 1 further

shows that the visibility of OKOBI women entrepreneurs attracts more women into entrepreneurship.

Indeed, these findings imply that the OKOBI initiative has created significant employment opportunities for women in Southeast Nigeria. Through the encouragement of kinship units to establish businesses, OKOBI has facilitated the creation of jobs that are locally relevant and sustainable. Established OKOBI businesses have created and employed women in great numbers. The OKOBI initiative is a practical solution to women's entrepreneurship as it creates jobs directly tied to the local economy.

Secondly, OKOBI is economically empowering women entrepreneurs in their numbers in various communities. The table is an indication that OKOBI targets the economic emancipation of the vulnerable and often marginalised group. The fact that OKOBI economically empowers the vulnerable and marginalised indicates that OKOBI targets to always achieve a shared prosperous community. This will, in turn, encourage a crime-free society where hard work and peaceful co-existence thrive. The Initiative is designed to make each person a contributor to the growth and development of the community and society in general. The same Table 2 further shows that more women are now involved in entrepreneurship, learning different vocational skills, as against idling. Indeed, OKOBI businesses are providing the women with a source of income but also instill a sense of responsibility and purpose. Women who had hitherto been idle as housewives now work in businesses established through OKOBI. This increases their participation and contribution to the well-being of their communities.

These results suggest that the OKOBI has proven to be a powerful tool for the creation and empowerment of women entrepreneurs in Southeast Nigeria. OKOBI promotes the establishment of businesses that benefit the broader community. This approach ensures that wealth is distributed more equitably and that local economies are strengthened.

The researchers discovered several successful examples of OKOBI businesses in action. These are group-owned businesses. They include but are not limited to palm oil processing, oil mills, Garri processing, poultry, pig farming, vegetable farming, establishment of community-owned farms, community retail stores, etc. These businesses not only provide jobs but also contribute to the overall economic development of the community. The key to OKOBI's success lies in its alignment with the job creation and empowerment of the marginalised groups, such as women. This reinforces the idea of shared entrepreneurship for economic development.

Conclusion and Recommendations

Conclusion

This study concludes that transforming women's entrepreneurship in Southeast Nigeria can be achieved through the OKOBI initiative. Grounded in cultural and traditional values, OKOBI not only offers a promising solution to unemployment issues but also represents a bold step toward creating economic empowerment for women in business. It fosters community-centered development, supporting harmonious communal living, peace, shared prosperity, and revitalising local economies.

It is our submission here that communities in Southeast Nigeria and indeed Nigeria and Africa should embrace OKOBI to not only create more women entrepreneurs, but also to support and scale the existing ones.

Recommendations

This study, in line with the research findings, recommends that women, community leaders, communities, and policymakers who have not yet embraced OKOBI should do so to foster and empower women entrepreneurs. This will, in turn, create a harmonious and prosperous community for all, helping them avoid the socio-economic consequences of underproductivity and unproductivity.

Abstract
Despite the growing emphasis on lead time reduction across various industries, many manufacturing plants, including Seven-Up Bottling Company and Nigerian Bottling Company Benin Plant, continue to grapple with extended lead times. The broad objective of this paper is to examine the relationship between lead time reduction and performance of Bottling Companies in Edo State, Nigeria. Specifically, this paper seeks to ascertain the relationship between production time reduction and firm agility. The study was fastened on the Theory of Constraints (TOC) developed by Eliyahu M. Goldratt (1984). The researchers employed the survey research design while questionnaire was the data collection instrument utilized for the study. A sample size of two hundred and six (206) derived using Krejcie and Morgan (1970) sampling technique was used for the study. An analysis of data done using regression analysis revealed that production time reduction has significant effect on the performance of the two studied firms (β =0.920, t-statistics =14.76478, $p<0.05$). Sequel to the findings obtained from a test of the formulated hypothesis, the researchers concluded that there exists a significant positive relationship between lead time reduction and performance of bottling firms in Edo State, Nigeria. Base on the findings and conclusion of the study, the researchers recommend that management of the studied firms should strive towards a total elimination of unnecessary delay in the production process as unnecessary delay in the production process could directly impact the performance level of the studied firms.

Keywords: *Lead time reduction, production time reduction, performance, firm agility*

Introduction

The origin of lead time reduction can be traced back to the broader principles of lean manufacturing and Just-in-Time (JIT) production systems developed in the mid-20th century. Pioneered by Toyota and popularized through the Toyota Production System (TPS), these principles emphasized minimizing waste and reducing cycle times to enhance production efficiency (Ohno, 2023; Womack & Jones, 2024). Its adoption by business organizations has been influenced by global trends, technological advancements, and the need to remain competitive in a rapidly evolving market. The focus on lead time reduction reflects a broader recognition of its importance in enhancing operational efficiency and achieving strategic business objectives. Lead time reduction has become a focal point in modern manufacturing and supply chain management due to its significant impact on operational efficiency and competitive advantage. The concept gained prominence as industries worldwide sought to streamline their processes, reduce costs, and improve service delivery. The adoption of lead time reduction techniques has been driven by the

need to respond rapidly to market demands and competitive pressures. As businesses have increasingly recognized the importance of reducing lead times to maintain market relevance, the concept has gained traction across various industries, including manufacturing, retail, and services (Monden, 2023; Bicheno & Holweg, 2023).

As noted by Irshadullah and Joydeb (2024), the key components of lead time reduction are procurement time reduction-reduction in time taken to acquire raw materials and components from suppliers; production time reduction-reduction in the time spent in the manufacturing process itself, including assembly, machining and other production activities; post-production time reduction-reduction in time spent for inspection, packaging and shipping of the finished product to the customer. In Nigeria, the emergence of lead time reduction in business practices can be attributed to several factors like rapid growth and an increasingly competitive market that has pushed companies to adopt more efficient operational strategies to stay ahead. The country's manufacturing sector has been particularly influenced by these global trends. The pressure to enhance performance and meet growing consumer demands has made lead time reduction strategies a strategy that is worthy of note (Akinola & Olaniyan, 2024).

Factors like the increasing availability of advanced technologies and data analytics; Advent of technologies such as Enterprise Resource Planning (ERP) systems; Availability of real-time monitoring tools and Automation have made business organizations to seek effective lead time reduction strategies (Ibrahim & Olufemi, 2024; Adeyemi, 2023). Also, the influence of global best practices and successful international global models such as Toyota's JIT and lean manufacturing principles has led to the quest for strategies that could help reduce unnecessary delay in the production process (Oluwaseun & Emmanuel, 2024; Adeoye & Adetunji, 2023).

Recent studies emphasize that the focus on lead time reduction has intensified as organizations recognize its potential to drive significant performance improvements. By addressing production bottlenecks, optimizing workflows, and leveraging advanced technologies such as automation and real-time data analytics, firms can achieve faster turnaround times and enhanced customer satisfaction (Lee & Chen, 2024). For business organizations, lead time reduction could play a pivotal role in improving production efficiency, reducing inventory holding costs, and increasing the organization's responsiveness to market changes (Nguyen, 2024). In this study, lead time reduction is not just about cutting down on the time it takes to produce and deliver products but also about enhancing the overall performance of the plant. Efficient lead time management could help in minimizing delays, reducing production costs, and improving product quality, which in turn boosts customer satisfaction and strengthens the company's market position (Gordon & Silverman, 2024). Furthermore, advanced technologies and process improvements can significantly impact lead time by enabling more agile and responsive operations (Huang & Wang, 2023).

Despite the growing emphasis on lead time reduction across various industries, many manufacturing plants, including Seven-Up Bottling Company and Nigerian Bottling Company Benin Plant, continue to grapple with extended lead times. These prolonged durations could negatively affect operational efficiency and overall performance. For these Plants, extended lead times pose significant challenges in several key areas, including order processing, production, and delivery. These delays can lead to increased costs, reduced customer satisfaction, the inability of

these firms to stay agile and diminished competitive advantage in the rapidly evolving beverage market. These Plants have been under pressure to streamline its operations to meet the escalating demands of the market and improve its service delivery. However, persistent inefficiencies in managing lead times could hinder the ability of these plants to respond swiftly to market changes and customer requirements. Such inefficiencies can manifest in various ways, such as extended order processing times, production delays, and increased waiting periods for delivery, all of which compromise the plants' operational effectiveness and market responsiveness (Oluwaseun & Emmanuel, 2024). Though scholars like Martin and Edwards (2023) who conducted a similar study in the United States; Oluwaseun and Emmanuel 2024 who conducted a similar study in Nigeria have suggested an elimination of unnecessary delay in the production process, observation by the researchers reveals that there is more to be done by the studied firms. By focusing on lead time reduction, the study aims to explore and implement strategies that can streamline operations, enhance efficiency, and ultimately improve the performance of the studied firms.

The broad objective of this paper is to examine the relationship between lead time reduction and performance of Bottling Companies in Edo State, Nigeria. Specifically, this paper seeks to ascertain the relationship between production time reduction and firm agility.

Review of Related Literature

Conceptual Review

Lead Time Reduction

Lead time is defined as the total time taken from the initiation of a process to its completion, encompassing all stages such as order processing, production, and delivery. In the context of manufacturing, lead time reduction involves strategies that streamline operations, enhance workflow efficiency, and eliminate bottlenecks to ensure faster order fulfillment (Tan, 2024). Effective lead time management is vital for any organization aiming to maintain a competitive edge in today's dynamic market landscape. Jones (2020) opines that lead time reduction is essential for improving customer satisfaction, as it enables companies to respond quickly to market demand. When customers experience shorter lead times, they are more likely to be satisfied with their purchases, which fosters loyalty and repeat business. The impact of lead time on customer satisfaction cannot be overstated. A study by Harrison (2023) revealed that companies that successfully reduced their lead times saw a 25% increase in customer retention rates, highlighting the direct correlation between efficient lead time reduction and enhanced customer experience. Additionally, shorter lead times also improve cash flow by minimizing the duration for which inventory is tied up in the production process. Kumar and Singh (2022) emphasize that effective lead time reduction can enhance a company's financial health by reducing holding costs and increasing the frequency of cash flow through faster sales cycles. In industries characterized by rapid changes in consumer preferences, lead time reduction becomes even more critical. Companies that can quickly adapt to market shifts are better positioned to seize new opportunities and mitigate risks associated with changing demand. Lead time reduction allows firms to synchronize production schedules with customer demand, thereby significantly reducing lead times (Tan, 2024).

Furthermore, lean manufacturing practices play a crucial role in lead time reduction. Lean methodologies focus on eliminating waste throughout the production process, which encompasses unnecessary steps, excess inventory, and inefficient workflows. By implementing lean principles,

organizations can streamline their operations, leading to faster production cycles and improved overall efficiency (Brown & Davis, 2021). Automation also plays a significant role in reducing lead times. With advancements in technology, manufacturers can now utilize automated systems for tasks such as order processing, inventory management, and production scheduling. Automation not only speeds up processes but also minimizes human errors, contributing to more accurate and efficient operations (Miller, 2023). As highlighted by Smith and Anderson (2022), reducing lead time is a critical driver of operational efficiency and can significantly impact a firm's ability to compete on delivery speed and flexibility.

As noted by Irshadullah and Joydeb (2024), the key components of lead time reduction are procurement time reduction, production time reduction and post-production time reduction. The production time reduction component was used for this study.

Production Time Reduction

Production time refers to the actual duration spent in manufacturing a product, encompassing all activities from the initiation of production to the completion of the finished good. Reducing production time is essential for enhancing operational performance, increasing output, and lowering overall costs. Companies that focus on minimizing production time can improve their responsiveness to market demands, optimize resource utilization, and enhance their competitive advantage (Miller, 2023). As noted by Chen and Zhao (2021), reducing production time enhances a company's capacity to meet customer demand more swiftly while maintaining quality standards, which is critical in today's fast-paced business environment.

Production time reduction is a crucial aspect of operational performance that directly impacts a company's ability to meet customer demands and maintain competitive advantage. By implementing strategies such as automation, process improvements, workflow optimization, limiting setups and change over schedule, enhancing supply chain management, ensuring quality control and workforce training, organizations can significantly reduce production times. The benefits of these efforts include increased output, cost savings, and enhanced customer satisfaction. As the manufacturing landscape continues to evolve, companies must prioritize production time reduction as a key driver of success in their operational strategies (Rodriguez & Kim, 2023).

Performance

Performance in a manufacturing context is a multifaceted concept that encompasses the efficiency, productivity, and profitability of operations. It is commonly assessed through various Key Performance Indicators (KPIs) that provide insight into how well a manufacturing facility is meeting its operational and strategic objectives. These KPIs often include production output, defect rates, cost per unit, and delivery timeliness, competitive position, firm agility, each serving as critical benchmarks for evaluating overall performance (Kaplan & Norton, 2019).

The relationship between performance metrics and operational efficiency cannot be overstated. High performance is often linked to streamlined processes, effective resource allocation, and robust quality management systems. Manufacturers that prioritize operational efficiency tend to experience enhanced productivity and reduced operational costs. For instance, implementing lean manufacturing principles can help eliminate waste and optimize production workflows, resulting in better performance outcomes (Womack & Jones, 2019). Continuous performance monitoring is

essential for identifying areas for improvement and aligning operational processes with organizational goals. By regularly assessing KPIs and performance metrics, manufacturers can pinpoint weaknesses and implement corrective actions. For example, if a company notices a decline in production output, it may choose to investigate the underlying causes, such as machinery downtime or inefficient workflows, and take steps to rectify these issues (Smith & Lee, 2023). Though there are several performance indicators that could be used by an organization, the researchers focused on firm agility.

Firm Agility

Firm agility refers to an organization's capacity to swiftly adapt to changing market conditions, evolving customer demands, and unforeseen external challenges. This concept encompasses not just responsiveness but also the ability to pivot effectively when faced with new opportunities or threats. Davidson (2022) emphasizes that firm agility is crucial in today's volatile business environment, where the pace of change can be rapid and unpredictable. Organizations characterized by high agility are typically able to make quick decisions, reconfigure their resources, and implement flexible systems that support adaptive strategies. The importance of agility is particularly pronounced in industries that experience intense competition or rapid technological advancements. For instance, technology and consumer goods sectors often face disruptions that require firms to innovate continuously and adjust their operations promptly. Firms that have cultivated agility are better positioned to capitalize on emerging trends, thereby gaining a competitive edge in the marketplace. As noted by Smith and Anderson (2022), companies that can swiftly alter production schedules and introduce new products in response to customer preferences are more likely to succeed in such dynamic environments.

A key component of firm agility is the presence of flexible systems that allow for quick adjustments in processes and operations. This flexibility can stem from various sources, including a well-trained workforce that can adapt to new roles and responsibilities, as well as the implementation of agile methodologies that promote iterative development and rapid feedback cycles. Chen and Zhao (2021) opine that organizations that adopt agile practices often experience improved collaboration across teams, enhancing their ability to respond to changes in real time. Fast decision-making processes also play a vital role in fostering agility. Companies that streamline their decision-making frameworks can respond to market shifts more effectively. This may involve decentralizing authority, empowering employees to make decisions without lengthy approvals, and leveraging data analytics to guide strategic choices. By doing so, organizations can reduce the time it takes to react to market changes, thereby enhancing their overall agility (Kaplan and Norton, 2019). As the business environment continues to evolve, cultivating agility is essential for achieving sustained success and maintaining a competitive edge. Organizations that prioritize agility will be better equipped to navigate uncertainties and leverage market dynamics for growth.

Theoretical Framework

Theoretical frameworks are essential for providing a structured approach to understanding the relationships between variables in research. In this study, the Theory of Constraints (TOC) developed by Eliyahu M. Goldratt (1984) served as the primary framework to examine the interplay between lead time reduction and organizational performance. The Theory of Constraints posits that every system, particularly in a production context, has at least one limiting factor, or constraint, that inhibits its overall throughput. Identifying and addressing these constraints is

crucial for enhancing operational efficiency and reducing lead times. Goldratt (1984) emphasizes that in any production process, constraints can arise from various sources, including equipment limitations, workforce inefficiencies, or even inefficient processes. By focusing on these bottlenecks, organizations can implement targeted improvements that lead to significant gains in performance. For instance, if a manufacturing line is constrained by a particular machine that cannot keep up with production demand, efforts to optimize the machine's operation or invest in additional capacity can result in reduced lead times and enhanced overall throughput.

Moreover, the Theory of Constraints encourages a holistic view of the production system, where improvements in one area can lead to ripple effects throughout the entire operation. Goldratt (1990) purports that organizations often fall into the trap of optimizing individual components without considering how these optimizations affect the overall system. This can lead to suboptimal results, as improvements in one area may inadvertently exacerbate constraints in another. Therefore, TOC advocates for a systematic approach to problem-solving that aligns with the goal of maximizing overall performance. Through this lens, the researcher seeks to ascertain how overcoming the delays associated with the production process can impact the overall performance level of the studied firms. By doing so, the researchers seeks to contribute valuable insights to both academic literature and practical applications in the field of operations management.

Empirical Review

Martin and Edwards (2023) conducted a study on the impact of lead time reduction on customer satisfaction in the manufacturing sector in the United States. Utilizing a quantitative research design, the researchers surveyed 150 manufacturing firms using a structured questionnaire to collect data on lead times, customer satisfaction, and operational efficiency and using regression analysis to analyze the collected data. Their findings revealed a significant positive correlation between reduced lead times and customer satisfaction levels.

Chen and Zhao (2021) explored the effect of production time reduction on operational efficiency in Chinese manufacturing firms. They employed a mixed-method approach, incorporating both qualitative interviews with production managers and quantitative analysis of production metrics across 120 firms. The findings indicated that reducing production time led to higher output and lower operational costs.

Ezeoke, Oyatoye and Mojekwu (2019) examined lead time practices and customer satisfaction of fast moving customer goods (FMCGs) in Nigerian industries. Survey research design was used, questionnaire was used to elicit information from the respondents. A sample size of 278 was used while regression analysis was used to analyze the collected data. The study findings revealed that lead time reduction brought about timely availability of products.

Karibo and Evwierhurhoma (2018) studied lead time uncertainties and scheduling practices of manufacturing firms in Nigeria. Survey design was employed, questionnaire and oral interview was used to retrieve data from respondents. The study population comprised twenty (20) selected manufacturing firms in Port-Harcourt, Nigeria. Collected data was analyzed using mean, standard deviation and covariance. Findings suggested that lead time reduction impacts timely delivery of products.

Garba (2020) studied lead time reduction and performance of Benue Brewery industry, Nigeria. The research design adopted was survey, questionnaire was used to retrieve data while a sample size of one hundred and fifty one (151) was used for the study. An analysis of data using regression analysis revealed there exist a relationship between lead time reduction and performance.

Womack and Jones (2019) investigated the relationship between waiting time reduction and overall production efficiency in automotive manufacturing in Japan. Using a case study methodology, the researchers analyzed production processes at three major automotive manufacturers using survey research design, questionnaire and correlation to analyze data collected from two hundred and forty (240) respondents. They found that significant reductions in waiting times resulted in improved throughput and lower inventory costs.

Gap in Knowledge

None of the empirically reviewed examined lead time reduction as it relates to performance of Bottling companies in Edo State Nigeria. This is the crack in knowledge that this study seeks to fill.

Methodology

Research Design

Survey research design was utilized for this study. It was utilized as a result of the nature of the study. Survey research design enables the researcher to study what happens to the studied sample subjects without altering them.

Area of Study

The study examined Lead-Time Reduction and Performance of Seven Up Bottling Company plant (Iguosa, Benin-city) and Nigerian Bottling Company plant (Eyaen, Benin-city).

Population Size

The population of the studied beverage firms in Edo State was used for the study. The population of Nigerian bottling company, Benin plant is 265 (115 lower level employees, 124 middle level employees and 26 top level employees). That of Seven up bottling company is 182 (106 lower level employees, 62 middle level employees and 14 top level employees). This gives a total population of 447.

Sample Size and Sampling Technique

Krejcie and Morgan (1970) sampling technique was utilized by the researcher. The formular is given thus:

$$S = \frac{x^2 NP(1-P)}{d^2 (N-1) + x^2 P(1-P)}$$

Where S= Sample Size

X^2= Table value of chi-square for 1 degree of freedom 0.05 confidence level (3.84)

N= population Size (447)

P= Population proportion (0.5)

d^2= Degree of accuracy (0.05)

$$S = \frac{3.84 \quad (447) \quad (0.5) \quad (1-0.5)}{(0.05)^2 (447-1) + (3.84)(0.5)(1-0.5)}$$

$$S = \frac{429.12}{1.12+0.96}$$

$$S = \frac{429.12}{2.08}$$

$$S = 206.3 = 206$$

As a result of the analysis above, two hundred and six (206) copies of the data collection tool were randomly distributed to respondents of the studied firms.

Bowley's (1926) allocation formula was used to determine the copies of the data collection instrument to be randomly administered to each of the studied organizations. As a result of the analysis above, one hundred and twenty two (122) copies of the data collection instrument were randomly distributed to employees of Nigerian Bottling Company, Benin Plant while eighty four (84) copies of the data collection tool were randomly distributed to employees of Seven Up Bottling Company, Benin plant.

Instrument of Data Collection

Questionnaire was used to elicit information from the respondents. The questionnaire was designed on a five point Likert Scale. Strongly Agree (SA), Agree (A), Undecided (U), Disagree (D), and Strongly Disagree (SD).

Validity of the Instrument

The extent to which a research instrument measures what it intends to measure is referred to as validity. Content and face validity test were applied by the researchers for the study.

Reliability of the Instrument

The measure of consistency of a research instrument is referred to as reliability. Cronbach Alpha reliability test was utilized by the researcher for the study. Suwannoppharat and Kaewsa, (2015) reliability coefficient of 0.696 was used for the study. Therefore, a benchmark of 0.696 was used for the study.

Table 1: **Scale: Reliability Statistics for Lead Time Reduction**

Reliability Statistics	
Cronbach's Alpha	N of Items
.843	5

Source: Field Survey 2025

The Cronbach Alpha score of the reliability statistics for Lead Time Reduction is 0.84. Since it is is greater than 0.696, it makes the instrument reliable.

Table 2: Scale: Reliability Statistics for Organizational Performance

Reliability Statistics	
Cronbach's Alpha	N of Items

.851	5

Source: Field Survey 2025

The Cronbach Alpha score of the reliability statistics for Organizational Performance is 0.85. Since it is greater than 0.696, it makes the instrument reliable.

Techniques of Data Analysis

Mean was the descriptive statistics used to analyze the research question using SPSS version 20; regression analysis was the inferential statistics used to test the formulated hypotheses using E-Views 10.

Data Presentation and Analysis

Table 3: Analysis of Returned and Unreturned Questionnaire

Returned (Un-mutilated)	168	81.55%
Returned (Mutilated)	15	07.28%
Unreturned	23	11.17%
Total Copies Administered	206	100.00%

Source: Field Survey, 2025

From the two hundred and six (206) copies of the questionnaire administered to respondents, one hundred and sixty eight (168) un-mutilated copies (81.55%) was returned, fifteen (15) mutilated copies (07.28%) were returned while 23 (11.17%) copies were unreturned. As a result of that, one hundred and sixty eight (168) copies of the questionnaire were used for the analysis.

Is there a relationship between production time reduction and performance of bottling companies in Edo State?

Table 4: Descriptive Statistics for Production Time Reduction

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Q1	168	1.00	5.00	3.2000	1.51528
Q2	168	1.00	5.00	3.1000	1.42162
Q3	168	1.00	5.00	3.5000	1.36451
Q4	168	2.00	5.00	3.7000	.97267
Q5	168	1.00	5.00	3.2000	1.10224
Valid N (listwise)	168				

Source: Field Survey, 2025

Mean scores based on responses from the questions relating to production time reduction of the two studied firms are >2.5. This makes the responses appropriate for the study.

Table 5: Descriptive Statistics for Organizational Performance (Firm Agility)

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Q1	168	1.00	5.00	2.7531	1.41428
Q2	168	1.00	5.00	3.1722	1.22574

Q3	168	1.00	5.00	3.5158	1.34532
Q4	168	1.00	5.00	3.6416	.99634
Q5	168	1.00	5.00	3.2154	1.06252
Valid N (listwise)	168				

Source: Field Survey, 2025

Mean scores based on responses from the questions relating to organizational performance (firm agility) on the two studied firms are >2.5. This makes the responses appropriate for the study.

Test of Hypothesis

Ho: The relationship between production time reduction and performance of bottling companies in Edo State is not significant and positive.

Table 6: Regression Output

Dependent Variable: ORG_PERF

Method: Least Squares
Date: 08/09/25 Time: 06:14
Sample: 1 168
Included observations: 168

Variable	Coefficient	Std. Error	t-Statistic	Prob.
C	2.700000	0.172635	14.76478	0.0000
PRO_TIME	0.920000	0.021018	84.20351	0.0000

R-squared	0.902431	Mean dependent var	15.00000
Adjusted R-squared	0.902297	S.D. dependent var	5.642753

Log likelihood	-212.7026	Hannan-Quinn criter.	2.676178
F-statistic	7255.604	Durbin-Watson stat	1.816478
Prob(F-statistic)	0.000000		

Source: Field Survey, 2025

Findings obtained from a test of the formulated hypothesis revealed that production time reduction has significant effect on the performance of the two studied firms (β =0.920, t-statistics =14.76478, $p<0.05$). Also, production time reduction is a predictor of organizational performance (F-statistics=7255.604; R-squared=0.902; $p<0.05$). The predictor variable explained 90.2% of the variance in performance of the studied firms, while the remaining 9.8% could be as a result of the effect of the extraneous variables. The Durbin Watson value of 1.8 reveals that there is no first order serial correlation. This makes the result appropriate.

Discussion of Findings

Findings obtained from a test of the formulated hypothesis revealed that the relationship between production time reduction and performance of bottling companies in Edo State is significant and positive. This is in tandem with the study of Martin and Edwards (2023) who conducted a study

on the impact of lead time reduction on customer satisfaction in the manufacturing sector in the United States. Their findings revealed a significant positive correlation between reduced production time and customer satisfaction levels. The study of Chen and Zhao (2021) who explored the effect of production time reduction on operational efficiency in Chinese manufacturing firms also agrees with findings obtained from a test of the formulated hypothesis. The findings indicated that reducing production time led to higher output and lower operational costs. This could help a firm to stay agile. The study of Karibo and Evwierhurhoma (2018) who studied lead time uncertainties and scheduling practices of manufacturing firms in Nigeria also corroborates findings obtained from a test of the hypothesis. Findings suggested that lead time reduction impacts timely delivery of products and by extension firm agility. The work of Garba (2020) who studied lead time reduction and performance of Benue Brewery industry, Nigeria is in tandem with the study findings. His study findings revealed that there exists a relationship between production time reduction and performance. The study of Ezeoke, Oyatoye and Mojekwu (2019) who examined lead time practices and customer satisfaction of fast moving customer goods (FMCGs) in Nigerian industries also agrees with findings obtained from a test of the hypothesis. The study findings revealed that lead time reduction impacted the overall performance level of an organization.

Summary, Conclusion and Recommendation

Summary

Findings obtained from a test of the formulated hypothesis revealed that production time reduction has significant effect on the performance of the two studied firms (β =0.920, t-statistics =14.76478, $p<0.05$). Also, production time reduction is a predictor of organizational performance (F-statistics=7255.604; R-squared=0.902; $p<0.05$).

Conclusion

Sequel to the findings obtained from a test of the formulated hypothesis, the researchers concluded that there exists a significant positive relationship between lead time reduction and performance of bottling firms in Edo State, Nigeria. In other words, when unnecessary delay is eliminated from the production process, it could by extension positively impact the overall performance level of the studied firms.

Recommendation

Base on the findings and conclusion of the study, the researchers recommend that management of the studied firms should strive towards a total elimination of unnecessary delay in the production process as unnecessary delay in the production process could directly impact the performance level of the studied firms.

Abstract
This study explores the transformative role of artificial intelligence (AI) in enhancing creativity and productivity within knowledge-based industries, providing a theoretical framework for understanding how AI-driven technologies augment human ingenuity, streamline complex processes, and foster innovation. The integration of AI is reshaping these industries by redefining the boundaries of creativity and productivity. Creativity—the ability to generate novel and valuable ideas that advance organizational goals, is increasingly augmented through AI technologies such as machine learning, natural language processing, and generative algorithms that accelerate ideation and problem-solving. Productivity, defined as the efficient use of resources to deliver measurable outcomes, is similarly enhanced by intelligent systems that automate routine tasks, optimize workflows, and facilitate data-driven decision-making. The study identifies barriers to AI adoption, including high implementation costs, data quality issues, security and privacy concerns, and employee resistance to change. Conversely, enablers of AI adoption include technological advancements, organizational leadership support, and employee digital skills and training. The study concludes that while AI has the capacity to expand human ingenuity and streamline performance, its transformative potential depends on deliberate governance, institutional support, and the cultivation of human–machine collaboration. By balancing technological capabilities with human expertise, knowledge-based industries can leverage AI not only to enhance competitiveness but also to foster sustainable value creation in a rapidly evolving global economy.

Introduction

In recent times, technological advancements have been rapidly transforming the way organizations operate, innovate, and create value. There is a growing adoption of digital tools to enhance organizational agility by streamlining processes, improving efficiency, and responding to market demands. Among the most transformative developments is the emergence of Artificial Intelligence (AI), which enables machines to simulate human intelligence and perform tasks such as reasoning, learning, and problem-solving (Zeb-Obipi, 2025; Russell & Norvig, 2021). The proliferation of AI technologies has introduced a paradigm shift across various sectors, particularly in knowledge-based industries (KBIs), where intellectual capital, innovation, and problem-solving are central to value creation. As global economies transition toward more knowledge-driven models, the imperative to harness AI to enhance creativity and productivity has become increasingly pronounced.

Knowledge-based industries fundamentally rely on human intellect, expertise, and creative output. These sectors demand high levels of innovation and depend heavily on intangible assets such as data, skills, and processes (Powell & Snellman, 2004). Consequently, productivity is not merely a function of physical input but rather of how effectively knowledge is applied and transformed into actionable solutions. Leveraging AI enhances productivity, cost efficiency, and global competitiveness. It offers unique opportunities to augment human capabilities, optimize processes, and generate novel ideas that would otherwise be difficult to achieve through traditional methods (Brynjolfsson & McAfee, 2014). Streamlining processes and reducing manual errors lowers operational costs and minimizes resource wastage. Industries can expand operations and manage larger workloads without proportionally increasing costs or human resources. Scholars emphasize that AI technologies such as machine learning (ML), natural language processing (NLP), computer vision, robotic process automation, and generative models have demonstrated significant potential in enhancing creativity and productivity (Al Naqbi, Bahroun & Ahmed, 2024; Pandy, Pugazhenthi & Murugan, 2025). For example, AI-driven systems assist professionals in generating new content, identifying patterns within large datasets, and automating repetitive tasks, thereby freeing time for more strategic and creative endeavours (Amabile & Pratt, 2016; Davenport & Ronanki, 2018). Tools like Semantic Scholar, DataRobot, and Midjourney illustrate how generative AI can serve as a collaborative partner in the creative process, helping individuals and teams explore novel concepts and design innovative solutions.

Creativity, traditionally regarded as an inherently human trait, is increasingly being redefined in the era of artificial intelligence (AI). With advancements in machine learning, natural language processing, and generative algorithms, AI systems can now automate routine and repetitive knowledge tasks, summarize and synthesize information, and enable intelligent search and knowledge discovery. This does not imply that AI replaces human creativity; rather, it extends and complements it by providing new tools, perspectives, and efficiencies that enhance human imagination. Consequently, the collaborative interaction between humans and intelligent machines, where AI acts as a catalyst that amplifies human potential and expands the boundaries of what is possible in artistic, scientific, and industrial domains—has garnered significant scholarly attention. Researchers argue that AI can serve as a cognitive co-pilot, stimulating ideation and broadening the horizons of human imagination (Zeb-Obipi, 2025; Sawyer, 2012; McCormack, Gifford, & Hutchings, 2019). In fields such as design, advertising, architecture, and content

creation, AI is no longer viewed merely as a tool but as a co-creator, capable of generating meaningful alternatives and augmenting the creative workflow (Elgammal et al., 2017). Strategically, AI orchestrates human expertise and intelligence to design forward-thinking, data-informed, inclusive, and adaptable practices. This shift necessitates a re-examination of how organizations and institutions perceive and measure creativity in environments increasingly mediated by intelligent technologies. Similarly, AI's impact on productivity is evident through enhanced decision-making, real-time analytics, and the automation of knowledge work. According to a study by the McKinsey Global Institute (2018), AI can increase productivity by up to 40% in knowledge-based tasks by improving speed, accuracy, and cost efficiency. Examples of AI applications that streamline operations, reduce errors, and support proactive business decisions include Robotic Process Automation (RPA), intelligent document processing, and predictive analytics. These advances, according to Bessen (2019) and Arntz, Gregory, and Zierahn (2016), suggest that AI does not replace human labour but rather transforms it, redefining job roles, skills, and workflows in ways that can lead to higher organizational performance.

Despite the transformative impact of artificial intelligence (AI) in reshaping creativity and productivity within knowledge-based industries, significant challenges and concerns remain. The extent to which these technologies can be effectively harnessed continues to be a subject of both scholarly and practical interest. The risk of technological displacement and the deskilling of workers has sparked debates about the future of human labour in AI-augmented environments. As AI assumes more cognitive tasks, it is crucial for organizations to invest in upskilling and reskilling their workforce to maintain a balance between human intuition and machine intelligence (World Economic Forum, 2020). The readiness of knowledge-based industries to adopt and integrate AI into existing workflows is paramount for fostering creativity and productivity. Large technology companies have rapidly embraced AI to enhance innovation and scalability, thereby gaining several strategic, operational, and competitive advantages. This recognition informed the choice of the research topic, *"Harnessing Artificial Intelligence (AI) for Creativity and Productivity in Knowledge-Based Industries,"* which seeks to explore how artificial intelligence enhances creativity and productivity in these sectors, offering a theoretical framework for its ability to augment human ingenuity, streamline processes, and drive innovation. Specifically, the paper will examine the theoretical foundations, emerging trends of AI in professional domain, artificial intelligence in action, ethics in AI, artificial intelligence for creativity and productivity, and as well barriers and enablers to AI adoption.

Theoretical Foundations

Resource-Based View (RBV)

The Resource-Based View (RBV) theory posits that competitive advantage arises from unique, valuable, and difficult-to-imitate resources.

The theory, formally articulated by Jay Barney in 1991, builds on earlier strategic management concepts introduced by Edith Penrose in 1959. It posits that an organization's sustainable competitive advantage stems from its possession and effective deployment of valuable, rare, inimitable, and non-substitutable resources (Barney, 1991). These resources can be tangible, such as physical assets and technology, or intangible, including skills, knowledge, and organizational culture.

In knowledge-based industries, artificial intelligence (AI) serves as a core strategic resource by providing innovative capacity and operational efficiency. These industries, which rely heavily on intellectual capital, stand to gain significant advantages when AI is integrated with human expertise to create unique capabilities that competitors cannot easily replicate. For instance, an organization that effectively combines advanced AI algorithms for data analysis or generative design with a highly skilled and creatively driven workforce develops a hybrid human–machine competency that meets the VRIN (valuable, rare, inimitable, and non-substitutable) criteria. The resource-based view (RBV) emphasizes that competitive advantage is not derived solely from acquiring AI systems but from embedding them into organizational processes, cultivating complementary human skills, and fostering a culture of continuous learning to fully exploit AI's potential. In this way, AI becomes part of a firm's core strategic assets, driving both creativity—through the generation of novel ideas, solutions, and innovations—and productivity—through optimized workflows, reduced turnaround times, and enhanced decision-making. By framing AI as a resource that must be integrated with other organizational strengths to yield sustained advantage, RBV directly supports the objective of enhancing creativity and productivity in knowledge-based industries (Barney, 1991). Consequently, AI becomes a strategic capability when combined with human talent.

Socio-Technical Systems Theory (STS)

This theory explains that organizational effectiveness depends on the joint optimization of social systems (people, culture, processes) and technical systems (AI tools, digital platforms). Socio-Technical Systems Theory (STS), developed in the 1950s by Eric Trist and his colleagues at the Tavistock Institute of Human Relations in London, originated from studies on coal mining operations. These studies revealed that productivity and job satisfaction were highest when both social and technical elements of work were optimized together (Trist & Bamforth, 1951). The theory posits that organizations function as integrated systems composed of a technical subsystem—comprising tools, technologies, and processes—and a social subsystem, which includes people, relationships, skills, and cultural norms.

The central principle of Socio-Technical Systems (STS) is that optimal performance is achieved when the technical and social subsystems are harmonized, a concept known as "joint optimization." This theory provides a robust framework for understanding how to integrate advanced AI technologies into work processes without undermining the human capabilities that drive innovation. Knowledge-based industries thrive on intellectual capital, problem-solving, and creative thinking, all of which require human judgment, contextual understanding, and collaboration. AI can enhance these capacities by automating repetitive tasks, generating data-driven insights, and even contributing to idea generation through generative models, thereby boosting both creativity and productivity. However, STS emphasizes that these technological enhancements must be matched by parallel investments in the social system, such as employee training, participatory decision-making, and the preservation of autonomy, to ensure sustainable adoption and engagement. Without this balance, the risk of employee resistance, reduced intrinsic motivation, or overreliance on technology could undermine the very productivity and creativity gains AI promises. By framing AI as a complement to, rather than a replacement for, human ingenuity, STS supports the design of socio-technical environments in which AI tools and human expertise work synergistically, fostering innovation while maintaining employee satisfaction and organizational resilience (Trist & Bamforth, 1951). By implication, AI in knowledge industries

should not replace human creativity but enhance it, requiring a balance between human expertise and AI capabilities to achieve productivity gains. With this balance in mind, attention turns to the emerging trends of AI in professional domains, where its applications reveal new patterns of integration, adaptation, and innovation that are transforming industries in real time.

Emerging Trends of Artificial Intelligence in Professional Domains

Emerging trends in artificial intelligence (AI) across professional domains reflect its rapid evolution from a supportive tool to a strategic driver of innovation, efficiency, and decision-making. The strategic integration of AI into professional domains raises important questions about leadership, organizational culture, and change management. Embracing AI requires a shift in mindset, from viewing technology as a threat to recognizing it as a strategic enabler. According to Westerman, Bonnet, and McAfee (2014), leadership plays a pivotal role in driving this transformation by fostering a culture of innovation, experimentation, and digital literacy. Ultimately, the human element remains central to the successful deployment of AI, underscoring the need for a holistic approach that aligns people, processes, and technology.

In healthcare, AI is increasingly applied to diagnostic imaging, predictive analytics for patient outcomes, and personalized treatment planning. Machine learning models have demonstrated accuracy comparable to, and in some cases exceeding, that of human experts (Esteva et al., 2019). The legal profession is adopting AI-powered tools for contract review, legal research, and case prediction, enabling lawyers to process vast volumes of documents efficiently while focusing on complex legal reasoning (Surden, 2019). In the financial sector, AI trends include algorithmic trading, fraud detection, and customer service chatbots, all of which leverage real-time data analysis to enhance risk management and improve client engagement (McAfee & Brynjolfsson, 2017). Education is also undergoing transformation, with adaptive learning platforms personalizing instructional content to suit individual learning styles and pacing, thereby improving retention and performance (Luckin Holmes, Griffiths & Forcier, 2016).

Industries are witnessing the rise of generative AI in graphic design, music production, and digital storytelling, where systems collaborate with human creators to produce high-quality content, thereby expanding the boundaries of artistic expression (Elgammal, Liu, Elhoseiny & Mazzone 2017). In manufacturing and engineering, AI enables predictive maintenance, optimizes production processes, and integrates with Internet of Things (IoT) devices to create intelligent, self-regulating systems (Lee, Davari, Singh & Pandhare, 2018). Additionally, More so, AI supports sustainability initiatives by optimizing energy consumption, reducing waste, and modeling environmental impacts to guide green innovation strategies (Rolnick et al., 2019).

The field of human resources increasingly adopts artificial intelligence (AI) for talent acquisition, skills assessment, and employee engagement analytics, streamlining recruitment processes while enhancing workforce planning (Jarrahi, 2018). Trends in AI within human resource management (HRM) reveal a shift toward data-driven, predictive, and personalized workforce strategies that boost both creativity and productivity in organizations. A significant development is the use of AI-powered recruitment tools that leverage natural language processing and machine learning to screen résumés, analyze candidate profiles, and match applicants to job requirements more accurately than traditional methods. This approach reduces time-to-hire and improves talent quality (Cattermole, 2018). Beyond initial hiring, AI is increasingly employed for predictive

analytics in workforce planning, enabling HR managers to forecast skill gaps, anticipate turnover risks, and proactively design training programs aligned with future organizational needs (Jarrahi, 2018). Learning and development also benefit from AI, with adaptive learning platforms delivering personalized training content based on individual performance data and learning styles, thereby fostering continuous skill enhancement and employee engagement (Madhumithaa, Sharma, Adabala, Siddiqui & Kothinti, 2025). In performance management, AI systems analyze real-time productivity metrics, peer feedback, and behavioral data, providing managers with actionable insights for objective evaluation and targeted coaching (Huang & Rust, 2021). Employee engagement platforms now incorporate sentiment analysis to monitor workforce morale, enabling early intervention in cases of disengagement or burnout (Omose & Ikuyinminu, 2024). AI-driven chatbots are transforming HR service delivery by providing instant, round-the-clock responses to employee queries, automating administrative processes such as leave requests, and facilitating onboarding, which frees HR professionals to focus on strategic initiatives (Praveen & Peri, 2025). Additionally, diversity and inclusion efforts are supported by AI tools designed to detect and mitigate unconscious bias in recruitment and promotion decisions, contributing to more equitable workplace practices (Raghavan et al., 2020). As these trends converge, AI's role in HRM is evolving from an operational support function to a strategic enabler of organizational agility, creativity, and productivity, positioning human capital management as a central driver of competitive advantage in knowledge-based industries.

These trends indicate that AI is moving toward a future of deep integration into professional practice, where it not only enhances productivity but also reshapes the very nature of work and value creation. Beyond theoretical potential, artificial intelligence is actively shaping workflows and decision-making in real-world applications. Its use across diverse professional settings demonstrates how organizations are harnessing AI to achieve measurable impact.

Artificial Intelligence in Action

Artificial intelligence (AI) has evolved from a purely theoretical concept into a transformative force with extensive practical applications across knowledge-based industries, driving both creativity and productivity (Uctu, Tuluce, & Aykac, 2024). In sectors such as education, information technology, research and development, consulting, finance, media, and design, AI serves as an enabler of innovation by augmenting human capabilities rather than replacing them. One notable application is in data analytics and decision support, where AI-powered tools process vast datasets to uncover patterns, trends, and correlations that inform strategic decisions, market predictions, and product development. In creative work, generative AI models such as GPT-based text generators, image synthesis tools, and music composition algorithms are used to ideate, prototype, and produce creative content at unprecedented speeds, thereby expanding the scope of innovation. AI also plays a significant role in knowledge management, where intelligent systems organize, index, and retrieve information from large corporate repositories, enabling employees to access relevant insights quickly and reducing cognitive load.

In productivity enhancement, AI-powered automation streamlines repetitive tasks such as scheduling, document processing, and report generation, allowing professionals to focus on higher-value activities that require critical thinking and problem-solving. In research and development, AI accelerates innovation cycles by simulating complex scenarios, conducting virtual experiments, and suggesting novel solutions based on predictive modeling. Knowledge-

based industries also benefit from AI-driven personalization engines that tailor customer experiences, learning programs, and product recommendations to individual needs, thereby improving engagement and satisfaction. Furthermore, collaborative AI systems, such as intelligent project management platforms, facilitate real-time coordination, workload optimization, and resource allocation across geographically dispersed teams. By strategically integrating these applications, organizations in knowledge-based sectors can not only increase efficiency but also foster a culture of human–machine co-creation, where AI acts as a partner in generating ideas, solving problems, and delivering value. This synergy underscores AI's role as a catalyst for sustained creativity and productivity in the modern knowledge economy. However, the growing reliance on AI as a partner in value creation also raises critical ethical considerations. Issues of fairness, transparency, accountability, and data privacy must be addressed to ensure that AI serves as a responsible enabler of creativity and productivity rather than a source of unintended harm.

ETHICS in AI

Ethics in artificial intelligence (AI) has become a central consideration in harnessing the technology for creativity and productivity within knowledge-based industries, as the opportunities it presents are closely linked to potential risks and societal implications. A primary concern is privacy and data protection, since AI systems often require extensive datasets that may include sensitive personal or proprietary information. Mishandling such data or insufficient anonymization can lead to breaches of confidentiality and violations of legal and ethical standards (Jobin, Ienca & Vayena 2019). Closely related to this is the issue of transparency and explainability, as many AI models, particularly deep learning systems—function as "black boxes," making it difficult for stakeholders to understand or challenge their outputs, thereby undermining accountability in decision-making (Doshi-Velez & Kim, 2017).

Another ethical challenge involves bias and discrimination. AI systems trained on skewed or incomplete datasets can reproduce and even amplify social inequalities, such as gender or racial bias, in recruitment, lending, or content curation (Mehrabi et al., 2021). This issue is particularly relevant in knowledge-based industries, where fairness and credibility are essential for sustaining trust and fostering creativity. The question of responsibility and accountability is equally important, as there must be a clear delineation of who is answerable when AI-driven decisions cause harm—whether developers, organizations, or end-users (Floridi & Cowls, 2019). In creative sectors, generative AI raises concerns about intellectual property rights and creative integrity, especially when it uses human-produced works for training without consent or compensation, which some argue constitutes a form of cultural appropriation (Elgammal et al., 2017).

Beyond these risks, there is an ethical imperative to ensure that AI systems remain human-centered, meaning they should augment human capabilities rather than diminish autonomy or reduce meaningful human involvement in decision-making (Shneiderman, 2020). While AI can enhance productivity, research suggests that without careful integration and user support, it may also lead to work intensification, stress, or decreased job satisfaction (Huang & Rust, 2021). Furthermore, the global dimension of AI ethics cannot be overlooked, as technologies designed in high-income countries may not align with the cultural norms, economic realities, or governance structures of lower-income regions, thereby risking the reinforcement of global inequities (Mohamed et al., 2020). For AI to be ethically harnessed in knowledge-based industries, governance frameworks and regulations must embed principles such as fairness, accountability,

transparency, and respect for human rights into both system design and organizational policy (Jobin et al., 2019). Ultimately, the ethical deployment of AI requires a deliberate commitment to ensuring that its use fosters innovation and productivity without compromising justice, dignity, or societal well-being. Beyond ethical considerations, a crucial dimension of AI adoption is its role in advancing creativity and productivity. Hence, the section below.

Artificial Intelligence for Creativity and Productivity

Creativity is the ability to generate novel and valuable ideas, solutions, or innovations by combining knowledge and imagination in ways that advance organizational goals. Productivity, on the other hand, is the efficient and effective use of resources to generate measurable outcomes, innovations, or value that enhance organizational performance and competitiveness.

Artificial intelligence (AI) has emerged as a transformative force driving creativity and productivity in knowledge-based industries by augmenting human capabilities, automating routine processes, and enabling new forms of innovation. In creative contexts, AI-powered generative models such as GPT-based text systems, image synthesis algorithms, and music composition networks facilitate rapid ideation, prototyping, and content production. These tools allow individuals and teams to expand their creative scope while reducing time-to-output (Elgammal et al., 2017). They not only accelerate the creative process but also introduce novel aesthetic possibilities that might be difficult for humans to conceive independently, fostering a symbiotic relationship between human ingenuity and machine computation (Shneiderman, 2020). Regarding productivity, AI contributes significantly through intelligent automation, streamlining repetitive tasks such as scheduling, document analysis, and report generation. This automation frees professionals to focus on higher-value activities that require critical thinking and strategic decision-making (Huang & Rust, 2021). AI-driven data analytics enhances productivity by processing vast datasets to uncover patterns, correlations, and predictive insights that inform market forecasts, operational improvements, and product development strategies (Davenport & Ronanki, 2018).

The impact of AI on knowledge management is equally profound, as intelligent systems can organize, index, and retrieve information from large repositories, reducing cognitive load and enabling quicker access to relevant insights (Jobin et al., 2019). This not only supports more efficient workflows but also enhances decision-making quality by ensuring stakeholders are informed with timely and accurate information. In collaborative environments, AI-enabled platforms facilitate seamless coordination among geographically dispersed teams, optimizing resource allocation and project timelines (Brynjolfsson & McAfee, 2017). Furthermore, AI-powered personalization engines powered by AI tailor learning experiences, customer interactions, and product recommendations to individual preferences, thereby boosting engagement, satisfaction, and overall value delivery (Jarrahi, 2018). The integration of these capabilities into organizational processes does not merely increase efficiency; it fosters a culture of human–machine co-creation, in which AI serves both as a catalyst for novel ideas and a multiplier of output quality. Ultimately, when deployed thoughtfully, AI enables knowledge-based industries to achieve a sustained balance between innovation and operational excellence, ensuring that creative breakthroughs and productivity gains reinforce one another in driving competitive advantage. However, realizing these transformative possibilities is not automatic. The integration of AI into knowledge-based industries is shaped by various enablers that facilitate adoption and barriers that

constrain it. Understanding these factors is essential to explain why some organizations advance rapidly in AI adoption while others lag behind.

Barriers and Enablers to AI Adoption

Barriers

The adoption of AI in knowledge-based industries faces significant barriers. A critical barrier is the high implementation cost, which includes not only the acquisition of AI technologies but also expenses related to training, system integration, and infrastructure upgrades. Many organizations, particularly in developing economies, struggle with these financial demands, limiting their ability to adopt AI at scale (Duan, Edwards & Dwivedi, 2019). Another prominent barrier is data-related challenges, such as issues of data quality, security, and privacy. Since AI relies heavily on large datasets, organizations with fragmented or poor-quality data find it difficult to achieve effective outcomes, while strict data protection regulations sometimes create additional compliance burdens (Mikalef, Krogstie, Pappas & Giannakos, 2019). Resistance to change among employees also presents a barrier, as fears of job displacement and lack of trust in AI systems can hinder acceptance and usage (Dwivedi et al., 2021). Moreover, ethical concerns surrounding bias, transparency, and accountability create skepticism about adopting AI in sensitive areas of knowledge work. Knowledge-based industries often deal with intellectual outputs that require fairness and accuracy, and the "black box" nature of some AI models reduces trust in the technology (Floridi & Cowls, 2019). Finally, a lack of adequate expertise and skills in AI development and application within organizations remains a persistent obstacle. Without the right talent, organizations may either fail to implement AI effectively or rely excessively on external vendors, leading to dependency and higher risk (Ransbotham et al., 2021). These barriers collectively demonstrate that while AI adoption offers immense opportunities for creativity and productivity, overcoming them requires deliberate organizational strategies and supportive institutional frameworks.

Enablers

Enablers of artificial intelligence (AI) that facilitate creativity and productivity in knowledge-based industries are driven by technological advancements, organizational leadership support, and employee digital skills and training.

Technological advancements, such as the increasing availability of robust computing infrastructure, big data analytics, and cloud-based platforms, have made AI integration more feasible and cost-effective (Dwivedi et al., 2021). These advancements reduce entry barriers for organizations, enabling even small knowledge-driven firms to leverage AI solutions to enhance innovation. Another key enabler is organizational leadership support; management commitment and vision play critical roles in championing AI adoption. When leaders encourage experimentation and allocate resources for AI, organizations cultivate a culture that embraces innovation and continuous learning (Bughin et al., 2018). More so, employee digital skills and training facilitate smooth adoption, as workers with higher AI literacy are more adaptable to technological transformation and are more likely to use AI tools to augment their creativity rather than resist them. Strategic partnerships also serve as enablers, as collaborations among industry players, technology vendors, and research institutions enhance knowledge transfer and reduce implementation risks (Wamba et al., 2021). Finally, regulatory support and national digital strategies in some countries create an enabling ecosystem by providing legal frameworks, data governance policies, and incentives that encourage organizations to integrate AI into knowledge-

based activities (Chen et al., 2021). Collectively, these enablers establish a foundation that not only promotes AI adoption but also ensures it contributes to enhanced creativity and productivity.

Conclusion

The integration of artificial intelligence into knowledge-based industries represents a paradigm shift in how creativity and productivity are conceived and realized. While AI has the capacity to enhance human ingenuity and streamline performance, its transformative potential depends on deliberate governance, institutional support, and the cultivation of human–machine collaboration. These elements ensure that AI functions not merely as a tool for automation but as a catalyst for innovation, resilience, and sustained organizational competitiveness. At the same time, challenges related to ethical use, transparency, workforce adaptability, and equitable access underscore the need for frameworks that balance technological advancement with human values. Ultimately, the future of AI in knowledge-driven sectors lies in its ability to complement rather than replace human creativity, creating a socio-technical environment where innovation and efficiency reinforce one another to drive sustainable growth in the evolving knowledge economy.

Effect Of Human Resource Information System Usage on Administrative Efficiency of the Teaching Hospitals in Port Harcourt, Rivers State.

Dr Ethel Ifeyinwa Emmanuel
Department of Employment Relations/Human Resource Management,
Faculty of Administration and Management, Rivers State University.
ethel.emmanuel@ust.edu.ng

Abstract
This study examined the relationship between Human Resource Information Systems (HRIS) and administrative efficiency in teaching hospitals in Port Harcourt, Rivers State. Specifically, it assessed the effects of function automation and system usage on two dimensions of efficiency: task duration and error rate. The study adopted a cross-sectional survey design, with a population of 325 HR and administrative staff, ICT staff, department heads, and healthcare workers who directly use HRIS. A sample size of 175 was determined using Krejcie and Morgan's (1970) table, and data were analysed using Spearman's Rank Order Correlation via SPSS. Results revealed a strong and positive relationship between function automation and task duration and between function automation and error rate reduction. Similarly, system usage showed a significant positive effect on task duration and error rate The findings indicate that HRIS enhances efficiency by accelerating administrative processes and reducing errors in hospital management. The study recommends strengthening HRIS adoption, providing continuous staff training, and standardizing system usage across hospital departments to maximize efficiency gains.

Keywords: *Human Resource Information System, Function Automation, System Usage, Administrative Efficiency.*

Introduction

A good healthcare system relies on its doctors and nurses as well as its administrative backbone. Administrative efficiency is what keeps hospitals running well so that doctors and nurses can focus on saving lives while support systems run smoothly in the background. In teaching hospitals, where patient care, research, and medical training all happen at the same time, good management is even more important for keeping up high-quality service (Ikonne & Adeniran, 2024). Administrative efficiency enhances the best use of limited resources. In many developing countries, like Nigeria, healthcare facilities typically have to work with very limited budgets and infrastructure. The use of efficient administrative systems helps cut down on waste, save money, and make sure that resources like staff time, medical supplies, and money are used wisely. This process makes people more accountable and helps teaching hospitals be financially stable (Okoroafor et al., 2022).

The administration efficiency's direct effect on the motivation and productivity of the healthcare staff is very essential. Delays in salary payments, poor handling of personnel data, or poor communication among staff can all impair morale and performance. Conversely, efficient administrative systems ensure timely payments, accurate record-keeping, and better coordination of training. These steps boost employees' motivation, which in turn makes the care they supply to patients better (Ahmad et al., 2024). Effective management makes patients happier and makes people trust the health sector more. Hospitals that have open systems, efficient data management, and easy-to-follow service protocols can provide care that is timely and responsive. Such leadership makes the public trust you more and makes sure you follow the rules. In the long term, efficient administration not only helps hospitals run well, but it also helps achieve bigger goals like providing healthcare that is sustainable, fair, and of high quality.

Hospitals are essential for providing healthcare, doing research, and training doctors and nurses. The efficacy of these hospitals depends a lot on how well their administrative processes work (Amin et al., 2025). The task is often hard because there are so many employees, staff turnover is significant, and proper handling of personnel data is important. In the past, teaching hospitals did their administrative work by hand and on paper. People have said that these methods are too slow, too likely to make mistakes, and not able to keep up with the expanding need for quick and accurate information. As healthcare organisations grow, the need for new tools that make administrative tasks easier and more efficient has become clearer (Ofori, 2025). HRIS makes administrative tasks easier, improves the accuracy of data, and helps care and support professionals make better decisions (Chauhan et al., 2011).

Human Resource Information Systems (HRIS) have become an important new technology that helps organizations— notably teaching hospitals, manage their human resources better. HRIS combines tasks related to human resources into a single digital system. Otamiri and Onwubuche (2024) showed that HR support systems, HRIS technical capabilities, and core HRIS components all have a favourable effect on managing people, managing time, and making money in South-South Nigerian academic institutions. These activities include hiring, managing payroll, evaluating performance, training personnel, and keeping employee records. HRIS not only makes these tasks easier for administrators, but it also makes sure that employee data is accurate, easy to identify, and safe. Victor (2024) corroborated these findings, emphasising that HRIS promotes more efficient people management and streamlines financial operations by improving digital proficiency and systems architecture. In teaching hospitals, where the quality-of-service delivery is strongly tied to the performance and wellbeing of staff, HRIS deployment can potentially address the inefficiencies associated with manual methods. This new technology fits with global trends in healthcare administration that stress making decisions based on data and using human resources efficiently.

HRIS is acknowledged to have many benefits, but it has proven slow and unfair to use in many developing countries, like Nigeria. Teaching hospitals in Nigeria often have problems, such as not having enough money, having poor ICT infrastructure, not being able to hire skilled workers, and personnel not wanting to change (Okoroafor et al., 2022; Ogba-Amaugo, 2024). Because of these limitations, HRIS is less likely to be able to make critical administrative tasks like scheduling staff, coordinating training, and ensuring payroll is proper more efficient. Moreover, administrative inefficiency in teaching hospitals is often linked to delays in staff compensation, ineffective

management of personnel records, and insufficient monitoring of staff performance, all of which can negatively impact employee motivation and the overall quality of healthcare delivery (Ahmad et al., 2024). So, it is very important to carefully examine how using HRIS affects how well these organisations run their businesses.

Despite the existence of several studies on HRIS (Ogba-Amaugo, 2024; HRPayHub, 2024) and efficiency (Okoroafor et al., 2022; Ikonne & Adeniran, 2024), there remains a gap in empirical research on the influence of human resource information system usage on administrative efficiency of the teaching hospitals in Port Harcourt motivates this study; hence, it is crucial for both policy and practice to know how using HRIS affects the efficiency of administration at teaching hospitals. If used correctly, an HRIS could help the company reach its goal of providing high-quality, long-lasting healthcare services by increasing employee productivity, satisfaction, and overall happiness.

Statement of the Problem

Teaching hospitals are very important for tertiary health care, but they still have trouble with inadequate administrative efficiency. Reports have said that paper-based processes and broken information systems at UPTH have caused long wait times for patients and poor record-keeping (Direct Research Publisher, 2023; Global Journal of Medical and Health Science, 2025). Larger assessments of Nigeria's health care system also show that problems are still happening because of inadequate personnel coordination, limited administrative tools, and not using data in the best way (Josiah et al., 2024). The effects of such inadequate administrative efficiency are big. One big effect is that patients have to wait longer because scheduling, attendance monitoring, and permission systems are not working well, which slows down service delivery. This problem is especially severe in Rivers State, where manual workflows make even simple services take. On the other hand, hospitals with streamlined systems cut down on waiting times by a lot (Financial Times, 2024a, 2024b).

Another undesirable result is the poor quality of the data, which makes it challenging to follow the rules and prepare for the workforce. Incomplete or late human resources (HR) records, such as appointments, leave, and payroll adjustments, make it harder to make favourable decisions and become ready for an audit. Research demonstrates that subnational health facilities in Nigeria have inadequate accountability and waste resources because their information systems don't work well (Mbau et al., 2022). In the same way, health workers in Nigeria have raised concerns about systemic problems, such as insufficient administrative tools and gaps in record-keeping, which make the system less efficient and effective (Josiah et al., 2024).

Both the federal and state governments have worked to solve these problems. The Nigeria Health Workforce Registry (HWR), the national health information strategy, and digital health projects are all examples of efforts to create a single, reliable database for managing the workforce (Chibuzor et al., 2021; Federal Ministry of Health, 2024). The Rivers State Ministry of Health (2025) says that the state has also set up regulatory platforms to digitise control of health establishments. But even with these steps, teaching hospitals still have problems with their administration. Limited use of Human Resource Information Systems (HRIS) in everyday HR tasks, poor communication between HR, payroll, and clinical systems, and not enough training for staff are still important problems (Ravi et al., 2024; Egwudo & Eze, 2025).

This study suggests that using Human Resource Information Systems (HRIS) on a regular basis can make teaching hospitals in Port Harcourt far more efficient when it comes to administration. HRIS features, including employee master records, e-attendance, leave management, payroll integration, and HR analytics, can help reduce duplicate work, speed up tasks, and make staff records more accurate. Teaching hospitals can fix ongoing administrative problems and boost productivity by connecting their HRIS systems to the national Health Workforce Registry (HWR) and improving staff training and data governance (Tursunbayeva et al., 2017; Adebayo, 2024; Bardhan et al., 2025).

Aim and Objectives of the Study

The aim of this study is to examine the relationship between human resource information system and administrative efficiency Teaching hospitals in Port Harcourt, Rivers State. The specific objectives are to:

i. Examine the relationship between function automation and task duration of the teaching hospitals in Port Harcourt, Rivers State.
ii. Determine the relationship between function automation and error rate of the teaching hospitals in Port Harcourt, Rivers State.
iii. Examine the relationship between system usage and task duration of the teaching hospitals in Port Harcourt, Rivers State.
iv. Determine the relationship between system usage and error rate of the teaching hospitals in Port Harcourt, Rivers State.

Research Questions

The following research questions were given in the study:

i. What is the relationship between function automation and task duration of the teaching hospitals in Port Harcourt, Rivers State?
ii. How does function automation relate to error rate of the teaching hospitals in Port Harcourt, Rivers State?
iii. How does system usage relates to task duration of the teaching hospitals in Port Harcourt, Rivers State?
iv. What is the relationship between system usage and error rate of the teaching hospitals in Port Harcourt, Rivers State?

Research Hypotheses

The following research hypotheses were stated and tested in this study:

H_{o1}: There is no significant relationship between function automation task duration of the teaching hospitals in Port Harcourt, Rivers State.

H_{o2}: There is no significant relationship between function automation and error rate of the teaching hospitals in Port Harcourt, Rivers State.

H_{o3}: There is no significant relationship between system usage and task duration of the teaching hospitals in Abia State.

H_{o4}: There is no significant relationship between system usage and error rate of the teaching hospitals in Port Harcourt, Rivers State.

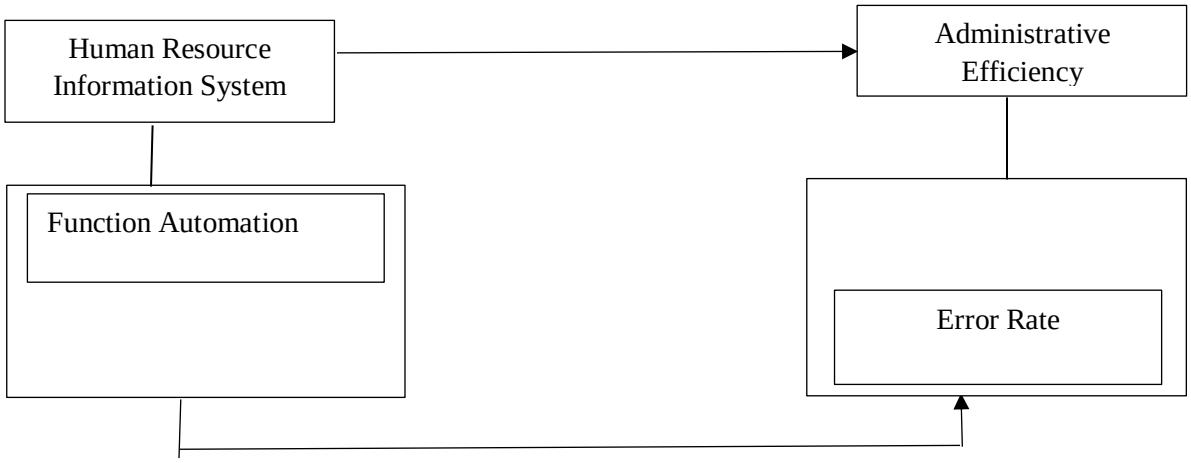

Figure 1: A conceptual framework showing the relationship between human resource information system and administrative efficiency Teaching hospitals in Port Harcourt, Rivers State **Source**: Adapted from Kovach et al. (2002); Laudon & Laudon (2020); and Ojo & Adenike (2023).

Review of Related Literature

Conceptual Review

Human Resource Information System (HRIS)

The term "Human Resource Information System" (HRIS) refers to the use of software and digital platforms to handle HR tasks like hiring, payroll, keeping personnel data, training, and evaluating performance. HRIS combines diverse HR tasks into one system, which makes it easier to manage data, make decisions, and plan the workforce accurately. HRIS is crucial in the health industry, especially in teaching hospitals where human capital is a key resource. It helps keep track of a lot of staff information in a way that is easy to locate and use. The USAID-funded HRIS project in Nigeria has made State Health Workforce Registries stronger, giving HR managers real-time data to help them make decisions about hiring, deploying, and training (Banyan Global, 2024). But using HRIS in Nigerian healthcare settings is still not consistent. This is mostly because of broken data systems and poor infrastructure, which make it difficult to use data in real time and make the system less useful for making decisions (Banyan Global, 2024). For teaching hospitals in Nigeria, HRIS is a way to navigate around problems that come with keeping information on paper, like losing files and not being able to quickly update staff records. By digitising HR tasks, managers can keep an eye on how well their employees are doing, track attendance, and plan for the future of the workforce more effectively. This makes the HR process more open, holds people more accountable, and helps the hospital reach its aim of providing timely, high-quality health care.

Function Automation

Function automation in HRIS is using automated procedures to do operations that people do repeatedly, like processing payroll, managing leave, scheduling employees, and coordinating training. Automating these tasks makes the work of the HR department less stressful, cuts down on mistakes made by people, and makes sure that HR tasks are done more promptly and consistently ((Kavanagh & Johnson, 2023; Strohmeier, 2023). This lets HR experts focus on

important responsibilities like planning the workforce and taking care of workers, which are important for the hospital to run smoothly. Automating these basic operations makes things run more smoothly, cuts down on wait times, and helps businesses follow labour laws (HRPayHub, 2024). Even though automation has numerous benefits, it is often held down by problems including a lack of ICT infrastructure, a lack of digital literacy, and a reluctance to change (Tursunbayeva et al., 2017; Bardhan et al., 2025. These factors can hinder the long-term adoption of HRIS and reduce its effectiveness. Automation helps HR departments manage a vast and diverse group of employees, such as doctors, nurses, interns, and administrative personnel. It also accelerates the process. For example, automated payroll systems safeguard that salaries are paid on time and correctly, while digital scheduling systems make sure that staff is used most effectively and conflicts are less likely to happen. This process not only makes employees happier, but it also makes sure that patient care isn't affected by staffing problems.

System Usage

System usage is the level to which hospital workers actively use digital tools like Human Resource Information Systems (HRIS) in their regular work. Staff training, ICT literacy, infrastructure availability, and organisational support are some of the most important things that affect how well these systems are used (Laudon & Laudon, 2022; Strohmeier, 2023). Even if an HRIS has great features, it may not work as well as it could because users don't know how to use it, enforcement is weak, or the institution is against it (Tursunbayeva et al., 2017). For example, research has revealed that health professionals in Nigerian tertiary institutions can use electronic systems, but they don't because they aren't trained well enough, there aren't any policies, and they don't want to use new technologies (Onyema et al., 2022). This means that just having the system available doesn't mean it will work well. For it to work well, it needs to be used consistently, with the help of rules and adequate training. When HRIS is utilised often and well, it makes sure that staff records are correct, training programmes are tracked, and reports are made on time. All these things make administration more efficient (Kavanagh & Johnson, 2023; Josiah et al., 2024). On the other hand, hospitals can't get the most out of automation if they don't use it properly or consistently, which wastes money and keeps previous inefficiencies (Egwudo & Eze, 2025). To get the most out of HRIS, hospitals need to increase user training, offer technical assistance, and get management's commitment. This will help with better planning of the workforce, smoother workflows, and better patient support services.

Administrative Efficiency

Administrative efficiency means that an organisation can run its business with as little wasted time, money, and resources as possible while getting the most done. It includes making decisions quickly, keeping correct records, and managing the staff well. In healthcare settings, good administration is very important since delays or inefficiencies can have a direct impact on the quality of patient care and the overall functioning of the facility. Inefficiencies such as manual payroll processing, delays in HR paperwork, and disconnected administrative processes make it much harder for Nigerian health institutions to offer services (HRPayHub, 2024). Strengthening the use of HRIS in the health sector, including teaching hospitals, is likely to make administration more efficient by improving data management and automating processes, which will lead to better health outcomes. Administrative problems, including late pay cheques, bad record-keeping for workers, and slow decision-making, are common at teaching hospitals in Nigeria (Banyan Global, 2024). If you use HRIS correctly, you may make your administration more efficient by making

sure that data is entered correctly, that records are always available, and that resources are used wisely. Such efficiency makes workers more motivated, lowers operational expenses, and improves service delivery. All these things make the hospital's position in medical education, research, and patient care stronger.

Task Duration

Task duration is the amount of time it takes to do certain administrative tasks, such as updating employee information, processing payroll, or making reports. In traditional manual systems, tasks take longer because of paperwork, doing the same thing twice, and mistakes made by people (Laudon & Laudon, 2022). Implementing Human Resource Information Systems (HRIS) greatly shortens the time it takes to complete tasks by automating repetitive tasks and making it easier to get to accurate data quickly (Kavanagh & Johnson, 2023). HRIS frees up valuable administrative resources for more strategic activities, which is especially advantageous for teaching hospitals in Nigeria. Shorter task times enhance productivity and reduce paperwork delays. For instance, HRIS can make payroll and attendance records that are correct in minutes, but manual systems take days to do the same thing (Strohmeier, 2023). As a result, hospital management can use the time they saved for other important things, such initiatives to help staff grow or better patient care services (Oladipo & Adebayo, 2023).

Error Rate

The error rate shows how often mistakes happen when doing administrative chores, such as making mistakes on payroll, keeping the wrong staff records, or giving people the wrong jobs. High error rates hurt faith in the administration and make workers less happy and productive. HRIS reduces mistakes by automating data entry, adding validation features, and making sure that reports are always the same. This eliminates rid of a lot of the human error that comes with doing things by hand. The Kogi State Specialist Hospital in Lokoja has begun using electronic health record (EHR) technologies. Staff reported a significant decrease in errors, with 82.9% recognising a reduction in administrative mistakes—such as decreased transcription, paperwork, and administrative expenses—subsequent to the system's implementation (Adedoyin et al., 2020). The study focused on EHR rather than HRIS specifically; however, the results show that HRIS-equipped workplaces could also see similar benefits in terms of reducing errors. When Nigerian teaching hospitals use well-designed HRIS automation, they could experience big increases in accuracy and operational reliability since they rely on accurate payroll, credential tracking, and performance documentation. To keep staff pay, training records, and workforce planning accurate, teaching hospitals need to lower their error rates. For example, mistakes in payroll can make employees unhappy, and mistakes in recordkeeping can generate problems with the law. By using HRIS, hospitals can ensure that administrative duties are done more accurately. This builds trust among employees, cuts down on complaints, and eventually improves service delivery.

Technology Acceptance Model (TAM)

Davis's Technology Acceptance Model (TAM) (1989). The Technology Acceptance Model (TAM) says that two main perceptions affect how well people embrace and use technology: perceived utility (how much a person thinks the system will help them do their work better) and perceived ease of use (how easy the system is to use). The model is very important for teaching hospitals because staff typically oppose adopting HRIS because they don't know much about ICT, haven't had enough training, or the infrastructure isn't good enough. Healthcare managers and staff

are more likely to utilise an HRIS in their everyday work if they think it is both beneficial (for example, it cuts down on payroll mistakes, makes record-keeping easier, and helps people make decisions quickly) and easy to use. This directly makes administration more efficient by cutting down on delays, mistakes, and unnecessary steps in HR processes that are necessary for providing good healthcare.

Empirical Review

Numerous empirical studies have investigated various facets of human resource practices and administrative efficiency at teaching hospitals, especially in Port Harcourt. For example, Isaruk and Dike (2025) investigated how health records management systems (HRMS) affect patient satisfaction at the University of Port Harcourt Teaching Hospital (UPTH). The research examined 227 outpatients, yielding 198 valid replies analysed by structured questionnaires and interviews. Findings found that paper-based record systems still dominate at UPTH, adding to inefficiency and patient unhappiness. The study advocated for the implementation of electronic health records and staff training; however, it failed to precisely assess the impact of HRIS adoption on administrative efficiency metrics, such as error rates or job completion time, hence creating a research gap.

Isaruk and Dike (2024) investigated the impact of waiting time on patient satisfaction at UPTH. Utilising a sample of 227 patients from six departments, the researchers implemented a cross-sectional survey methodology and Pearson correlation to examine correlations. The findings demonstrated that extended waiting periods markedly diminished patient satisfaction, primarily due to substandard record-keeping systems and insufficient staffing. The study emphasised the impact of record management inefficiencies but did not evaluate HRIS adoption as a direct contributor to administrative efficiency; hence, it identified a need for more research in this area.

Ejumudo, Adogbeji, and Ejumudo (2024) examined reward systems and employee performance at UPTH. The study employed survey methodologies and Spearman's rank correlation with a sample of 92 respondents to demonstrate a substantial positive link between rewards (promotions and incentives) and employee performance. The results indicated that suitable HR procedures improve employee dedication and service provision. The study focused on HR practices instead of HR technologies, neglecting to investigate how HRIS could enhance incentive administration and increase administrative efficiency.

Tursunbayeva, Pagliari, Bunduchi, and Franco (2017) conducted a systematic evaluation of HRIS in healthcare organisations at the global level. After looking at 68 articles, the authors observed that HRIS research in healthcare is not well organised, doesn't have a clear theory, and doesn't always have strict assessment. While numerous studies indicated advantages such as enhanced payroll accuracy and record maintenance, persistent implementation problems, including inadequate interoperability and restricted training, were prevalent. The analysis highlighted the absence of empirical evidence explicitly correlating HRIS utilisation to quantifiable outcomes, particularly in low- and middle-income nations.

Together, these studies demonstrate that while issues in records administration, staffing, and HR practices are well reported in Port Harcourt teaching hospitals, no empirical study has directly investigated the impact of HRIS on administrative efficiency. This gap highlights the significance

of the current study, which aims to assess the impacts of HRIS aspects, including function automation and system utilisation, on administrative outcomes such as reaction time and mistake mitigation.

Methodology

The cross-sectional survey was used in this study. The accessible populations comprise of 325 HR and administrative staff, ICT staff, department heads, and a few healthcare workers who utilise HRIS directly in teaching hospitals, within Port Harcourt, Rivers State. A sample of 175 was derived using krejcie and Morgan (1970) table. The primary data was obtained using a well-structured questionnaire. The independent variable, human resource information system (HRIS), was operationalized using two dimensions: function automation and system usage. Each construct was measured with a set of five items. For instance, function automation was assessed with five items (e.g., HRIS automates payroll processing accurately and on time). Similarly, system usage was measured with five items (e.g., I regularly use HRIS to update staff records). The criterion variable, administrative efficiency, was measured using two dimensions: task duration and error rate. Task duration was assessed with five items (e.g., HRIS has reduced the time it takes to process staff records). Error rate was also measured with five items (e.g., Payroll errors have significantly reduced since the introduction of HRIS). Face and content validity were used to determine the validity of the instrument used in this investigation. The reliability was determined using Cronbach's Alpha. Cronbach's Alpha reliability level of 0.7 was used in the investigation. Values above 7.0 are considered composite reliable. Spearman's rank correlation analyses were used for the analysis.

Results and Discussion

175 questionnaires were distributed, but only 172(98.2%) copies were returned, and this constitutes the valid questionnaire. The hypotheses test is undertaken at a 95.5% confidence interval, and the decision rule is stated below.

Where $P < 0.05$ = Reject the null hypotheses

Where $P > 0.05$ = Accept the null hypotheses

Table 1: Correlations Between Function Automation and Dimensions Of Administrative Efficiency

			Function Automation	Task duration	Error Rate
Spearman's Rho	Function Automation	Correlation Coefficient	1.000	.815**	.825**
		Sig. (2-tailed)	.	.000	.000
		N	172	172	172
	Task duration	Correlation Coefficient	.815**	1.000	.785**
		Sig. (2-tailed)	.000	.	.000
		N	172	172	172
	Error Rate	Correlation Coefficient	.825**	.785**	1.000
		Sig. (2-tailed)	.000	.000	.
		N	172	172	172

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Output, 2025.

Function Automation and Task Duration: As shown in Table 1, the Spearman's rho value is **0.815** (p = 0.000), which is less than the significance threshold of 0.05. The coefficient of determination (r^2) is **0.664**, indicating that approximately 66.4% of the variation in task duration can be explained by function automation. Based on these results, the null hypothesis (Ho_1) is rejected, and the alternative hypothesis (Ha_1) is accepted. This indicates a **significant and positive relationship** between function automation task duration.

Function Automation and Error Rate: Table 1 reveals a Spearman's rho value of **0.825** (p = 0.000), which is also below the alpha level of 0.05. The r^2 value of 0.681 suggests that 68.1% of the variance in error rate is attributable to function automation. Consequently, the null hypothesis (Ho_2) is rejected in favour of the alternative hypothesis. This confirms a **strong and positive relationship** between Function automation and error rate.

Table 2: Correlations between System Usage and the Dimension of Administrative Efficiency

			System Usage	Task duration	Error Rate
Spearman's rho	System Usage	Correlation Coefficient	1.000	.830**	.810**
		Sig. (2-tailed)	.	.000	.000
		N	172	172	172
	Task duration	Correlation Coefficient	.830**	1.000	.775**
		Sig. (2-tailed)	.000	.	.000
		N	172	172	172
	Error Rate	Correlation Coefficient	.810**	.775**	1.000
		Sig. (2-tailed)	.000	.000	.
		N	172	172	172

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Output, 2025.

System Usage Task Duration: According to Table 2, the Spearman's rho value is **0.830** (p = 0.000), which is below the significance level of 0.05. The coefficient of determination (r^2) is 0.689, indicating that 68.9% of the variation in task duration is explained by system usage. Given this result, the null hypothesis (Ho_3) is rejected, and the alternative hypothesis (Ha_3) is accepted. This demonstrates **a strong and significant positive relationship** between system usage task duration.

System Usage and Error Rate: As shown in table2, the Spearman's rho value is **0.810** (p = 0.000), which is less than the 0.05 significance level. The r^2 value is 0.656 indicating that system usage accounts for 65.6% of the variation in error rate. Based on this evidence, the null hypothesis (Ho_4) is rejected in favour of the alternative hypothesis. This suggests that there is a strong **significant and positive relationship** between system usage and error rate.

Discussion of Finding

The findings of this study offer compelling evidence that the human resource information system (HRIS) markedly improves administrative efficiency in teaching hospitals located in Port Harcourt. The correlation analysis demonstrated that both dimensions of HRIS—function automation and system utilization—exhibited a positive and substantial relationship with

indicators of administrative efficiency, including task duration and error reduction.

The results indicate that function automation exhibits a substantial positive correlation with task duration ($r = 0.815$, $p < 0.01$) and error rate ($r = 0.825$, $p < 0.01$). This means that automating HR tasks like payroll processing, managing leave, and preserving personnel records can help speed up service delivery and cut down on administrative bottlenecks. This finding corroborates previous research, including the work of Kariuki and Omwenga (2016), which demonstrated that HRIS automation reduced delays and enhanced efficiency in Kenyan public hospitals.

In the same way, system use was substantially linked to both task duration ($r = 0.830$, $p < 0.01$) and mistake rate ($r = 0.810$, $p < 0.01$). This shows that using HRIS systems consistently and effectively makes HR processes more accurate and reliable, which cuts down on expensive administrative mistakes. These results corroborate the assertions of Tursunbayeva et al. (2017), who posited that elevated system adoption rates correlate with enhanced organisational performance outcomes in healthcare institutions.

The study shows that teaching hospitals in Port Harcourt that use HRIS correctly and adopt it see big gains in how well they run their businesses. The results indicate that function automation and system use together account for 65% to 69% of the differences in efficiency indicators. This supports the Technology Acceptance Model (Davis, 1989), which says that how useful and easy a system is to use determines how well it works. The results also indicate that regular staff training, technical support, and system upgrades are necessary to maintain productivity improvements. This conclusion is because problems like system downtime or low ICT literacy could lessen the benefits of HRIS.

Conclusion

This study investigated the impact of human resource information systems (HRIS) on administrative efficiency in teaching hospitals located in Port Harcourt, Rivers State. The findings indicated that HRIS, evaluated by function automation and system utilisation, had a substantial positive influence on response time and error mitigation. Function automation helped speed up tasks and decrease administrative bottlenecks, while using the system correctly improved accuracy and cut down on mistakes in HR activities. These data collectively confirm that the use of HRIS is a crucial catalyst for enhancing efficiency in healthcare administration. In conclusion, teaching hospitals that completely integrate and use HRIS are better able to improve service delivery, cut down on operational inefficiencies, and boost their overall administrative performance. But to keep these benefits, we need to keep spending money on staff training, system updates, and ICT infrastructure to deal with problems like technical problems and low digital literacy. The study adds to what we know by using real data from Nigerian teaching hospitals to show that HRIS is an important tool for improving administration in the healthcare field.

Recommendations

1. Teaching hospitals should expand the use of automated HR processes, such as payroll, recruitment, and attendance tracking, to minimise administrative delays. Automation will reduce manual workload, improve task duration, and ensure faster service delivery to staff and patients.

2. Management should invest in reliable HRIS software with in-built error detection and validation features. Regular system audits and updates should also be conducted to ensure accuracy in HR records, payroll, and other sensitive data, thereby minimising costly errors.
3. Hospitals should prioritise staff training and capacity-building programs to enhance HRIS usage competencies. When users are confident and skilled in operating the system, task completion times are shortened, and overall administrative responsiveness is improved.
4. Hospital administrators should mandate the consistent use of HRIS in all departments and discourage the use of manual processes. Standardising system usage and ensuring uniform data entry practices can significantly reduce errors, leading to higher efficiency and reliability in hospital administration.

Abstract
The purpose of the study was to examine the effect of Green technology on the sustainability of chain stores in Cross River State. The specific objectives were to: examine the effect of social technology on sustainability of chain stores; investigate the effect of economic technology on sustainability of chain stores; examine the effect of cultural technology on sustainability of chain store. The Survey research design was employed in the study. Data were primarily sourced using questionnaire instrument. The study employed multiple regression statistical tool. Based on the empirical results, it was revealed that social technology has a negative significant effect on sustainability of chain stores. Economic and cultural technology has positive significant effects on sustainability of chain stores. The study recommended that education and community involvement

should be stable so as to promote the overall goal of sustainability. Governments should play an important role in fostering green technology adoption through policy and regulation.

Keywords: *Green technology, social technology, economic technology, cultural technology, sustainability, chain stores.*

Introduction

Green technology is a broad phrase that refers to a field of fresh, creative ways to make everyday adjustments that are more environmentally friendly. It is produced and used with consideration for the environment and natural resources. It is intended as a substitute for fossil fuels as a source of technology that causes less harm to the health of people, animals, and plants, as well as to the environment. Green technology is meant to lessen the waste and pollutants that are produced during production and use. Also, it is referred to as clean technology and environmental technology Although it can be challenging to precisely identify which fields fall under the purview of green technology, it is safe to state that " Green technology is the development and application of products, equipment, and systems used to conserve the natural environment and resources, which minimizes and reduces the adverse effects of human activities." The requirements of society should be met by this technology in ways that won't harm or deplete natural resources in the long run.

Green technology can be summed up as technology that satisfies current requirements while not interfering with the ability of future generations to satiate their own needs. According to Elliot (2023) environmental sustainability indicates that natural resources should be maintained at a sustainable pace because they are often non-renewable. It suggests preserving, or at the very least not destroying, environmental resources. Development may be livable, equitable, and tolerable if one of these three pillars is weak, but because of how these pillars interact, development as a whole is unsustainable. Green technology is the development and application of products, equipment, and systems used to conserve the natural environment and resources, which minimizes and reduces the adverse effects of human activities. Green technology can be summed up as technology that satisfies current requirements while not interfering with the ability of future generations to satiate their own needs. Environmental sustainability indicates that natural resources should be maintained at a sustainable pace because they are often non-renewable. Economic development is closely linked with the energy development. Most of the world's commercial energy supplies are provided by fossil fuels, with the associated emissions causing global environmental problems. It is feared that not only these levels of energy production and use from current energy sources are difficult to achieve but also unsustainable (World Bank, 2019). Therefore, energy use efficiency needs to be increased to moderate the growth of energy while the contribution from clean energy sources needs to be increased to reduce adverse environmental impacts of energy usage. Green energy offers a promising alternative to traditional energy sources. The fact that renewable energy accounts for only a modest proportion in meeting the world's (commercial) energy demand means that there is a missing link in their potential and their implementation - the barriers in their implementation. These barriers (either financial or non-financial) need to be identified and addressed in order to design innovative policy approaches for the international and domestic financing or renewable energy technologies.

Many individuals may be unaware of the benefits that green technology may have on both our environment and our economy. We can empower individuals and communities to make more sustainable choices in their daily lives by spreading knowledge and advocating the use of green technologies. Another critical factor is the requirement for legislative reforms that encourage and incentivise the deployment of green technologies. Governments have an important role in encouraging and rewarding the adoption of sustainable practices. Tax breaks for green enterprises, rules on emissions and waste management, and subsidies for renewable energy sources are examples of such policies. So, let us all take responsibility for our planet and make conscious choices to support the development and implementation of green technology. This can include supporting policies that encourage investment in renewable energy sources, advocating for sustainable practices in industries such as transportation and agriculture, and using eco-friendly products in our daily lives. Green technology is limited to large-scale initiatives or government policies. It can also be adopted at an individual level through small changes in our daily lives.

Simple actions such as using energy-efficient appliances, recycling, and reducing our carbon footprint can all contribute to a greener future. By being mindful of our choices and making conscious efforts towards sustainability, we can collectively make a significant impact on the environment. Moreover, green technology offers numerous economic benefits as well. It presents opportunities for job creation, particularly in the renewable energy sector, and can lead to long-term cost savings for businesses and households alike. By investing in green technology, we are not only helping the environment but also supporting a more resilient and sustainable economy. It is critical to realize that the shift to a greener future will take time. All individuals, businesses, and governments must put forth persistent effort and devotion. We can, however, create a more sustainable and affluent world for ourselves and future generations by working together and adopting green technologies. The specific objectives were to:

1. examine the effect of social technology on sustainability of chain stores
2. investigate the effect of economic technology on sustainability of chain stores
3. examine the effect of cultural technology on sustainability of chain store

Theoretical Framework

Innovation Diffusion Theory

The innovation diffusion theory was developed by Everett Rogers, a prominent sociologist, and communication scholar. Rogers introduced this theory in his book titled "Diffusion of Innovations," first published in 1962. Over the years, Rogers extensively researched and refined this theory, examining how innovations spread and are adopted among individuals and within social systems. His work laid the foundation for understanding the processes and factors influencing the adoption of new ideas, products, or technologies within societies and organizations. However, in the exploration of business innovation and the performance of manufacturing firms relationship, innovation diffusion theory emerges as a compelling lens through which to understand the dynamics of implementing change and technological innovations within these organizations. At its core, innovation diffusion theory delves into the dissemination and adoption of new ideas or innovations within organizations. It underscores the process through which innovations spread among members of a social system, shedding light on the factors that influence the rate and extent of adoption. This theory offers invaluable insights into the relevance of process analysis, redesign, technology integration, and process monitoring within the context of business

innovation. The theory emphasizes that a clear understanding of the need for change and its potential benefits enhances the likelihood of acceptance and adoption.

Green Technology

Green technology (GT) is a broad term and a field of new innovative ways to make environmental friendly changes in daily life. It is created and used in a way that conserves natural resources and the environment. It is meant as an alternative source of technology that reduces fossil fuels and demonstrates less damage to the human, animal, and plant health, as well as damage to the world. The use of green technology is supposed to reduce the amount of waste and pollution that are created during production and consumption (World Bank, 2019). It is also referred to as environmental technology and clean technology. In fact, the United Nations Environment Programme has reported that investing just 2% of global GDP in green technology could create millions of jobs and significantly boost global GDP. Additionally, green technology can also play a crucial role in reducing poverty and promoting social equity. By providing access to cleaner energy and sustainable resources, it can improve the quality of life for those living in developing countries. This is especially important because these are typically the countries most exposed to the effects of climate change.

However, establishing and employing green technology is not without challenges. The high initial cost of implementing these technologies, which may be prohibitively expensive for developing countries with limited financial resources, is one key hurdle. This is where international engagement and partnerships can assist in bridging the gap and promoting the transfer of sustainable technologies to developing countries. Another concern is the general public's lack of understanding and awareness of green technologies. Many individuals are still uninformed of the potential benefits of green technology and may have misconceptions or reservations about its efficacy. This emphasizes the importance of excellent communication and education in raising awareness and encouraging wider adoption of green technologies. However, despite its many benefits, green technology also faces challenges. The significant upfront expenses associated with implementing green technology solutions are a key problem. As a result, small businesses and poor countries with little resources may face issues (World Bank, 2019).

Governments and international organizations must work together to provide financial assistance and incentives for the adoption of green technologies. Furthermore, green technology is still in its early stages of development, and specific businesses or locations may have restricted possibilities. This emphasizes the significance of continual research and innovation to increase the range of available sustainable technologies. Governments must also promote green technology research and development to foster economic growth. Green technology has revolutionized the way people approach sustainable development. By investing in green technology, communities can reduce their carbon footprint, increase energy conservation, and promote renewable resources. For instance, green technology helps reduce water consumption by implementing efficient water-saving devices, such as sensor-based taps. Similarly, green technology can lead to a reduction in energy consumption by improving a building's overall energy efficiency. In fact, the use of solar panels, wind turbines, and other renewable energy sources has the potential to significantly decrease fossil fuel consumption and mitigate climate change. Installing energy-efficient windows and insulation, for example, can cut energy usage in buildings by up to 30-40%. Additionally, green technology encourages the use of renewable resources, such as solar and wind energy, over

energy generated from fossil fuels. Studies show that solar and wind energy are more cost-effective and sustainable than traditional fossil fuels, and can reduce the reliance on carbon-rich energy sources.

In Ohio, for instance, green energy initiatives have been launched to reduce the state's carbon footprint with businesses like Cogeneration Systems, which helps reduce energy costs while providing energy consumption insights. Other programs such as LEED Green Building Rating Systems assess how "green" a building is by rating its energy efficiency, sustainability, and the use of renewable energy sources (UND, 2020). Ultimately, green technology has proven to be highly beneficial to sustainable development, making it an important investment for communities and businesses to embrace. Another significant benefit of green technology is its positive impact on public health. By reducing air pollution and utilizing cleaner methods for waste management, green technology can improve air quality and reduce health risks associated with toxic contaminants. This not only benefits humans, but it also improves the environment. Furthermore, the use of green technology can create new job possibilities in a variety of areas, including renewable energy, sustainable agriculture, and eco-tourism. This not only helps to stimulate economic growth but also promotes social equity by creating jobs in communities that may have been previously marginalized (UND, 2020).

Sustainable Development

The World Commission on the Environment and Development also known as the Brundtland Commission, in their report, "Our Common Future" introduced and defined the term sustainable development as the process in which the exploitation of natural resources, the allocation of investments, and the process of technological development and organizational change are in harmony with each other for both current and future generations. Based on this context, "sustainability" is considered as a path forward that allows humanity to meet current environmental and human health, economic, and societal needs without compromising the progress and success of future generations (UND, 2020).

Green Technology and Sustainability

The exploration of green technology's impact on sustainable development has been the subject of much debate in recent years. Green technology, also known as environmental technology, is an interdisciplinary field of research and development which seeks to create a better relationship between humanity and the ecosystems we inhabit. In its pursuit of a more sustainable way of living, green technology has generated a variety of opinions and arguments as to its effectiveness. On one end of the spectrum, some view green technology as a cost-effective tool with which to achieve sustainable development (UND, 2018). Conversely, other individuals believe green technology is too costly and will not lead to significant long-term environmental benefits. This essay aims to address the complexity of the topic by examining both sides of the argument to determine whether green technology is the best path forward towards a more sustainable future. Because of its potential to tackle our planet's environmental challenges, green technology has gained a lot of attention in recent years. Green technology's goal is to leverage scientific and technological advancements to prevent negative environmental impacts while fostering long-term growth. Lowering greenhouse gas emissions, conserving natural resources, and finding cleaner, more efficient energy sources are all part of this. The development and implementation of green technology has the potential to significantly mitigate the negative effects of human activities on

the environment, such as climate change, pollution, and resource depletion. By integrating sustainable practices into our daily lives through green technology, we can work towards a more balanced relationship with our planet. Green technology (Greentech) is any technology that is environmentally friendly and rooted in environmental science. It can be applied for various purposes, from energy efficiency and recycling to renewable resources. Examples of green technology include LED lighting, which saves much more energy than traditional incandescent lights, and vertical farming, an innovative agricultural practice which has the potential of solving the food crisis.

Green technology is divided into two areas by the United Nations Framework Convention on Climate Change (UNFCCC): mitigation and adaptation. Mitigation refers to technologies which reduce or avoid the release of greenhouse gases, such as low-carbon hydrogen and biofuels, and carbon capture (Siegle). Adaptation, on the other hand, can be defined as adjustment in nature or human systems in response to GHG emissions. Other green technology examples include plant-based meat, 3D printing, and solar energy, all of which play a substantial role in achieving sustainable development. Green technology is not only beneficial to the environment, but it is also beneficial to business. Green technology has the potential to create new job opportunities and improve economic growth. The International Renewable Energy Agency (IRENA) estimates that the renewable energy sector employed 11 million people worldwide in 2018, with 42 million predicted by 2050.

Furthermore, green technology can save long-term costs for businesses and homes by reducing energy consumption and increasing efficiency. As the world moves toward a more sustainable future, the need for green technologies will grow, creating even more economic opportunities (World Bank, 2020). Another benefit of green technology is that it promotes public health. Traditional fossil fuels, which are used to generate energy, emit pollutants into the atmosphere that are hazardous to human health. Green technology, such as renewable energy sources and electric vehicles, reduces the use of fossil fuels and consequently decreases air pollution. This leads to lower rates of respiratory diseases, cardiovascular issues, and premature deaths caused by air pollution. Moreover, green technology can also enhance food security. With climate change threatening agricultural production, innovative solutions are needed to ensure a stable food supply for a growing population.

Green technology can help address this issue through sustainable farming practices, such as agriculture and hydroponics. Furthermore, the use of plant-based meat alternatives reduces the reliance on traditional livestock farming, which is a major contributor to greenhouse gas emissions. According to a new World Economic Forum and PwC report, if we harness technology innovation, we can make significant progress on two-thirds of the 169 Sustainable Development Goals targets. However, to properly deploy green technology for sustainable development, we must understand the competing discourses of sustainability. Green technology is continually expanding and developing, with new inventions being introduced daily. As a result, qualified experts in the field of green technology are in high demand. This has led to an increase in demand for specialized education and training programs in universities and technical institutes all over the world. Moreover, governments have recognized the importance of investing in green technology as it not only helps in mitigating climate change, but also creates new job opportunities and promotes economic growth (Stern, 2018)

Green technology is a rapidly expanding industry that has the potential to facilitate sustainable development, but questions remain in regards to the environmental and economic accessibility of these technologies. Currently, green technology adoption can be hindered by a combination of high initial costs, a need for consistent maintenance, disparities in accessibility, and potential unintended environmental consequences. For example, the use of sustainable aviation fuel (SAF) has grown in popularity due to its potential for reducing aviation emissions. However, according to a 2019 article, the industry usage of SAF was only 0.01%, significantly lower than the goal of 6% usage by 2020. It is also important to consider, as highlighted by the United Nations Sustainable Development Cooperation Framework (UNSCDF), that individual behavior change is necessary to influence the policy set in place for green technology. This requires education and community involvement to promote the overall goal of sustainability. Furthermore, by reducing carbon emissions, green technology can alleviate global climate change. Renewable energy sources such as solar, wind, and hydropower have the potential to drastically reduce greenhouse gas emissions that contribute to climate change.

Furthermore, implementing sustainable practices in industries such as transportation, construction, and agriculture can also contribute to reducing carbon emissions. This not only benefits the environment, but also has economic advantages by decreasing reliance on non-renewable resources and potentially creating new job opportunities in green technology industries. However, it is crucial to ensure that these benefits of green technology are accessible to all communities, especially those who may have been marginalized or disproportionately affected by climate change.

Environment

The concept of "environmental justice" comes into play here. Environmental justice advocates for equal treatment and participation in environmental decision-making for all people, regardless of race, income, or geography. This involves dealing with any potential negative implications of green technology implementation. The difficulty therefore becomes determining how to promote behavioural change to assure the successful application of green technologies. Furthermore, groups such as the World Business Council for Sustainable Development have recognized the significance of business performance and accountability in controlling plastic pollution and circularity opportunities throughout the value chain. Without appropriate performance and accountability frameworks, the full potential of green technology in advancing sustainable development may never be reached. As the world continues to face pressing environmental and economic challenges, the need for sustainable development through green technology becomes increasingly important (Elliot, 2023). However, as previously said, there are still obstacles to the general implementation of these technologies. Aside from worries about cost and accessibility, there is also a lack of expertise and understanding of green technologies.

Education and information dissemination are critical in changing behaviour and generating demand for green technology. This involves teaching people about the advantages of utilizing sustainable aviation fuels and raising awareness about plastic litter and circularity opportunities. Furthermore, governments play an important role in fostering green technology adoption through policy and regulation. For example, tax breaks and subsidies can encourage enterprises to adopt more environmentally friendly practices and technologies. Furthermore, rules that restrict the use of single-use plastics or encourage recycling can have a big impact on minimizing plastic pollution.

Collaboration is also essential for accelerating the general adoption of green technology. Partnerships between governments, businesses, and individuals to produce new solutions and strategies for sustainable development are examples of this. It also involves collaboration between different industries to share knowledge and resources, as well as working with local communities to ensure that green technology is accessible and beneficial for all. In addition to addressing current challenges, it is also important to continue investing in research and development for green technology.

This includes developing new and improved forms of renewable energy, as well as finding ways to make existing technologies more efficient and affordable. By continuing to invest in research, we can ensure that the future of green technology is constantly evolving and improving. The use of green technology in the pursuit of sustainable development is a complex and multifaceted issue. While green technology can be seen as the key to unlocking a more sustainable future, there are also concerns that it may be too costly, inefficient, difficult to implement, or open to abuse. Nonetheless, green technology is indispensable in resolving the climate crisis, and if properly managed it can play a critical role in achieving more sustainable human societies (UND, 2020).

It is vital that the true potential of green technology is effectively harnessed and wielded for our collective benefit, while always keeping in mind the need to protect our environment and the planet. To create a better world, we must work together to find ways to use green technology to enhance, rather than damage, our environment With the right strategies in place, green technology can play a critical role in helping us achieve a more sustainable and equitable future. By promoting and investing in green technology, we can help to create a cleaner, healthier, and more sustainable environment for future generations. Allow green technology to continue to collaborate and create as an ally in the battle against climate change and environmental degradation. We can have a positive impact on our world and ensure a brighter future for all if we work together. So let us keep pushing for progress, and never forget the immense potential of green technology to drive us towards a greener and more sustainable world. Let us embrace it as a powerful tool in our arsenal, and use it to create positive change for both people and planet. The future is in our hands, let us make it a green one. By harnessing the power of green technology, we can work towards achieving a balance between economic growth and environmental preservation. We must prioritize investments in research and development to continue to improve and advance green technology, making it more accessible and affordable for all. This will require cooperation and collaboration from governments, businesses, and individuals alike. One important consideration is the requirement for education and knowledge about the advantages of green technology.

Empirical Literature

Empirical studies have extensively examined on this topic in Nigeria and other countries. Awolusi and Atiku (2019) investigated technology and profitability in the Nigerian oil and gas industry: The mediating influence of operational performance. The aim of this study was to operationalize and test a conceptual model to measure the effect of technology on profitability in the Nigerian oil and gas industry. Based on a framework from Al-Mashari and Zairi, these objectives were achieved using the following procedures: reliability and validity analysis, factor analyses (exploratory factor analysis-EFA and confirmatory factor analysis-CFA) and Structural Equation Modelling (SEM). The model contrived therefore confirmed the positive influence of BPR on profitability, as well as the mediating influence of operational performance in the Nigerian Oil and Gas industry.

Specifically, the structural model shows the positive effect of organizational structure and IT Infrastructures on both profitability and operational performance. However, SEM failed to establish the relationship between management competence and support and profitability. The study is expected to enhance the adoption and successful implementation of BPR programmes in the oil and gas industry.

Muema (2019) conducted a study on technology and organizational performance of selected commercial banks in Nairobi city County Kenya. The main study objective was to establish influence of business process reengineering practices on organizational performance of commercial banks in Nairobi City County, Kenya. Specifically, the research sought to initiate the impact of leadership change, customer focus, information technology and innovation on organizational performance of Commercial banks in Nairobi City County, Kenya. The study scope was limited to Nairobi County commercial banks. The study focused on 43 commercial banks in Nairobi city County, Kenya. A descriptive research design was utilized for the study. A population of 1020 staff from the 43 commercial banks at Nairobi headquarters in Kenya was used, where a sample of 278 staff was selected. The study utilized primary information. The data gathered was analysed using inferential and descriptive statistics. Multiple linear regressions were used. The study revealed that leadership change maintaining all the other factors constant would positively change commercial bank performance. Customer focus had a significance influence on commercial banks performance.

Methodology

The study employed survey design and primary sources of data. Questionnaire instrument was used to collect useful information on Green technology and sustainability of chain stores. Cochrane (1977) formula was used to determine the sample since the population of the study was unknown. The formula is stated below:

$$n = \frac{Z^2pq}{e^2}$$

where

n is the sample size.

z is the selected critical value of the desired confidence level.

p is the estimated proportion of an attribute that is present in the population.

$q = 1 - p$ and

e is the desired level of precision

To calculate a sample size of a large population whose degree of variability is not known, it is assumed that the maximum variability is equal to 50% (p =0.5) at 95% confidence level with ±5% precision.

$$n = \frac{1.962*0.5*0.5}{0.052}$$

$$n = 384.16$$

$$\approx 384$$

Therefore, the sample size for the study is 384

Ordinary least square of multiple regression statistical tool was used. The model of the study stated thus:

Y = f(x1 x2)
Where
Y = Dependent variable
X = Independent variables
The equation is stated in OLS model
SUS = b0 + b1ST + b2ET + b2CT + Ut
Where b0 = Regression constant, b1-b3 = Regression parameters, SUS = Sustainability, ST = Social technology, ET= Economic technology, CT = Cultural technology, Ut = Statistic error term.

Analysis of Results
Test of Hypotheses
H1: Social technology has no significant effect on sustainability of chain stores in Cross River State.

Test statistic: Multiple Linear Regression Analysis.
Decision Criteria: Accept the alternative hypothesis if (P <.05) and reject the null hypothesis. The results revealed that the relationship between social technology and sustainability of chain stores in Cross River State is 0.542 per cent, which indicates strong degree of relationship. The coefficient of determination (R2) of 0.294 indicates that up to 29 per cent of the variability in the dependent variable is accounted for by the independent variable. This implies that a unit change in conduct of the social technology will sustain chain stores by up to 29 per cent when other factors are held constant. Also, considering that t-test = -2.550; P<0.0; the results show that social technology has a negative significant effect on sustainability in Cross River State. We therefore, reject the null hypothesis, accept the alternative hypothesis and concluded that social technology has negative significant effect on sustainability of stores.

Test Of Hypothesis Two
H2: Economic technology has no significant effect on sustainability of chain stores in Cross River State.

Test Statistic: Multiple Linear Regression Analysis.
Decision criteria: Accept the alternative hypothesis if (P <.05) and reject the null hypothesis. The results revealed that the relationship between economic technology and sustainability of chain stores in Cross River State is 0.542 per cent, which indicates strong degree of relationship. The coefficient of determination (R2) of 0.294 indicates that up to 29 per cent of the variability in the dependent variable is accounted for by the independent variable. This implies that a unit change in conduct of the economic technology will sustain chain stores by up to 29 per cent when other factors are held constant. Also, considering that t-test = 1.344; P<0.0; the results show that Economic technology has a positive and non- significant effect on sustainability of chain stores in Cross River State. We therefore, reject the alternative hypothesis, accept the null hypothesis and concluded that economic technology has positive and non-significant effect on sustainability of chain stores.

Test Of Hypothesis Three
H3: Cultural technology has no significant effect on sustainability of chain stores in Cross River State.

Test Statistic: Multiple Linear Regression Analysis.
Decision Criteria: Accept the alternative hypothesis if (P <.05) and reject the null hypothesis.
From Table 1 to 3, the results revealed the relationship between cultural technology and sustainability of chain stores in Cross River State is 0.542 per cent, which indicates strong degree of relationship. The coefficient of determination (R2) of 0.294 indicates that up to 29 per cent of the variability in the dependent variable is accounted for by the independent variable. This implies that a unit change in conduct of the cultural technology will improve sustainability of chain stores by up to 29 per cent when other factors are held constant. Also, the f-statistic is used to test for the significant of such good or tight fit. The model reports on effectively high f-statistic value of 41.008 which when compared with the table value. Also, considering that t-test = 8.204; P<0.0; the results show that cultural technology has a positive significant effect on sustainability of chain stores in Cross River State. We therefore, reject the null hypothesis, accept the alternative hypothesis and concluded that cultural technology has a positive significant effect on sustainability in Cross River State.

a. Dependent Variable: SUS

Summary of Findings

1. Social technology has negative significant effect on sustainability of stores.
2. Economic technology has positive and non-significant effect on sustainability of chain stores.

3. Cultural technology has a positive significant effect on sustainability in Cross River State.

Conclusion

Green technology is a necessary step towards building a better and more sustainable world. By implementing it in our lives and supporting its development, we can protect the environment, create economic opportunities, and ensure a brighter future for all. So, for the benefit of both current and future generations. When it comes to sustainability, different locations and communities may have distinct demands and resources. Prioritizing localized solutions and involving local populations in decision-making are critical. By considering cultural, social, and economic factors, we can ensure that green technology is implemented in a way that benefits everyone and leaves no one behind.

Recommendations

The following recommendations were proffered thus:

1. Green technology is a rapidly expanding industry that has the potential to facilitate sustainable development. Therefore, education and community involvement should be stable so as to promote the overall goal of sustainability.
2. There should be effective sustainable practices in industries such as transportation, construction, and agriculture can also contribute to reducing carbon emissions.
3. Governments should play an important role in fostering green technology adoption through policy and regulation.

Abstract
This study investigated the relationship between emotional resilience, ethical commitment, and counterproductive work behavior among civil servants in Rivers State, Nigeria. Counterproductive work behavior, including absenteeism, lateness, insubordination, and resource misuse, continues to undermine organizational efficiency and public trust despite existing reforms. Using a descriptive survey design, data were collected from a representative sample of civil servants across selected ministries, departments, and agencies. Analyses were conducted using descriptive statistics and inferential techniques, including correlation and regression analysis, to test the hypothesized relationships. Findings reveal that emotional resilience is negatively associated with counterproductive work behavior, indicating that employees who effectively manage stress and adapt to challenges are less likely to engage in deviant behaviors. Similarly, ethical commitment demonstrates a strong negative relationship with counterproductive work behavior, suggesting that adherence to moral standards and organizational codes promotes accountability and reduces workplace deviance. The study concludes that both psychological resources and ethical orientation are critical in mitigating counterproductive behaviors in the public sector. Practical implications include the need for resilience-building programs and strengthened ethical orientation initiatives to enhance service delivery, employee productivity, and institutional credibility.

Keywords: *Emotional Resilience, Ethical Commitment, Counterproductive Work Behavior, Civil Service, Public Sector Efficiency*

Introduction

The civil service plays a pivotal role in shaping the governance and socio-economic development of nations, particularly in Nigeria where the bureaucracy constitutes the machinery for implementing public policy. In Rivers State, the civil service is the largest single employer of labor and is regarded as the backbone of government activities, responsible for ensuring continuity, stability, and effective service delivery to citizens. However, the productivity of the civil service

has been consistently undermined by persistent organizational challenges, including inefficiency, corruption, and entrenched counterproductive work behaviors. Scholars have noted that public servants often operate under high stress, resource constraints, and political pressures, which compromise their performance and ethical standing (Afolabi & Laseinde, 2023). In this regard, the ability of workers to adapt positively in the face of adversity, otherwise conceptualized as emotional resilience, has become increasingly important for sustaining efficiency and fostering a culture of accountability in public organizations (Abdullahi, Mohammed, & Salisu, 2022).

Emotional resilience, as a psychological resource, determines how individuals cope with workplace stressors and recover from setbacks without exhibiting negative behavioral outcomes. Employees with high resilience are more capable of maintaining composure, making rational decisions, and avoiding destructive tendencies that undermine organizational goals (Suleiman & Adeoye, 2021). Within the civil service, where public expectations are high and institutional bottlenecks are prevalent, resilience becomes critical for sustaining work engagement and mitigating burnout. In contrast, employees with low resilience may become susceptible to deviant tendencies such as absenteeism, insubordination, and inefficiency, which collectively fall under the umbrella of counterproductive work behaviors. Empirical studies in public administration have revealed that resilience not only supports personal well-being but also reduces the likelihood of engaging in behaviors that harm organizational efficiency (Okereke, Uchenna, & Dike, 2022). Given the evolving complexities of governance in Rivers State, where public servants face increasing pressure to meet the demands of diverse stakeholders, the construct of emotional resilience deserves empirical examination as a determinant of workplace behavior.

Alongside resilience, ethical commitment has been emphasized as a moral compass guiding employees toward behaviors that align with established norms and values. Ethical commitment is reflected in the degree to which civil servants internalize integrity, honesty, fairness, and accountability in the discharge of their responsibilities. In contexts where ethical standards are weakly enforced, counterproductive behaviors thrive, ranging from abuse of office to mismanagement of public resources (Okoro & Ede, 2023). In the Nigerian civil service, multiple reforms such as the Code of Conduct Bureau, public service rules, and anti-corruption frameworks have been introduced to enforce ethical conduct, yet the manifestation of deviant workplace behaviors continues to challenge institutional credibility. Scholars argue that without a strong sense of ethical commitment at the individual level, structural reforms are often insufficient in curbing malpractice (Usman, Ibrahim, & Adamu, 2021). The Rivers State Civil Service, being a microcosm of the national bureaucracy, exemplifies this paradox where institutional rules exist but counterproductive work behaviors remain widespread, necessitating further research into the ethical dispositions of employees.

Counterproductive work behavior, as a criterion variable, captures a range of deliberate or unintentional actions by employees that undermine organizational performance and public trust. These include but are not limited to lateness, absenteeism, misuse of resources, corruption, sabotage, and neglect of duty (Adewale & Olowu, 2023). Such behaviors not only erode efficiency but also distort the perception of the civil service as a credible institution capable of delivering quality services. In Rivers State, citizens often complain about delays, inefficiency, and unresponsiveness in government offices, issues largely traceable to entrenched counterproductive practices. Previous research in organizational behavior has shown that such negative tendencies

are often moderated by psychological resources like resilience and moral frameworks such as ethical commitment (Kelechi, Nwachukwu, & Onyema, 2022). Yet, few studies have integrated these constructs within the specific context of the civil service in Rivers State. Therefore, this study is poised to fill that gap by investigating the relationship between emotional resilience, ethical commitment, and counterproductive work behavior in the Rivers State Civil Service, thereby contributing both theoretically and practically to the discourse on public sector efficiency.

Statement of the Problem

Notwithstanding ongoing reforms, policy frameworks, and regulatory oversight, the Rivers State Civil Service continues to grapple with pervasive counterproductive work behaviors. These behaviors, including absenteeism, lateness, resource mismanagement, insubordination, and deliberate inefficiency, significantly undermine service delivery and erode public trust in government institutions (Adewale & Olowu, 2023). Prior studies have often examined counterproductive behaviors in general organizational settings but rarely integrate psychological and ethical determinants such as emotional resilience and ethical commitment within the context of the Rivers State Civil Service (Kelechi et al., 2022). Consequently, there remains limited empirical evidence on how these constructs influence the tendency of civil servants to engage in behaviors detrimental to organizational efficiency. Furthermore, while resilience and ethical commitment are recognized as critical moderators of workplace deviance in global literature, their interaction in a public sector setting marked by bureaucratic bottlenecks, high workload, and political pressures is largely underexplored. This knowledge gap impedes the design of targeted interventions aimed at reducing counterproductive behaviors and enhancing productivity in the Rivers State Civil Service. Therefore, understanding the relationship between emotional resilience, ethical commitment, and counterproductive work behavior is crucial for improving administrative effectiveness, strengthening public trust, and fostering a culture of accountability.

Objectives of the Study

1. To examine the relationship between emotional resilience and counterproductive work behavior in the Rivers State Civil Service.
2. To investigate the relationship between ethical commitment and counterproductive work behavior in the Rivers State Civil Service.

Research Questions

1. What is the relationship between emotional resilience and counterproductive work behavior in the Rivers State Civil Service?
2. What is the relationship between ethical commitment and counterproductive work behavior in the Rivers State Civil Service?

Research Hypotheses

H_{01}: There is no significant relationship between emotional resilience and counterproductive work behavior in the Rivers State Civil Service.

H_{02}: There is no significant relationship between ethical commitment and counterproductive work behavior in the Rivers State Civil Service.

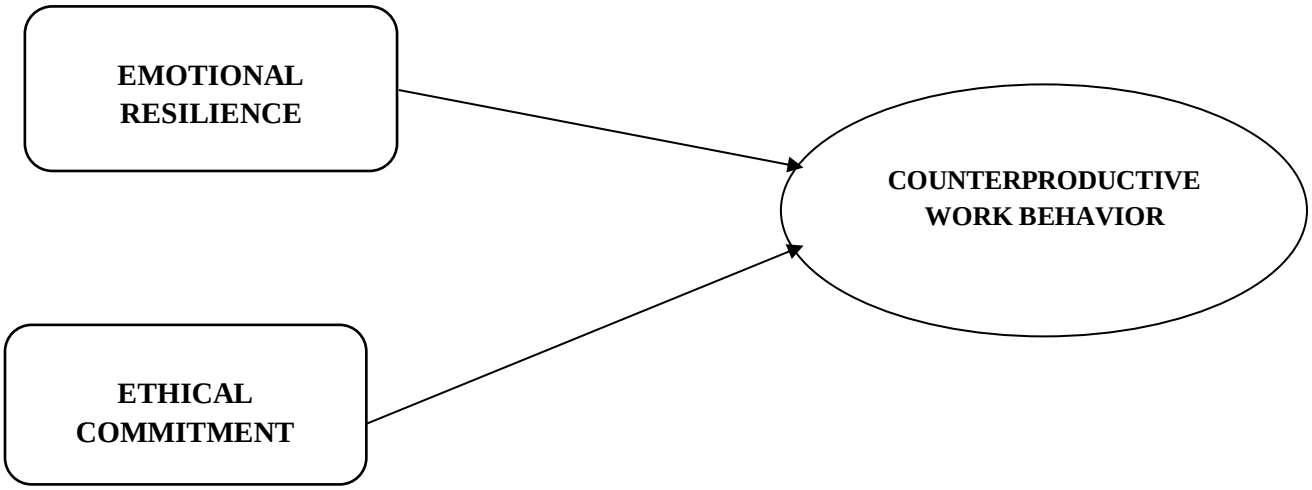

Fig1: Conceptual framework showing Emotional Resilience, Ethical Commitment and Counterproductive Work Behavior in the Rivers State Civil Service.

Literature Review

Theoretical Framework

The study is anchored on the **Conservation of Resources (COR) Theory** and the **Ethical Climate Theory**.

The Conservation of Resources (COR) Theory, developed by Hobfoll (1989), provides a framework for understanding how individuals respond to stress through resource acquisition and preservation. The theory posits that people are inherently motivated to obtain, retain, and protect resources, which may include tangible assets like time and energy, as well as intangible assets such as psychological resilience, skills, and social support. Stress arises not simply from workload or external pressures, but from the threat of resource loss, actual depletion of resources, or failure to gain expected resources after investment. In organizational settings, employees constantly expend physical, cognitive, and emotional resources to meet job demands, making the theory highly relevant. Individuals experiencing resource scarcity are more likely to exhibit maladaptive coping strategies, including withdrawal, reduced effort, interpersonal conflict, or counterproductive work behaviors. Within the Rivers State Civil Service, emotional resilience acts as a key resource that buffers employees against stress from high workloads, bureaucratic challenges, and service delivery pressures. Employees with abundant resources are better positioned to sustain productivity, maintain organizational commitment, and uphold workplace norms. Conversely, resource-depleted employees are prone to disengagement, negative interactions, and behaviors that undermine organizational objectives, highlighting the practical importance of fostering resilience (Abdullahi et al., 2022).

The COR Theory further elucidates how emotional resilience can translate into sustained performance. Resource-rich employees engage in proactive coping strategies such as time management, problem-solving, and seeking social support, which mitigate the effects of stressors. Resilience enables not only recovery from setbacks but also anticipation of potential threats, allowing employees to act preventively. For example, a civil servant facing increased workload may draw on resilience to remain focused, regulate emotions, and prioritize tasks, thereby avoiding errors and conflicts. Employees with chronically depleted resources, however, may perceive routine challenges as overwhelming, leading to irritability, reduced cooperation, and disengagement. Human resource interventions, including training, mentoring, and wellness programs, can bolster employees' resource pools and protect against stress-induced behavioral disruptions. Understanding resource dynamics also helps managers identify employees at risk of depletion and implement timely support mechanisms. In this way, the COR framework integrates individual capacities and organizational responsibilities, showing how cultivating resilience strategically reduces counterproductive work behaviors and enhances overall efficiency in the Rivers State Civil Service.

Ethical Climate Theory

The Ethical Climate Theory, proposed by Victor and Cullen (1988), provides a framework for understanding ethical commitment within organizations. The theory posits that each organization develops a shared set of ethical norms, values, and expectations, which collectively shape employees' moral reasoning and decision-making. A positive ethical climate guides employees in distinguishing right from wrong and encourages alignment with organizational codes of conduct and societal values. Conversely, a weak or ambiguous ethical climate may normalize misconduct, allowing employees to justify unethical behavior or engage in corruption. In public institutions such as the Rivers State Civil Service, a strong ethical climate is critical because organizational effectiveness and service delivery rely on the ethical orientation of employees. Leadership plays a central role in sustaining this climate, as leaders who model integrity and enforce ethical standards reinforce employees' moral expectations. Over time, this creates a self-reinforcing cycle in which ethical behavior is expected, rewarded, and internalized, promoting a culture resistant to deviance. Employees operating in such environments are more likely to consistently uphold ethical standards, even when personal interests or systemic pressures might encourage otherwise.

Within the Rivers State Civil Service, the Ethical Climate Theory helps explain how ethical commitment develops and influences behavior. Public sector employees often face pressures such as political interference, bureaucratic bottlenecks, and limited resources, all of which may create opportunities for unethical conduct. However, when ethical norms are clearly articulated, reinforced, and monitored, employees are better able to resist these pressures and act in the interest of organizational integrity. For example, civil servants who internalize ethical standards are less likely to engage in absenteeism, viewing attendance as a moral obligation tied to public trust. Similarly, the risk of resource mismanagement diminishes when employees perceive that their actions are subject to both moral and organizational scrutiny. Research indicates that cultivating an ethical climate enhances accountability, loyalty, and commitment to organizational goals (Usman et al., 2021). Integrating the Ethical Climate Theory with the Conservation of Resources Theory provides a more comprehensive understanding of workplace behavior by linking psychological resources with moral orientation. Together, these theories show that emotional resilience enables employees to withstand stress, while ethical commitment guides their actions in

line with organizational values, jointly reducing counterproductive work behaviors. This dual-theoretical perspective offers a robust foundation for studying employee behavior in the Rivers State Civil Service.

Conceptual Review

Emotional Resilience

Emotional resilience is defined as an individual's capacity to withstand stress, adapt to challenges, and recover from setbacks while maintaining psychological stability and behavioral effectiveness (Suleiman & Adeoye, 2021). This capacity enables employees to absorb pressures without succumbing to negative outcomes, acting as a buffer against workplace stressors. In organizational settings, resilient employees manage high-pressure demands, maintain focus on tasks, and avoid behaviors that disrupt productivity or workplace harmony. Resilience fosters proactive coping strategies, allowing individuals to confront challenges constructively rather than reactively, thereby reducing the likelihood of counterproductive work behaviors. Additionally, resilient employees demonstrate stronger problem-solving abilities, processing setbacks effectively, identifying alternative solutions, and implementing corrective measures efficiently. Workplace relationships also benefit from resilience, as employees can manage conflicts, communicate clearly, and collaborate despite stressful conditions (Okereke et al., 2022). In the civil service, where bureaucratic bottlenecks, political interference, and heavy workloads are common, resilience is crucial for sustaining operational efficiency. Employees who adapt to systemic pressures without letting stress affect judgment contribute to a stable, reliable workforce, maintaining both ethical standards and professional conduct.

Empirical evidence further underscores the importance of emotional resilience in reducing workplace deviance, showing a negative correlation between resilience and counterproductive work behavior (Abdullahi et al., 2022). Highly resilient employees are less likely to engage in absenteeism, chronic lateness, sabotage, or other forms of misconduct, as they manage stress effectively and maintain focus on organizational goals. They also exhibit stronger commitment to personal and organizational objectives, sustaining motivation and engaging in proactive problem-solving during challenging circumstances. This commitment reduces the prevalence of deviant practices, as constructive action is prioritized over counterproductive impulses. Resilience also supports adaptability, enabling civil servants to respond positively to policy changes, technological innovations, and procedural reforms without disrupting workflow (Suleiman & Adeoye, 2021). Furthermore, emotional resilience encompasses cognitive and emotional regulation, allowing employees to process stress without compromising ethical judgment or professional responsibility (Okereke et al., 2022). The construct is multidimensional, involving optimism, self-efficacy, and social support, which collectively enhance the ability to resist maladaptive behaviors (Afolabi & Laseinde, 2023). In public sector environments characterized by resource constraints and systemic pressures, resilience serves not only as a personal asset but also as an organizational safeguard, supporting efficiency, ethical conduct, and sustained performance within the Rivers State Civil Service.

Ethical Commitment

Ethical commitment can be defined as the internalized sense of moral responsibility that guides an individual's behavior in accordance with professional standards, institutional codes of conduct, and broader societal norms (Usman et al., 2021). It represents an enduring psychological

attachment to ethical principles, reflecting a personal obligation to act with integrity, fairness, and accountability in the execution of duties. Within organizational contexts, particularly in public institutions such as the Rivers State Civil Service, ethical commitment functions as a key determinant of compliance with regulations and adherence to professional norms. Employees who demonstrate strong ethical commitment are less likely to exploit their positions for personal gain, and are more likely to engage in behaviors that reinforce the values, reputation, and legitimacy of the organization (Okoro & Ede, 2023). This commitment fosters a culture of accountability, transparency, and conscientious decision-making, which collectively reduce the likelihood of counterproductive behaviors, including corruption, neglect of duty, misappropriation of resources, and insubordination. Ethical commitment also enhances employees' capacity to navigate moral dilemmas, as individuals with well-internalized ethical standards are guided by principles rather than expediency when confronted with conflicting interests. In addition, it supports organizational cohesion by creating a shared understanding of acceptable and unacceptable behavior, thereby reducing interpersonal conflicts and promoting trust among colleagues and with the public. Through consistent modeling of ethical behavior by leadership and reinforcement through policies and training, the ethical climate and employees' commitment to it are mutually strengthened. Research indicates that ethical commitment moderates the relationship between organizational pressures and deviant behavior, with employees exhibiting high levels of commitment demonstrating resilience against stressors that might otherwise provoke unethical actions (Usman et al., 2021). In practical terms, ethical commitment acts as both a personal resource and an organizational safeguard, ensuring that employees' decisions align with institutional goals and the public interest. The multidimensional nature of ethical commitment encompasses cognitive understanding of moral standards, affective attachment to ethical principles, and behavioral enactment of ethical choices, all of which contribute to organizational integrity. By fostering ethical commitment, public service organizations can not only reduce instances of counterproductive work behavior but also enhance employee engagement, institutional credibility, and service delivery outcomes. Consequently, examining ethical commitment within the Rivers State Civil Service provides insight into how moral orientation interacts with organizational structures and pressures to shape employee conduct.

Within the Rivers State Civil Service, promoting ethical commitment requires deliberate strategies aimed at cultivating both awareness and practice of ethical standards. Training programs focused on public sector ethics, leadership exemplars who consistently model integrity, and transparent enforcement of institutional regulations serve as critical mechanisms for embedding ethical commitment across all levels of the organization (Okoro & Ede, 2023). Such interventions reinforce the importance of fairness, honesty, due process, and respect for organizational rules, creating a culture in which ethical behavior is expected, recognized, and rewarded. Employees internalizing these standards are more likely to act consistently with organizational objectives, even when faced with challenges such as bureaucratic delays, political interference, or resource scarcity. Furthermore, ethical commitment promotes a sense of personal accountability, motivating employees to consider the broader consequences of their actions on colleagues, the public, and institutional outcomes. It also facilitates moral courage, enabling employees to resist pressures to engage in misconduct or to report unethical practices without fear of retaliation. In tandem with psychological resources such as emotional resilience, ethical commitment provides a comprehensive framework for understanding counterproductive work behaviors. While resilience allows employees to withstand stress and maintain performance under pressure, ethical

commitment guides decision-making toward integrity and lawful conduct. Integrating these constructs into a theoretical model offers a robust approach to explaining how both individual psychological capacities and moral orientations influence workplace behavior, particularly in environments characterized by complex operational and ethical challenges. The combined influence of resilience and ethical commitment thus represents a strategic pathway for mitigating deviance, sustaining organizational productivity, and enhancing public trust in the Rivers State Civil Service.

Counterproductive Work Behavior

Counterproductive Work Behavior (CWB) is broadly defined as voluntary actions undertaken by employees that intentionally or unintentionally harm the organization, its members, or its stakeholders (Adewale & Olowu, 2023). Such behaviors can manifest in a wide range of actions, including absenteeism, lateness, deliberate inefficiency, misuse of organizational resources, sabotage, and engagement in unethical or corrupt practices. The consequences of CWBs are substantial, as they not only impair productivity but also disrupt organizational harmony, weaken team cohesion, and reduce the overall effectiveness of institutional operations. In public sector organizations like the Rivers State Civil Service, CWBs pose significant challenges to the realization of administrative goals, despite the presence of formal regulations, codes of conduct, and oversight mechanisms designed to enforce compliance. Employees' engagement in CWBs often undermines public confidence in the institution, diminishes service delivery quality, and may result in financial and reputational losses for the organization. Beyond direct operational impacts, CWBs also affect the morale of other employees, as individuals may feel demotivated when they perceive unfair workload distribution or witness unethical behavior going unchecked. The complexity of CWBs lies in their multifactorial origins, with individual, organizational, and environmental determinants interacting to influence behavior patterns. Individual factors such as lack of emotional resilience, limited coping skills, low motivation, or weak ethical commitment can predispose employees to engage in deviant actions. Organizational factors, including poor supervision, inadequate communication, insufficient recognition, and ambiguous performance expectations, can exacerbate the likelihood of counterproductive behaviors. Moreover, workplace stress and job insecurity can act as catalysts, compelling employees to prioritize self-preservation over organizational goals. Understanding CWBs through this lens allows for a more nuanced approach to identifying the underlying psychological and moral mechanisms driving such behaviors. Research suggests that employees who are resilient, ethically committed, and supported by a strong organizational climate are less likely to engage in CWBs, highlighting the interplay between personal resources and institutional culture (Kelechi et al., 2022). By conceptualizing CWB as a criterion variable, researchers and practitioners can develop targeted interventions aimed at mitigating workplace deviance, promoting ethical conduct, and enhancing operational efficiency.

In the Rivers State Civil Service, exploring CWBs requires attention to the sociopolitical, bureaucratic, and cultural conditions that shape employee behavior. Public sector employees often operate under complex pressures, including political influence, resource constraints, and procedural bottlenecks, which may create opportunities for deviant practices. CWBs in this setting are not merely isolated individual choices but are influenced by systemic factors such as organizational policies, supervision quality, and ethical norms within departments. For example, weak enforcement of codes of conduct or inconsistent disciplinary practices may embolden some

employees to engage in misconduct, while others may refrain due to fear of accountability or internalized ethical standards. Studying CWBs within this localized context ensures that interventions are both practical and relevant to the unique challenges faced by the civil service in Rivers State. It also allows policymakers to design evidence-based strategies that address the root causes of deviance rather than merely responding to its symptoms. These strategies may include resilience-building programs, ethics training, leadership modeling, and enhanced monitoring mechanisms, all aimed at reducing the incidence of counterproductive behaviors. In addition, understanding the interaction between employee psychological resources, moral orientation, and organizational pressures provides a comprehensive framework for improving performance and sustaining public trust. Investigating CWBs with this multidimensional perspective helps align individual behavior with institutional objectives, fostering an environment where efficiency, integrity, and accountability are reinforced. Consequently, counterproductive work behavior emerges as a crucial criterion variable for empirical research, offering insights into both the determinants of workplace deviance and the mechanisms through which public sector performance can be enhanced.

Emotional Resilience, Ethical Commitment, and Counterproductive Work Behavior

Integrating the constructs of emotional resilience, ethical commitment, and counterproductive work behavior (CWB) provides a comprehensive framework for understanding employee behavior within the Rivers State Civil Service. Emotional resilience and ethical commitment function as critical individual resources that shape how employees respond to workplace demands, stressors, and ethical dilemmas. Resilient employees possess the psychological capacity to manage stress, recover from setbacks, and maintain focus under pressure, thereby reducing the likelihood of engaging in behaviors that compromise organizational goals (Suleiman & Adeoye, 2021; Okereke et al., 2022). Simultaneously, ethical commitment reflects the internalization of moral standards and professional norms, guiding employees to act with integrity, fairness, and accountability, even in the face of systemic pressures or personal gain incentives (Usman et al., 2021; Okoro & Ede, 2023). Together, these constructs provide both a protective and normative mechanism that buffers against engagement in counterproductive work behaviors.

Counterproductive work behavior, encompassing voluntary actions that harm organizational effectiveness or stakeholder interests, represents a critical outcome influenced by the presence or absence of these psychological and moral resources (Adewale & Olowu, 2023). Employees lacking resilience may succumb to stress-induced impulses, leading to absenteeism, inefficiency, or sabotage, while those with weak ethical commitment may rationalize misconduct, misappropriation of resources, or neglect of duty. Conversely, individuals endowed with emotional resilience are better able to regulate stress responses and maintain productive engagement, whereas those with strong ethical commitment consistently align their decisions and actions with organizational values and societal norms. The intersection of these constructs suggests a synergistic effect: resilience provides the capacity to withstand workplace adversity, while ethical commitment ensures that behavioral choices remain morally and professionally guided. Empirical evidence indicates that the combination of high emotional resilience and strong ethical commitment is associated with lower incidences of CWBs, thereby supporting organizational efficiency, accountability, and public trust (Abdullahi et al., 2022; Usman et al., 2021).

Within the premise of the Rivers State Civil Service, understanding this theoretical integration has practical implications for human resource management and policy development. Interventions aimed at enhancing emotional resilience, such as stress management programs, counseling, and professional development, equip employees to cope effectively with the pressures of public sector work. Simultaneously, initiatives that reinforce ethical commitment through ethics training, leadership modeling, and enforcement of codes of conduct strengthen employees' moral orientation, reducing the likelihood of deviance. By situating these constructs within the Conservation of Resources Theory and Ethical Climate Theory, the framework elucidates how both psychological resources and moral standards collectively influence counterproductive work behavior. This dual-theoretical approach emphasizes that mitigating CWBs requires attention not only to individual capacities but also to the organizational environment, including leadership practices, institutional norms, and structural supports. Consequently, the integration of emotional resilience and ethical commitment as antecedents of CWB provides a robust explanatory model, highlighting pathways through which public sector organizations can sustain productivity, enhance ethical standards, and promote a culture of integrity and accountability within the Rivers State Civil Service.

Empirical Review

Empirical studies have highlighted the inverse relationship between emotional resilience and counterproductive work behavior in organizational settings. For example, Suleiman and Adeoye (2021) found that employees with higher resilience scores were significantly less likely to engage in absenteeism or sabotage. Similarly, Usman et al. (2021) demonstrated that ethical commitment is a strong predictor of reduced deviant workplace behaviors, particularly in public institutions. Okereke et al. (2022) reported that civil servants with combined high resilience and ethical commitment exhibited lower levels of counterproductive tendencies, suggesting a synergistic effect.

However, few studies have integrated both emotional resilience and ethical commitment as predictors of CWBs in the Nigerian public sector, with limited focus on state-level civil services. Most existing research is either sector-general or conducted in private organizations, creating a contextual gap in understanding how these variables operate specifically within Rivers State. This gap underscores the need for empirical investigation into how psychological and ethical resources jointly influence employee conduct in the civil service, which forms the basis for the current study.

Methodology

This study adopted a descriptive survey research design to examine the relationship between emotional resilience, ethical commitment, and counterproductive work behavior in the Rivers State Civil Service. The target population comprised all civil servants across selected ministries, departments, and agencies within Rivers State, encompassing various cadres and functional units. A sample size was determined using a proportionate stratified sampling technique to ensure fair representation across different departments and levels of employment. Data were collected using a structured questionnaire designed to capture information on respondents' emotional resilience, ethical commitment, and observed counterproductive work behaviors. The instrument was pre-tested for clarity and reliability to ensure consistent measurement of the constructs. Respondents were approached in their offices, and ethical considerations such as informed consent, anonymity, and voluntary participation were strictly observed. Collected data were coded, entered, and

analyzed using descriptive statistics to summarize demographic characteristics, and inferential statistics, including Pearson correlation and regression analysis, were employed to test the stated hypotheses and examine the relationships among the variables.

Results and Presentation

Descriptive Statistics of Respondents

Table 1 presents the demographic characteristics of respondents in terms of age, gender, educational qualification, and length of service within the Rivers State Civil Service.

Table 1: Demographic Characteristics of Respondents

Demographic Variable	Frequency	Percentage (%)
Age (years)		
25–34	60	30
35–44	80	40
45–54	40	20
55 and above	20	10
Gender		
Male	120	60
Female	80	40
Educational Level		
ND/NCE	30	15
HND/Bachelor's	100	50
Master's/Above	70	35
Length of Service		
1–5 years	40	20
6–10 years	60	30
11–15 years	50	25
16 years and above	50	25

The majority of respondents were aged 35–44 years (40%), with more males (60%) than females (40%). Most respondents held Bachelor's or HND qualifications (50%), and the length of service was fairly distributed across categories, ensuring a representative sample for analysis.

Hypotheses Testing

Hypothesis One (H_{01}): There is no significant relationship between emotional resilience and counterproductive work behavior.

Table 2: Correlation between Emotional Resilience and Counterproductive Work Behavior

Variables	r	p-value	Interpretation
Emotional Resilience & CWB	-0.562	0.000	Significant, Moderate Negative

Hypothesis One (H_{01}) examined the relationship between emotional resilience and counterproductive work behavior (CWB) among employees in the Rivers State Civil Service. Table 2 shows a correlation coefficient of -0.562, indicating a moderate negative relationship between emotional resilience and CWB. This means that as employees' emotional resilience increases, their engagement in counterproductive work behaviors decreases. The p-value of 0.000

indicates that this relationship is statistically significant, leading to the rejection of H_{01}. The result aligns with the Conservation of Resources Theory, which suggests that psychological resources protect employees from stress-induced deviant behavior. Practically, fostering emotional resilience through training and support can reduce workplace deviance and improve organizational productivity.

Hypothesis Two (H_{02}): There is no significant relationship between ethical commitment and counterproductive work behavior.

Table 3: Correlation between Ethical Commitment and Counterproductive Work Behavior

Variables	r	p-value	Interpretation
Ethical Commitment & CWB	-0.614	0.000	Significant, Strong Negative

Hypothesis Two (H_{02}) assessed the relationship between ethical commitment and counterproductive work behavior among civil servants. Table 3 reports a correlation coefficient of -0.614, showing a strong negative relationship between ethical commitment and CWB. This implies that employees with higher ethical commitment are less likely to engage in absenteeism, misuse of resources, or unethical practices. The p-value of 0.000 confirms statistical significance, leading to the rejection of H_{02}. The finding supports the Ethical Climate Theory, highlighting the role of ethical orientation in guiding moral decision-making. Strengthening ethical commitment through training, leadership modeling, and policy enforcement can therefore reduce counterproductive behaviors and enhance institutional integrity.

Table 4: Multiple Regression Analysis of Predictors on CWB

Predictor	β	t-value	p-value	Interpretation
Emotional Resilience (ER)	-0.312	-4.15	0.000	Significant negative predictor
Ethical Commitment (EC)	-0.427	-5.72	0.000	Significant negative predictor
Constant (β0)	4.105	8.20	0.000	Intercept
R^2	0.528			52.8% variance explained
F-value	67.34		0.000	Model is significant

Interpretation of Multiple Regressions

a. **Model Fit:** The R^2 value of 0.528 indicates that **52.8% of the variance** in counterproductive work behavior is jointly explained by emotional resilience and ethical commitment. This shows a substantial effect size for social science research and underscores the importance of both predictors in explaining CWB among civil servants.

b. **Significance of Model:** The F-value (67.34, p = 0.000) confirms that the regression model is statistically significant, meaning that ER and EC collectively predict CWB.

c. **Effect of Individual Predictors:**

- **Emotional Resilience:** β = -0.312, p = 0.000 indicates that resilience is a **significant inverse predictor** of CWB. For every unit increase in resilience, CWB decreases by 0.312 units, holding ethical commitment constant.

- **Ethical Commitment:** β = -0.427, p = 0.000 indicates that ethical commitment is a **stronger inverse predictor** of CWB. For every unit increase in ethical commitment, CWB decreases by 0.427 units, holding resilience constant.

d. **Interpretation of Negative Relationships:** The negative regression coefficients confirm that both predictors reduce counterproductive work behavior. Employees with higher emotional resilience are better able to cope with stress and avoid deviant behaviors, while those with stronger ethical commitment are more likely to adhere to moral standards and organizational norms, reducing misconduct.

e. **Practical Implication:** Enhancing emotional resilience and ethical commitment in the Rivers State Civil Service would meaningfully lower counterproductive work behaviors, improving productivity, accountability, and public trust.

Discussion of Findings

The study established that emotional resilience and ethical commitment significantly predict counterproductive work behavior among civil servants in Rivers State. The multiple regression analysis revealed that both predictors jointly explain 52.8% of the variance in counterproductive work behavior, indicating a substantial combined effect. Individually, emotional resilience exhibited a moderate negative effect (β = -0.312, p = 0.000), while ethical commitment showed a stronger negative effect (β = -0.427, p = 0.000), confirming that higher levels of these constructs are associated with lower engagement in counterproductive behaviors. These findings indicate that employees who effectively manage stress, adapt to challenges, and maintain a strong moral orientation are less likely to engage in absenteeism, insubordination, resource misuse, or other deviant behaviors that undermine organizational efficiency.

The negative relationships observed corroborate earlier studies. Suleiman and Adeoye (2021) found that emotional resilience significantly reduces workplace deviance, highlighting its role in enabling employees to cope with stressors without resorting to maladaptive behaviors. Similarly, Usman et al. (2021) reported that ethical commitment is a strong determinant of compliance with organizational norms, reducing the incidence of counterproductive work behaviors in public institutions. Okereke et al. (2022) emphasized the combined effect of resilience and ethical commitment in lowering deviant tendencies among civil servants, consistent with the joint explanatory power identified in this study.

These findings further underscore the theoretical relevance of the Conservation of Resources Theory and Ethical Climate Theory. Employees with higher resilience possess the psychological resources necessary to withstand occupational stress, consistent with the COR framework, while ethical commitment aligns with the principles of Ethical Climate Theory, guiding moral reasoning and promoting adherence to organizational codes. The stronger negative effect of ethical commitment compared to resilience suggests that moral orientation may play a more decisive role in curbing counterproductive behaviors in the civil service context, although resilience remains a critical protective factor.

By implication, the study demonstrates that strategies aimed at enhancing emotional resilience and fostering ethical commitment can substantially reduce counterproductive behaviors, improve public sector performance, and strengthen organizational integrity in Rivers State. The empirical

alignment with prior studies affirms the robustness and contextual relevance of these predictors within Nigerian public service settings.

Conclusion

The study established that emotional resilience and ethical commitment significantly reduce counterproductive work behavior among civil servants in Rivers State. Findings demonstrate that employees who effectively manage workplace stress and internalize moral standards are less likely to engage in absenteeism, insubordination, resource misuse, or other behaviors that undermine organizational efficiency. These results confirm that both psychological resources and ethical orientation are critical determinants of workplace conduct in the public sector, emphasizing the need for targeted interventions that strengthen resilience and promote ethical commitment to enhance service delivery and institutional credibility.

Recommendations

1. Rivers State Civil Service should implement structured resilience-building programs, including stress management workshops and adaptive skills training, to minimize counterproductive behaviors among employees.
2. The civil service should strengthen ethical orientation initiatives, including regular ethics training, leadership modeling, and strict enforcement of codes of conduct, to cultivate a culture of integrity and accountability.

Abstract
The eating pattern and changing food choices of Nigerian youths; particularly those in Abuja is increasingly being characterised by eating out. Seventeen years after the introduction of bachelor of science degree in entrepreneurship into the Nigerian universities' curriculum, it is only natural to think that these graduates who were posted to the capital city of Nigeria for their national youth service corps (NYSC) ought to have started deploying their cooking skills to establish mama-puts (unstandardised restaurants) to meet the food needs of the youths who eat out, become self-employed and create jobs. This is actually not so as shown by the increasing unemployment rate among the youths and the graduates. Hence, this study investigates the mediating effects of cooking passion (CPN), cooking tacit knowledge sharing (CTS) and cooking self-efficacy (CSE) on the cooking skills (CSS) and entrepreneurial intentions (EIS) nexus. A cross-sectional research design, criterion sampling technique and census method were adopted to select 148 respondents from a population of 238. The results of the Hayes process macro 3.5 with bias-corrected 5,000 resample bootstraps reveal that the direct and total effects of CSS on CPN, CTS, CSE and EIS are positive and significant. Also, the indirect effect of CSS on EIS via CPN, CTS and CSE is positive and significant. The study concludes by shedding light on the theoretical and practical implications, and limitations and future research directions.

Keywords: *Cooking passion, cooking self-efficacy, cooking skills, cooking tacit knowledge sharing, entrepreneurial intentions*

Introduction

The fact that people need food on a daily basis and some cannot prepare the food they desire by themselves makes food a lifestyle and a basic necessity, and culinary a required permanent enterprise. As such, food preparation procedures and methods are taught as cooking skills (CSS) at home, school and via the social media (Godara & Dev, 2021). The unprecedented increase in food programming, food reality shows, online food content and food photos in the social media is increasing eating-out culture among viewers; particularly the youths. It is at the same time fueling the need for more food media, food businesses and chefs. These cooks are characterized by CSS, cooking passion (CPN), cooking tacit knowledge sharing (CTS) and cooking self-efficacy (CSE) (Traynor et al., 2021). CSS represent the ability to perform food preparation tasks in the kitchen. Dalem et al. (2024) view CSS as a person's behaviour regarding meal preparation, which includes CPN. Passion is an emotional state that may trigger entrepreneurial intentions (EIS) (Biraglia & Kadile, 2017; Tanoto et al., 2024). Further, CSS is related to cooking knowledge (Corotan &

Chavez, 2024). This knowledge is the awareness, identification, applied know-how and competencies concerning food preparation that are accumulated through education, work and life experiences (Agbim et al., 2013a&b). All knowledge is either tacit or emanated from it. Tacit knowledge was introduced by Michael Polanyi as personal knowledge (Polanyi, 1958) that is created in the minds of individuals who possess it (Agbim et al., 2013b). Thus, it is difficult to disseminate.

Nevertheless, tacit knowledge may be shared through learning-by-doing and/or learning-by interaction (Kucharska & Erickson, 2021). It increases in value when it is shared and utilised to create new knowledge or enterprise (Agbim et al., 2013b; Kremer & Steudten, 2021). Jiatong et al. (2021) aver that the desire to start a business can as well be triggered by self-efficacy. This is because the learning of CSS among students can influence their self-efficacy and attitudes towards food (O'Kane et al., 2021). CSS is associated with CSE since the later reflects an individual's confidence in using cooking techniques. Again, CSS is assessed by CSE (Jomori et al., 2018). The social cognitive theory (SCT) affirms that an individual's perception of his/her skills or abilities plays a crucial role in fostering EIS. The theory of planned behaviour (TPB) adds that such EIS can be triggered mainly by planned and goal-oriented behaviours such as cooking foods for commercial purposes (Tantono et al., 2022).

In spite of the foregoing, most youths who desire to create culinary businesses lack culinary skills (Nasution et al., 2021). In addition, young people lack CPN (Biraglia & Kadile, 2017). Most of the culinary knowledge possessed by teachers and students have not been translated to explicit knowledge and shared (Rahmawati et al., 2015), while studies on CSS and knowledge are scant (e.g., Hinalinan et al., 2023; Pascual et al., 2019). Studies on the learning of CSS at home and in school and how it triggers culinary business intentions are scant in developing countries (e.g., Martins et al., 2020). Again, the consumer food choices and time spent in the kitchen cooking are unprecedentedly changing, particularly among young people. This is due to factors such as convenience, finance, lifestyle, office schedule and lack of CSS (Surgenor et al., 2017).

It is evident in extant literature that several researchers have related CSS to factors such as attitude (e.g., Corotan & Chavez, 2024), healthy eating (e.g., Çelik et al., 2023), and knowledge and self-efficacy (e.g., Bruno, 2019), while the study that have associated CSS to EIS was conducted with special focus on students (e.g., Dalem et al., 2024). As such, no study seems to investigated the CSS and EIS nexus in the domain of graduates of entrepreneurship. Again, despite the relatedness of CSS and EIS with CPN, CTS and CSE, no study seems to have brought to the fore the roles of CPN, CTS and CSE on the CSS and EIS nexus. Thus, these research gaps were filled by investigating the mediating effects of CPN, CTS and CSE on the relationship between CSS and EIS of graduates of entrepreneurship in the Nigerian context.

With the increasing number of graduates of entrepreneurship in Nigeria and Abuja in particular, it is only natural to think that the opportunity portrayed by the national youth service corps (NYSC) orientation in Abuja will trigger EIS for "mama put" among these graduates. This is because the Departments of Entrepreneurship and/or Entrepreneurship Development Centers in Nigerian universities promotes food preparation techniques through their CSS or catering programs. This thinking is not totally so in Abuja as evident from the increasing number of unemployed graduates and university undergraduates with high eating-out habit (Agbim et al., 2023). The NYSC is a

mandatory one-year service to Nigeria by graduates. The term "mama put" refers to small enterprises that prepare and serve commercial foods and drinks by the road sides. They are unstandardised restaurants that offer fast table foods mostly in areas that are dominated by low-income earners. The graduates of entrepreneurship who were posted to the city of Abuja for their NYSC are rarely transforming their food preparation knowledge and skills into "mama put" to meet the changing food needs of individuals in the city who cannot prepare the food they eat by themselves at home and/or lack the wherewithal to afford food from standardised restaurants. There is therefore need to investigate the mediating roles of CPN, CTS and CSE on the nexus between CSS and EIS to create "mama puts". Failure to carry out this study may imply overlooking the abounding opportunities for "mama puts" in Abuja. It may result to further deepening the waste of resources in teaching CSS and by extension increasing the rate of unemployment among graduates, particularly those who studied entrepreneurship.

The rest of the paper is organised thus; the next section focuses on the theoretical foundation. This includes the hypothesis development. The next section discusses the research methods. This is followed by the results, test of hypothesis and discussion of major findings. Finally, the theoretical implications, practical implications and conclusion are presented in the last sections.

Theoretical Foundation

The theoretical foundation of this study is laid on the SCT and TPB. The SCT as postulated by Bandura (1986) states that learning takes place in a social context, with a dynamic and reciprocal interaction involving the individuals, their environment and their behaviour. Thus, the theory serves as a paradigm for comprehending, forecasting and altering human behaviour (Tantono et al., 2022) like eating pattern and food preparation. The TPB as theorised by Icek Ajzen in 1991 proposed that desired actions by individuals will usually be initiated by intentions. The TPB view intention as the best predictor of behaviour. As such, it is influenced by attitude, control and norms. The intended personal attitude towards relevant activities and behavioural control manifests through an individual's perception of how easy or difficult his/her plans will be. The subjective norm is determined by the opinions of others, which can encourage or hinder someone from implementing his/her plans (Ajzen, 1991; Tsaknis & Sahinidis, 2020).

Cooking Skills and Entrepreneurial Intentions

Entrepreneurial skills can ignite the flame of entrepreneurial intentions in university students (Mujtaba et al., 2025). Students who have limited CSS show little or no interest in cooking (Lavelle et al., 2019), while students who view CSS as important skills are committed to cooking (Czup, 2020). Even though most young people are enormously endowed with the requisite cooking capabilities, they show very little interest in establishing culinary enterprises. However, with the growing opportunities in the culinary sector in recent times, many culinary businesses have been started by young people (Chatterjee, 2023). Corroborating the foregoing, Dalem et al. (2024) affirm that culinary skills can influence entrepreneurial desires or trigger the desire to start a business venture in the future. Xu and Lee (2025) establish that restaurant entrepreneurship education triggers start-up intentions in graduating hospitality students. However, when the risks of venturing into restaurant business is emphasised more that the benefits it lowers the rate at which the students develop entrepreneurial intentions to become restauranteurs. Therefore, we propose that:

H1: Cooking skills have no significant effect on entrepreneurial intentions

Cooking Skills and Cooking Passion

Entrepreneurial passion helps individuals to mobilise the requisite personal and vicarious experiences, and financial, human and social resources to overcome the barriers that are associated with new venture formation (Biraglia & Kadile, 2017). Proactive personality and entrepreneurial passion may foster entrepreneurial behaviour among university students (Sajjad et al., 2024). As the expression of enthusiasm for setting up a business, entrepreneurial passion (Chen et al., 2009) can keep an individual engaged in the practice of food preparation. Thus, exposing youths to culinary skills through training can facilitate the development of the desire to learn the skills and to work in the culinary sector (Abbas et al., 2021). Taggar et al. (2024) establish that positive passion engenders higher team fit, while Morsiani et al. (2024) found that group management skills are associated with both harmonious passion and obsessive passion. Hence, we hypothesise that:

H2a: Cooking skills have no significant effect on cooking passion

Cooking Skills and Cooking Tacit Knowledge Sharing

Cooking tacit knowledge and skills such as food ingredients, preparation procedures, handling techniques and safety practices in an individual's cooking ideas, competencies and experiences can be converted into forms that can be understood, absorbed, used and reused by other individuals (Sullivan, 2019) in a social context. Farmer et al. (2021) argue that social networking facilitates the sharing and improvement of tacit knowledge (Rohman et al., 2020). As such, social networks are rich sources of skills, tacit knowledge and business opportunities (Nonaka & Krogh, 2009). The practical activities that are associated with entrepreneurial knowledge and skills acquisition in such network can help in nurturing the participants to share and learn new knowledge and skills (Donnellon et al., 2014). The more knowledge is shared, the more requisite skills are developed and relevant enterprises are formed (Setianto et al., 2020). Lack of cooking knowledge makes mastering and sharing practical CSS challenging (Farmer et al., 2021). Farmer and Hingst (2025) affirm that the development of cooking as a practice is associated with tacit knowledge transfer. Again, de Oliveira Andrade et al. (2025) argue that CSS are enhanced by good coking knowledge. Accordingly, we propose that:

H2b: Cooking skills have no significant effect on cooking tacit knowledge sharing

Cooking Skills and Cooking Self-Efficacy

Personal ability or skill to carry out entrepreneurial activities can contribute to the development of entrepreneurial self-efficacy (Alammari et al., 2019; Hutasuhut, 2018). In turn, self-confidence or self-efficacy can enhance the utilisation of skills to achieve entrepreneurial outcomes (Ferreira-Neto et al., 2023; Jiatong et al., 2021). As such, skills can be used to predict one's level of self-efficacy (Wardana et al., 2020). Martins et al. (2020) empirically establish that CSS confidence can influence children's ultra-processed foods consumption pattern and further CSS (Esim, 2019). Policastro et al. (2023) asserts that culinary literacy influences self-efficacy, while Lagrada and Arroyo (2025) conclude that high self-efficacy is associated with an advanced level of CSS. Thus, we hypothesise that:

H2c: Cooking skills have no significant effect on cooking self-efficacy

Cooking Passion and Entrepreneurial Intentions

Entrepreneurial passion plays important role in entrepreneurship development (e.g., Li et al., 2017; Mueller et al., 2017). Specifically, passion empowers individuals to overcome challenges that are associated with entrepreneurship development. It equally influences would-be entrepreneurs to be committed to transforming personal interests into successful enterprises (Ferreira-Neto et al., 2023). Individuals who are passionate at entrepreneurship exhibit intense emotions and willingness towards (Cardon & Kirk, 2015) new venture formation especially among university graduates (Anjum et al., 2021). Entrepreneurial passion can lead a person to focus on what needs to be done in new venture creation process by triggering the planning of context-related and conduct of action-oriented EIS (Biraglia & Kadile, 2017). In addition to contributing to triggering digital EIS (Prameka & Kurniawan, 2023), entrepreneurial passion influences EIS for diverse business ventures (e.g., Bignetti et al., 2021; Neneh, 2022). Wu et al. (2022) establish that eentrepreneurial passion is the strongest predictor of the willingness to be self-employed among college students, while Maziriri et al. (2024) found that parents' entrepreneurial passion can influence students' attitude towards becoming technopreneurs. Thus, we argue that CPN may trigger EIS for food business. Accordingly, the following proposition was developed:

H3a: Cooking passion has no significant effect on entrepreneurial intentions

Cooking Tacit Knowledge Sharing and Entrepreneurial Intentions

Entrepreneurial knowledge enhances the ability of an individual to identify and/or create business opportunities, and to satisfy the opportunities through new venture formation (Martin et al., 2013). Similarly, the discovery and exploitation of entrepreneurial opportunities requires entrepreneurial knowledge (Oosterbeek et al., 2010). Hence, entrepreneurial knowledge; particularly tacit knowledge sharing can trigger EIS (Ferreira-Neto et al., 2023; van Houten, 2023). Tacit knowledge is difficult to share (Nonaka 1994). However, since it is a personal and practical knowledge, it can be learned from the person who has it (Sternberg et al., 1995) through practice, experience and socialisation (Kucharska & Erickson, 2021). Involvement in knowledge sharing influences self-learning, self-study, innovative behaviour, tacit knowledge development, willingness to share, and the creation of innovative product and/or service (Kucharska & Erickson, 2021; Setianto et al., 2020). Karakaş et al. (2024) found that entrepreneurial knowledge influences students' entrepreneurial intentions. Babarinde and Elutide (2024) conclude that knowledge sharing behaviour is related to entrepreneurial intention. Thus, we argue that CTS may trigger EIS. Accordingly, we hypothesise that:

H3b: Cooking tacit knowledge sharing has no significant effect on entrepreneurial intentions

Cooking Self-Efficacy and Entrepreneurial Intentions

Entrepreneurial self-efficacy drives entrepreneurship (Cardon & Kirk, 2015) by improving intentions (Ajzen, 2002) and giving individuals the abilities to achieve outcomes (Jiatong et al., 2021) such as new venture formation (McGee et al., 2009). Thus, entrepreneurial self-efficacy is an antecedent of EIS (Bacq et al., 2017; Crespo et al., 2018) and higher EIS (Oktaviana et al., 2018), and a better predictor of EIS (Ceresia & Mendola, 2020; Kurjono et al., 2020). This suggests that "people with a higher level of self-efficacy demonstrate stronger EIS, while those with lower levels of self-efficacy demonstrate weaker ones" (Ndofirepi, 2022, p. 4). Maemunah et al. (2019)

found that self-efficacy contributes to the development of interest in entrepreneurship among vocational high school students in Indonesia. Corroborating these assertions, Nasri and Morched (2023), and Monica and Anuradha (2023) in their separate studies affirm that entrepreneurial self-efficacy and EIS are related. Salami et al. (2023) argue that self-efficacy and EIS are associated among university students., while Ye et al. (2025) concludes that entrepreneurial self-efficacy influences entrepreneurial intention of college students in Korea. Thus, we propose that:

H3c: Cooking self-efficacy has no significant effect on entrepreneurial intentions

Cooking Skills, Cooking Passion and Entrepreneurial Intentions

Skills can trigger entrepreneurial passion (Chen et al., 2009) and entrepreneurial desires or intentions (Dalem et al., 2024). Entrepreneurial passion can influence EIS (Anjum et al., 2021) and new venture creation (e.g., Gielnik et al., 2017). Entrepreneurial passion facilitates the surmounting of entrepreneurial barriers, accomplishment of new venture creation and achievement of relevant business results (Ferreira-Neto et al., 2023). Ferreira-Neto et al. adds that entrepreneurial passion mediates the relationship between creativity and EIS. Noreña-Chavez and Guevara (2020) establish that entrepreneurial passion significantly mediates the relationship between entrepreneurial self-efficacy and innovative behaviour, while Murad et al. (2021) argue that this relationship is only partially mediated by entrepreneurial passion. Thuy et al. (2020) found that passion mediates the relationships between entrepreneurial identity centrality and entrepreneurship intention on one hand, and between entrepreneurial role model and entrepreneurship intention. Zhou et al. (2022) asserts that entrepreneurial passion play a mediating role between entrepreneurial institutional environment and entrepreneurial orientation. We further argue that the CSS and EIS may be mediated by CPN. Hence, we propose that:

H4a: Cooking passion has no significant mediating effect on the relationship between cooking skills and entrepreneurial intentions

Cooking Skills, Cooking Tacit Knowledge Sharing and Entrepreneurial Intentions

Skills acquisition promotes knowledge sharing (Gajam & Yıldız, 2023; Singh et al., 2021), while tacit knowledge sharing augments learning, enterprise creation and productivity (Huie et al., 2020). More specifically, tacit knowledge sharing can influence EIS (Ferreira-Neto et al., 2023; van Houten, 2023). Conversely, knowledge sharing lowers turnover intentions (Srivastava & Pradhan, 2019). Further, knowledge sharing partially mediates the relationship between social capital and innovative behaviour. Again, tacit knowledge sharing mediates the relationship between affect and cognition-based trust with innovative behaviour, but partially mediates the relationships among individual factors and innovative behaviour (Gajam & Yıldız, 2023; Wah et al., 2018). Yang et al. (2018) affirm that knowledge sharing mediates the relationship between collaborative culture, and product innovation and process innovation. Hu et al. (2023) conclude that tacit knowledge sharing partially mediates the relationship between psychological capital and breakthrough innovation. As such, we hypothesise that:

H4b: Cooking tacit knowledge sharing does not significantly mediate the cooking skills - entrepreneurial intentions nexus

Cooking Skills, Cooking Self-Efficacy and Entrepreneurial Intentions

Entrepreneurial skills can facilitate the development of self-efficacy (Hutasuhut, 2018) and can be employed to estimate an individual's self-efficacy (Wardana et al., 2020). In turn, entrepreneurial self-efficacy can trigger EIS in such persons (Kurjono et al., 2020; Monica & Anuradha, 2023). Further, entrepreneurial self-efficacy mediates the development of students' EIS (Tsai et al., 2016), and creativity and EIS nexus (Bellò et al., 2018; Bignetti et al., 2021). The direct effect of entrepreneurial self-efficacy on intention to pursue an entrepreneurial goal is statistically significant (Ndofirepi, 2022). Rastiti et al. (2021) found that self-efficacy partially mediates the effects of entrepreneurship education, economic literacy and family environment on EIS among vocational school students. Wu et al. (2022) establish that entrepreneurial self-efficacy completely mediates the relationship between entrepreneurship education and EIS. Lioe et al. (2023) conclude based on an empirical study that entrepreneurial self-efficacy positively and significantly mediates the relationship between entrepreneurial network and resources, and EIS. Thus, we hypothesise that:

H4c: The relationship between cooking skills and entrepreneurial intentions is not significantly mediated by cooking self-efficacy

Based on the conceptualisations, the proposed conceptual framework showing the hypothesised relationships is presented in Figure 1.

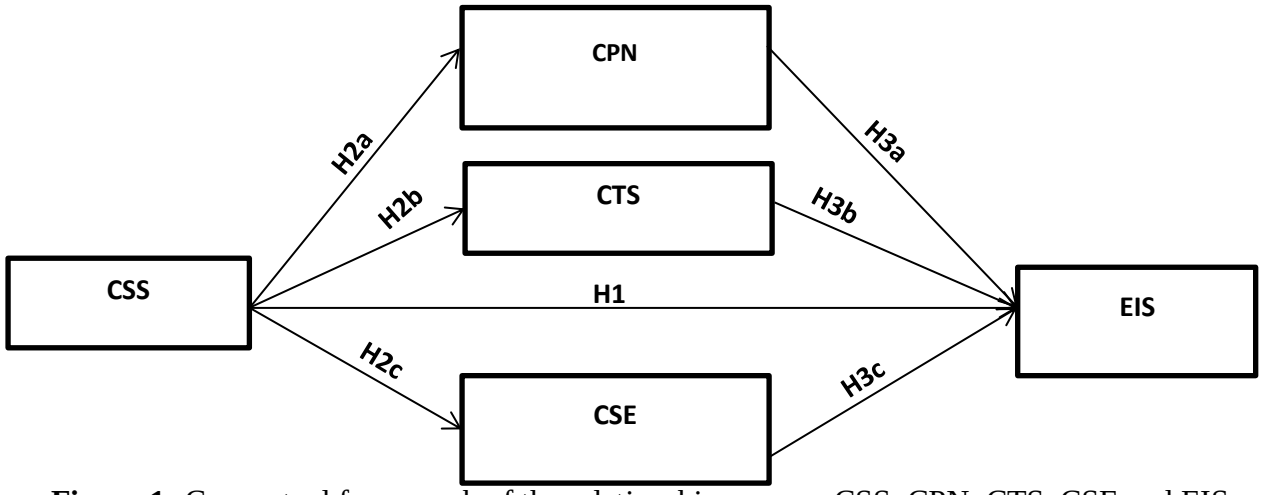

Figure 1: Conceptual framework of the relationships among CSS, CPN, CTS, CSE and EIS

Research ethods

A cross-sectional research design was adopted to study the population of 238 university fresh graduates of entrepreneurship that were posted to Abuja for the 2024 Batch "C" NYSC. Criterion sampling technique was employed to screen the graduates based on the following predetermined criteria: (i) the graduate is from a family that regularly and frequently prepares meals at home; (ii) the graduate learnt CSS from the parents starting from childhood to adolescent up to the period he/she gained admission into the university; (iii) in the graduate's family, all members participate in food preparation; (iv) while in the university, the graduate lived off-campus. This is to ensure

that as a student, he/she had cooking utensils and prepares food by himself/herself; and (v) the graduate detests fries, processed foods and eating-out. Based on the aforementioned criteria, the target population of the study is 148. Census method was employed due to the small size of the target population, while the unit of analysis is fresh graduate.

The measures of CSS were adapted from Bruno (2019) and Lavelle et al. (2017). The measures of CPN were adapted from Feng and Chen (2020). The measures of CTS were adapted from Kucharska (2017) and Pu et al. (2022). The measures of CSE were adapted from Saoula et al. (2023). The variables in the questionnaire were measured on a 5-point Likert scale that ranged from strongly agree (5) to strongly disagree (1). The validity of the research instrument was confirmed by three lecturers in the Department of Entrepreneurial Studies, Veritas University, Abuja. The one hundred and forty-eight (148) copies of questionnaire were administered on the fresh graduates during their three weeks NYSC orientation camp exercise on a face-to-face basis. A two-way parallel analysis using Hayes process macro 3.5 with bias-corrected 5,000 resample bootstraps was employed to test the direct, total and indirect effects. This method was adopted because it simultaneously analyses multiple pathways, estimates the indirect effects separately, and shades better light on the relationships among the variables. The reliability of the instrument was confirmed through confirmatory factor analysis (see Table 1).

Table 1: Confirmatory Factor Analysis

			Convergent and Discriminant Validity Check				Reliability Test	
Variables	Indicators	Loading	AVE	DV	MSV	MaxR (H)	CR	Cronbachs' α
CSS	CSS1	0.774						
	CSS2	0.806						
	CSS3	0.790						
	CSS4	0.792	0.860	0.78	0.871	0.792	0.88	0.82
	CSS5	0.834						
CPN	CPN1	0.760						
	CPN2	0.769						
	CPN3	0.841	0.931	0.762	0.877	0.835	0.88	0.89
	CPN4	0.855						
	CPN5	0.862						
CTS	CTS1	0.784						
	CTS2	0.934						
	CTS3	0.873	0.785	0.797	0.769	0.888	0.76	0.79
	CTS4	0.865						
	CTS5	0.961						
CSE	CSE1	0.854						
	CSE2	0.871						
	CSE3	0.843						
	CSE4	0.763	0.854	0.718	0.864	0.899	0.92	0.89
	CSE5	0.851						

EIS	EIS1	0.822						
	EIS2	0.903	0.784	0.862	0.785	0.952	0.87	0.79
	EIS3	0.788						
	EIS4	0.811						
	EIS5	0.856						

Note: AVE = Average variance extracted; DV = Discriminant Validity; CR = Composite Reliability; MSV = Maximum Shared Variance

The Cronbach's α scores (CSS = 0.77; CPN = 0.78; CTS = 0.81; CSE = 0.79; EIS = 0.84) as shown in Table 1 confirms the internal consistency of the items. The adequacy of the overall goodness-of-fit was confirmed with the aid of AMOS 24.0 ($\chi 2 = 228.725$; df = 155; $\chi 2/df=1.557$; GFI=0.76, CFI =0.79; AGFI=0.75, TLI=0.77; RMR=0.07; RMSEA=0.07). The convergent validity (CV) (AVE is ≥ 0.50) and discriminant validity (DV) (square root of AVE is greater than the correlation of the latent variables in the CFA) were confirmed (Fornell & Larcker, 1981).

Results

It can be inferred from Table 2 that CSS relates positively with CPN, CTS, CSE and EIS.

Table 2: Mean, Standard Deviation and Bivariate Correlations of the Variables

Variables	Mean	SD	1	2	3	4	5	6
CSS	7.46	0.522	1					
CPN	9.42	0.607	0.414**	1				
CTS	11.81	0.654	0.388**	0.381**	1			
CSE	10.44	0.583	0.442**	0.385**	0.371**	0.321**	1	
EIS	12.22	0.744	0.503**	0.377**	0.383**	0.341**	0.445**	1

**. Correlation is significant at the 0.01 level (2-tailed).

*. Correlation is significant at the 0.05 level (2-tailed).

Test of Hypotheses

The regression model in Figure 2 shows that the direct effect of CSS on EIS is significant (β =0.128, p<0.000), while the total effect is significant and positive ($\beta = 0.246$, $p < 0.001$). Thus, H1 is supported. Figure 2 also shows that the direct effects of CSS on CPN, CTS and CSE are significant and positive (β =0.219, $p < 0.001$; β =0.237, $p < 0.001$; β =0.225, $p < 0.001$). Hence, H2a, H2b and H2c are supported. The results of the direct effects of CPN, CTS and CSE on EIS are significant and positive ($\beta = 0.326$, $p < 0.001$; $\beta = 0.378$, $p < 0.001$; $\beta = 0.299$, $p < 0.01$). Thus, H3a, H3b and H3c are supported.

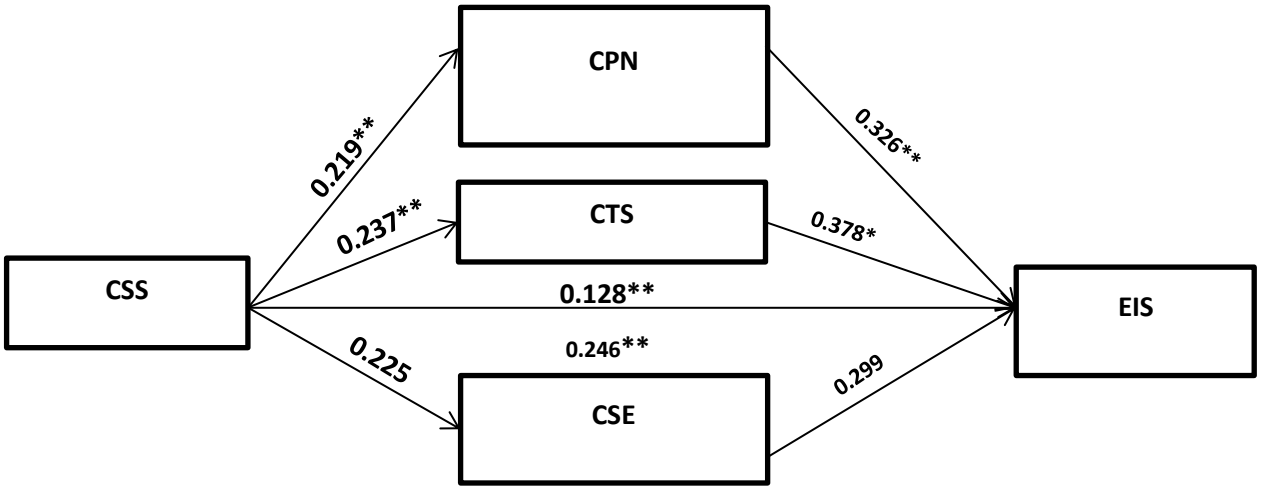

Figure 2: Results of the causal model of the direct relationships among CSS, EIS, CPN, CTS and CSE

The analysis of the indirect effect of CSS on EIS through CPN, CTS and CSE is presented in Table 3.

Table 3: Mediation Analysis

		Bias-correlated 95% CI	
Path	**Indirect Effect**	**Lower**	**Upper**
CSS → CPN → EIS	0.0289	0.0019	0.0244
CSS → CTS → EIS	0.0341	0.0014	0.0172
CSS → CSE → EIS	0.0355	0.0015	0.0161

Table 3 shows that the indirect effect of CSS on EIS via CPN, CTS and CSE is significant and positive ($\beta = 0.0289$, $p < 0.001$; $\beta = 0.0341$, $p < 0.001$; $\beta = 0.0355$, $p < 0.001$) at 95% bias-corrected confidence interval. As such, H4a, H4b and H4c are supported.

Discussion

First, the output of our analysis shows that the direct and total effects of CSS on EIS are positive and significant. This suggest that the EIS to start a "mama put" can be triggered in graduates who have acquired substantial level of CSS. This finding is somewhat related to prior studies (e.g., Dalem et al., 2024; Dragin et al., 2022) that affirm that skills correlate positively with EIS. Before now, culinary business was trivialised by young people, especially university graduates. However, with the high rate of joblessness, changing eating style and health status of youths and families in general, graduates are increasingly acquiring CSS and opening culinary businesses. However, while some graduates perceive the culinary business subsector to hold opportunities for huge entrepreneurial success, a few others do not (Çelik et al., 2023; Dalem et al., 2024). Nevertheless,

generally, personal skills such as CSS can significantly influence the entrepreneurial intent of graduating students (Abbas & Osunsan, 2020).

Second, our results reveal that the direct effects of CSS on CPN, CTS and CSE are positive and significant. These findings imply that CSS can trigger CTS, and facilitate the development of CPN and CSE. Corroborating this finding, De Chiara et al. (2024) asserts that collaborative skills trigger the development of passion for circular entrepreneurship, while Corotan and Chavez (2024) concludes that CSS significantly influences cooking knowledge. Moreover, Smith et al. (2019) notes that skills contribute to the development of self-efficacy. Smith et al. adds that acquiring diverse skills alone is not enough. Such individual must have confidence or self-efficacy that the possessed skill(s) when utilised can enhance the achievement of desired tasks or goals.

Third, we found that the direct effects of CPN, CTS and CSE on EIS are positive and significant. This finding depicts that the positive emotion and force that CPN generates can drive the graduates to start "mama puts" and at the same time help to sustain the business notwithstanding the challenges in the entrepreneurial environment. Again, tacit knowledge sharing behaviour can influence the graduates to take up jobs in restaurants or hotels for a short period for the purpose of garnering cooking experience as well as interacting and sharing cutting edge food preparation procedures and techniques with seasoned chefs. This can be with the intent of acquiring their tacit knowledge so as to create new tacit knowledge that will trigger the intention to engage in "mama put" formation. The result also connotes that graduates can engage in diverse cooking activities so as to develop confidence in their cooking abilities to the point that they will be willing to start and/or own "mama puts". In support of the foregoing, Feng and Chen (2020) aver that entrepreneurial passion can drive an individual to be persistent in the conduct of entrepreneurial activities by stimulating his/her positive emotions, creativity, innovation and attitude.

Further, despite the difficulties associated with disseminating tacit knowledge, it can still be shared via personal experience, reflection, stories, extensive personal contacts, practice, regular interactions, networking (van Houten, 2023), and externalisation (when it is converted into explicit knowledge) (Nonaka & Konno, 1998). Again, it can be shared through social interaction (e.g., observation and imitation), experiments in the laboratory and digital media (Letmathe et al., 2012), apprenticeship, mentorship (Kucharska & Erickson, 2021), working with the expert, independent self-study and practice by the trainee, receiving feedback and effecting corrections if need be (Agbim et al., 2013b). The sharing of tacit knowledge is based on trust (Goffin & Koners 2011). As these individuals internalise the shared tacit knowledge, they gain both self-efficacy and a sense of expert power. This confidence in their own knowledge can lead to more willingness to share the knowledge with others and/or transform it into a business (Kucharska & Kowalczyk, 2016; Kucharska, 2017). In more practical terms, individuals will share rather than hoard knowledge that can stimulate EIS when they are confident in what they know (Göksel & Aydintan, 2017).

Fourth, our results reveal that the indirect effect of CSS on EIS via CPN, CTS and CSE is positive and significant. These findings are in agreement with the outcome of Feng and Chen's (2020) study that creativity only influences EIS when mediated by entrepreneurial passion. This passion is exhibited by entrepreneurs in the form of intense positive feelings towards inventing, founding, starting entrepreneurial activities and developing entrepreneurships (Cardon et al., 2013). As tacit knowledge learning contributes to the development of new tacit knowledge, self-efficacy and EIS

(Göksel & Aydintan, 2017), the diffusion of such knowledge can mediate the relationship between social capital and innovativeness (Gajam & Yıldız, 2023). In addition, the relationship between entrepreneurship education (in terms of personal skills) and start-up readiness is partially mediated by entrepreneurial self-efficacy (Adeniyi, 2023). This is because, entrepreneurial self-efficacy enhances the readiness of an individual to create a start-up (Ajzen, 2020). Self-efficacy fosters entrepreneurial aspirations by influencing an entrepreneur to believe in his/her ability to engage in entrepreneurial activities and to perceive entrepreneurial challenges as surmountable (Salami et al., 2023).

Based on the SCT and TPB, the CPN, CTS and CSE can serve as a bridge between CSS and EIS. As such, the acquisition of CSS is not enough to trigger EIS in the unemployed graduates of entrepreneurship. There is need to actively and frequently engage them in food preparation. This will ensure that the graduates develop CPN and CSE, and that they form a social network for exchanging and sharing cooking tacit knowledge. Ngah and Jusoff (2009) argue that social networks provide platforms for formal and informal face-to-face interactions that help to foster ties among the interacting actors. These relationships can facilitate the building of trust and motivation of the interacting members to share their experiences which to some extents are tacit knowledge (Huang, 2017).

Theoretical Implications

First, the study extends the existing literature on CSS and EIS by investigating the mediating effects of CPN, CTS and CSE. Second, the framework of the study presents CPN, CTS and CSE as bridges for transforming the CSS of graduates of entrepreneurship into EIS for "mama puts". It also presents the interplay among CSS, CPN, CTS, CSE and EIS as a strategy for reducing the rate of unemployment among entrepreneurship graduates. Third, the significant and positive interrelationships among CSS, CPN, CTS, CSE and EIS depict that Ajzen's (1991) TPB is validated among unemployed graduates of entrepreneurship in the Nigerian context. Thus, behaviours such as engagement in food preparation can trigger the intention to create "mama puts".

Practical Implications

First, the knowledge of the positive effect of CSS on EIS can influence graduates of entrepreneurship to be engaged in more food preparation exercises so as to trigger their EIS for "mama puts". This effort of the graduates can be enhanced by policymakers through the sponsorship of cooking classes and competition during the NYSC orientation camps. Second, our study has shown that CTS is a mediator of the CSS-EIS nexus. Graduates of entrepreneurship can draw from this knowledge to avoid all forms of practices that promotes cooking knowledge hoarding and those that inhibit the creation of new tacit knowledge based on shared tacit knowledge. Policymakers can motivate experts in the industry to share their tacit knowledge by encouraging all the entrepreneurship graduates to form social networks. The interactions among the actors in the network can easily facilitate the building of trust and tacit learning based on the shared experiences among the interacting graduates. Third, the positive effect of CTS on the relationship between CSS and EIS emphasises the import of the seamless collaboration of the seasoned chefs, cookery instructors/lecturers and the graduates in the sharing of cooking tacit knowledge. Policymakers can assist with policies that encourages cooking legends and cooking facilitators to share their cooking experiences. Such policies should as well ensure that the

graduates create new tacit knowledge from the shared tacit knowledge that will inspire them to develop EIS to start mama puts.

Conclusion

This study has shown that the effects of CSS on CPN, CTS, CSE and EIS are direct, total and positive. Again, CSS positively and significantly influenced EIS through CPN, CTS and CSE. Notwithstanding the positive results, the study has a number of limitations. First, despite the advantages of the cross-sectional research design in this study, it however, did not show the changes that occurred among the study variables overtime. Second, the geographical scope of the study is graduates of entrepreneurship that are posted to Abuja for their one-year NYSC. This suggest that the interpretation and application of the results are limited to graduates of entrepreneurship in Abuja. Third, the study only investigated the mediating roles of CPN, CTS and CSE in the CSS and EIS nexus; even when there are other factors that can influence this relationship, Fourth, with the increasing rate of unemployment in Nigeria, a critical look at the research model empirically suggests that there is room for another theoretical construct that can be used in place of CSS to improve the model fitness. Yet, these constructs were not employed. Fifth, the study data were generated from the graduates of entrepreneurship. Thus, limiting the research findings with respect to scope and population.

Hence, students, the academia, government, organisations and researchers who want to conduct similar study in the future should consider adopting a longitudinal research design and data. This is important as it will enhance our understanding of the causalities among the variables which were not brought to the fore by the cross-sectional approach. Future researchers can validate these results by widening this scope to cover at least one State per the six geopolitical zones in Nigeria or another part of the world. Future studies can employ factors such as perception and family background as either mediators or moderators. Further researchers can replace the CSS with constructs such as soft skills or hard skills. Future studies should consider utilising parents and lecturers/instructors as respondents. This is the first study that has shown that CSS can directly trigger EIS for "mama puts" among graduates of entrepreneurship and indirectly through CPN, CTS and CSE. The study presents the development of intentions for "mama put" formation as a strategy for meeting the food needs of individuals who cannot afford food in standardised restaurants. It also serves as a framework for reducing unemployment rate and promoting job creation among graduates of entrepreneurship who have CSS.

Abstract
This study examined the relationship between entrepreneurial orientation and business performance of fast food enterprises in Owerri. The study adopted a cross-sectional survey research design. The accessible population was 132 fast food enterprises in Owerri. The study adopted a census method in determining the sample size. However, each fast food received two copies of questionnaire administered to the owner and manager, thus bringing the survey to 264. The primary data was generated through structured questionnaire based on the 5-point Likert scale. 213 copies of questionnaire were retrieved and used for analysis. Descriptive and inferential statistics were used to analyse the data. The research instrument was validated by two experts in the field of entrepreneurship. The reliability of the instrument was attained using the Cronbach Alpha coefficient with all the items scored above the threshold of 0.70. The hypotheses were tested using the Spearman Rank Order Correlation Coefficient with the aid of Statistical Package for Social Sciences version 25.0. The tests were carried out at the 0.05 level of significance. The findings revealed a significant and positive relationship between innovativeness, proactiveness and customer satisfaction and retention, and operational efficiency of fast food enterprises in Owerri. The study recommends among others that business owners/managers of fast foods should continually promote a culture of innovativeness, by developing new product/service, improving exiting process and adopting modern technology. Moreover, they should engage in regular market research, customer feedback systems, and environmental scanning, in order to exploit emerging market opportunities before competitors.

Keywords: *Entrepreneurial Orientation, Innovativeness, Proactiveness, Customer Satisfaction and retention, Operational Efficiency.*

Introduction

Small and medium enterprises (SMEs) are vital to economic growth in developing countries, through job creation and substantial contribution to the GDP (World Bank, 2021; Audretsch, 2007). In Nigeria, the food service and fast-food sector has expanded rapidly in recent years driven by urbanization, changing consumer lifestyles, and growth in food-delivery platforms making the segment an important part of the national food economy (Mordor Intelligence, 2025). However, operating fast-food outlets in Nigeria also presents structural challenges including power instability, high inflation and operating costs, and supply-chain constraints which can lead to reduction in margins among others (GAIN/USDA, 2021; Eze et al., 2020). As posited by Okoli and Mgbudom (2025), in spite of government supports for SMEs in Nigeria, SMEs owners are still finding it difficult to achieve sustainability and success at the long run. It has been observed that Fast-food enterprises in Owerri face intense competition, rising customer expectations, and macroeconomic shocks such as inflation and currency volatility that can erode profitability and make retention and operational consistency difficult. Entrepreneurial Orientation (EO) which is a firm's strategic posture toward innovativeness, proactiveness, and risk-taking has been widely studied as a determinant of firm performance (Miller, 1983; Lumpkin & Dess, 1996). Meta-analytic evidence suggests a positive relationship between EO and firm performance across contexts (Rauch et al., 2009). For fast-food enterprises, EO dimensions such as innovativeness and proactiveness may influence customer-centred outcomes (satisfaction and retention; and operational efficiency) which are critical non-financial performance proxies for SMEs where detailed financial data may be unavailable (Rauch et al., 2009).

For SMEs, especially in Nigeria, financial data may be scarce, unreliable, or inconsistently reported, making non-financial measures more practical and valid (Agyapong, 2010). Despite the theoretical linkages, there are lack of empirical evidence specifically focused on fast-food enterprises in Owerri, thus, constituting a gap in context-specific knowledge about how EO dimensions of innovativeness, and proactiveness associates with customer and operational outcomes in this sector (World Bank, 2021; Mordor Intelligence, 2025). Therefore, adopting non-financial indicators provides a more accurate and context-appropriate assessment of fast foods performance in entrepreneurship studies since some of the fast food businesses don't have published financials. It is against this backdrop the study investigated the relationship between entrepreneurial orientation and non-business performance of Fast food enterprises in Owerri.

Conceptual Framework

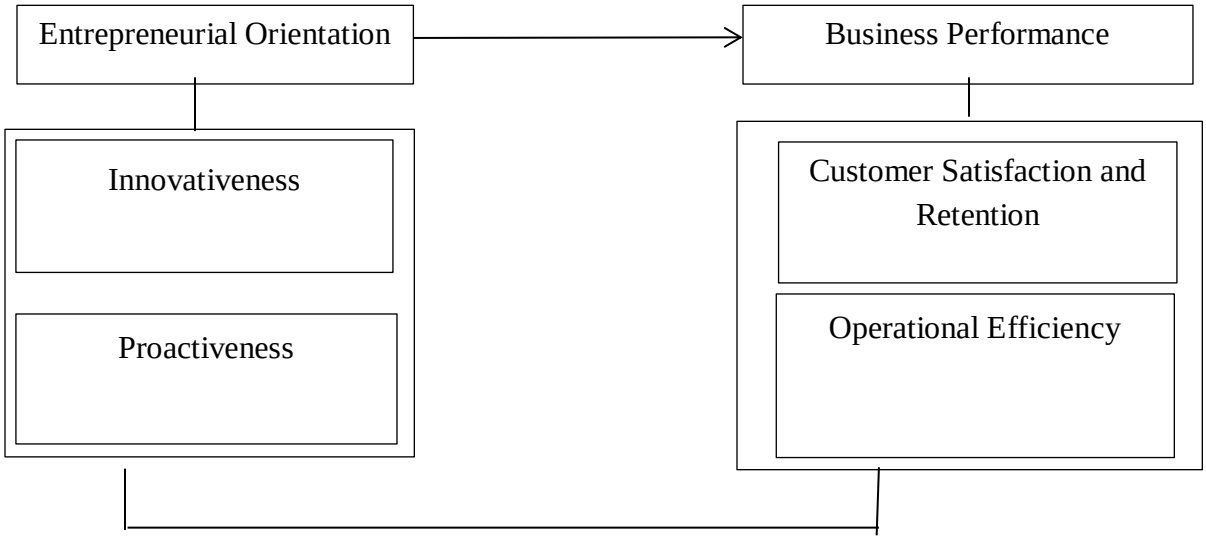

Fig 1: Conceptual Framework of Entrepreneurial Orientation (EO) and Business Performance of Fast Foods Enterprises in Owerri.
Source: EO (Miller, 1983; Lumpkin & Dess, 1996); Business Performance (Rauch et al., 2009)

Review of Related Literature
Theoretical Review
The study was underpinned by resource-based view theory and Dynamic capabilities theory.

Resource-Based View Theory
The resource based view theory was originally propounded by Wernerfelt (1984), and was further developed by Barney (1991), who instituted the fundamental characteristics of a sustainable competitive advantage. The assumptions of the theory are: (i) resource heterogeneity (firms possess different bundles of resources); and resource immobility (various differences are difficult to transfer between firms). Thus, this gave rise to the core idea that firms gain sustainable competitive advantage when they develop and deploy valuable, rare, inimitable, and non-substitutable (VRIN) resources and capabilities. Linking this theory to EO;
innovativeness will help firms create unique products/services to meet evolving customer needs, thus, will improve customer satisfaction and retention. Similarly, proactiveness will enable enterprises to anticipate market changes and allocate resources efficiently, leading to higher operational efficiency. EO will equip fast food enterprises with distinctive capabilities such as innovation in menus, and proactive service delivery that serve as intangible resources, driving non-financial performance outcomes.

Dynamic Capability Theory
This Theory was propounded by Teece et al. (1997). The study assumed beyond owning resources, firms must develop the ability to integrate, build, and reconfigure both their internal and external resources, skills, as well as competencies in response to rapidly changing environments. Hence, this ability is different from standard operational proficiencies, concentrating instead on a firm's capacity for adaptive, continuous learning and renewal to respond to dynamic market

conditions. Linking this theory to EO: innovativeness will align with the dynamic capability of sensing opportunities in changing consumer tastes, which improves customer satisfaction. In the same vein, proactiveness will be tied to seizing opportunities by quickly adapting menus, technology, and processes, leading to improved operational efficiency. This is because of the highly dynamic nature of the sector, with changing consumer preferences such as healthier options, and digital ordering. This implies that fast food enterprises with strong EO (innovation in recipes, and proactive use of technology) will develop dynamic capabilities that will sustain non-financial performance.

Entrepreneurial Orientation

EO was originally conceptualized by Miller (1983) and covers a firm's predisposition to risk taking, innovation and proactiveness while competitive aggressiveness and autonomy were added by Lumpkin & Dess (1996). EO is described as the degree to which top managers take business related risks, embrace change and innovation in order to attain a competitive advantage and compete aggressively with other firms (Covin & Slevin, 1988). Keith (2016) opined that EO practice measures a firm's leaning toward entrepreneurial behaviours and referred it as an entrepreneurial attitude, climate, or strategic orientation. Similarly, Stam and Elfring (2008) see entrepreneurial orientation as the processes and structures of organizations, as well as their behavioural inclination towards innovativeness, proactiveness and risk taking, Hence, these behavioural inclinations serves as an expression of the organizations' overall entrepreneurial position. In the same vein, Engelen *et al.* (2015) posit that EO is a strategic organizational position that focuses the organization and its people on innovation, new opportunities, proactiveness, and risk-taking. EO is a 'frame of mind and perspective about entrepreneurship that are reflected in a firm's ongoing processes and corporate culture'' (Lumpkin & Dess, 2005: pg 147). Accordingly, EO covers those policies and practices that aid entrepreneurial decisions and actions designed at developing business opportunities for the organization (Rauch *et al*., 2009).

From the above definitions, these common elements are deduced: (i) EO provide opportunities for an organization to expand by identifying gaps in the market; (ii)entrepreneurship differs from other businesses, hence, entrepreneurs are more driven, resilient, and energetic than their competitors; (iii) is a change mantra which aids organizational learning and improves performance and productivity; (iv) is a survival tool that can be employed in maximizing the opportunity and change-crises presented by the business environment; (v) aids the conversion of creative ideas into useful innovation. Therefore, it is evident that EO is rooted in the strategy-making process literature, and is often illustrated as the strategy making processes that provide organizations' with a basis for entrepreneurial decisions and action. Covin and Slevin (1991) opined that the performance of an organization such as SMEs are effectively related to the entrepreneurial orientations adopted by the business owners. Therefore, the two dimensions of EO adopted for the study are innovativeness and proactiveness.

Innovativeness

Innovativeness entails a firm's propensity to employ creativity, carrying out tests through the introduction of new products/services, as well as achieving technological leadership by conducting research and developing new processes (Rauch et al. 2009). Lumpkin and Dess (1996) describe innovativeness as the predisposition of a firm to engage in new ideas and novelty, and departing from established practices. Innovativeness is critical for SMEs as it enables them to adapt to

dynamic environments, differentiate from competitors, and create value for customers (Covin & Slevin, 1989; Wiklund & Shepherd, 2005). Research has shown that innovative SMEs often achieve superior non-financial outcomes, including higher customer satisfaction, stronger market performance, and improved operational efficiency, because they continuously align offerings with changing customer needs (Rauch et al., 2009; Huang et al., 2023).

Proactiveness

This focuses on seeking opportunities, and forward-looking outlook characterized by the introduction of new products and services in advance of competition and acting in expectation of future demand (Rauch *et al*. 2009). Lumpkin and Dess (1996) define proactiveness as a posture of anticipating and acting on future needs, thereby creating first-mover advantages rather than reacting to environmental changes. Proactive firms tend to identify emerging market trends, initiate new products or services before competitors, and exploit untapped market opportunities (Covin & Slevin, 1989; Hughes & Morgan, 2007). Research shows that proactiveness enhances SMEs' competitiveness by improving market share, responsiveness, and long-term customer loyalty (Rauch et al., 2009). Therefore, proactiveness implies acting in advance with respect to future condition than being reactive, as such the entrepreneur will be in control or in charge of activities in the organization as an entrepreneur.

Business Performance

Business performance refers to the outcomes achieved by a firm in relation to its objectives, encompassing both financial and non-financial indicators. Traditionally, performance was assessed through financial metrics such as profitability, return on investment, and sales growth; however, scholars argue that non-financial measures such as customer satisfaction, innovation outcomes, and operational efficiency are equally important for capturing the holistic success of firms (Kaplan & Norton, 1996). Chong (2008) states that in the context of small and medium-sized enterprises (SMEs), non-financial indicators often provide a more accurate reflection of sustainability and competitiveness, since SMEs typically operate with limited financial resources and depend heavily on customer loyalty and efficient operations.

Customer Satisfaction and Retention

Customer satisfaction describes the degree to which a firm's products or services meet or exceed customer expectations, while retention captures the ability to maintain long-term relationships and encourage repeat patronage. Kotler and Keller (2016) argue that satisfaction is a key driver of loyalty and business sustainability. Consequently, high satisfaction leads to stronger customer trust, repeat purchases, and positive word-of-mouth, which are essential for SMEs that depend on relationship-based marketing (Keh et al., 2007). According to Cuevas-Vargas et al. (2019), customer retention not only lowers the cost of acquiring new customers but also contributes to long-term profitability and market performance. In entrepreneurial contexts, customer satisfaction and retention are considered crucial non-financial performance indicators that enhance competitiveness and survival.

Operational Efficiency

This denotes a firm's ability to minimize wasting of resource while maximizing productivity, quality, and customer value delivery. It reveals how effectively SMEs transform inputs (labour, capital, technology) into outputs that meet customer needs (Filser et al., 2014). In the

entrepreneurial orientation framework, efficiency is important because resource-constrained SMEs must optimize operations to remain competitive (Yaseen et al., 2024). Naskar and Singh (2025) advanced that operational efficiency enhances speed of service delivery, reduces costs, and improves adaptability in turbulent environments, all of which directly influence customer satisfaction and market sustainability. Thus, it is considered a critical non-financial performance indicator in entrepreneurship studies.

Entrepreneurial Orientation and Business Performance

Entrepreneurial orientation (innovativeness, and proactiveness) significantly enhances the non-financial performance of fast food enterprises. Literature has shown that EO drives customer satisfaction and retention through creativity, responsiveness, and competitive actions. Moreover, it improves operational efficiency through proactive resource allocation, innovative technologies, and process improvements. Studies has shown that entrepreneurial orientation are strongly associated with non-financial performance outcomes such as enhanced customer loyalty, better operational processes, and stronger market presence (Wiklund & Shepherd, 2005; Rauch et al., 2009). Given the above, we strongly believe that EO will positively correlates with the non-financial performance of fast foods enterprises in Owerri. Studies have shown that EO dimensions (innovativeness and proactiveness) influences the performance of SMEs in other sectors of the economy (Muazu et al., 2023; Ishaya et al., 2024).

Innovativeness and Customer Satisfaction and Retention

When fast foods develop new products/services and convenient technology such as mobile orders delivery and kiosks. This will increase convenience and perceived service quality, thus leads to higher satisfaction, as well as repeat patronage. Moreover, differentiation reduces switching and builds loyalty (retention). Fast-food customers are experience and convenience-sensitive; innovations that speed service or improve taste/variety directly affect their satisfaction. Research in fast-food/quick-service settings report positive links between innovation practices and customer satisfaction/loyalty (Escamilla-Fajardo et al., 2021).

Innovativeness and Operational Efficiency

Process innovation such as kitchen layout and standardization reduces service time and errors. Moreover, technology (POS systems, ordering-ahead, self-service kiosks) and automated tasks, reduces queuing and labour bottlenecks. Also, packaging and supply-chain innovations reduce waste and stock outs, thereby improves operational metrics. When fast foods enterprises engages in process, technology, layout, supply or packaging innovation, it will help them achieve operational efficiency. The resultant effect will be faster throughput, lower wastage, and smoother service delivery. Meta-analytic and sectoral evidence shows innovativeness had links to organizational quality/process performance and operational efficiency across service and hospitality sectors (El Manzani et al., 2025).

Proactiveness and Customer Satisfaction and Retention

Proactive firms detect and meet customer needs earlier, which fosters trust and repeat business. When fast foods adopt and implement menu changes, promotions, and service options (e.g., contactless delivery) before competitors, hence, they will satisfy unmet needs. Furthermore, early problem detection and service recovery practices will improve perceived reliability and

strengthens retention. This corroborates with the study carried out by (Anees et al, 2020; Banabo & Otobo, 2024).

Proactiveness and Operational Efficiency

Proactiveness such as anticipatory planning, proactive supply-chain adjustments, and early tech adoption tends to improve operational efficiency in fast-food firms because it allows managers to avoid bottlenecks and implement improvements before problems escalate. Anticipating high demand such as during peak periods and proactively reallocating staff, prepping inventory, or using demand forecasting reduces service delays. Also, early adoption of automation streamlines order handling and kitchen workflows. Additionally, proactive supplier management prevents stock outs and reduces emergency procurement costs. Studies have revealed that proactiveness relates with operational efficiency (Ogundare & Van der Merwe, 2024; Muazu et al., 2023)

Empirical Review

Some empirical studies underscore the positive significant relationship between EO and non-financial business performance.

Cheng et al. (2025) investigated EO and market performance of manufacturing and service firms in China. The study found that EO improved market performance through market orientation. Moreover, Hanaysha and Al-Shaikh (2024) study on Saudi SMEs showed that EO significantly improved corporate reputation and business sustainability when combined with marketing capabilities. Akinwale and Ogunleye (2023) study on entrepreneurial orientation and customer satisfaction of family-owned businesses in Lagos State, Nigeria reported that innovativeness and proactiveness significantly improved customer satisfaction, while risk-taking had no strong effect on customer satisfaction. Additionally, Morgan et al. (2023) study carried in the United States of America on entrepreneurial orientation and new product performance in SMEs: The mediating role of customer participation reported that EO improved new product performance (Market outcome). Moreover, Mercy and Rotich (2021) carried out a study on the effect of entrepreneurial orientation on perceived non-financial performance of hotels in Kampala, Uganda. The study revealed that EO positively influenced non-financial performance (service quality, customer loyalty, and staff satisfaction). Also, Escamilla-Fajardo et al. (2021) study on Sports Clubs in Spain reported that EO positively influenced service quality and organizational outcomes, while passion for work moderated this effect.

Gaps of the Study

The observed gaps between this study and above empirical studies are in the areas of: location (geographical scope-China, Saudi, Lagos, United States of America, Kenya, and Spain); some measures were different (market performance, and innovation capability): different and combined statistical tools (multiple regression), as well as different sampling technique-convenient and stratified techniques. Also, there is gap on the industry (manufacturing and services, family owned business, sports clubs and hotels). Conclusively, the point of departure includes: outcome gap (non-financial measures); dimensional focus gap (individual effects); contextual gap (Owerri) and sectoral gap (limited focus on fast foods). Thus, these observed gaps will contribute to the body of academic knowledge as well as point of departure from these studies.

Methodology

The study adopted a correlational survey research design. The accessible population was 132 fast food enterprises accessed from the database of https://rentechdigital.com list of fast foods in Owerri. However, since the accessible population is manageable, we adopted a census method in determining our sample size. Thus, our sample size was 132. However, two copies of questionnaire were administered to the owners and managers of each of the 132 fast food enterprises making it a total of 264 surveys. Therefore, the respondents were 264 business owners/managers. They were chosen because they are knowledgeable with strategic decisions and thus, we can elicit information concerning our study variables from them. Data was collected using structured questionnaire and administered to respondents by the researcher and two research assistants. A pilot survey was conducted to test the research instruments to evaluate content and construct validity among 30 business owners/managers of fast foods within the Imo State University axis. The reliability was ascertained using the Cronbach's alpha coefficient and the study variables entrepreneurial orientation and business performance had 0.894 and 0.862 respectively above the established threshold of 0.70. Thus, the research instrument has high internal consistency, and is statistically reliable. Both descriptive and inferential statistics were utilized. The earlier stated hypothetical statements were analysed using the Spearman Rank Order Correlation with the aid of statistical package for social science version 25.0. However, out of 264 copies of questionnaire that were distributed to respondents, 213 were retrieved and used for analysis representing 80.68% response rate.

Data Analysis and Presentation of Results

Descriptive Statistics Analysis

Table 1: Descriptive Statistics on Emtrepneurial Orientation

	N	Minimum	Maximum	Mean	Std. Deviation
Innovativeness	213	1.00	5.00	3.9643	.57365
Proactiveness	213	1.00	5.00	3.8205	.58172
Valid N (listwise)	213				

Source: Field Survey, 2025 and SPSS version 25.0

Table 1 above illustrates the descriptive statistics of the dimensions of entrepreneurial orientation (innovativeness and proactiveness) with mean scores of 3.9643, and 3.8205 respectively. This implies that innovativeness and proactiveness are strongly embedded in the entrepreneurial orientation of SMEs in Owerri. The SD of .57365 and .58172 of (<1) indicate stability and respondents generally share similar views about their firms' innovativeness and proactiveness.

Table 2: Descriptive Statistics on Business Performance

	N	Minimum	Maximum	Mean	Std. Deviation
Customer Satisfaction and Retention	213	1.00	5.00	3.8721	.64382
Operational Efficiency	213	1.00	5.00	3.7935	.59626

Valid N (listwise)	213

Source: Field Survey, 2025 and SPSS version 25.0

Table 2 above explains the descriptive statistics of the dimensions of business performance (customer satisfaction and retention and operational efficiency) with mean scores of 3.8721, and 3.7935 respectively. This suggests that respondents agree their firms achieve relatively high levels of customer satisfaction and retention as well efficient in their operations. The SD value shows that SMEs have found reliable ways of keeping their customers happy, and to operate efficiently.

Testing of Hypotheses

Our decision rule: Where P < 0.05 = Reject the null hypotheses Where P > 0.05 = Accept the null hypotheses.

Table 3: Correlation Matrix of Innovativeness and Measures of Business Performance

			Innovativeness	Customer Satisfaction and Retention	Operational Efficiency
Spearman's rho	Innovativeness	Correlation Coefficient	1.000	.853**	.847**
		Sig.(2-tailed)	-	.011	.013
		N	213	213	213

** Correlation is significant at the 0.05 level (2-tailed).

Source: Field Survey, 2025 and SPSS version 25.0

Ho1: There is no significant relationship between innovativeness and customer satisfaction and retention of fast-food enterprises in Owerri.

Table 3 shows a correlation matrix obtained between innovativeness and customer satisfaction and retention ($r = 0.853$; $p < 0.05$). The result shows a significant and very strong positive relationship between innovativeness and customer satisfaction and retention. Based on this finding, the null hypothesis **(Ho1)** is rejected and the alternate upheld.

H02: There is no significant relationship between innovativeness and operational efficiency of fast-food enterprises in Owerri.

Also, displayed in table 3 above, is the correlation matrix obtained between innovativeness and operational efficiency ($r=0.847$; $p<0.05$). The result indicates a significant and very strong positive relationship between innovativeness and operational efficiency. Based on this finding, the null hypothesis **(Ho2)** is rejected and the alternate upheld.

Table 4: Correlation Matrix of Proactiveness and Measures of Business Performance

			Proactiveness	Customer Satisfaction and Retention	Operational Efficiency
Spearman's rho	Proactiveness	Correlation Coefficient	1.000	.765**	.751**
		Sig. (2-tailed)	-	.014	.016
		N	213	213	213
	Customer Satisfaction and Retention	Correlation Coefficient	.765**	1.000	.741**
		Sig. (2-tailed)	.000	-	.010
		N	213	213	213
	Operational Efficiency	Correlation Coefficient	.751**	.741**	1.000
		Sig. (2-tailed)	.012	.000	-
		N	213	213	213

** Correlation is significant at the 0.05 level (2-tailed).

Source: Field Survey, 2025 and SPSS version 25.0

H03: There is no significant relationship between proactiveness and customer satisfaction and retention of fast-food enterprises in Owerri.

Table 4 above, illustrates a correlation matrix obtained between proactiveness and customer satisfaction and retention ($r=0.765$; $p<0.05$). The result shows a significant and strong positive relationship between proactiveness and customer satisfaction and retention. Based on this finding, the null hypothesis **(Ho3)** is rejected and the alternate upheld.

H04: There is no significant relationship between proactiveness and operational efficiency of fast food enterprises in Owerri

Additionally, table 5 above showed the correlation matrix obtained between proactiveness and operational efficiency ($r=0.751$; $p<0.05$). The result indicates a significant and strong positive association between proactiveness and operational efficiency. Based on this finding, the null hypothesis **(Ho4)** is rejected and the alternate upheld.

Discussion on Findings

The empirical results revealed that innovativeness had a positive and significant relationship with both customer satisfaction and retention and operational efficiency. The outcome in table 3 above showed that innovativeness has significant link with customer satisfaction and retention ($r =0.853$; $p<0.05$) and operational efficiency ($r=0.847$; $p<0.05$) of fast food enterprises in Owerri. This implies that SMEs which actively introduce new ideas, improve their offerings, and adopt innovative business practices are more likely to satisfy and retain customers while also achieving greater efficiency in their operations. These findings aligns with the studies carried out by (Muazu et al., 2023; Ishaya et al., 2024) which revealed that innovativeness enhances non-financial performance.

Likewise, the study found a positive and significant relationship between proactiveness and both customer satisfaction and retention and operational efficiency of fast foods enterprises in Owerri. The outcome in table 4 above showed that innovativeness has significant correlation with customer satisfaction and retention ($r=0.765$; $p<0.05$) and operational efficiency ($r=0.751$; $p<0.05$) of fast food enterprises in Owerri. This suggests that proactive fast food enterprise, which anticipate customer needs and act ahead of competitors, are more likely to build strong customer connections, tilting toward achieving higher satisfaction and loyalty. Similarly, proactive fast food enterprises will attain superior operational efficiency by initiating timely changes, reducing delays, and adopting innovative processes. These results are in tandem with recent studies conducted by (Muazu et al., 2023; Ishaya et al., 2024) which revealed that proactiveness enables SMEs to enhance customer-centric outcomes while making their internal processes more efficient.

Furthermore, the findings buttress the view that proactiveness is not only a customer-centered inclination, however is also a strategic abilities that boosts efficiency and resilience in competitive and resource-constrained markets. Therefore, in accordance with the resource-based view theory, fast foods enterprises that are innovation-driven are better positioned to deploy unique capabilities that create exceptional customer value while simultaneously making the internal processes more efficient. This outcome further strengthens the argument that innovativeness is not only a driver of market competitiveness, but also a foundation for sustainable SME growth in emerging economies such as Nigeria, and in particular Owerri.

Conclusion

The study investigated the relationship between entrepreneurial orientation and non-financial performance proxies of fast food businesses in Owerri. The study findings indicated a positive significant association between innovativeness, proactiveness and customer centric outcomes customer satisfaction and retention; and operational efficiency. The result of the study has shown that non-financial proxies are important and can be used by fast food enterprises in Owerri to achieve survival, sustainability and competitive advantage. Moreover, it shows distinct roles of EO dimensions by disaggregating EO dimensions instead of treating EO as a single construct by investigating innovativeness and proactiveness separately showing how each uniquely contributes

to different outcomes. Furthermore, it has empirically link EO with customer-centric and efficiency related performance. Lastly, it offers policy and theoretical implications. Thus, it extends resource-based view by showing that EO dimensions act as strategic resources that drive non-financial performance, while strengthening dynamic capabilities theory by showing how EO enables fast foods enterprises to sense and seize customer and operational opportunities in volatile markets.

Recommendations

Based on the findings and conclusion, the study recommends that Fast foods owners in Owerri should:

i. Promote a culture of continuous innovation by developing new product/service, improve existing process, and adopt new technology in order to sustain customer satisfaction and retention.
ii. Proactively adopt emerging technologies such as digital payment systems, supply chain tracking apps, as well as embrace process automation aimed at reducing waste, improving delivery time and resource optimization.
iii. Strengthen proactive customer engagement strategies by adopting customer feedback systems, social media analytics, and trend monitoring to anticipate customer needs before they arise.
iv. Engage in regular market research, and environmental scanning, in order to exploit emerging market opportunities before competitors.

Abstract
The purpose of this paper is to provide understanding on the concept of content management strategy also examined the relationship with organizational competitiveness among companies in Port Harcourt, Rivers State. Resource based theory was adopted as the baseline theory for this study and the method adopted for this study is the reviewed of extant literature. The study findings revealed that there is a significant and positive relationship between content management strategy and organization competitiveness Therefore, based on these findings and conclusion, the study suggested that for organizations to have a competitive advantage, the use of content management strategy should be encouraged and actively used as it gives companies higher chances in competing in the industry.

Keywords*: content, content management strategy, content creation, content planning, content creation, and competitiveness.*

Introduction

An economy that is based on technology, innovation, resource efficiency, sustainability and high social welfare as engine for success is refer to as smart economy. This economy triggers high competition among firms. Hence competitiveness is essential for any organizations that desire to survive or last in business. Osei-Kyei & Chan (2017), defined organizational competitiveness as firm's ability to maintain an advantageous position over industry peers by achieving superior performance in areas such as efficiency, quality, and innovation. Thus, in the contemporary business environment, information has emerged as a critical asset that determines the success and sustainability of organizations. Camison and Fores (2015), noted that competitiveness is influenced by both internal capabilities and external market conditions. They observed that firms

need to align their resources and strategies with the demands of the environment to sustain competitive advantage. McKinsey & Company (2021) opined that organizations leveraging digital tools and platforms can enhance customer experiences, optimize operations, and access new markets. They concurred that digital transformation enables firms to adapt swiftly to changes in the business environment, thereby sustaining their competitive advantage.

Content in this context is a compilation of information, ideas and messages, translated into written, visual or audible. Content management is a combination of technology and business processes; technology that facilitates the creation, storage and delivery of content; and business process and work flow essential for a successful implementation of the technology (Vipul, Govindarajan & Tonya 2010). Content management refers to the process of creating, collecting, editing, and delivering any form of information on any medium. Anything can be considered content: from images to video, audio, multimedia, and text. All content comes with a content lifecycle that needs to be managed: from creation to either storage or deletion (bynder.com 2025). Content management strategies (CMS) focus on the planning, creation, delivery, and governance of content (eGovjamaica 2022). Thus, content management enhance organizations to manage knowledge, improve decision-making, and respond swiftly to environmental changes. Understanding and meeting customer needs are fundamental to organizational competitiveness. Kotler and Keller (2021) emphasized that customer satisfaction leads to loyalty, which in turn drives repeat business and referrals. The way content is generated, stored, shared, and utilized influences an organization's ability to adapt to changing market dynamics, enhance productivity, and maintain a competitive advantage (Chatterjee, Rana, & Dwivedi, 2021). Content management strategies have gained significant attention in today's digital economy due to the high volume of information being published on intranet, extranet and Internet websites. These strategies are particularly critical for organizations that require seamless access to information. Content management has become a vital tool for improving the operational performance and competitiveness of organization.

Organizations are faced with challenges such as infrastructural limitations, regulatory shifts, and growing competition, the ability of this companies to manage and leverage information effectively can significantly influence their success. Content management strategies facilitate better handling and organizing of content and ensuring that decision-makers have real-time access to accurate and up-to-date information (Gupta et al., 2011). Furthermore, automated content management systems can reduce the risks of data loss, improve compliance with regulatory requirements, and enhance customer service through quicker response times and personalized financial products. Content management strategies provide companies with a comprehensive view of market trends and customer behavior. This enables management to identify opportunities, forecast market shifts, and make strategic decisions more effectively. For example, Mohamed (2023) highlighted that digital transformation through CMS improves the operational performance and strategic responsiveness of organizations.

Statement Of the Problem

In today's fast-evolving economy, organizations are faced with numerous challenges that demand swift adaptation to changing market conditions, customer expectations, and regulatory requirements. The ability of a company to quickly adjust its operations, strategies, and structures in response to changes is becoming increasingly important for firms striving to remain competitive and efficient. However, most firms are still struggling with adopting the necessary strategies to

enhance their competitiveness among their competitors. Content management strategies have been widely recognized as a crucial factor that make organizations stand out among their peers, as it facilitates quicker decision-making, improve service delivery, streamline internal communication, transform service delivery and improve strategic responsiveness.

However, the extent to which content management strategies are effectively implemented and their impact in most organizations remains unclear despite the growing recognition of the importance of content management strategy in enhancing operational efficiency and responsiveness. This lack of knowledge of content management strategies has made firms not to be able to standout because of difficulty to access information that is needed at the right time and this led to inconsistency and poor workflow management that affect the performance of the organization and them less competitive among their competitors. Hence, content management strategies are essential as it can directly influence organizational competitiveness among firms in Rivers State.

Despite the recognized importance of content management strategies in enhancing organizational competitiveness there is limited research on its specific impact on organizational competiveness among firms, particularly in Rivers State. Thus, the study tends to provide understanding on the relationship between content management strategies and organizational performance.

Literature Review

Theoretical Foundation

The theoretical foundation of this study is hinged on the Resource-Based Theory (RBT). This theory was first put forward by Penrose (2009), who proposed a model on the effective management of firms' resources, diversification strategy, and productive opportunities. This theory provides a framework to highlight and predict the fundamentals of organisation performance and competitive advantage. According to resource-based theory, a firm is a strategic entity, a social structure that exists as a more or less efficient mechanism for creating and allocating economic value as defined above. This characterization of a firm does not necessarily contradict other characterizations. Thus, transaction cost minimization may be important in how economic value is created and appropriated, incomplete contracts may be important in how economic value is allocated to stakeholders, and so forth (Barney, 2018). However, as a strategic management theory, resource-based theory is keenly focused on both how economic value is created and allocated and on the role that firms can play in this process. The theory is agnostic regarding other ways of characterizing a firm except to the extent that these other characterizations have implications for the creation and appropriation of economic value (Barney et al 2025). RBT addresses an internally-driven approach by focusing on internal organisation resources, as opposed to externally driven approaches to understanding the accomplishment or failure of leveraging organisational activities (Kozlenkova, Samaha & Palmatier, 2014). It aims to elaborate on imperfectly imitable firm resources that could potentially become the source of sustained competitive advantage (Barney, 1991). The **Resource-Based theory (RBT)** is a significant to this study as it is a strategic management theory that emphasizes on the importance of a company's internal resources and capabilities as the key determinants of competitive advantage. Rather than focusing solely on the external environment, suggests that a firms achieve superior performance by effectively developing, managing, and leveraging their unique resources. These resources, which include tangible assets like equipment and facilities, as well as intangible assets like brand reputation, organizational culture, and proprietary knowledge, form the backbone of a firm's strategy.

Concept of Content Management Strategies

Content management strategy focuses on the planning, creation, delivery, and governance of content (eGovjamaica 2022). Content in this context is a compilation of information, ideas and messages, translated into written, visual or audible. Content not only includes the words on the page, but also the images and multimedia elements used. Thus, anything can be considered content: from images to video, audio, multimedia, and text. All content comes with a content lifecycle that needs to be managed: from creation to either storage or deletion (bynder.com 2025). Content management is a combination of technology and business processes; technology that facilitates the creation, storage and delivery of content; and business process and workflow essential for a successful implementation of the technology (Vipul, Govindarajan & Tonya 2010). Content management refers to the process of creating, collecting, editing, and delivering any form of information on any medium. Content management refers to the process of efficiently managing digital information and media, enabling an organization to respond effectively to market demands, customer needs, and regulatory changes (Barger et al., 2016). Content management strategy is a plan of action on how a business creates, organizes, and coordinates digital content across different social media and marketing channels. It includes strategies to optimize the user experience, increase visibility, secure data, conduct analysis, and track performance (aprimo.com). Content management strategies also help businesses maximize their return on investment and effort. With the correct strategy in place, marketers develop on-target content for customers and deliver it at the right moment for their target audience. Content management strategies are key to driving overall business success and growth. Thus, content management strategy enhances organizations to manage knowledge, improve decision-making, and respond swiftly to environmental changes. The goal of this content management strategy is to create a standardized look and feel, workflow, and a consistent framework for communicating changes to stakeholders. Achieving these goals will also help to ensure that the content is useful, usable, and well structured. This is a guide towards assisting with keeping content secure, useful, and usable throughout the content's life cycle. It is intended to serve as the foundation for understanding how to get the vast amounts of information and services offered by the government to recipients who may not understand how to get them, or even know that they exist in the first pl ace (eGovjamaica 2022). Content management strategies (CMS) enable these organization to store, organize, and retrieve information efficiently, thereby enhancing decision making which enable them to have competitive advantage.

The evolution of content management strategies mirrors broader shifts in organizational behavior, technological innovation, and user engagement paradigms. From structured content hierarchies to modular ecosystems and AI-enabled personalization, content strategies have become critical instruments for competitive advantage, digital continuity, and sustained engagement across business, education, and public sectors. Content management (CM) was originally associated with Web-development projects. As the Web moved past small, informally designed sites and into large, rapidly changing sites, the need for strong management tools became pressing. Systems vendors addressed this need and began offering content management systems (Hackos, 2002). Websites, however, are simply one of many outlets. And, as the number of outlets and the information shared between them grow (e.g. multiple Web sites, print publications and anything else that can be created from the same information, especially in e-business networks), the need for a general approach becomes essential. CM is an overall process for collecting, managing, and publishing content to any outlet. As organizations scale, these strategies evolve into Enterprise Content Management (ECM), an integrated discipline encompassing not just content capture and

organization but also the intelligent processing, contextual analysis, and maintenance of content across its lifecycle. The model proposed by Smith and McKeen illustrates this, emphasizing the four lifecycle stages of entrepreneur content management which are; capture, organize, process, and maintain and stressing the need for strategic flexibility to future-proof content systems (Smith & McKeen, 2003). Alongside this structural evolution, content strategy has emerged as a unifying vision that transcends departmental silos, combining technical communication, marketing, web development, and user experience design into a cohesive framework. Batova and Andersen (2016) underscores this interdisciplinary shift, where modular, component-based content management allows for granular content reuse, cross-channel consistency, and collaborative workflows across diverse stakeholder groups. Such strategies not only enhance productivity but also ensure that content remains relevant, accessible, and aligned with user expectations and organizational objectives (Batova & Andersen, 2016). Furthermore, in enterprise environments, content strategies function as dynamic blueprints that define how content supports business objectives, facilitates knowledge transfer, and aligns with future digital transformation initiatives. More recently, the rise of digital learning platforms has given rise to e-content management strategies focused on user-centric design, multimedia integration, and adaptive learning. Khan's research highlights key pillars such as metadata tagging, content versioning, seamless navigation, and mobile-first design, which are critical in supporting personalized learning and content scalability. These strategies emphasize the convergence of technology, pedagogy, and user analytics to optimize educational outcomes (Khan, 2024). As digital ecosystems grow more complex, effective content management strategies must now encompass cross-platform interoperability, AI-driven content recommendations, real-time analytics, and compliance with data governance standards such as GDPR. This calls for a shift from reactive content tactics to proactive strategies built on continuous optimization, user feedback loops, and agile content governance models.

Dimensions of Content Management Strategies

Content Planning

Content planning is a foundational process in the lifecycle of content strategy that serves as the blueprint for the creation, management, and dissemination of content across various platforms and audiences (bynder.com). Content planning involves series of strategic decisions that ensure content aligns with organizational objectives, speaks effectively to target audiences, and maintains consistency across all communication channels. Content planning entails identifying content goals, researching audience personas, analyzing market trends, and organizing a detailed roadmap often in the form of an editorial or content calendar that dictates what content is produced, when it is published, and where it is distributed. This strategic foresight is particularly critical in today's fragmented digital landscape where content must perform across multiple touchpoints, from websites and social media to newsletters and digital campaigns. Their planning process included defining a brand essence with a unique value proposition and crafting a campaign deck outlining key messages, media channels, and a content matrix tailored to audience segments. This approach resulted in focused and impactful digital content that enhanced brand visibility and engagement (Naufal et al., 2024). Beyond the corporate sphere, content planning also holds significant value in education and skill-building. Ultimately, the power of content planning lies in its ability to bring structure, foresight, and strategic alignment to the content creation process. It ensures that all content, whether crafted by a marketing team, a student, a scholarly journal, or an AI system serves a specific purpose, reaches the right audience, and supports broader communication and business objectives.

Content Creation

According to Li, (2022), the content creation process must be approached with a structured, repeatable framework to achieve sustainable success; without such organization, efforts can become inefficient and misaligned with strategic goals (Li, 2022). A typical content creation framework begins with research and ideation, guided by content strategy and user insights, followed by drafting, editing, design integration, and distribution. Each stage must align with audience personas and platform algorithms to ensure optimal engagement and reach. Content creation stands at the heart of digital communication, acting as the principal vehicle through which individuals, brands, and institutions engage their audiences and express their identities in the digital landscape. At its most fundamental level, content creation involves ideation, development, and publishing of material designed to inform, entertain, persuade, or educate target audiences. As content creation has become central to brand strategy, its role in global brand building is more pronounced than ever. A recent study emphasizes that well-crafted content fosters brand consistency and emotional resonance across geographies. Through compelling narratives and visual coherence, brands like Coca-Cola and Netflix have demonstrated how content transcends cultural barriers, leveraging localization and digital storytelling to maintain a cohesive identity worldwide (IOSR, 2024).

Content Storage

Content storage is an essential pillar of digital infrastructure that supports the vast ecosystem of digital information sharing, media streaming, remote collaboration, and data governance. As digital content continues to proliferate in volume, complexity, and importance, the systems and strategies that underpin content storage have evolved far beyond simple data archiving. Today's content storage solutions must ensure durability, scalability, accessibility, security, and adaptability in real time. At a foundational level, content storage involves capturing, organizing, and retaining content ranging from static text documents and images to dynamic video streams and complex interactive media. Early models emphasized local storage and manual cataloging, but modern approaches incorporate intelligent content indexing, automated metadata tagging, and integration with content delivery networks (CDNs) to support efficient retrieval and cross-platform accessibility. For instance, Mohan proposed a storage system featuring content analyzers that update indexes dynamically as content changes, ensuring that storage systems can adapt in real-time to content lifecycle events (Mohan, 2013). This dynamic indexing supports enhanced performance in enterprise content environments where data is constantly being modified or augmented.

Concept of Organizational Competitiveness

According to Porter (1985), achieving a competitive advantage involves positioning a firm uniquely in the marketplace. He emphasized that organizations must choose between cost leadership, differentiation, or focus strategies to create value that is perceived as unique by customers. Similarly, Camison and Fores (2015) noted that competitiveness is influenced by both internal capabilities and external market conditions. They observed that firms need to align their resources and strategies with the demands of the environment to sustain competitive advantage. Innovation plays a pivotal role in enhancing organizational competitiveness. As Zuniga-Collazos et al. (2019) averred, organizations that invest in research and development can introduce new products and services that meet the evolving needs of customers. They emphasized that innovation enable firms to differentiate themselves from competitors, thereby gaining a competitive edge. In

the same vein, Hamid (2020) supported the notion that continuous innovation fosters organizational growth and resilience in dynamic markets. The human capital within an organization significantly contributes to its competitiveness. Luthans and Youssef-Morgan (2020) emphasized that employee engagement, training, and development are crucial for fostering a competitive workforce. They observed that organizations that invest in their employees' growth tend to experience higher productivity and innovation. Furthermore, Northouse (2018) noted that effective leadership is essential in guiding teams towards achieving organizational goals and maintaining a competitive position. Operational efficiency is another critical factor influencing organizational competitiveness. Christopher (2016) emphasized that streamlining processes and reducing waste can lead to cost savings and improved service delivery. In this context, ISO 9001:2015 standards provide a framework for organizations to enhance their quality management systems, thereby improving competitiveness (Fonseca et al., 2017). They asserted that the integration of change management and continuous improvement processes within these standards fosters organizational agility and responsiveness to market demands.

In the digital age, technology adoption is imperative for maintaining competitiveness. McKinsey & Company (2021) opined that organizations leveraging digital tools and platforms can enhance customer experiences, optimize operations, and access new markets. They concurred that digital transformation enables firms to adapt swiftly to changes in the business environment, thereby sustaining their competitive advantage. Understanding and meeting customer needs are fundamental to organizational competitiveness. Kotler and Keller (2021) emphasized that customer satisfaction leads to loyalty, which in turn drives repeat business and referrals. They noted that organizations that prioritize customer relationships and personalize their offerings are better positioned to outperform competitors. Similarly, Berry et al. (2021) supported this view, asserting that delivering exceptional customer service creates a strong competitive differentiation.

Effective financial management ensures that organizations can invest in growth opportunities and weather economic downturns. Moyer et al. (2021) observed that prudent budgeting, cost control, and strategic investment decisions are essential for maintaining financial health. They asserted that organizations with sound financial practices are more resilient and capable of sustaining competitiveness in challenging times. An organization's reputation and brand equity are intangible assets that contribute to its competitiveness. Fombrun and Shanley (2017) emphasized that a positive reputation attracts customers, investors, and talent, all of which are vital for sustained success. They noted that organizations that uphold ethical standards and deliver consistent quality build trust and loyalty among stakeholders. In today's volatile business environment, adaptability and resilience are crucial for organizational competitiveness. According to the International Federation of Robotics (2021), firms that embrace automation and flexible work arrangements can respond more effectively to disruptions. They observed that organizations with resilient supply chains and adaptive strategies are better equipped to maintain operations during crises.

Empirical Review on Content Management Strategies as a Strategic Initiative for Competitiveness

Gupta et al (2010) in their study overview of content management approach and strategies stated that the benefit of content management strategies include Standardized approach, which promotes a uniform approach to managing information resources. Standardized training, administration, and support can be applied corporate-wide with few exceptions. Furthermore, Scalability and cost

efficiency. The exploitation of intra net technology in corporations allows opportunity to every employee to potentially contribute content to the corporate, divisional or departmental intranet. With the help of a CM tool, this increase in the number of web pages and web contributors will not require a proportional increase in the number of technical support staff. Several Content Management vendors have created tools that allow non-technical staff to easily create and modify site content without having to learn the technical aspects.

According to Fukushima (2019) the evolution of content creation is also evident in educational contexts where emotionally responsive methods are used to enhance learning retention. Fukushima's content creation model involves linking emotional stimuli to learning data, optimizing memory formation through sensory cues and emotional engagement. This fusion of neuroscience and content design exemplifies how content creation is becoming a multidisciplinary field that draws from behavioral science, technology, and marketing to craft impactful experiences. Emerging trends such as short-form video, interactive content, and immersive media (e.g., AR/VR) are further pushing the boundaries of what content can do, necessitating new skills and frameworks for creators.

Aprimo.com posted about the benefit of content management strategy. It stated that the benefit of content management strategy includes **more productivity, Increased automation opportunities, Improved employee onboarding, better data governance and content optimization. Which can enhance competiveness in any organization.**

Methods

The study adopts review of extant literature as the method of this study. For the purpose of providing a better understanding about the concept, several literatures were studied and reviewed. Both empirical and non-empirical papers were reviewed to give insight on the topic; content management strategies: a strategic initiative for competitiveness among companies in Port Harcourt, Rivers State.

Conclusion / Recommendations

Organizational competiveness is a necessity for any organizations that wishes to last long and excel in business. Organizational competitiveness is enhanced by the standard of content management strategies. Content management strategies facilitate better handling and organizing of content and ensuring that decision-makers have real-time access to accurate and up-to-date information are essential. The study concludes that content management strategy has a significant influence on organizational competitiveness. The implication is that a well-managed content in the organization enhance efficiency and performance that give organizations a competitive edge over their competitors.

Based on the findings, the study recommends that content management strategies should be effectively use in companies as it enables them to achieve maximum results when aiming for organizational competitiveness.

Contribution to Knowledge

The study based on reviews, validated the purpose of the study, which is to examine and provide understanding on content management strategy and organization competiveness. The study also

validated the dimensions of content management strategy which are content planning, content creation and content storage.

Abstract:
This study investigates the relationship between dark data management and administrative competence within public sector organizations in Rivers State, Nigeria. Drawing on the Information Lifecycle Theory and the Competency-Based Theory, the research adopts a correlational survey design to evaluate how dark data influences two core indicators of administrative competence: decision-making precision and process execution efficiency. A structured questionnaire was administered to 217 administrative personnel sampled from twelve Ministries, Departments, and Agencies using stratified random sampling. The instrument demonstrated strong internal reliability, with Cronbach's alpha values ranging from 0.82 to 0.89. Data were analyzed using descriptive statistics, Pearson correlation, and linear regression. Results reveal a significant positive relationship between dark data management and both decision-making and process execution, with correlation coefficients of 0.674 and 0.702 respectively. The study concludes that effective management of dark data enhances administrative responsiveness, reduces redundancies, and strengthens institutional performance. It recommends the institutionalization of robust data governance frameworks to unlock the latent value of dark data in support of evidence-based administration and improved public service delivery.

Keywords: *Dark data management, Administrative competence, Decision-making precision, Process execution efficiency, Data governance, Public sector performance*

Introduction

The rapid adoption of digital technologies and the increasing automation of public sector processes have resulted in the generation of massive volumes of data across government institutions. However, a significant portion of this data remains unutilized, residing in the background as latent or overlooked information. This unused information, commonly referred to as dark data, is defined by Gartner (2023) as the information assets organizations collect, process, and store during regular business activities but generally fail to use for other purposes such as analytics, business

relationships, or strategic decision-making. Within the context of public administration, dark data may include archived correspondence, outdated records, system logs, unused survey outputs, or duplicated entries that are stored but never mined for administrative value.

In the developing economy of Nigeria, particularly at the sub-national level, the issue of dark data accumulation presents growing risks to institutional effectiveness. Ministries, Departments, and Agencies (MDAs) within Rivers State generate large volumes of data from budgeting, personnel administration, procurement, and citizen engagement exercises. Despite this, many institutions lack structured frameworks to convert stored data into actionable insights. As observed by Eze, Nwachukwu, and Ogbari (2021), data governance challenges such as poor classification, lack of metadata policies, and weak institutional awareness remain major barriers to public sector efficiency in Nigeria. These limitations not only waste storage resources but also constrain the capacity of public officers to access critical information when needed.

Administrative competence refers to the ability of public administrators to execute decisions, apply procedures efficiently, and manage organizational resources effectively. In this study, administrative competence is assessed using two core indicators: decision-making precision and process execution efficiency. These constructs reflect both the strategic and operational dimensions of public administration, emphasizing the role of timely, relevant, and complete information in shaping public sector performance. When dark data is poorly managed, administrators operate in information vacuums, leading to slow response times, resource duplication, and suboptimal outcomes (Okon, Asuquo, & Bassey, 2023). Globally, public administration is undergoing a shift toward data-driven decision-making, supported by international frameworks such as the Organization for Economic Co-operation and Development (OECD, 2022), which advocates for improved data literacy and infrastructure as a pathway to institutional effectiveness. However, the discourse around dark data remains relatively underdeveloped in African administrative scholarship. Empirical investigations on public sector data management in Nigeria tend to focus on big data or general digital adoption, with little attention given to the concept and implications of dark data.

This study is therefore significant on several fronts. Theoretically, it contributes to the nascent academic conversation on data blindness in governance by spotlighting dark data as an overlooked determinant of institutional performance. It expands the discourse on public administration in Nigeria by introducing a nuanced data governance construct with real-time administrative implications. Practically, this study provides policymakers, data managers, and administrative heads within Rivers State MDAs with insight into how unmanaged data reservoirs may be limiting organizational competence. By evaluating how dark data management influences decision-making and process implementation, the research offers a pathway for promoting evidence-based policy execution and administrative accountability. In broader terms, it aligns with Sustainable Development Goal 16, which underscores the importance of building effective, accountable, and inclusive institutions at all levels.

Statement of the Problem

Amidst growing investment in digital infrastructure within public sector institutions in Rivers State, data governance remains largely fragmented. Government agencies continue to accumulate enormous volumes of unused information across local servers, email storage, log files, scanned

memos, and outdated databases. Yet, there is minimal awareness of the risks and potential embedded in these data assets. Administrative audits and performance reviews frequently highlight delayed processes, inaccurate reporting, and misinformed decisions, all of which may be attributed to the absence of a structured approach to dark data management (Rivers State Government ICT Report, 2023). Many public officers rely on intuition or manually curated summaries when making decisions, bypassing potentially relevant data stored in institutional systems. The disconnection between data availability and administrative use undermines the competence of governance actors, affects public trust, and diminishes the responsiveness of MDAs to developmental needs. While the idea of dark data is gaining recognition in global conversations around e-governance and smart administration, its practical implications in Nigerian public administration, particularly in Rivers State, have not been sufficiently studied. This gap necessitates an empirical examination of how dark data management practices correlate with key indicators of administrative competence in the state's public institutions.

Objectives of the Study

The main objective of the study is to examine the relationship between dark data management and administrative competence in public sector organizations in Rivers State, Nigeria. The specific objectives are to:

1. Investigate the relationship between dark data management and decision-making precision in public sector organizations.
2. Determine the effect of dark data management on process execution efficiency in public sector organizations.

Research Questions

The following research questions guided the study:

1. How does dark data management relate to decision-making precision in public sector organizations?
2. What is the effect of dark data management on process execution efficiency in public sector organizations?

Research Hypotheses

The study is guided by the following hypotheses:

H_{01}: There is no significant relationship between dark data management and decision-making precision in public sector organizations in Rivers State.

H_{02}: Dark data management does not significantly affect process execution efficiency in public sector organizations in Rivers State.

Literature Review

Dark Data Management

Dark data has emerged as a central concern in contemporary information governance discourse, particularly as the volume of data within organizational systems continues to grow exponentially. According to Gartner (2023), dark data refers to information assets that organizations collect, process, and store during routine operations, but which are not used for further analysis, decision-making, or strategy development. While this category of data may appear insignificant, it has been found to contain untapped insights, operational relevance, and often, sensitive content that could influence institutional outcomes if appropriately managed.

In public sector institutions, dark data can manifest in numerous formats, including but not limited to, obsolete files, unprocessed log records, archived communications, underutilized survey outputs, and administrative reports stored without retrieval systems. These data silos are often symptoms of fragmented digital systems, poor data literacy, and the absence of a defined information lifecycle management framework. As noted by Kiron, Ferguson, Prentice, and Shwartz (2022), when dark data is left ungoverned, it introduces operational risk, reduces institutional responsiveness, and obstructs innovation. Their study further emphasized the organizational consequences of dark data in the public sector, where administrative decision-making and public service delivery depend on timely and comprehensive access to historical and real-time data.

Managing dark data, therefore, requires deliberate institutional action. Gandomi and Haider (2021) highlighted the importance of integrating dark data within the broader data governance framework by applying techniques such as classification, tagging, system interoperability, and retention audits. These practices are not only technical interventions but also demand cultural and procedural changes that promote a conscious awareness of data utility across departments. In the Nigerian context, dark data management remains an emerging issue, as many government organizations have only recently begun digitizing their operations. This transitional phase presents both a challenge and an opportunity, particularly within sub-national settings like Rivers State, where public institutions continue to grapple with legacy data environments.

Administrative Competence

Administrative competence refers to the ability of public institutions and their personnel to carry out their statutory functions effectively, consistently, and with accountability. It encompasses a range of capabilities including policy execution, resource coordination, staff supervision, procedural compliance, and citizen service delivery. According to Micheli, Mura, and Agostino (2021), administrative competence is a core determinant of institutional legitimacy, especially in democratic societies where public expectations are high, and resources are limited.

In the contemporary public sector, competence is no longer measured solely by technical knowledge or hierarchical experience, but increasingly by the capacity to make evidence-based decisions, adapt to changing conditions, and implement processes efficiently. This competence is shaped not only by the personal attributes of administrators but also by institutional factors such as access to relevant data, ICT tools, and structured workflow systems. As Chigbu and Nwogu (2022) argued, the quality of administrative action is often a reflection of the quality and accessibility of data at the administrator's disposal.

***Decision-making precision*: this** refers to the ability of administrators to take informed actions based on accurate, timely, and complete data. It reflects how effectively data is used in analyzing problems, forecasting outcomes, and formulating administrative responses. According to Okon, Asuquo, and Bassey (2023), poor decision-making in public organizations is frequently associated with data gaps, fragmentation, or reliance on outdated information. Where dark data is ignored or inaccessible, administrators risk making choices based on partial knowledge, which could lead to inefficiencies, errors, or unintended policy outcomes. This limitation creates a disconnection between institutional memory and present-day governance needs. In many cases, public

administrators are left to rely on fragmented data summaries or anecdotal knowledge when making crucial decisions. This reactive approach undermines the strategic goals of the institution, especially in environments where policy agility and timely interventions are essential. Moreover, poor decision-making arising from inaccessible dark data can propagate systemic inefficiencies, where wrong actions are taken based on incomplete or outdated information. As these decisions accumulate over time, they form a pattern of administrative inertia that slows organizational progress. Effective decision-making requires not just data availability but also relevance, structure, and contextual alignment. Thus, the ability of public administrators to act with clarity and foresight is fundamentally linked to how well dark data is identified, retrieved, and transformed into actionable intelligence.

***Process execution efficiency*:** denotes the smoothness, timeliness, and cost-effectiveness with which public administrators carry out organizational tasks and procedures. It reflects the operational competence of staff in translating policies into actions, completing tasks with minimal redundancy, and optimizing internal workflows. Arowolo and Olatunji (2023) posited that efficiency in administrative procedures requires adequate documentation, coordinated communication, and centralized access to supporting data. When dark data is not systematically integrated or is locked within fragmented systems, procedural steps may be duplicated, deadlines missed, and institutional resources underutilized. These inefficiencies are often compounded when staff must navigate disjointed data environments, leading to duplicated steps or delayed actions. The absence of real-time access to historical or procedural information forces administrators to reprocess tasks, conduct redundant verifications, or make follow-up requests that could have been avoided with centralized data availability. Over time, this not only impedes productivity but also strains interdepartmental coordination and resource utilization. When execution timelines are extended due to inaccessible data, it reflects poorly on institutional agility and responsiveness. Moreover, the lack of structured data retrieval systems diminishes the capacity for continuous process improvement, as recurring challenges remain hidden within unmanaged archives. Enhancing efficiency, therefore, demands more than procedural training or automation; it requires a systematic approach to uncover and integrate dark data into daily operations. Only through such integration can public sector institutions ensure that every process is supported by complete, timely, and verifiable information.

Dark Data Management and Administrative Competence

A growing body of literature acknowledges the critical relationship between data governance and institutional performance. However, the specific nexus between dark data management and administrative competence remains underexplored, particularly in developing countries. Alhassan, Sammon, and Daly (2022) observed that public sector organizations that implement internal systems for identifying and managing latent data perform better in aligning their operations with strategic objectives. Their research showed that proper integration of dormant data improved policy formulation, reduced duplication of work, and promoted institutional learning.

Similarly, Boudreau and Watson (2021) emphasized that dark data, when appropriately categorized and processed, contributes to organizational memory and supports long-term administrative planning. They noted that ignoring dark data leads to repeated errors, knowledge loss due to staff turnover, and administrative redundancy.

In Nigeria, studies by Ojo, Ajayi, and Hassan (2022) have highlighted systemic challenges in public records management, noting that weak data governance practices, poor digital infrastructure, and inadequate archival systems prevent institutions from leveraging accumulated data. Although their work focused broadly on data fragmentation, the findings suggest that unmanaged dark data may directly undermine administrative efficiency and weaken the capacity of MDAs to respond effectively to developmental demands.

The inability to retrieve, analyze, and apply dormant information limits the range of insights available to decision-makers and affects the execution quality of administrative processes. As such, dark data management is not merely an IT issue, but a strategic administrative concern with implications for competence, accountability, and service quality.

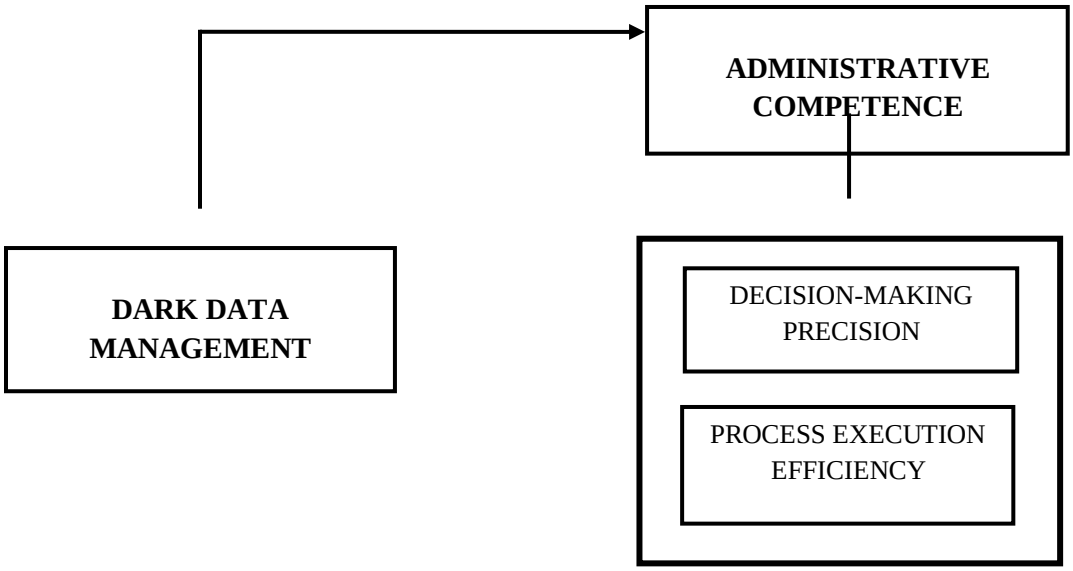

Figure 1: Conceptual framework Dark Data Management and Administrative Competence of public Sector Organizations in Rivers State, Nigeria

Theoretical Framework

Two theoretical perspectives underpinned this study: the Information Lifecycle Theory and the Competency-Based Theory.

The Information Lifecycle Theory, as explained by Smallwood (2020), posits that data passes through identifiable stages including creation, storage, usage, retention, and disposal. The failure to manage any of these stages results in data decay, inefficiencies, and increased organizational risk. Dark data exists when information remains stuck within the storage phase, never progressing into usage or informed disposal. In the public sector, this static stage can hinder the effectiveness of administrative operations. The theory provides a useful framework for analyzing the failure to convert dormant data into active institutional assets.

The Competency-Based Theory, originally advanced by Boyatzis (2008), holds that institutional performance is driven by a combination of knowledge, skills, behavior, and contextual awareness. In the administrative context, competence requires not only personal capability but also access to

enabling systems, including relevant data. If dark data is not managed or made accessible, it compromises the informational environment within which competence operates. Thus, managing dark data becomes essential to sustaining the conditions that make administrative competence possible.

Empirical Review

There is increasing empirical evidence suggesting that data governance practices are associated with administrative efficiency. Alabi, Daramola, and Fakorede (2021), in a study on Lagos State civil service, found that uncoordinated data systems were a major cause of slow decision-making, inaccurate reporting, and weak service outcomes. The study, however, did not isolate dark data as a distinct construct, nor did it examine the effect on competence.

Ogunyemi, Balogun, and Emecheta (2022) assessed the impact of digital transformation on administrative efficiency in Ogun State, finding that while there was investment in digital infrastructure, backend data utilization remained weak. The research pointed to a lack of awareness and absence of clear policies on unstructured data management as major challenges.

Alikornwo and Adiele (2024) examined the relationship between strategic data digitization and information management success in tertiary institutions within Rivers State. Their study employed enterprise content management as the predictor variable and measured information management success through two dimensions: effective repository and quality decision-making. The results indicated that structured digitization of dark and latent data resources significantly improved institutional capacity for timely decision-making and resource alignment. This finding affirms the potential of dark data transformation in achieving administrative competence within public organizations.

In an international context, Kwon, Lee, and Shin (2021) evaluated the role of latent data in South Korea's public health response and found that poor integration of archived data led to gaps in crisis management, duplication of efforts, and policy misalignment. The study reinforces the relevance of dark data management in enhancing decision-making and process coordination.

Though these findings are insightful, most studies either focus on big data analytics or general ICT adoption. There remains a lack of empirical work that explicitly links dark data management to administrative competence within sub-national government institutions in Nigeria. This study addresses that gap by investigating how dark data management affects both decision-making precision and process execution efficiency in Rivers State public sector organizations.

Methodology

This study adopted a correlational survey design to examine the relationship between dark data management and administrative competence in public sector organizations within Rivers State, Nigeria. The design was considered appropriate for establishing the nature and direction of the association between the variables without manipulation. The study population comprised administrative staff across twelve selected Ministries, Departments, and Agencies (MDAs) operating within Rivers State. A total population of 473 administrative personnel was identified from the nominal staff registers across the selected MDAs. Stratified sampling was applied to ensure proportionate representation from each organization based on staff strength and operational

relevance, after which a sample size of 217 respondents was determined using Taro Yamane's formula at a 95% confidence level and a 5% margin of error. The sampling ensured inclusivity across gender, seniority level, and department to enhance the representativeness and generalizability of findings. Data were collected through a structured questionnaire divided into sections corresponding to the predictor variable, dark data management, and the criterion variable, administrative competence, measured by task execution efficiency and decision-making reliability. The instrument underwent rigorous content and construct validation through expert evaluations and a pre-test involving twenty administrative staff from a non-sampled MDA within the same region. The Cronbach's alpha reliability coefficients for all variables ranged from 0.82 to 0.89, indicating high internal consistency. Data collected were analyzed using both descriptive and inferential statistics. Mean and standard deviation were used to describe the distribution of responses, while Pearson Product-Moment Correlation and linear regression were employed to test the hypotheses at a 0.05 level of significance. Ethical protocols were strictly followed, including obtaining informed consent, maintaining voluntary participation, ensuring anonymity, and preserving the confidentiality of all participant information throughout the study.

Results

A total of 372 valid responses were retrieved from staff across Ministries, Departments, and Agencies (MDAs) in Rivers State. These respondents were drawn using proportionate stratified sampling from a population of 496 administrative officers.

Table 1: Descriptive Statistics of Dark Data Management

Statement	N	Mean	Standard Deviation
Our agency has strategies for identifying obsolete data	372	3.61	0.84
We employ data filtering mechanisms to remove non-essential data	372	3.58	0.88
There is regular assessment of our digital archives	372	3.47	0.91
Obsolete or redundant data are periodically deleted	372	3.39	0.94

The responses show that the participating public sector organizations exhibit moderately high practices in dark data management. The highest mean score (M = 3.61) indicates a fair level of strategy for identifying obsolete data, while the lowest (M = 3.39) suggests inconsistency in the periodic deletion of redundant data.

Table 2: Descriptive Statistics of Administrative Competence (Decision-Making Precision and Process Execution Efficiency)

Statement	N	Mean	Standard Deviation
Our agency relies on accurate data for administrative decisions	372	3.64	0.83
Staff members are competent in handling complex administrative tasks	372	3.57	0.86
We frequently conduct internal process reviews	372	3.48	0.91
Employees are encouraged to use data-informed task execution	372	3.53	0.87

The criterion variable, administrative competence, measured by decision-making and task execution, revealed strong affirmations. Notably, reliance on data for decision-making received the highest mean score (M = 3.64), implying that administrative decisions are moderately data-dependent across the sampled organizations.

Table 3: Pearson Product-Moment Correlation Analysis Testing the Relationship between Dark Data Management and Administrative Competence

Hypothesis	Variables	N	r	Sig. (2-tailed)	Decision
H_{01}	Dark Data Management and Decision-Making	372	0.674	0.000	Rejected Null
H_{02}	Dark Data Management and Task Execution	372	0.702	0.000	Rejected Null

The Pearson correlation results provide statistical evidence for both hypotheses. For Hypothesis One (H_{01}), which posited that there is no significant relationship between dark data management and decision-making precision in public sector organizations, the calculated correlation coefficient (r = 0.674) indicates a strong positive relationship. With a p-value of 0.000, which is less than the 0.05 threshold, the null hypothesis is rejected, confirming that dark data management significantly influences administrative decision-making.

Similarly, Hypothesis Two (H_{02}) tested the relationship between dark data management and process execution efficiency. The correlation coefficient (r = 0.702) suggests an even stronger positive relationship. With a p-value of 0.000, the result is statistically significant. Consequently, the null hypothesis is also rejected, implying that effective dark data management enhances the competence of administrative personnel in task execution.

Table 4: Pearson Correlation between Dark Data Management and Administrative Competence

Variables	N	r	Sig. (2-tailed)
Dark Data Management & Administrative Competence	372	0.692	0.000

The result in Table 4 shows a statistically significant and positive relationship between dark data management and administrative competence (r = 0.692, p < 0.05). This confirms that better handling of dark data significantly improves administrative competence in decision-making and process execution within public institutions.

Discussion of Findings

The findings of this study offer empirical confirmation of a significant and positive relationship between dark data management and administrative competence within public sector organizations in Rivers State. The first hypothesis tested the relationship between dark data management and decision-making. The Pearson correlation coefficient of 0.674 with a significance value of 0.000 revealed that as public institutions improve their strategies for managing dark data, their capacity to make informed and responsive administrative decisions also improves. This aligns with the position of Yaqoob, Hashem, Gani, Mokhtar, Ahmed, Anuar, and Vasilakos (2016), who

emphasized that dark data, when properly structured and analyzed, contributes to contextual decision-making in complex administrative environments. Moreover, this outcome supports the assertion by Choo (2016) that the strategic retrieval and processing of underutilized organizational data enhances knowledge management and governance quality.

Furthermore, the second hypothesis explored the link between dark data management and process execution efficiency. The computed correlation coefficient of 0.702, with a significance level of 0.000, demonstrates a strong and statistically significant relationship. This implies that a well-implemented dark data management framework contributes to improved task performance, operational coordination, and efficiency within public institutions. This finding is corroborated by the work of Khurshid, Saleem, Iqbal, Iftikhar, and Anwar (2020), who identified data accessibility and structure as core predictors of employee output and workflow precision in bureaucratic systems.

Additionally, the outcome resonates with the conclusion of Alikornwo and Adiele (2024), whose study on strategic data digitization and information management success in tertiary institutions found that digital access to previously dormant data significantly boosted administrative responsiveness and documentation accuracy. This further validates the assertion that the strategic harnessing of dark data is not only relevant for academic institutions but also applicable across various public administrative domains where information processing and compliance tracking are fundamental.

Conclusion and Recommendations

The study investigated the influence of dark data management on administrative competence in public sector organizations within Rivers State, Nigeria. Grounded in the Information Lifecycle Theory and the Competency-Based Theory, the study conceptualized administrative competence using decision-making precision and process execution efficiency as its core measures. Empirical findings confirmed that effective dark data management significantly enhances both components of administrative competence. This affirms that when organizations appropriately harness data that is traditionally unstructured, dormant, or overlooked, it becomes a strategic resource that improves the accuracy of administrative decisions and the smooth execution of institutional processes. These findings reinforce the strategic necessity of integrating dark data into organizational knowledge systems to optimize competence levels across public agencies.

Recommendations:

1. Public sector institutions should institutionalize robust dark data management protocols, particularly emphasizing data discovery, extraction, and classification to improve the precision of decision-making processes.
2. Government ministries and departments should implement policy-driven frameworks that support the operational utilization of dark data to enhance process execution efficiency across administrative functions.

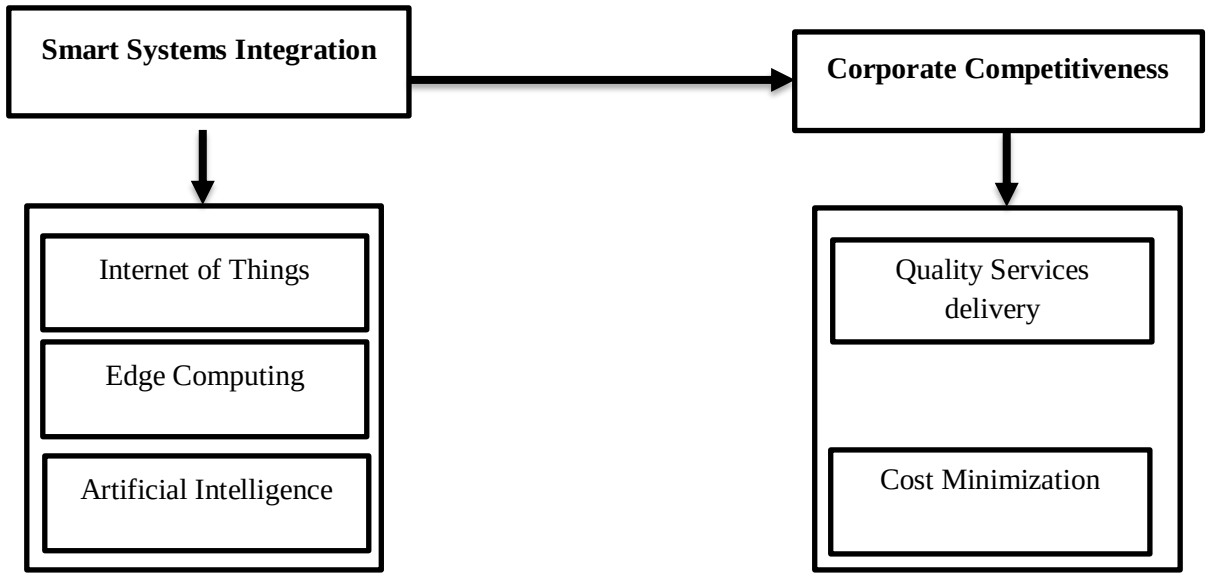
Abstract
The study examined the relationship between smart systems integration and corporate competitiveness of tertiary hospital in South-South, Nigeria. A Quasi-experimental survey research design was adopted using cross-sectional survey approach. The population of the study comprised the 16-government owned tertiary hospitals operating in South-South, Nigeria. Considering the finite nature of the population, the study adopted a census method, therefore, the sample size is the same as the population given the small population. However, 6 copies of questionnaire were administered to six management staff of 16 government tertiary hospitals which are; Chief Medical Officer, Chief Operating Officer, Chief Nursing Officer, Chief Information Officer, Director of Clinical Services, and Director of Administration, making the population size 96 management staff of the 16 tertiary hospitals in South-South, Nigeria. Therefore, 96 copies of questionnaire were administered but only 88 copies of the questionnaire were retrieved. Person product moment correlation statistics was used for the analysis. Based on the analysis, the study findings revealed that there is a strong significant positive relationship between smart system integration and corporate competitiveness of tertiary hospitals, South-South, Nigeria. Therefore, the study concluded that organizations that deploy smart systems, are most likely to gain competitive edge. Based on the findings and conclusion, the study recommended that management of government owned tertiary hospitals should deploy internet of things, edge computing and artificial intelligent tools as it has been found to reduce operational cost and enhance quality service in government owned tertiary hospitals in South-South, Nigeria.

Keywords: *Smart Systems, Corporate Competitiveness, Artificial Intelligence, Edge Computing, Internet of Things*

Introduction



In this era of digitalization, corporate competitiveness has become a critical factor for the survival of organizations. Interestingly, one of the many drivers of competitiveness is the integration of technology in administrative, and operational activities, amongst others. It is with this, organizations are continuously looking for ways to remain relevant and competitive in today's business world. Therefore, organizations are beginning to leverage on smart systems to achieve competitiveness. Organizational competitiveness is the extent to which an organization generates and sustains a prevailing position over its competitors through value creation for stakeholders (Porter cited in Laguir et al., 2022). Competitiveness is also the ability of an organisation to produce goods and services at a favourable price and quality to impact their productivity and meet customers' needs over other competitors (Gucel et al., 2013). Notwithstanding, considering the rapid technological progress and growing economic uncertainty, companies face the challenge of maintaining and improving their competitive position in increasingly dynamic and demanding markets (Hallioui et al., 2022; Liao, 2021). These economic intensities as a result of the advent of technology can have negative impact on the organization, if organizations fail to adopt and deploy these technologies in their operations.

According to Qhal (2023), the smart systems integration can be defined as an integration of actuation, control, description, sensing and analysing a situation to generate appropriate decisions depending upon the available data which can be adaptive or predictive. Smart systems era has a vital function to play in enhancing the hospitals with real time monitoring, higher diagnostic tools, interactions, treatment and excellence of existence for sufferers with the aid of using decreasing charges of public healthcare structures (Qhal, 2023). In the same vein, the term can also be described as a system based on devices, and technologies, with recognition techniques, and a high ability of management improvement, detecting issues, and anticipating failures. (Ferreira et al., 2019). EPoSS (2017) which defines smart systems as systems that aim to combine cognitive functions with sensing, actuation, data communication, and energy management in an integrated way. Smart systems are gradually becoming the main driver for innovations and efficient services giving organizations competitive edge over their competitors. In the same vein, this study defined smart systems integration as the combination or assemblage of various intelligent technologies under a single network with a view to achieve efficiency, enhance real-time monitoring and improve decision making.

According to Ender (2019), the deployment of smart systems provides key technical advantages for increased products competitiveness in most industrial sectors. The integration and the implementation of smart systems, according to Ramrez et al. (2019), have been enabled by the Internet of Things, which was primarily used for tracking operations in other fields, it can nowadays easily be repurposed for more industries such as health and manufacturing with a view to increase productivity and efficiency. There are three grades of government owned hospitals in Nigerian and they include primary, secondary, and tertiary hospitals. However, the focus of this study is on the government owned tertiary hospitals in South-South, Nigeria. This is because the tertiary hospitals provide advance, specialized medical services, while functioning as a referral centre for complex cases beyond the capacity of primary and secondary hospitals. It is no longer news that hospitals are one of the most important needs for every nation and it is with this, the need to deploy smart systems in the operations of hospitals in Nigeria has become necessary, considering the advancement of technology in almost every sector. Schwab (2013) emphasized

that healthcare systems are often viewed as financially unstable in developed economies, yet they are still advancing in emerging economies. Accordingly, Gafa et al. (2024) posited that healthcare is a broad field, which is one of the main reasons why the competition among experts in the digital health sector might go on forever. By combining cutting-edge technologies with top-notch network services, organizations can enhance healthcare delivery and increase its accessibility (Haleem et al., 2021).

One of the more significant technological innovations of recent years is smart systems, which has the ability to react based on the surrounding conditions through adjustment, sense, inference, learning, prediction and self-organization (Worden et al., 2003). However, some of the health care sector in Nigeria are yet to integrate this system in their daily and routine work activities citing issues of operational cost, lack of technological know-how, resistance to change amongst other factors. This overtime has led to poor patient outcomes such as, inefficient data management, increased security risks, privacy breaches, reduced access to care, increased costs, hindering the development of a skilled digital workforce and inefficient service delivery which has posed a threat to the competitiveness of the hospitals in Nigeria. Therefore, the study examined corporate competitiveness: leveraging smart systems integration of tertiary hospitals in South-South, Nigeria. Many studies have been conducted on the adoption of technology in business or organizations all over the world and some of such studies includes; Kanojia (2024) highlighted on technological adoption on small business management, while Pazhanimala (2023) investigated technology adoption in an established organization: A case study analysis. whereas, others looked at emerging technology adoption and competitive advantage (Stratopoulos, 2015). Yet, there is still little or no literature that addressed smart system integration and corporate competitiveness specifically on tertiary hospitals in South-South, Nigeria. This study has the tendency to close this gap by examining the relationship between corporate competitiveness and integration of smart systems in tertiary hospitals in Nigeria. Below is the conceptual framework that guided the study;

Source: Researchers Conceptualization, (2025)

Smart System Integration

The need to deploy smart systems in almost every industry or sector has become critical in recent years and this is due to the advancement of technology and the continues demands of heads of industries as well as customers for systems that will promote seamless service delivery as well as quality customer experience. This is because, the main measure of success for smart systems applications, according to Stone et al. (2016) is the value they create for human lives. Therefore, smart system integration is a system based on devices and technologies, with recognition techniques, and a high ability for management improvement, detecting issues, and anticipating failures (Ferreira et al., 2019). Similarly, European Technology Platform on Smart Systems Integration looked at smart systems as systems that aim to combine cognitive functions with sensing, actuation, data communication, and energy management in an integrated way (EPoSS, 2017). In the same vein, Smart systems can be regarded as self-sufficient, intelligent, technical systems with advanced functionality (European Commission, 2014). Simmonds and Bhattacherjee (2015) defined a smart system as a framework which supports and facilitates the delivery of any task or project, especially those which are complex; subject to uncertainty.

It is no longer news that 21st century organisations are constantly faced with new and emerging technologies irrespective of the kind or type of organization involved. Therefore, these organizations are beginning to rely solely on smart systems that allows them to gain competitive-edge, and one of such organizations is the health sector in Nigeria. Accordingly, in 2020, hospitals became the leading investors in smart systems with a view to enhance their activities and their trust with patients (Deloitte, 2017). The integration of smart systems into health sector has transformed business models and also revolutionize the way services are rendered. Therefore, the deployment of smart systems in the health sector can enhance its effectiveness and the quality of its services, as well as effective decision making (Chen, Chiang, & Storey, 2012). Smart systems Integration has been a key driver of the technological advances of the past decade and is still a key contributor to economic growth and prosperity as well as an important enabler of industrial success in Europe (EPoSS, 2018). According to WHO et al. (2024) smart systems go beyond technical advancement for delivery of health services but rather it is a multi-level transformation that involves changes to medical management and treatment concepts, informatization construction, and other aspects of healthcare delivery. According to Jara et al. (2014), smart systems are used in almost every industry throughout the world to achieve a competitive edge and increase productivity. Therefore, in utilizing technology and innovation in healthcare delivery, smarts systems aim to improve patient outcomes, increase efficiency, and address a range of issues. (Dzenowagis, 2018), and some of these issues relate with patient care as well as administrative needs.

Internet of Things (IoT)

As hospitals continually look for ways to reduce cost and improve on their performance, internet of things is one of those technologies that organizations of today uses to solve complex problems. Internet of things stands for the integration of numerous physical objects in the world starting from the mundane to the most complex technical processes that are conventionally connected through sensors, software and other technology (Alansari et al., 2018), with the view to improve organizational performance. Accordingly, the aim is to enhance efficiency, convenience, and decision-making across various domains, including healthcare, transportation, agriculture, and urban planning, by harnessing the power of real-time data collection and analysis (Chataut et al.,

2023; Perwej et al., 2019). The Internet of Things (IoT) represents a transformative wave in the healthcare landscape, characterized by a network of interconnected devices capable of generating, collecting, and exchanging data (Aceto et al., 2018; Vermesan & Bacquet, 2017; Vermesan & Friess, 2013). Similarly, The Federal Trade Commission (FTC) states IoT as "an interconnected environment where all manner of objects has a digital presence and the ability to communicate with other objects and people" (Terry, 2017). IoT transforms physical objects into smart devices to collect, communicate, monitor and interpret information from their surroundings in real time (WCO cited in Sharaf &Safi, 2020).

Oluigbo et al. (2017); Adeleke and Abdul (2020); posited that the healthcare industry in Nigeria needs to incorporate the IoT to enhance the present healthcare system due to an increase in the number of people seeking healthcare services, growing prices, and pressure to innovate. The advent of internet of things has significantly enhanced the capabilities of telehealth, telemedicine, and providing patients with remote access to healthcare services (Atadoga et al., 2024). As IoT continues to evolve and expand its reach, it can revolutionize industries and improve the quality of life for individuals and communities worldwide, ushering in an era of unprecedented connectivity and intelligence in our everyday environment (Bello & Zeadally, 2014; Borgia, 2014; Gubbi et al., 2013). These devices empower patients to actively engage in their health management, promoting a proactive approach to well-being (Estrela et al., 2018; Rayan et al., 2021). The implementation of real-time smart healthcare data facilities, providing information on the examination of patients becomes easier, improving human health status rather than relying solely on treatment after sickness (Liu et al., 2022).

Edge Computing

With increased adoption, remote patient monitoring, automated care delivery, AI-powered diagnostics, and many such applications are going to grow using edge computing for better healthcare outcomes (Sahu, 2024). Edge computing is a distributed computing model that processes data closer to where it is generated (wang et al., 2020). Accordingly, it is the act of processing data in real-time and does not require any kind of high-speed internet connectivity (Sahu, 2024). It is driving the transformation of hospitals by bringing data processing and analysis closer to the point of data generation, whether in hospitals or other organizations. They can also give users added security compared to traditional computing, which allows for blood pressure, heart rate, blood sugar, and health history data to be transmitted to caregivers via a connected system (Bhunia et al., 2015; Thiyagaraja et al., 2017; Yoon, 2017). As a result of improvement in tracking and mobility that comes with edge computing systems, health providers can care for people with chronic illnesses in their own homes using ambient sensors placed around their homes in conjunction with wearable vital sign sensors (Chung & Park 2017; Bhunia et al., 2014).

Despite the advantages of edge computing in tackling inactivity issues, it introduces important security challenges due to its distributed data processing and distinctive characteristics. Security threats in edge computing span various perspectives, including personal, attribute-based, and compliance-related issues (Khan et al., 2019; Shi et al., 2016). Therefore, to mitigate the possibility of intrusion, authentication protocol and trust ratings are used in edge computing applications (Alrawais, 2017). Additionally, the architecture of edge computing is designed to allow edge nodes to actively respond to service demands, effectively reducing both bandwidth consumption and network latency (Arcas et al., 2024). Edge computing allows for faster, more efficient

processing of data in turn leading to better decisions and improved performance (Seeburger, 2021). According to Zsah, (n.d), In terms of real information, from inventory and expiration to others, the right and on-time information enable pharmaceutical companies to always offer medications that are necessary at any point in time.

Artificial Intelligence (AI)

The use of artificial intelligence in healthcare in Nigeria is on the rise and this is because of the numerous benefits it brings to any sector that deploys it. Artificial intelligence is "the ability of a digital computer or computer-controlled robot to perform tasks commonly associated with intelligent beings" (Copeland, 2020). AI in healthcare refers to the application of artificial intelligence technologies, such as machine learning and natural language processing, to improve healthcare delivery, delivery, diagnostics, treatment planning, patient monitoring, and administrative functions (Bhagat et al. 2024). Accordingly, (AI) is a key technological advancement that has enabled humans to replace manual work with superior mental capacities and intellectual levels in a variety of industries (Chien et al., 2020; Kumar et al., 2023). AI is a discipline of science and technology that enables intelligent computers and computer programs to undertake activities traditionally requiring human intelligence (Aiken & Epstein, 2000). AI or machine intelligence is an area of computer science whereby machines are programmed with the ability to perform intelligent tasks that are usually undertaken by humans (Tsang et al., 2020).

Hospitals that deploy smart systems such as AI in care services, increases the quality of care and reduce diagnostic and treatment delays (Hong & Lee, 2018). IT systems generate new information that allows medical personnel to make more accurate diagnoses and provide more tailored therapies for patients (Mohamad et al., 2023). Hospitals can gain a competitive advantage by using AI to build new competencies and skills. Today, technological advancement and digital innovations influence every aspect of human life, with healthcare being the most affected industry (Teece, 2018; Appio et al., 2018; Leone et al., 2021). AI can significantly enhance patient care while simultaneously lowering healthcare expenses (Wahl et al., 2018; Dhieb et al., 2020; Kaur et al., 2021). The demand of health care services are constantly on the rise and as such, innovative AI solutions are needed in the healthcare sector to improve efficiency (Pee et al., 2019). Accordingly, AI algorithms have the capability to highlight areas of interest or concern and to provide quantitative measurements in this regard. Computer-aided diagnostics shorten diagnosis times, reduce incorrect interpretation and improve diagnostic accuracy (Balamurugan et al., 2022). AI's competitive advantages emphasize the key role of institutional intervention in supporting digital technologies implementation in healthcare organizations improving overall performance (Appio et al., 2018). In this regard, Adigwe et al. (2024) posited that the deployment of AI in hospitals will improve the standard of healthcare provided to Nigerians (Adigwe et al., 2024).

Corporate Competitiveness

Li et al. (2009) Competitiveness has long been considered a core factor for the success and sustainable development of companies. According to European Commission (2001) defines competitiveness as the ability of an economy to provide its population with high and rising standards of living and high rates of employment on a sustainable basis. Similarly, Organizational competitiveness is the extent to which an organization generates and sustains a prevailing position over its competitors through value creation for stakeholders (Porter cited in Laguir et al., 2022). Interestingly, Organizations search for new technologies to be used as a competitive tool to

develop a competitive advantage (Adane, 2018), such as smart systems. In an international context characterized by globalization, rapid technological progress and growing economic uncertainty, companies face the challenge of maintaining and improving their competitive position in increasingly dynamic and demanding markets (Hallioui et al., 2022; Liao, 2021). Zuniga-Collazos et al. (2019) asserted that corporate competitiveness has been supported by the firms' ability to produce more unique products, at a competitive price compared with their competitors, which impacts organisations' performance. Competitive advantage aims to create a sustainable and profitable enterprise, which is based on understanding and controlling competition priorities compared to competitors (Sigalas, 2015). In this scenario, corporate competitiveness has evolved beyond traditional factors such as costs and quality, to encompass aspects such as innovation, adaptability, sustainability, amongst others (Bocken & Geradts, 2020; Kristoffersen et al., 2021).

Quality Service Delivery

To survive in the modern competitive markets, it has become of utmost importance for service providers to understand the needs and expectations of customers. According to Ikoromasoma and Echendu (2024), "quality service delivery is "the perceived perception of service rendered as opposed to actual expectations". Harvey (2015) defines quality service as an assessment of how well a delivered service conforms to the client's expectations. Notwithstanding, it has been observed that many private hospitals in Nigeria lack basic infrastructure such as adequate space, equipment, and personnel (Adejumo et al., 2022). This has overtime led to poor service delivery as of being unable to meet the expectations of their patients knowing, a firm is said to provides quality service only when its services at least meet or exceed the expectations of the customers, amongst others (Owusu-Frimpong et al., 2010). Therefore, when the services rendered as powered by smart systems meets the expectations of patients, they will be assured of their competence, credibility and security of service (Juwaheer & Ross, 2003), of the health sector. Thus so, this study defined quality service delivery as the process of exceeding the expectations of customers.

Cost Minimization

Smart systems integration reduces hospital costs by automating routine tasks, optimizing resource allocation through real-time data analytics, minimizing errors, and enhancing operational efficiency across various departments. Integrated systems streamline workflows by consolidating data, leading to more informed decision-making, reduced waste, and a lower cost of care. Smart systems have become indispensable assets for organizations across various industries, including healthcare, seeking to optimize operations, enhance decision-making, and drive cost reduction initiatives (Jejeniwa et al., 2024). Operational costs in healthcare encompass a broad spectrum of expenditures required to deliver patient care, manage facilities, and sustain administrative functions (Adenekan et al., 2024). The healthcare industry faces significant challenges in managing operational costs, which encompass a wide range of expenses associated with delivering patient care and running healthcare facilities (Abaku & Odimarha, 2024; Uzougbo et al., 2024), using the traditionally methods. However, the deployment of smart systems is a game changer. According to Ugboko and Ikechukwu (2021) resource management is the efficient and effective utilization of an organization's resources when they are needed. these resources may include; financial resources, inventory, human talents, and production resources.

Methods

The Quasi-experimental research design was adopted using a cross-sectional survey approach. The population of the study comprised the 16-government owned tertiary hospitals operating in south-south, Nigeria. Namely; Rivers State University Teaching Hospital, University of Port Harcourt Teaching Hospital, Rivers State Dental and Maxillofacial Hospital, Neuro-Psychiatric Hospital, University of Benin Teaching Hospital, Specialist Hospital Ossiomo, Irrua Specialist Hospital Irrua, Federal Neuro-Psychiatric Hospital Benin city, Federal Psychiatric Hospital Calabar, University of Calabar Teaching Hospital, Federal Medical Center Yenagoa, Niger Delta University Teaching Hospital, University of Uyo Teaching Hospital, Psychiatric Hospital Ikot Ebiyan, eket, Delta State University Teaching Hospital, and Federal Medical Center, Asaba. Considering the finite nature of the population, the study adopted a census method, therefore, the sample size is the same as the population given the small population. However, 6 copies of questionnaire were administered to management staff of 16 government tertiary hospitals which are; Chief Medical Officer, Chief Operating Officer, Chief Nursing Officer, Chief Information Officer, Director of Clinical Services, and Director of Administration, making the population size 96 management staff of the 16 tertiary hospitals in South-South, Nigeria. Therefore, 96 copies of questionnaire were administered but only 88 copies of the questionnaire were retrieved and used for the analysis. Pearson product moment correlation statistic was used for the analysis. Below is the formula;

$$r = \frac{n\sum xy - \sum x \sum y}{\sqrt{\left(n\sum x^2 - \sum x^2\right)\left(n\sum y^2 - \left(\sum y\right)^2\right)}}$$

Where:

r =Pearson product moment correlation coefficient,

X and Y =individual observations of the two variables,

$\overline{X} and \overline{Y}$ = arithmetic means of the two sets of observations.

n =number of bivariate observations

Correlation between Internet of Things (IoT) and Corporate Competitiveness

Table 1.1 shows the result of correlation matrix obtained for internet of things and corporate competitiveness. Also displayed in the table is the statistical test of significance (p - value), which makes us to provide answer to our research question and generalize our findings to the study population.

Table 1.1: Correlations Matrix for Internet of Things and Corporate Competitiveness

		Internet of Things	Quality Service	Cost Minimization
Internet of things	Pearson Correlation	1	.915**	.991**
	Sig. (2-tailed)		.000	.000
	N	88	88	88
Quality Service Delivery	Pearson Correlation	.915**	1	.944**
	Sig. (2-tailed)	.000		.000
	N	88	88	88

Cost Minimization	Pearson Correlation	.991**	.944**	1
	Sig. (2-tailed)	.000	.000	
	N	88	88	88
	Pearson Correlation	.991**	.903**	.986**
	N	88	88	88

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Result Output, 20.0

The correlation coefficient (r) result in table 1.1 above shows a Pearson Product Moment Coefficient (r) of 0.915 on the relationship between internet of things and quality service. This value implies that strong relationship exists between the variables. The direction of the relationship indicates that the correlation is positive; Therefore, there is a strong positive correlation between internet of things and quality service of Tertiary Hospitals in Nigeria. Similarly, Table 1.1 also shows a Pearson Product Moment Correlation Coefficient (r) of 0.991 on the relationship between internet of things and cost minimization. This value implies that a strong relationship exists between the variables. The direction of the relationship indicates that the correlation is positive; Therefore, there is a strong positive correlation between internet of things and cost minimization of Tertiary Hospitals in, Nigeria.

Correlation between Edge Computing and Corporate Competitiveness

Table 1.2. shows the result of correlation matrix obtained for edge computing and corporate competitiveness. Also displayed in the table is the statistical test of significance (p - value), which makes us to provide answer to our research question and generalize our findings to the study population.

Table 1.2: Correlations Matrix for Edge Computing and Corporate Competitiveness

		Edge Computing	Quality Service	Cost Minimization
Edge Computing	Pearson Correlation	1	.924**	.988**
	Sig. (2-tailed)		.000	.000
	N	88	88	88
Quality Service Delivery	Pearson Correlation	.924**	1	.944**
	Sig. (2-tailed)	.000		.000
	N	88	88	88
Cost Minimization	Pearson Correlation	.988**	.944**	1
	Sig. (2-tailed)	.000	.000	
	N	88	88	88

	Pearson Correlation	.977**	.903**	.986**
	N	88	88	88

**. Correlation is significant at the 0.01 level (2-tailed).
Source: SPSS Output, version 20.0

Table 1.2 above shows a Pearson Product Moment Coefficient (r) of 0.924 on the relationship between Edge computing and quality service. This value implies that strong relationship exists between the variables. The direction of the relationship indicates that the correlation is positive; therefore, there is a strong positive correlation between edge computing and quality service of Tertiary Hospitals in, Nigeria. Similarly, Table 1.2 shows a Pearson Product Moment Correlation Coefficient (r) of 0.988 on the relationship between edge computing and cost minimization. This value implies that a strong relationship exists between the variables. The direction of the relationship indicates that the correlation is positive; Therefore, there is a strong positive correlation between edge computing and cost minimization of Tertiary Hospitals in Nigeria.

Correlation between Artificial Intelligence and Corporate Competitiveness

Table 1.3 shows the result of correlation matrix obtained for artificial intelligence and corporate competitiveness. Also displayed in the table is the statistical test of significance (p - value), which makes us to provide answer to our research question and generalize our findings to the study population.

Table 1.3: Correlations Matrix for Artificial Intelligence and Corporate Competitiveness

		Artificial Intelligence	Quality Service	Cost Minimization
Artificial Intelligence	Pearson Correlation	1	.906**	.985**
	Sig. (2-tailed)		.000	.000
	N	88	88	88
Quality Service Delivery	Pearson Correlation	.906**	1	.944**
	Sig. (2-tailed)	.000		.000
	N	88	88	88
Cost Minimization	Pearson Correlation	.985**	.944**	1
	Sig. (2-tailed)	.000	.000	
	N	88	88	88
	Pearson Correlation	.988**	.903**	.986**
	N	88	88	88

**. Correlation is significant at the 0.01 level (2-tailed).
Source: SPSS Output, version 20.0

Table 1.3 shows a Pearson Product Moment Coefficient (r) of 0.906 on the relationship between artificial intelligence and quality service. This value implies that strong relationship exists between the variables. The direction of the relationship indicates that the correlation is positive; Therefore, there is a strong positive correlation between artificial intelligence and quality service of Tertiary Hospitals in South-South, Nigeria. Similarly, Table 1.3 shows a Pearson Product Moment Correlation Coefficient (r) of 0.985 on the relationship between artificial intelligence and cost minimization. This value implies that a strong relationship exists between the variables. The direction of the relationship indicates that the correlation is positive; Therefore, there is a strong positive correlation between artificial intelligence and cost minimization of Tertiary Hospitals in South-South, Nigeria.

Findings and Discussion

Based on the analysis, the study findings revealed that there is a strong significant positive relationship between smart system integration and corporate competitiveness of tertiary hospitals, South-South, Nigeria. Therefore, the study concluded that organizations that deploy smart systems, are most likely to gain competitive edge.

Recommendations

i. The study recommended that management of tertiary hospitals should embrace internet of things as it will improve telemedicine, remote access to medical care, and reduce administrative and operational cost which in return gives the hospitals competitive edge.

ii. The study recommended that management of tertiary hospitals should invest in edge computing as it will facilitate data processing and analysis at the point of its generation as well as facilitate caring for people with chronic illnesses in their own homes using ambient sensors placed around their homes in conjunction with wearable vital sign sensors which reduces the cost of operation but increases quality service.

iii. The study recommended that management of tertiary hospitals should encourage the deployment of artificial intelligence tools to built new competences and skill which will facilitate seamless execution of the routine and daily operations of tertiary hospitals.

Abstract
This study investigated the correlation between the entrepreneurial ecosystem and the resilience of small and medium enterprises (SMEs) in Rivers State, Nigeria. The study specifically examined two aspects of the entrepreneurial ecosystem, access to capital and institutional support, and two aspects of SME resilience, adaptive ability and robustness. The researchers utilised a cross-sectional survey methodology. The population comprises 385 managers and supervisors from 20 SMEs in Port Harcourt. The Krejcie and Morgan (1970) table was used to determine a sample of 195 people, and structured questionnaires were used to gather the data. Face and content validity was used. The results revealed a positive significant relationship between the dimension of the entrepreneurial ecosystem (access to finance and institutional support) and the resilience of SMEs in Rivers State. The study recommends enhancing institutional support and funding for the resilience of the SMEs in Rivers State.

Keywords: *Entrepreneurial Ecosystem, Resilience, Adaptive Capacity, Robustness*.

Introduction

The ability of small and medium-sized businesses (SMEs) to withstand turbulence is essential for survival, growth and competitiveness in this fast-growing world. Resilience is the organisation's ability to adapt to changes, withstand shocks, and bounce back without losing effectiveness in carrying out its functions. Resilience allows organisations to endure stress during challenging situations, particularly when faced with economic stagnation, environmental disturbances, unpredictable market conditions, and other unforeseen events. Resilience enables SMEs to turn their weaknesses into strengths, become creative and innovative, take advantage of new opportunities, and remain competitive in the long run.

The inefficiencies and lack of resilience during the Covid-19 period resulted in the collapse of many of the SMEs. Most of the SMEs' financial capabilities are low, and they have limited access to finance; likewise, their supply chain is fragile. That is why the pandemic hit them harder than larger organisations. According to Amin (2023), the SMEs' ability to be strategic in digitalisation, diversify their offerings, and wisely source funds would have strengthened them by withstanding threats and overcoming challenges. Hadjielias et al. (2022) suggest that organisations that have

financial capabilities are more resilient during the pandemic. This study confirms the importance of the need for SMEs to bounce back from shocks and keep running during crises. Bhamra et al. (2021) stated that strategies that focus on resilience help small and medium-sized businesses (SMEs) keep learning and getting better, allowing them to go forward instead of just going back. The ability of SMEs to demonstrate their capacity to withstand uncertainties, risks, and difficulties will instill trust among various stakeholders, such as banks and investors, making it easier for these businesses to enhance their financial credibility.

Pal et al. (2021) and Organisation for Economic Co-operation and Development (2020) studies have shown that when small-scale firms are resilient, it becomes easier for them to secure funds for managing their business and have better relationships with different stakeholders who could be of help to them during emergency situations. This shows that having financial trust enables them to overcome difficulties, grow, and become resilient. The SMEs are the organisations that make jobs available to many; they give opportunities for creative and innovative ideas, and fostering resilience is one of their ways of enhancing employees' career growth, which subsequently results in the firm's economic growth. Since small-scale industries contribute significantly to the majority of economic activity, they have a substantial impact on the country's GDP and job availability. Despite SMEs' importance, they often experience poor infrastructure and limited funding, and these are the circumstances that expose them to risks, disruptions, and adverse effects of variations in the economy (SMEDAN, 2025).

The entrepreneurial ecosystem includes various institutions, cultures, networks, markets, and support services that SMEs need to perform their activities. It provides funds, resources, and technology, facilitates coordination among employees, encourages the sharing of innovative ideas, and promotes the use of digital tools for greater efficiency in job execution. According to Oketch (2021), SMEs can withstand shocks and environmental changes when they possess efficient digital tools and infrastructure that enhance their technical awareness and provide access to supportive laws, which in turn encourages them to gain a competitive edge over others. s.

The impact of Covid-19 has shown the importance of a firm's resilience. Since these periods are challenging, only a well-prepared organisation can withstand shocks arising from unforeseen circumstances. To be resilient, an organisation must manage difficulties and quickly adapt to changing circumstances. Having a strong entrepreneurial ecosystem has made it easier for SMEs to use digital platforms, engage in creative and innovative ideas with others and receive support from members of the ecosystem (Gonzalez-Varona et al., 2024). Resilience provides solutions in confronting problems and unforeseen circumstances, and it is only when a strong ecosystem exists that growth can be enhanced during trial periods. Despite several studies on entrepreneurial ecosystems and resilience (Alake et al., 2024; Gonzalez-Varona et al., 2024; Pal et al., 2021), a dearth of empirical studies on how entrepreneurial ecosystems influence SMEs in Rivers State motivates this study. This study will address this gap in knowledge by investigating the influence of entrepreneurial ecosystems on the resilience of SMEs in Rivers State.

Statement of the Problem

Confronting obstacles has weakened the capacity of many SMEs in Nigeria. In developing countries, most often SMEs face serious challenges of insufficient funds, lack of support from various institutions that could be of help during difficult times, and the infrastructure available is

often obsolete, not meeting the demands of the changes in technology and environment, and insufficient strategic alliances worsen the whole case. In the Wegwu (2025) and Mustapha (2023) studies, it was observed that most SMEs have adaptability and learning problems, and these are vital for their sustainability and maintaining a competitive edge over others. These learning and adaptability skills are essential for handling economic shocks, and when the firms are not resilient, it becomes harder to survive during trials.

Poor resilience has affected many SMEs because they lack the capability to withstand environmental, technical, and market changes. This, in turn, leads to lower business profits, a smaller market share, and an inability to secure sufficient funding (Amadi & Thom-Otuya, 2025). Also, Zutshi et al. (2021) observed that their inability to adapt to changing circumstances, nor creative, innovative and proactive results, led to difficulty in thriving locally and in the global market. Poor resilience destroys the business and the overall economy of a nation. When the SMEs are not thriving, it becomes difficult to have job opportunities and fund and sustain the economy. As many people lose their jobs and have no investor, we want to invest in a company that has many challenges. (Wube, 2023; Pal et al., 2021).

Poor resilience has gained more strength, despite attempts to improve legislation, financial aid programmes, and create learning opportunities to enhance most SMEs' growth. Orisah-Godfrey (2024) suggests in his study that enhancing digital transformation opportunities and career-building programmes can help SMEs to be more resilient, but the inability to implement has become a huge problem as many lack the required resources or technical capability. To resolve this challenge, entrepreneurial ecosystems should be enhanced for the resilience of the SMEs. This study investigates how entrepreneurial ecosystems can enhance the resilience of the SMEs in Rivers State.

Aim and Objectives of the Study

The study investigates the association entrepreneurial ecosystem and resilient of SMEs, in Rivers State. The specific objectives are to:

i. Assess the link between access to finance and adaptive capacity of the SMEs in Rivers State.
ii. investigate the bond between access to finance and robustness of the SMEs in Rivers State.
iii. Examine the relationship between institutional support and adaptive capacity of the SMEs in Rivers State.
iv. Determine the relationship between institutional support and robustness of the SMEs in Rivers State.

Research Questions

The following research questions were given in the study:

i. How does access to finance relates adaptive capacity of the SMEs in Rivers State?
ii. How does access to finance relate to the robustness of the SMEs in Rivers State?
iii. How does institutional support relate to the adaptive capacity of the SMEs in Rivers State?
iv. How does institutional support relate to the robustness of the SMEs in Rivers State?

Research Hypotheses

The following research hypotheses were stated and tested in this study:

H_{o1}: There is no significant relationship between access to finance and adaptive capacity of the SMEs in Rivers State.
H_{o2}: There is no significant relationship between access to finance and robustness of the SMEs in Rivers State.
H_{o3}: There is no significant relationship between institutional support and adaptive capacity of the SMEs in Rivers State.
H_{o4}: There is no significant relationship between institutional support and robustness of the SMEs in Rivers State.

Review of Related Literature

Entrepreneurial Ecosystem

The entrepreneurial ecosystem encompasses institutions, people and environmental factors that are required in carrying out the business activities for growth and sustainability. Ecosystems involve several institutions, such as the banking sector, business networks, schools, career development programmes, etc. Having a healthy ecosystem guarantees the provision of adequate tools required in the organisation, information, and stakeholder involvement in providing creative and innovative ideas to support the growth and sustainability of the firms (Mustapha, 2023). A better ecosystem enhances growth and competitive advantage and creates an entrepreneurship culture that gives the opportunity to share ideas, collaborate, share expertise and quickly take advantage of new opportunities in order to be resilient in turbulent times. Hence the need for study on entrepreneurial ecosystems to support long-term growth of small and medium-sized businesses (Wube, 2023).

Access to Finance

Access to financing refers to the SMEs' ability to fund their business operations effectively, as no organisation can survive without funding. Capital is essential for being creative, innovative, taking risks, and meeting organisational goals. No organisation can run smoothly without having enough access to finance, and when there is limited finance, it becomes difficult for the organisation to survive in this turbulent economy. The SMEs need capital to invest in technology, manage risks, and acquire resources and infrastructure needed in carrying out their businesses. Amin (2023) opines that dependable access to credit, grants, and venture capital gives opportunities to SMEs to be more proactive, creative, and innovative. These virtues make them exhibit better resilience. Moreover, access to finance enhances various market opportunities and long-term strategic initiatives. According to Mustapha (2023), diversification of products and growth competitiveness can be enhanced with access to finance.

Institutional Support

Institutional support refers to formal and informal systems that provide policy frameworks, advice, and mentorship to SMEs. This involves services from stakeholders such as company incubators, professional networks, government regulatory bodies, and other institutions that support the career development and learning in their organisations. Institutional support is required in understanding the law, acquiring formation, and making strategic relationships that strengthen and make them prosperous (Wube, 2023). Institutional enhancement of trust from stakeholders' supportive networks enhance credibility and stability and are vital for overcoming obstacles (Mustapha, 2023).

Resilience

Resilience refers to the ability to survive difficulties, adapt and handle shocks without any difficulty in achieving the set goals and objectives. It shows and reveals the organisation's strength and weakness in handling unforeseen circumstances and supply chain difficulties, adapting to environmental, economic and technological changes, and being capable of surviving turbulent times, no matter the risk involved. A resilient firm endures turbulent circumstances, capitalises on new opportunities and enhances growth and takes a competitive edge over others. (Zutshi et al., 2021).

Adaptive Capacity

This refers to a firm's ability to adjust its processes, strategies, and operations in response to turbulence, risk, and changes in technology and the environment. It involves adaptive capacity in implementing quick corporate strategies, managing personnel, and integrating technology. Adaptability enhances the ability to swiftly take advantage of opportunities, reduce risks, and become more strategic and competitive (Zhou et al., 2023). An organization that has adaptive capability as its strength can foresee opportunities and trends while implementing innovative tools to maintain relevance in the marketplace. Organisations must confront challenges and be ready to have skills that will make them surpass difficult times and confront challenges (Amin, 2023).

Robustness

Robustness' refers to the firm’s capability of working efficiently no matter the circumstances. It determines an organization's ability to withstand shocks. The organisation's strength in strong structures, processes, and resources accounts for this. Robustness promotes stability, product quality, processes, and service delivery, no matter the circumstances the organisation faces (Zhou et al., 2023). Robustness means processes, structure, and finance are stable, and the firm has the capability to withstand turbulent times. It enhances sustainability and greater trust and confidence from stakeholders. It also simplifies the process of strategic planning and execution for the firm.

The Resource-Based View (RBV) Theory

The Resource-Based View (RBV) Theory suggests that organisations achieve competitive advantage through efficient development, acquisition, and utilisation of valuable, scarce, inimitable, and non-substitutable resources (Barney, 1991). RBV is significant for small and medium-sized enterprises (SMEs), as their performance and capability to be resilient lie on their resources. These could be material, financial capital, human resources, closeness to market and institutional support. Adaptive capacities enhance SMEs' growth in turbulent times; through leveraging of the available resources within a suitable entrepreneurial ecosystem, SMEs' resilience, adaptability, and recovery capacity enable them to respond to economic, technical, or environmental disruptions. swiftly

Empirical Review

Nwabuatu and Nnajiubah (2025) examined mentorship and networking in fostering a resilient entrepreneurial environment. Their population comprises of 120 local entrepreneurs in Rivers State. A purposive sampling and a qualitative research approach was adopted likewise structured questionnaires was used. The findings revealed a significant relationship between mentorship and networking. Concluding that mentorship and networking enhance resilient of the SMEs. However

the study could not cover, the mechanisms by which mentoring and networking affect resilience within the entrepreneurial ecosystem.

Ogunbiyi's (2023) examines entrepreneurial alertness and SME resilience, with the moderating influence of environmental instability. The research focused on the management staff of SMEs in Rivers State. Quantitative approach and structured questionnaires were used. The findings show entrepreneurial alertness interns of explorative and exploitative learning, and risk perception—having a significant positive relationship with SME resilience. Despite these insights, the study identified a deficiency in empirical studies investigating how environmental turbulence alters the link between alertness and resilience, signifying a critical domain for further exploration.

Amadi and Thom-Otuya (2025) examined entrepreneurial resilience (adaptive capability, resourcefulness, and optimism) and the business survival among 139 registered food and beverage manufacturing SMEs in Rivers State. The study employed a survey research design. Structured questionnaires was used. The findings reveal a positive relationship between entrepreneurial resilience and business survival indicators, such as market share and profitability.

Wegwu (2025) studied strategic alliances and resilience of small and medium-sized businesses (SMEs). The study focussed on firms adaptability and employed quantitative analysis through structured questionnaires. The findings shows that strategic alliances enhance SMEs resilience by enhancing adaptive ability and facilitating information transfer. The study identified a deficiency of empirical data about the overarching function of strategic partnerships within the entrepreneurial ecosystem, suggesting the need for more extensive research that connects ecosystem elements to SME resilience.

Methodology

The cross-sectional survey was used in this study. The accessible populations comprise of 385 management staff of 20 SMEs in Rivers State, within Port Harcourt, Rivers State. A sample of 195 was derived using krejcie and Morgan (1970) table. The primary data was obtained using a well-structured questionnaire. The independent variable, entrepreneurial ecosystem, was operationalized using two dimensions: access to finance and institutional support. Each construct was measured with a set of five items. For instance, access to finance was assessed with five items such as: "My company can easily access loans or credit facilities when needed" and "There are sufficient funding opportunities for SMEs in my industry". Similarly, institutional support was measured with five items, including: "Government agencies provide adequate guidance for SMEs" and "Business networks and mentorship programs are accessible and helpful". The criterion variable, resilience, was measured using two dimensions: adaptive capacity and robustness. Adaptive capacity was assessed with five items, such as: "My company can quickly adjust business operations in response to market changes" and "Employees easily adapt to new technologies or processes". Robustness was also measured with five items, including: "Our company can maintain core operations during economic or environmental disruptions" and "The business has stable financial and operational structures that withstand shocks". The reliability was determined using Cronbach's Alpha. The Cronbach's Alpha reliability level of 0.7 was used in the investigation. Values above 7.0 are considered composite reliable. Spearman's rank correlation analyses were used for the analysis.

Results and Discussion

195 questionnaires were distributed, but only 189(96.92%) copies were returned, and this constitutes the valid questionnaire. The hypotheses test is undertaken at a 95.5% confidence interval, and the decision rule is stated below.

Where P < 0.05 = Reject the null hypotheses

Where P > 0.05 = Accept the null hypotheses

Table 1: Correlations Between Access to finance and Dimensions Of Administrative Efficiency

			Access to Finance	Adaptive Capacity	Robustness
Spearman's Rho	Access to Finance	Correlation Coefficient	1.000	.885**	.865**
		Sig. (2-tailed)	.	.000	.000
		N	189	189	189
	Adaptive Capacity	Correlation Coefficient	.885**	1.000	.845**
		Sig. (2-tailed)	.000	.	.000
		N	189	189	189
	Robustness	Correlation Coefficient	.865**	.845**	1.000
		Sig. (2-tailed)	.000	.000	.
		N	189	189	189

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Output, 2025.

Access to Finance and Adaptive Capacity: As shown in Table 1, the Spearman's rho value is **0.885** (p = 0.000), which is less than the significance threshold of 0.05. The coefficient of determination (r^2) is **0.783**, indicating that approximately 78.3% of the variation in adaptive capacity can be explained by access to finance. Based on these results, the null hypothesis (Ho_1) is rejected, and the alternative hypothesis (Ha_1) is accepted. This indicates a **significant and positive relationship** between access to finance adaptive capacity.

Access to Finance and Robustness: Table 1 reveals a Spearman's rho value of **0.865** (p = 0.000), which is also below the alpha level of 0.05. The r^2 value of 0.748 suggests that 74.8% of the variance in robustness is attributable to access to finance. Consequently, the null hypothesis (Ho_2) is rejected in favour of the alternative hypothesis. This confirms a **strong and positive relationship** between Access to finance and robustness.

Table 2: Correlations between Institutional Support and the Dimension of Administrative Efficiency

			Institutional Support	Adaptive Capacity	Robustness
Spearman'	Institutional Support	Correlation Coefficient	1.000	.855**	.875**
		Sig. (2-tailed)	.	.000	.000
		N	189	189	189

Adaptive Capacity	Correlation Coefficient	.855**	1.000	.840**
	Sig. (2-tailed)	.000	.	.000
	N	189	189	189
Robustness	Correlation Coefficient	.875**	.840**	1.000
	Sig. (2-tailed)	.000	.000	.
	N	189	189	189

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Output, 2025.

Institutional support Adaptive capacity: According to Table 2, the Spearman's rho value is **0.855** (p = 0.000), which is below the significance level of 0.05. The coefficient of determination (r^2) is 0.731, indicating that 73.1% of the variation in adaptive capacity is explained by institutional support. Given this result, the null hypothesis (Ho_3) is rejected, and the alternative hypothesis (Ha_3) is accepted. This demonstrates a **strong and significant positive relationship** between institutional support and adaptive capacity.

Institutional support and Robustness: As shown in table2, the Spearman's rho value is **0.875** (p = 0.000), which is less than the 0.05 significance level. The r^2 value is 0.766 indicating that institutional support accounts for 76.6% of the variation in robustness. Based on this evidence, the null hypothesis (Ho_4) is rejected in favour of the alternative hypothesis. This suggests that there is a strong **significant and positive relationship** between institutional support and robustness.

Discussion of Finding

Hypothesis 1: The analysis in Table 1 shows that Spearman's rho is 0.885 (p = 0.000) and r^2 is 0.783. This suggests that funding access accounts for 78.3% of the variability in adaptive capability among SMEs in Rivers State. Consequently, the null hypothesis (Ho_1) is rejected, and the alternative hypothesis (Ha_1) is affirmed. This reveals a significant association between access to finance and adaptive capacity. This confirms that SMEs with access to finance are better equipped to embrace new technologies, changes in the environment and to change their operations. This finding aligns with Amin (2023) and Nwabuatu & Nnajiubah, 2025) that financial access enhances SME resilience.

Hypothesis 2: Table 1 shows that the Spearman's rho value of 0.865 (p = 0.000) and the r^2 value of 0.748 mean that 74.8% of the changes in resilience are due to access to finance. Consequently, the null hypothesis (Ho_2) is dismissed in favour of the alternative hypothesis. This result shows that SMEs with access to capital have stable operations and structures in turbulent times. The study aligns with Amadi & Thom-Otuya, 2025 that resilience is a crucial determinant of robustness.

Hypothesis 3: Table 2 reveals that institutional support has a Spearman's rho value of 0.855 (p = 0.000) and an r^2 value of 0.731. This means that institutional support explains 73.1% of the change in adaptive capability. Consequently, Ho_3 is rejected and Ha_3 is accepted. Indicating a robust positive relationship SMEs who receive government assistance, mentorship initiatives, and business networks may more adeptly adapt to market fluctuations and implement innovative

tactics. The study aligns with Wegwu (2025) and Nwabuatu & Nnajiubah (2025) that institutional support relates with adaptability.

Hypothesis 4: Table 2 shows a Spearman's rho value of 0.875 ($p = 0.000$) and an r^2 value of 0.766. This means that institutional support explains 76.6% of the variance in resilience. Hence, Ho_4 is rejected and the alternate Ha_4 accepted. Implying that institutional support relates with resilient. The study agrees Ogunbiyi, (2023) that formal and informal institutional processes enhance structural stability of SMEs.

Conclusion

This study examined the relationship between the entrepreneurial ecosystem and the resilience of small and medium enterprises (SMEs) in Rivers State. Ecosystem dimensions in the study are access to finance and institutional support, while resilience is measured with adaptive capacity and robustness. The findings reveal that access to capital and institutional assistance had strong, positive, significant relationship with resilience of SMEs in Rivers State. This necessitates the need for SMEs to change business methods and processes and adopting new environment changes. Institutional support also enhances stable operations int the face of environmental challenges. The research proposed that an effectively operating entrepreneurial ecosystem is an essential facilitator of SME resilience. Hence, it is essential for SMEs to have financial resources and institutional networks to be able to handle economic shocks, adjust to changes in the market, and survive environmental turbulences.

Recommendations

1. SMEs should adapt new market and technologies changes, and financial institutions and authorities should create flexible funding programs, low-interest loans, and grants to assist the SMEs.
2. Set up good financial management practices and support loan guarantee schemes to keep operations going and their structures stable even when the economy or the environment changes.
3. The different stakeholders should provide mentorship programmes, training workshops, and advisory services for SMEs to facilitate easier information, connect with others, and use institutional resources.
4. SMEs should be giving getting more support from institutions and Institutions should enhance uniform regulatory guidance, infrastructure assistance, and formal business networks that promote organisational stability.

Abstract
This study focused on cargo consolidation and optimal resource utilization of freight forwarding companies in Rivers State; specifically, to ascertain the relationship between cargo consolidation and optimal resource utilization of freight forwarding companies A correlational research model was articulated to handle one (1) hypothesis expressed for the study. The survey research method was adopted for the study on a population comprised of twenty-four (24) freight forwarding companies in Rivers State. Afterward, the simple random sampling technique was espoused to draw 96 respondents for the study. A 5-point likert-scale questionnaire was administered to the respondents, and 69 were returned, ensuing a response rate of 72%. However, 53 returned copies of questionnaire were usable, signifying 77% that were used for analysis. The study espoused descriptive statistics and Pearsons's Product Moment Correlation analysis the results exposed that, cargo consolidation had a strong, significant and positive relationship with optimal resource utilization. The study concludes that cargo consolidation positively and significantly relates with optimal resource utilization of freight forwarding companies in Rivers State and recommends that the management of freight forwarding companies should maintain or improve cargo consolidation that structure their business in line with optimal resource utilization for effective operation of their business in the 21st century.

KeyWords: *Cargo consolidation, Freight forwarding companies, Optimal resource utilization, Rivers State.*

Introduction

Cargo consolidation reduces fuel costs and improves delivery economics (Sivakumar *et al.*, 2024; Sakr, El-Afifi, & Plvar, 2023). Yet, most freight forwarding companies in Rivers State have not adopted this arrangement or integrated them into their planning processes. This arrangement gap spreads inadequacies in resource usage and limits the suppleness required to compete in today's dynamic transportation scenery. Deprived of flexible logistics systems and effective cost controls, freight and forwarding remain ill-equipped to scale or sustain profitability. In contemporary supply chain practices, resource utilization is a key performance indicator, especially in time-sensitive industries such as the freight and forwarding sector.

Cargo consolidation is a critical function within transportation management systems that enhances logistics efficiency, reduces operational costs, and supports sustainable distribution practices. Through smart bundling of shipments and dynamic planning, cargo consolidation helps firms deliver more with fewer resources. This is especially important for freight and forwarding companies managing daily deliveries to multiple locations. With cargo consolidation, these firms can reduce vehicle use, fuel consumption, and delivery time while preserving service quality and enhancing optimal resource utilization. Reinforced by robust digital platforms, cargo consolidation turns fragmented logistics into optimized, ecologically responsible supply chains.

Some scholarly enquiries on cargo consolidation have been amassed. For example, Rushton, Croucher, and Baker (2022) evaluated the role of consolidated distribution in bakery product logistics across the UK, and found that, consolidation enhances bakery logistics reliability, Ologbon and Adesina (2020) examined production optimization and corporate productivity in the Nigerian Manufacturing Industry and revealed that, production optimization practices have a relationship with product quality, Njuwasasira (2022) looked at the contribution of load optimization on organizational performance in automotive sector in Rwanda and found that there was a strong, positive monotonic correlation between load optimization and organizational performance of Toyota Rwanda, Rwanda. Nyang'au and Muturi (2021) investigated the influence of load optimization on organizational performance in retail sector in Kenya and demonstrate that, load optimization influences performance of retail outlets in Kenya positively, Ballou and Martins (2020) examined the role of load optimization in enhancing logistics performance in South American retail supply chains, and found a significant positive relationship between cargo consolidation and vehicle capacity utilization, and Musa (2020) studied integrated cargo consolidation and distribution costs in Nigerian agricultural supply chains and revealed that consolidation reduced fuel expenses and improved product preservation during transit

Despite extensive research on cargo consolidation to optimal resource utilization, most existing studies are context-specific and concentrated in sectors such as automotive, e-commerce, pharmaceuticals, and fast-moving consumer goods (Nurmasari *et al.*, 2025). While studies by Moronge *et al.* (2021) confirm the positive impact of TMS on supply chain and logistics performance in Kenya and Nigeria respectively, they do not dis amassed these effects into Optimal Resource Utilization, particularly within the freight and forwarding sector.

Furthermore, empirical investigations that focus specifically on cargo consolidations are relatively few and often lack alignment with optimal resource utilization relevant to freight and forwarding businesses. Moreover, most prior studies have not examined cargo consolidations functionalities within the geographical and infrastructural context of Rivers State, Nigeria, where freight and

forwarding companies often face logistical challenges such as inconsistent road conditions, power interruptions, and limited digital infrastructure. Although recent studies like Olusegun and Okafor (2021) have made progress in evaluating tracking systems and last-mile delivery, their scope remains narrow and sector-general. Consequently, there is a notable gap in literature on how cargo consolidations relate with optimal resource utilization in freight and forwarding distribution logistics in Rivers State. This study intends to fill that gap by providing empirical evidence on the relationship between cargo consolidations and optimal resource utilization of freight and forwarding companies in Rivers State.

Review of Related Literature

The foregoing section enfolds the introduction of the paper, while this section reviewed relevant literatures focused on intensifying the theoretical under pinning on which this study is shaped. The study enclosed literature on cargo consolidation and optimal resource utilization to set up theoretical and empirical connections.

Theoretical Underpinning

This study is anchored on the transaction cost economic theory.

Transaction Cost Economics Theory

Transaction Cost Economics is a theory that offers an alternative approach to the traditional mainstream economics through a lens of "choice" (Williamson, 2002). The fundamental premise of TCE is that firms seek to minimize the costs associated with transactions in their relationships. These costs include not just the price of goods and services but also the costs of negotiating, monitoring, and enforcing contracts. In supplier relationships, TCE emphasizes the need for organizations to structure contracts in a way that reduces the potential for opportunistic behavior and fosters long-term cooperation (Adewusi, Chiekezie & Eyo-Udo, 2022). When a firm is negotiating with a supplier, the goal is to design a contract that minimizes transaction costs while providing sufficient flexibility to adapt to unforeseen circumstances. In practical terms, TCE suggests that organizations should evaluate the risks associated with different types of supplier relationships. For example, long-term contracts may be more appropriate in environments where uncertainty is high.

Transaction Cost Economics (TCE) plays a central role in shaping how organizations approach partnership and relationships with suppliers. In the context of supply chain integration, understanding the theoretical foundations that influence supplier partnership and customer relationship management is crucial to enhancing marketing performance. TCE has been applied to understand the behaviour in cargo consolidation (Wilding & Humphries, 2006) and its impact on supply chain relationships and performance (Cao & Zhang, 2011; Nyaga et al., 2011).

Hence, Transaction Cost Economics is considered to fit with the nature of cargo consolidation. It has been shown that lower transaction costs favour outsourcing and higher transaction costs favour in-house operations (Williamson, 2008).

The Concept of Cargo Consolidation

Cargo consolidation refers to the process of combining multiple small shipments from different senders or locations into a single transportation unit to reduce costs and increase delivery

efficiency. It is particularly useful in Less-than-Truckload (LTL) transportation, where smaller parcels do not require a full vehicle and can be economically bundled. Savchenko and Gritsenko (2020) describe cargo consolidation as a logistics strategy that delivers "economies of scale" by minimizing the number of trips and maximizing vehicle load capacity (Savchenko & Gritsenko, 2020). This results in both direct cost savings and reduced environmental impact. For bakery firms, where deliveries are often small and frequent, consolidation ensures a more structured and cost-efficient distribution model.

In the context of Transportation Management Systems, cargo consolidation is supported through automated planning algorithms that identify compatible loads and optimal routes. Lukasik *et al.* (2020) emphasize that consolidation services within road transport are essential to reduce fragmentation, coordinate supplier deliveries, and lower total transport costs (Lukasik *et al.*, 2020). These systems consider shipment volume, time constraints, and vehicle availability to bundle cargoes efficiently. Wu (2013) explains that in intermodal transport, consolidation boosts container capacity utilization and decreases the number of half-empty containers moving through the supply chain (Wu, 2013). Consolidation algorithms embedded in TMS ensure smart, timely, and sustainable freight movement across complex logistics networks. Cargo consolidation contributes to delivery performance by increasing vehicle utilization and reducing the total number of trips, which is particularly relevant in urban environments. Heeswijk (2017) found that urban freight consolidation reduces congestion and carbon emissions while improving last-mile delivery efficiency (Heeswijk, 2017).

Consolidation centers and urban transshipment hubs are key infrastructure points where transportation management platforms can coordinate incoming shipments and assign them to optimized consolidated routes. These systems are increasingly important for bakery logistics in congested city centers, where regular small-scale deliveries are needed, but sustainability goals must also be met. Properly timed and combined deliveries reduce emissions, delivery time, and costs while ensuring freshness and reliability. Consolidation is also vital for strategic cost control.

Handayani *et al.* (2023) report that delivery consolidation in multi-product, multi-echelon food chains increased load efficiency and reduced the number of trips required, which significantly lowered transportation and storage costs (Handayani *et al.*, 2023). In bakery logistics, where daily product freshness is crucial, this means better resource use and lower spoilage rates. Lin *et al.* (2012) introduced an intelligent logistics decision support system that matches vehicles and cargoes in real-time to support cost-effective consolidation (Lin *et al.*, 2012). TMS systems that enable dynamic consolidation to allow for flexible planning across fluctuating delivery demands, maximizing efficiency even during peak or unpredictable periods.

From a policy and infrastructure standpoint, consolidation supports sustainability and reduces urban traffic stress. Tacla *et al.* (2007) observed that consolidation hubs at urban peripheries, combined with TMS-powered route optimization, led to major environmental and cost benefits for retail supply chains (Tacla *et al.*, 2007). Similarly, Chadha *et al.* (2021) found that incorporating shipment consolidation into "Physical Internet" supply chains reduced total delivery distance and improved fleet utilization (Chadha *et al.*, 2021). These insights confirm that consolidation is not just an operational tactic, but also a sustainability strategy. For bakery firms in areas with road congestion, consolidation helps reduce delivery redundancies and enhance on-time performance.

Optimal Resource Utilization

In business operations, managers are often required to do more with less as firms are often faced with resource constraints that threaten the quality of their products and seamlessness of their operations. Thus, they seek ways of stretching available resources to meet their resource needs (Sempebwa et al., 2012). Optimal resource utilization is therefore the efficient allocation of resources to produce products that meet customers' requirements at the lowest possible cost, without compromising on quality.

The term "Resource" is used to describe essential requirement including (human, machine, buildings, finance, material, information and time) to complete a project. Companies do hire or otherwise obtain resources to enable them to pursue and achieve desired objectives. However, improper utilization of resources may hurt expected growth. Resource utilization defines the procedure by which firms make the highest possible gains from existing resources. Ugboko and Ehugbo (2021) suggest that firms are increasingly looking inwards and optimally utilizing resources to formulate winning strategies in their effort to meet or beat competition. This is even as competitive advantage is becoming difficult to sustain for a long time due to competitors' tendency to imitate products and strategies. This position highlights the need for firms to accord optimal resources utilization renewed attention. Klingebiel and Rammer (2011, as cited in Ugboko & Ehugbo, 2021) argue that profitability in business often depends on efficient resource utilization.

Firms that do poorly in resource utilization characteristically experience wastages, high costs, delays and unsatisfied customers. Hence, Grimsley (2013) view resource utilization as how resources are used in activities intended to satisfy customers, while recognizing their processing and capacity limitations. Firms strive to achieve improved planning and scheduling of limited resources with a view to increasing productivity and lowering costs.

Resource utilization has long been a topic of interest, especially in operations research (Lazarov, 2016) where researchers have been concerned with determining necessary decisions made with respect to acquiring, allocating and using resources to create and deliver value that satisfies the requirements of relevant stakeholders in the most effective and efficient manner. Optimal utilization of resources is associated with several benefits. It ensures that resources are not underutilized, maintains productivity, ensures better visibility, increases yields and enhances managers' agility in rescheduling resources as quickly as possible, and avoids problems of resource redundancy. The continuously shifting shape of the business environment means that, even with all the resources in the world, businesses can still have trouble if their resources are not utilized properly. Optimal resource utilization is a formula for success, especially if managers can leverage the many benefits of efficient resource utilization (Hans et al., 2008).

Empirical Review

Rushton, Croucher, and Baker (2022) examined the role of consolidated distribution in bakery product logistics across the UK. The researchers collected primary data from 75 bakery logistics coordinators. It was found that firms employing cargo consolidation recorded fewer spoilage cases and faster delivery times. The authors concluded that consolidation enhances bakery logistics reliability.

Ologbon and Adesina (2020) examined the production optimization and corporate productivity in the Nigerian Manufacturing Industry, using primary and secondary sources of data collection on a population consisting of all manufacturing company in Lagos State, Nigeria. The study revealed a significant impact of production optimization on organizational performances.

Njuwasasira (2022) looked at the contribution of load optimization on organizational performance in automotive sector in Rwanda; with a target population of eighty-four staff working in corporate department at Toyota Rwanda. The study found that there was a strong, positive monotonic correlation between load optimization and organizational performance of Toyota Rwanda.

Rwanda. Nyang'au and Muturi (2021) investigated the influence of load optimization on organizational performance in retail sector in Kenya by means of a survey design and a target population of 810 large retail stores assessed from different segments of the retail sector and found that there was a significant positive influence of load optimization on organizational performance in retail sector in Kenya.

Stanfast and Lawrence (2020), investigated transportation model and cost control in Nigerian manufacturing firms. and a sample frame includes ten manufacturing companies in Rivers State, Nigeria with 103 participants, and discloses that the use of transportation model has a positive impact on the cost of goods shipped, the quantity of goods shipped and the reliability of delivery.

Nguyen *et al.* (2018) studied how multi-order consolidation impacts delivery timeliness in Asian e-commerce fulfillment networks. with a survey of 100 warehouse managers and logistics staff revealed. Data analysis using SPSS showed strong correlation between cargo consolidation and delivery efficiency.

Methodology

This section outlines the methodology adopted for examining the relationship between cargo consolidation and optimal resource utilization of freight forwarding companies in Rivers State. The survey design was used, and the study chose the questionnaire method as a source of data collection, the cross-sectional field survey of the quasi-experimental research design was employed the research setting was a non-contrived one. The study population comprised of twenty-four (24) freight forwarding companies in Rivers State, as listed in the Finelib.com Nigeria Directory and Search Engine (2024). Afterward, the simple random sampling technique was espoused to draw 96 respondents for the study. A structured questionnaire was administered to the respondents and descriptive statistics such as frequency, mean, and standard deviation were used to summarize responses, while the Inferential analysis was carried out using Pearson Product Moment Correlation (PPMC) to test the relationships between cargo consolidation and optimal resource utilization.

Results

This study focused on cargo consolidation and optimal resource utilization of freight forwarding companies in Rivers State; specifically, to ascertain the relationship between cargo consolidation and optimal resource utilization of freight forwarding companies A 5-point likert-scale questionnaire was administered to the respondents, and 69 were returned, ensuing a response rate of 72%. However, 53 returned copies of questionnaire were usable, signifying 77% that were used

for analysis. The study espoused descriptive statistics, and a correlational research model was articulated to handle one (1) hypothesis expressed for the study through Pearsons's Product Moment Correlation analysis.

Relationship between Cargo Consolidation and Optimal Resource Utilization

$H0_1$: There is a significant relationship between cargo consolidation and optimal resource utilization of freight and forwarding companies in Rivers State.

Table 1: Relationship between Cargo Consolidation and Optimal Resource Utilization (N=53).

	Cargo Consolidation	Optimal Resource Utilization
Cargo Consolidation	Pearson's correlation	1	.6345
	Sig. (2-tailed)		.0000
	N	53	53
Optimal Resource Utilization	Pearson's correlation	.6345	1
	Sig. (2-tailed)	.0000	
	N	53	53

** **Correlation is significant at 0.01 level (2-tailed).**

Table 1 shows that the correlation coefficient between cargo consolidation and optimal resource utilization. is r=0.63 implying there is a strong positive correlation. This implies that an increase in cargo consolidation by freight and forwarding companies in their operations has significant relationship with optimal resource utilization

Discussion of Findings

The result of the hypotheses show that cargo consolidation has positive and a positive and strong relationship with optimal resource utilization. (634: 0.000 <0.05). The results show that cargo consolidation has positive and strong relationship with optimal resource utilization, thus allowing us to reject the negative notion of there is no significant relationship between cargo consolidation and optimal resource utilization and accepting the positive notion of there is a significant relationship between cargo consolidation and optimal resource utilization Thus, our findings support this view regarding cargo consolidation and optimal resource utilization, and implying that cargo consolidation enhances the optimal resource utilization. This finding is in line with the findings of Rushton et al. (2022) that, firms employing cargo consolidation recorded fewer spoilage cases and faster delivery times and that, consolidation enhances logistics reliability. Also, our findings support that of Adebayo and Musa (2020) who disclosed that consolidated trips led to fewer delivery windows missing and improved delivery coordination, confirming a significant positive correlation between consolidation and on-time delivery.

Conclusion and Recommendation

The study examined how cargo consolidation relates with optimal resource utilization of freight and forwarding companies in River State by several estimates, and there is reasonable assurance that cargo consolidation has been discovered to relate with optimal resource utilization. Existing research has strongly linked cargo consolidation relationship with optimal resource utilization, providing the best solution to delivery efficiency in freight and forwarding companies in Rivers

State. The study concludes that cargo consolidation positively and significantly relates with optimal resource utilization of freight and forwarding companies in Rivers State and recommends that the management of freight forwarding companies should maintain or improve cargo consolidation that structure their business in line with optimal resource utilization for effective operation of their business in the 21st century.

Abstract
Nigeria oil economy enhanced the growth of its industrial sector. The industries were motivated by profits which left a gap in the social and environmental demand. The inefficiency of government further exacerbated the social and environmental gap. The activities of the industries deplete the natural resources and damaged the environment. The objective of the study is to examine the extent of social entrepreneurship and sustainable development in Nigeria. The study made use of secondary research method where extant and relevant literature on social entrepreneur, corporate social responsibilities, multinational corporations and local company activities in Nigeria were reviewed. It was observed that companies in Nigeria focused more on shareholders wealth and the amount set aside for corporate social responsibilities were grossly inadequate and some of the amount went for settlements at the detriment of the environment. Secondly, the social entrepreneurs were financially handicapped though impacts were effective in some areas. It was recommended that companies should incorporate responsibility frame work in terms of social and environmental issues into organization model that prioritized all stakeholders to achieve sustainable value. Second, the government should unduly drive policies that sustain and protect the environment.

Key word: *Social entrepreneur, Corporate social responsibility, Multinationals, local companies and Industrial development*

Introduction

Nigeria has a population of over 200 million people with a moderate standard of living occasioned by its oil economy which replaced the agrarian society. The country experienced growth in infrastructural development which enhanced its industrial development. The industries in the country were motivated by profits that left a gap in social and environmental demand. The inefficiency of government further exacerbated the social and environmental gap. Increase in production led to the depletion of natural resources and damaged the environment. Such damage is seen in areas such as environmental pollution, flooding, deforestation, heat due to climate change and others. Such activities led to hunger, poverty and diseases. These developments saw the emergence of social entrepreneurs that helped to improve lives and develop the country in a sustainable way though burden by funding.

The multinational organization companies in Nigeria and local firms embarked on corporate social responsibility activities ranging from provision of infrastructure facilities to empowerment packages to host communities which failed to address social and environmental responsiveness such as environmental degradation, hunger and diseases. Most of the multinational companies generate revenue to meet the needs of their shareholders and government without addressing the needs of the environment. It is possible to run an organization that prioritized the needs of the shareholders, government and favourable social and environmental outcome. That is sustainability that emphasizes minimum damage to the environment and society and at the same time protects future generations. Therefore incorporating corporate responsibility, framework in term of social and environmental issues into organization model that prioritized all stakeholders is the way to achieve sustainable value.

The objective of the research work is to examine the extent of social entrepreneurship and sustainable development in Nigeria. To achieve the objective, extant and relevant literature on social entrepreneurship, corporate social responsibility, Multinational and local company activities in Nigeria were reviewed. The significant of the study is to enable multinational companies and social entrepreneurs to understand social entrepreneurship role in promoting sustainable development and addressing environmental challenges. Second, it helps the government make policies that drive sustainability and protect the environment.

Social Entrepreneurship and Corporate Responsibilities in Nigeria: An overview

Schumpeter's view of entrepreneurship placed emphasis on innovation; new product, new product methods, new markets and new forms of organization. Therefore entrepreneurship is providing a unique or novel solution to problems. According to Drucker, the entrepreneur always search for change, responds to it and exploits it as an opportunity. Therefore an entrepreneur redefines equilibrium to suite perceived reality. Social entrepreneurs are persons who create or manage innovative entrepreneurial organizations or ventures for the development of the society rather than the pursuit of profit. The profit is seen as a means to an end. The social entrepreneur does not prioritized profitability above social and environmental demand. A social entrepreneur should balance profitability aspects of a business with social and environmental aspects.

Social businesses prioritize social and environmental impact in their quest for profitability in order to achieve a sustainable value. A social business that produces Eco-friendly products is mindful of the materials used in the manufacturing process. Most often preferred renewable or recycled resources. Therefore, social entrepreneurs evaluate their success in term of the impact on the society and environment. Battilana et al, (2017) posit that social entrepreneurship promote sustainable development in response to environmental challenges. The sustainable development and reducing environmental problems need creative solution (IPCC,2021). There must be innovative solutions to the problems of climate change, resource depletion and environmental degradation. Social entrepreneurs prioritize profit generation and environmental and social demand. Traditional business might focus on market share and profitability while social entrepreneurs does not profoundly prioritize profitability but make profit for its continuous survival and help in environmental issues like job creation, trees planting and environmental cleaning. Social entrepreneurship makes impact on society by offering different solution to social challenges.

Many organizations embarked on corporate social responsibilities without making social impact the primary mission. Therefore social enterprise differs from companies with corporate social responsibilities. Multinationals and some private companies in Nigeria embarked on all manner of corporate social responsibility activities to the host communities but such corporate social responsibilities did not meet social and environmental demand. Incorporating corporate social responsibility framework into business model encourages sustainability on environmental demand. Brennan et al., (2011) are of the opinion that business action is sustainable when supported by nature and the people. Therefore organization should incorporate social and environmental issues into their business goal to achieve sustainable value (Vallance et al.,2011). Sustainability implies using natural resources responsibly to provide for present and future generation (Jordan, 2013). To put more succinctly, activities that meets the needs of the presents without compromising the ability of future generation to meet their own needs (WCED, 1987). That is meeting the needs of the present generation without compromising the well- being of future generations. Entrepreneurs operating business in the modern business environment must employ sustainable strategies that balance the economic aspects (profitability) of a business with social and environmental aspects. Morelli (2011) defines environmental sustainability as meeting the resources and services needs of current and future generation without compromising the wealth of the eco-system that provides them. The sum argument is that nature needs to be protected from human activities. Nigeria being an emerging economy comes with the challenges of sustainability such as degradation, industrial pollution in the form of chemicals, toxic discharges, smoke, heavy metals, sewage and concentrated hazardous waste.

Multinational operating in Nigeria oil and gas industry causes environmental degradation through oil spillage and gas flaring. Nigeria ranks among the 10 gas flaring countries in the world with 6.63 billion cubic metres in 2021 (Uduu, 2022). Government efforts to regulate the industries to comply with acceptable international environmental standard have not yielded needed solutions. Instead of meeting environmental demand, they embarked in all manner of corporate social responsibility activities which led to agitation by the host communities despite spending in education, health and infrastructural development. Based on serious agitations, oil companies agreed to create $1 billion clean- up fund for the worst affected areas. Only $300 million was raised by the largest private oil and gas companies. This money was purported to have been poorly managed by Hydrocarbon Pollution Remediation Project (Hyprep) set up by the government. Oil spills and gas flaring are the source of an ongoing public health and environmental emergency I Niger Delta (SDN,2024). The oil industry generates a huge amount of revenue for private companies and government but the money set aside to address environmental degradation are grossly insufficient. Government efforts decreased gas flared by 30% between 2019 and 2020. Much needed to be done despite government efforts. Oil companies should aim to reduce their emission to zero in line with sustainable development goal of 2030. Nigeria oil and gas can be explored in social and environmentally responsible manner by placing social and environmental demand on the companies as part of their business model instead of corporate social responsibility that doesn't compel loyalty. Business have obligation to act responsibly even during production process that envision minimum damage to the environment.

Climate change is caused by natural and human activities. Emission of gases, flaring of gas and deforestation contribute to the depletion of the ozone layer or activities that result in reduce carbon

absorption from the atmosphere (Anabaraonye et al., 2018 as in Onnoghen et al., 2024), climate change causes land degradation, biodiversity loss and threat to public health.

According to international institute of Tropical Agriculture IITA (2011) as in Wajim (2020), Nigeria is ranked the worst country with the highest deforestation rate. Deforestation affects wind flows, water vapour flows, coastal flooding, create hotter drier weather thus increasing drought and desertification. In order to address the devastating effect of climate change, Nigeria government in 2009 install plastic recycling plants in 26 cities across Nigeria though poorly executed. The action of the government was necessitated by increased usage of plastic production and consumption in the country. According to Plastic Atlas , Nigeria edition (2020), Nigeria is already one of the largest importers and consumers of plastic in Africa. Between 1996 and 2017, about 20million tons of primary plastic products were imported into Nigeria. This development encourage many Nigeria waste recycler agents which collect bottles, plastic cans, aluminum cans, old newspapers, corrugated brown cartons, pure water sachets and paper. The collected wastes are sold as raw materials for the production of new items. African Creative Sustainable Synergy Hub, a waste up-cycling and remodeling enterprise engage in educating public schools on how to convert the waste around them into playground. Planet 3R, another social enterprise converts textiles and plastic waste into eco-friendly products. It creates reusable bags and other items from plastic waste. In order to reduce the impact of climate change in the country, many individuals and organization have embarked on tree planting. There is a government policy of replacement of economic tree felled by saw-millers. The production of kilishi in the northern part of the country has been supported by the World Bank that led to the construction of factory using solar panels to replace wood and coal to reduce deforestation. Solar powered stove are also produce to assist the rural areas and low income earners who depend heavily on wood and coal to avoid deforestation.

National Bureau of Statistics (2024) reports that youth have a combined unemployment and underemployment rate of 15.7 percent. Many of the youth do not have the skills to enter the labour market or to become self-employed. 63% of Nigeria are multidimensional poor according to National Bureau of Statistics NBS (2022). NBS (2022) further opined that poverty is higher in rural areas where 72% of the people are poor compared to 42% of people in urban areas. The economic policies of president Tinubu administration deepened inflation and raises poverty level astronomically that wiped out the middles class. Efforts have been made by many social entrepreneurs to alleviate the pains of the unemployed and poverty. Prominent among them is Tony Elumelu foundation- providing tools to improve skills for job creation and substance. The foundation engaged in the training and mentorship of youth in its digital hub, TEF connect and a grant of $5,000 to innovative young entrepreneurs as a start- up grant. He gave 2,000 farmers access to micro credits for input. LAPO micro finance is another social entrepreneur, it deliver financial services in small amount to entrepreneurs who do not have access to mainstream or traditional financial services. The organization is committed to help the poor, mostly target the rural area, unbanked individual to provide for financial inclusion. Members of low income household, micro, small and medium enterprises have benefited from the scheme. The economic empowerment has help cushion the scourge of unemployment and poverty.

Agriculture in the country has suffered great deal by the impact of climate change and devastating effect of bandits or terrorist. Agricultural social entrepreneurs have made significant efforts to reduce the pains. AACE food, source raw materials from small holders farmers across regions in

Nigeria in partnership with community group and non -profit associations and transform the raw materials into spices, seasonings, flours and snacks. This helps solve the high rate of post -harvest losses linked to minimal processing in the country and dependence on expensive imports. Fresh Direct Produce and Agro Allied Service is a social entrepreneur that has pioneered hydroponic Agriculture in Nigeria. The organization work has led to the production of top quality produce and meats.

Nigeria social entrepreneurs are investing in renewable energy and green technology to reduce environmental impact and encourage sustainable future more essentially the surging cost of electricity in the country that often put the public at knife edge with hydro –electricity firms. Adopting energy- efficient technologies reduces environmental impact.

Theoretical Framework

Triple bottom line (TBL) framework: this is theory of sustainability as popularized by John Elkington in 1994 which focus on 3ps; profit, people and planet. This sustainable business strategy take cognizance of the environment, social and profitability as a model that maximize all stakeholders interests rather than focusing on generating profit as the bottom line of every business. The new thinking is for organization to shift focus creating value for all the stakeholders instead of maximizing the interest of the shareholders only. The idea of the triple bottom line emphasizes the need to consider social and environmental issues which impact more on the future generation. Therefore sustainability is meeting the needs of the present generation without compromising the needs of the future generation. This is a shift from the traditional corporate responsibilities of organization which most often did not address social and environmental demand. This theory is apt for this research work, as it explain the extent to which business organization in Nigeria incorporate this model into their framework and sustainable business practices in Nigeria. Sticking to the traditional corporate responsibility create inequalities and environmental degradation which could be responsible for the various agitations and developmental issues in Nigeria. This theory will promote equity in the country.

Conclusion and Recommendations

Social entrepreneurs provide innovative solutions to social and environmental issue while still prioritizing profitability. By combining profitability with social and environmental demand, social entrepreneurship remains the possible way to promote sustainable development and solve environmental problems. Profitability and corporate social responsibility alone failed to compelled loyalty to the environment and short change the people. Therefore social entrepreneurs are well positioned to address societal problems neglected by government and corporate entity. Social entrepreneurs makes profits but not motivated by the appropriation of profits as most of the profits are reinvested to better the organization. It was obvious that companies in Nigeria focus more on shareholders wealth and the amount set aside for corporate social responsibilities were grossly inadequate and some of the amount went for settlements at the detriment of the environment. Second, the social entrepreneurs were financially handicapped though impacts were effective in some areas.

It is recommended that companies should incorporate responsible framework in terms of social and environmental issues into organization model that prioritized all stakeholders to achieve

sustainable value. Second, the government should unduly drive policies that sustain and protect the environment.

Moderating Role of Coping Strategy on the Effect of Entrepreneurial Orientation on Business Performance of Rural Women Enterprises in Kano State, Nigeria.

Asiya Kabir Umar

Executive Summary:
This research study will investigate the intricate relationship between entrepreneurial orientation, coping strategies, and business performance within the context of rural women-owned enterprises in Kano State, Nigeria. Rural women entrepreneurs face unique challenges in their business endeavors, and understanding how coping strategies influence the impact of entrepreneurial orientation on business performance is crucial for sustainable economic development in the region. These enterprises face unique challenges due to resource constraints, limited access to financial services, and socio-cultural norms. Understanding how coping strategies interact with entrepreneurial orientation in this context is essential for sustainable economic development. This research aims to address the critical knowledge gaps in the field of entrepreneurship by investigating how rural women entrepreneurs harness their entrepreneurial orientation and employ various coping strategies to overcome challenges and enhance their business performance. It is predicated on the understanding that the interplay between entrepreneurial orientation and coping strategies is pivotal for both the individual success of these women entrepreneurs and the broader socio-economic development objectives of Kano State and Nigeria as a whole.

Introduction:
Entrepreneurship, as a driving force for economic development and social empowerment, has gained increasing recognition worldwide (Brush, 2020). In the diverse entrepreneurial landscape of Nigeria, particularly in Kano State, rural women have emerged as a resilient and vital demographic, contributing significantly to local economic growth and poverty reduction. These women, despite operating in resource-constrained environments, have demonstrated remarkable entrepreneurial spirit in their pursuit of business ventures.

However, the entrepreneurial journey for rural women in Kano State is not without its challenges. These challenges encompass limited access to financial resources, inadequate infrastructure, and socio-cultural norms that may hinder their entrepreneurial pursuits (Ali, 2016). As such, understanding the dynamics of how these women navigate these hurdles and succeed in their business endeavors is not only of local importance but also has broader implications for gender equality, economic development, and poverty alleviation efforts. At the core of this research lies the exploration of the intricate relationship between entrepreneurial orientation, coping strategies, and business performance among rural women-owned enterprises in Kano State, Nigeria. Entrepreneurial orientation, characterized by traits such as innovation, risk-taking, and proactiveness (Lumpkin &Dess, 1996), has been recognized as a catalyst for competitiveness and sustainable business growth. However, in the context of rural women entrepreneurs, whose

businesses operate within unique socio-economic and cultural contexts, entrepreneurial orientation may interact with coping strategies in unique ways.

In the contemporary landscape of global entrepreneurship, women's participation in business activities has gained significant attention due to its potential to foster economic growth and social empowerment (Brush, 2020). Within the Nigerian context, particularly in the state of Kano, rural women have emerged as a vital demographic in the entrepreneurial ecosystem, contributing to economic development and poverty alleviation efforts. Their resilience and determination in the face of numerous challenges make them a subject of particular interest in the realm of entrepreneurship research. A Global concern for ameliorating the status of women has been expressed and deliberated in many ways. There is no doubt that women all over the world have made tremendous progress on entrepreneurship. Entrepreneurship and business enterprises performance contribute to emerging economies in several ways: as an important way-out to change innovative ideas into startup opportunities, revival of social networks, new employment, and upscale productivity (Fabian, &Okpanaki, 2022). Increasing entrepreneurial activities can be viewed as a way to improve access to economic opportunities for women in emerging economies. There is a huge potential to improve global economic conditions through a better understanding of the tools that empower these women entrepreneurs.

Sub-optimal results emanating from women's business performance is a matter of concern for both developed and developing economies. There are several reasons behind low outcome, like socio-cultural norms, business environment, lack of infrastructure and unawareness. Research on women entrepreneur and factors that influences their performance has been extensively carried out in developed countries, which help them gaining knowledge about noble business concepts and guide them towards success path. Entrepreneurship has been recognized widely in developing countries as an influential instrument for poverty reduction and an enhancer of economic growth. Sustaining the performance of business particularly the women entrepreneur is currently the primary cause of development, and is considered the driving force behind financial and social growth in most rural setting and this has an advent advantages in advanced and developing countries. Entrepreneurs play a very prominent role in employing the rural population, provide self-employment to those who start their own business and enhance the economic environment of the different sectors.

Meanwhile, in Northern Nigeria the challenge of banditry and kidnapping has affected firms large and small in many ways. Again most women entrepreneurs are faced with the impact of war happening between Russian and Ukraine, which forced many businesses to abruptly exit from markets, caused the prices of electricity and raw materials that increase sharply, and compromised the availability of production inputs.

Problem Statement

Rural women-owned enterprises in Kano State, Nigeria, constitute a vital component of the local economy, contributing significantly to economic development and poverty reduction. However, these enterprises face multifaceted challenges stemming from resource constraints, limited access to financial services, inadequate infrastructure, and socio-cultural norms that may impede their growth and sustainability (Ali, 2016). While entrepreneurial orientation has been recognized as a key driver of business performance (Lumpkin &Dess, 1996), the specific dynamics of how coping

strategies employed by rural women entrepreneurs interact with entrepreneurial orientation to influence business performance remain largely unexplored.

The problem at hand is the absence of a comprehensive understanding of the moderating role of coping strategies in the relationship between entrepreneurial orientation and business performance among rural women-owned enterprises in Kano State. This knowledge gap hinders the development of effective support systems, policies, and interventions tailored to the unique needs of this demographic, thereby limiting their economic empowerment and the region's sustainable development.

Without a clear understanding of how coping strategies influence the impact of entrepreneurial orientation, there is a risk of underutilizing the potential of rural women entrepreneurs and failing to address the specific barriers they face. Therefore, this research seeks to address the following key questions:

How does entrepreneurial orientation vary among rural women-owned enterprises in Kano State?

What coping strategies do rural women entrepreneurs employ in response to the challenges they encounter?

What is the nature of the relationship between entrepreneurial orientation and business performance among rural women-owned enterprises?

To what extent do coping strategies moderate the relationship between entrepreneurial orientation and business performance in this context?

Addressing these questions is essential for crafting targeted strategies and policies that can empower rural women entrepreneurs, promote sustainable business development, and contribute to the broader economic growth and poverty reduction objectives of Kano State and Nigeria as a whole.

This study believes that in crisis circumstances (environmentally uncertainty, business challenges, and social and economic inequality), avoiding poor performance becomes relatively more important for women SMEs than achieving good performance; thus, it is important that any causal asymmetries can be revealed. This study contributes to the entrepreneurial orientation literature in two ways. First, the study shows the effect of entrepreneurial orientation, in other words, how a lack of women entrepreneurial orientation in business operation can also result in poor performance. Second, propose a model for how entrepreneurial orientation can support the application of coping strategies as a moderator and the effect of these combinations on performance. The study further contributes to the literature on strategic and crisis management of SMEs during external crises and shows how different coping strategies are effective in different intensities of the crisis experienced by the rural women entrepreneurs. The study will show evidence that women entrepreneurs trying to apply coping strategies can be successful. By highlighting the difficulty of finding the balance in a crisis, especially when women entrepreneurs tend to use both persevering and pivoting strategies simultaneously.

Thus, there is a serious need to develop women entrepreneurs that possess entrepreneurial orientation. The skills will not only develop themselves and their businesses, they are supposed to develop or act as role models and mentors to their children and girls in particular. Hence, this proposed study will explore the relationship between entrepreneurial orientation and women enterprises performance in Kano state, Nigeria.

Justification:
Rural women entrepreneurs in Kano State face multifaceted challenges, including limited access to finance, inadequate infrastructure, and socio-cultural constraints. To navigate these challenges, these women employ diverse coping strategies, ranging from social networks and resource mobilization to resilience-building techniques. These strategies act as crucial mechanisms to overcome barriers and sustain their enterprises (Kabeer, 2005). While prior research has separately explored the impact of entrepreneurial orientation on business performance and the significance of coping strategies among rural women entrepreneurs, the interplay between these factors remains relatively uncharted territory. This study seeks to address this gap by examining whether coping strategies moderate the relationship between entrepreneurial orientation and business performance among rural women-owned enterprises in Kano State.

The research on the moderating role of coping strategies on the effect of entrepreneurial orientation on business performance among rural women-owned enterprises in Kano State, Nigeria, holds several important justifications some of which are as follows:

Empowerment of Rural Women:
Rural women in Kano State often face distinct socio-economic and cultural barriers in their entrepreneurial pursuits. Understanding how coping strategies and entrepreneurial orientation interact can empower these women by identifying effective approaches to enhance their business performance.

Economic Development:
Rural women-owned enterprises contribute significantly to the local economy in Kano State. Improving their business performance can have a cascading effect on job creation, poverty reduction, and overall economic development in the region.

Knowledge Gap in Entrepreneurship Literature:
Existing research on entrepreneurial orientation often focuses on urban settings and mainstream populations. This study addresses a notable gap in the literature by examining these constructs within the specific context of rural women entrepreneurs in Nigeria.

Policy Implications:
Findings from this study can inform the development of targeted policies and support programs aimed at enhancing the entrepreneurial ecosystem for rural women in Kano State. Policymakers can benefit from insights into which coping strategies are most effective in amplifying the positive effects of entrepreneurial orientation.

Practical Guidance for Entrepreneurs:
Rural women entrepreneurs in Kano State can gain practical insights from the study's findings. By understanding how to leverage their coping strategies to maximize the benefits of entrepreneurial orientation, they can make more informed decisions to improve their businesses' performance and sustainability.

Academic Contribution:
The study contributes to the academic discourse on entrepreneurship by examining the interplay between entrepreneurial orientation and coping strategies in a unique context. This can enrich the theoretical framework and contribute to the broader understanding of entrepreneurship in developing regions.

Sustainable Development Goals (SDGs):
The study aligns with the United Nations' Sustainable Development Goals, particularly Goal 1 (No Poverty) and Goal 5 (Gender Equality), by seeking to empower rural women economically and reduce gender disparities in entrepreneurship.

Local Relevance:
The study is locally relevant to Kano State, where rural women form a substantial part of the entrepreneurial landscape. Research outcomes can directly benefit the local community and its economic development efforts.

Global Perspective:
While focused on Kano State, the study can provide insights and lessons that are applicable to similar rural contexts globally. Entrepreneurship, coping strategies, and business performance are universal themes, and the study's findings can be transferable to other regions facing similar challenges.

In summary, this study's justification lies in its potential to empower rural women entrepreneurs, drive economic development, contribute to academic knowledge, and inform policy and practice in the field of entrepreneurship, while also aligning with broader sustainable development objectives.

Research Objectives

1. Assess the entrepreneurial orientation of rural women-owned enterprises in Kano State.
2. Evaluate the coping strategies employed by rural women entrepreneurs.
3. Examine the relationship between entrepreneurial orientation and business performance.
4. Explore the moderating effect of coping strategies on the relationship between entrepreneurial orientation and business performance.
5. To examine the effect of innovativeness on business performance of women enterprises in Kano State Nigeria
6. To assess the effect of proactiveness on business performance of women enterprises in Kano State Nigeria
7. To determine the effect of risk taking ability on business performance of women enterprises in Kano State Nigeria

Literature Review: Theoretical and Conceptual Literature Review

Entrepreneurship is a multifaceted phenomenon that plays a pivotal role in economic development, particularly when considering the contributions of women entrepreneurs (Brush, 2020). Within the Nigerian context, the state of Kano has witnessed the emergence of a vibrant community of rural women entrepreneurs. These women engage in various business activities, demonstrating resilience and determination in the face of numerous challenges. This literature review explores the theoretical foundations and conceptual frameworks that underpin the study's focus on the interplay between entrepreneurial orientation, coping strategies, and business performance among rural women-owned enterprises in Kano State, Nigeria.

Conceptual Literature Review:

Entrepreneurial Orientation:

Entrepreneurial orientation (EO) is a central concept in entrepreneurship research. It encompasses a firm's propensity to engage in innovative, risk-taking, and proactive behaviors (Lumpkin &Dess, 1996). These behaviors are believed to contribute significantly to a firm's competitive advantage and long-term success. EO is particularly relevant to our study as it forms the basis for understanding how rural women entrepreneurs approach business challenges and opportunities.

In the context of rural women entrepreneurs in Kano State, entrepreneurial orientation can manifest in various ways. For instance, it may involve the willingness to adopt innovative agricultural practices, explore new markets, or take calculated risks to expand their businesses. EO can be seen as a theoretical lens through which to analyze the attitudes and behaviors of these entrepreneurs as they navigate the complexities of their operating environment.

Coping Strategies:

Coping strategies are vital mechanisms that individuals and organizations employ to deal with adversity and challenges (Folkman & Lazarus, 1988). For rural women entrepreneurs in Kano State, the challenges are manifold, including limited access to financial resources, inadequate infrastructure, and social and cultural constraints (Ali, 2016). Coping strategies can encompass various dimensions, such as seeking support from social networks, mobilizing resources, and developing resilience to withstand setbacks.

Understanding the coping strategies adopted by rural women entrepreneurs is essential to appreciating their resourcefulness and adaptability in overcoming obstacles. The concept of coping strategies provides the theoretical foundation for exploring how these women navigate their unique set of challenges and how these strategies may influence their business performance.

The Interplay:

The integration of entrepreneurial orientation and coping strategies within the context of rural women-owned enterprises in Kano State offers a novel perspective. While previous research has individually examined the impact of EO on business performance and the significance of coping strategies among women entrepreneurs, our study aims to bridge these two streams of research by exploring whether coping strategies moderate the relationship between entrepreneurial orientation and business performance.

The theoretical framework guiding our study posits that the relationship between entrepreneurial orientation and business performance is not uniform but can be influenced by the coping strategies employed by rural women entrepreneurs. Certain coping strategies may amplify the positive impact of entrepreneurial orientation, while others may mitigate its effects. This nuanced understanding draws from existing literature on moderating effects and complements the broader context of entrepreneurship research in Nigeria.

Empirical Literature Review:
In this section, we review empirical studies that have explored various facets of entrepreneurial orientation, coping strategies, and business performance, with a particular focus on rural women-owned enterprises and similar contexts. These studies shed light on the dynamics and interplay of these variables and provide valuable insights for our research on the moderating role of coping strategies on the effect of entrepreneurial orientation on business performance among rural women-owned enterprises in Kano State, Nigeria.

Entrepreneurial Orientation and Business Performance:
Raubenheimer and Botha conducted a study among South African entrepreneurs and found a positive correlation between entrepreneurial orientation and business performance. Their research emphasized the importance of innovation, risk-taking, and proactiveness in enhancing the competitiveness and profitability of businesses.

Naldi et al. (2007): Naldi et al.'s research, which focused on small and medium-sized enterprises (SMEs) in Italy, reinforced the link between entrepreneurial orientation and business performance. They highlighted the role of proactiveness in driving growth and market expansion.

Coping Strategies in Entrepreneurship:
Minniti and Nardone's study explored the coping strategies of female entrepreneurs in rural Italy. They identified the importance of support networks, resource mobilization, and adaptability as key coping mechanisms that helped women entrepreneurs overcome challenges and sustain their businesses.

Sarasvathy (2001): Sarasvathy's research on "effectuation" as a decision-making logic among entrepreneurs emphasized the significance of coping strategies that involve leveraging existing resources and networks to create opportunities. Her work provides a different perspective on how entrepreneurs navigate uncertainty.

Gender and Entrepreneurship:
Brush et al. (2010) conducted a comparative study of male and female entrepreneurs in the United States and found that women entrepreneurs often rely on social networks and resourcefulness as coping strategies to overcome gender-related barriers. This underscores the gender-specific aspects of coping in entrepreneurship. Kabeer (2005) research on gender equality and women's empowerment highlighted the role of entrepreneurship in challenging traditional gender norms. Her work emphasizes the need for context-specific coping strategies to address the unique challenges faced by women entrepreneurs.

Rural Entrepreneurship:
Kumar and Ahmed (2015)study in India focused on rural women entrepreneurs and found that access to financial resources and community support networks played a critical role in their coping strategies. Their research underlines the importance of considering the rural context in understanding coping mechanisms.

Ali (2016) work on challenges faced by rural women entrepreneurs in Nigeria echoes the resource constraints and socio-cultural barriers highlighted in our research context. It emphasizes the need to explore coping strategies tailored to specific rural environments.

Moderating Effects in Entrepreneurship:
Wiklund and Shepherd (2003) research explored the moderating effects of environmental dynamism on the relationship between entrepreneurial orientation and firm performance. Their findings suggest that contextual factors can influence the impact of entrepreneurial orientation, supporting our interest in the moderating role of coping strategies. Sarkar and Costa (2008) investigated the moderating role of organizational size in the relationship between entrepreneurial orientation and performance. Their study underscores the need to consider contextual variables when examining how entrepreneurial orientation influences outcomes.

Collectively, these empirical studies offer a foundation for our research by highlighting the significance of entrepreneurial orientation, coping strategies, and the potential moderating effects of contextual factors. They provide valuable insights into how rural women-owned enterprises navigate challenges and strive for enhanced business performance, which will inform our investigation in the specific context of Kano State, Nigeria.

Methodology:
The research employs a mixed-methods approach, combining surveys and in-depth interviews. A sample of rural women entrepreneurs in Kano State is selected, and data is collected to measure entrepreneurial orientation, coping strategies, and business performance. Statistical analysis, including regression and moderation analysis, is used to test the research hypotheses and explore the moderating role of coping strategies.

Research Design:
This study employs a mixed-methods research design, combining both quantitative and qualitative data collection and analysis techniques. This approach allows for a comprehensive understanding of the complex interplay between entrepreneurial orientation, coping strategies, and business performance among rural women-owned enterprises in Kano State, Nigeria.

Population:
The target population of this study comprises 438 registered Women Enterprises in Kano state. Which include Rano, Wudil and Bichi Local Government Areas of Kano state. The research takes place in these contexts because (a) the business environment in these local government is challenging because of poor roads, bridges, electricity and communication technologies, as the environment is dominated by Muslim's religion, which affects the societal position of women.

Sample and Sampling Techniques:
The study will use multiple sampling techniques in determine the sample respondents from the target population. Three administration zones will be used (KNARDA zones), the first stage is purposive selection of three (3) local government which include Rano, Fagge and Bichi Local Government Areas of Kano state. The sampling frame is 438 (Rano 136, wudil 156 and Bichi 146).

Instrument for Data-Collection
The instrument provided will be a structured questionnaire designed for quantitative data collection in a research study focusing on the moderating role of coping strategies on the effect of entrepreneurial orientation on business performance among rural women-owned enterprises in Kano State, Nigeria. It has three sections as follows:

Entrepreneurial Orientation section: This section assesses the entrepreneurial orientation of the participants. It consists of three statements related to innovation, risk-taking, and proactiveness. The core components of entrepreneurial orientation (Lumpkin &Dess, 1996). Participants rate these statements on a 5-point Likert scale, reflecting the extent to which they agree or disagree with each statement.

Coping Strategies: This section explores the coping strategies employed by participants in response to business challenges. Four coping strategies are assessed, including seeking advice or support from family or friends, collaborating with other businesses or entrepreneurs, accessing financial resources, and developing resilience. Participants are asked to rate the frequency with which they employ each strategy on a 5-point Likert scale.

Business Performance section: This section collects data on the business performance of the participants' enterprises. It includes questions about annual revenue over the past three years, an assessment of overall profitability, and whether the business expanded into new markets or areas in the past year. These performance-related questions aim to measure the success and growth of the enterprises.

Overall, this questionnaire is a structured and systematic tool for gathering quantitative data from rural women entrepreneurs in Kano State. It covers demographic information, entrepreneurial orientation, coping strategies, and business performance, providing a comprehensive dataset for the research study. The instrument is designed to be clear, concise, and easy for participants to complete, ensuring accurate and valuable responses.

In-depth Interviews: Qualitative data will be collected through semi-structured interviews with a subset of survey participants. These interviews will provide deeper insights into the coping strategies employed and allow participants to elaborate on their experiences.

Validation of the instrument:
Both face and content validities will be established for the instrument using experts from entrepreneur experts, teachers and lecturers to ensure that the instrument will really measure what it is supposed to measure.

Reliability:
The reliability of the tool will be determined through pilot testing the instruments to ensure the internal consistency of the items in the instruments.

Data Collection Methods:
The data collection procedure for your research on the moderating role of coping strategies on the effect of entrepreneurial orientation on business performance among rural women-owned enterprises in Kano State, Nigeria, should be systematic and well-planned. Here's a step-by-step guide:

Preparatory Phase:
a. Research Ethics: Ensure that your research protocol complies with ethical guidelines. Obtain the necessary ethical approvals from your institution or relevant authorities.
b. Participant Recruitment: Identify and recruit participants from rural women-owned enterprises in Kano State using a stratified random sampling method to ensure representativeness.
c. Instrument Development: Finalize your questionnaire based on the validated and reliable instrument you designed earlier. Ensure that the questions are clear and easy to understand.
d. Pilot Testing: Conduct a pilot test with a small group of participants to identify any ambiguities, issues with question wording, or logistical challenges. Make necessary revisions to the questionnaire.

Data Collection Phase:
a. Survey Administration: Explain the purpose of the study, assure confidentiality, and encourage honest responses. Provide contact information for any questions.
b. Interviews: schedule appointments with participants at their convenience. Conduct semi-structured interviews to explore coping strategies and gather qualitative insights. Record and transcribe interviews for analysis.
c. Data Quality Control: Monitor data collection to ensure the quality of responses. Check for completeness and accuracy of survey responses. Address any issues or missing data promptly.

Methods of data analysis:
Descriptive Analysis: Basic statistical measures will be used to describe the characteristics of the sample and variables.
Regression Analysis: Regression models will assess the relationship between entrepreneurial orientation and business performance while controlling for covariates.
Moderation Analysis: To investigate the moderating effect of coping strategies, interaction terms will be added to regression models.
b. Qualitative Data:
Thematic Analysis: Qualitative data from interviews will be subjected to thematic analysis. Themes related to coping strategies, entrepreneurial orientation, and their impact on business performance will be identified.

Results (Expected Outputs/Results)
Variability in Entrepreneurial Orientation: The research anticipates finding varying levels of entrepreneurial orientation among rural women-owned enterprises in Kano State. Some businesses

are expected to exhibit a higher degree of innovation, risk-taking, and proactiveness, while others may demonstrate a more conservative approach.

Diverse Coping Strategies: The study expects to identify a diverse range of coping strategies employed by rural women entrepreneurs to overcome the challenges they face. These strategies may include seeking advice from social networks, collaborating with other businesses, accessing financial resources, and developing resilience.

Positive Relationship Between Entrepreneurial Orientation and Business Performance: It is hypothesized that there will be a positive relationship between entrepreneurial orientation and business performance among rural women-owned enterprises. Businesses with a higher entrepreneurial orientation are expected to demonstrate better performance in terms of revenue growth, profitability, and market expansion.

Moderating Effect of Coping Strategies: The research aims to reveal the moderating effect of coping strategies on the relationship between entrepreneurial orientation and business performance. It is expected that certain coping strategies will enhance the positive impact of entrepreneurial orientation on business performance, while others may mitigate its effects.

Identification of Effective Coping Strategies: The study anticipates identifying coping strategies that are particularly effective in enhancing business performance. These findings can provide actionable insights for rural women entrepreneurs in Kano State, as well as for policymakers and support organizations, on which coping strategies to prioritize.

Policy and Program Recommendations: The research outcomes are expected to yield policy recommendations and program insights. Policymakers can use these findings to design targeted policies and support programs that empower rural women entrepreneurs, improve their access to resources, and foster entrepreneurial orientation.

Economic Empowerment of Rural Women: As a long-term outcome, the study aims to contribute to the economic empowerment of rural women in Kano State. By understanding how coping strategies can amplify the effects of entrepreneurial orientation, the research seeks to help these women achieve sustainable business success, reduce poverty, and enhance their overall well-being.

Contribution to Academic Knowledge: The study's findings are expected to contribute to the academic discourse on entrepreneurship, particularly in rural and developing contexts. The identification of coping strategies as moderators of entrepreneurial orientation can enrich the theoretical framework in entrepreneurship research.

Knowledge Transfer to Similar Contexts: The insights gained from this research may be transferable to other regions and countries facing similar challenges in rural entrepreneurship. Lessons learned in Kano State can be applied in diverse contexts to support rural women entrepreneurs and drive economic development.

In summary, the expected outcomes of this research encompass a deeper understanding of the dynamics of rural women-owned enterprises, insights into effective coping strategies, and the potential for positive economic and policy-related impacts on both the local and broader levels. These outcomes align with the overarching goal of enhancing the economic empowerment and sustainability of rural women entrepreneurs in Kano State and beyond.

Leveraging Digital Finance by Nigeria's Small Businesses to Improve Efficiency and Growth: Situation Analysis and Policy Imperatives

Ndibe, Beatrice C.[1] & Eboh, Eric C.[2]
[1]Caritas University, Amorji-Nike, Enugu; ndibeatrice@yahoo.com; 08037582893
[2]University of Nigeria, Nsukka; eceboh@yahoo.com

Abstract:
Financial inclusion policy in Nigeria has evolved over time, culminating in the digital finance options currently available to small businesses. Though small businesses are increasingly embracing and benefit significantly from available digital finance options, there remains large scope for full realization of the opportunities for improved business efficiency and growth. This paper reviews the evolution of Nigeria's financial inclusion policy and strategy to present-day digital finance and discusses small business' access to and use of existing digital finance options. The opportunities for small businesses to improve operational efficiency and growth as well as the obstacles and limitations that hinder their full realization are examined. Consequently, the paper outlines key policy imperatives for tackling the identified obstacles and limitations and leveraging digital finance for efficiency gains and enterprise growth among Nigeria's small businesses.

Keywords: Digital finance; Small Businesses; Policy Imperatives; Growth; Efficiency

Introduction and Background:

Small businesses are the pillar of national economies, playing critical roles in employment and job creation, poverty reduction, economic integration, innovation and entrepreneurship development, and gross domestic product (GDP) (Oluremi & Maku, 2024). It remains a source of livelihood incomes for majority of the Nigerian populace. According NBS (2020), small and medium businesses (SMEs) employ over 84% of Nigeria's workers. This significant contribution highlights how small businesses support economic growth in Nigeria. Besides, small businesses play critical in promoting e economic integration and economic prosperity, increasing competition of emerging sectors, and igniting market rivalry through creativity and innovation (Oluremi & Maku, 2024; Zhao, 2024; Ribeiro-Soriano, 2017).

Over the years, businesses owners have seen a rapid shift in the way businesses are conducted internationally and locally, driven by the continuous revolution in financial technologies (Fintech), and making way for digital finance as a key driver of most business financial transactions. In a nutshell, digital finance is the integration and use of technology into financial processes, leading to expanded access to and use of financial services. It has revolutionized how people, business and financial institutions manage money, make and receive payments and generally have access to finance (OECD, 2024). This implies that digital finance is central to small businesses efficiency and growth as it presents prospects for enhancing their profitability and sustainability. Despite, the

bright outlook that digital finance has for small businesses, there are challenges faced and encountered by small business owners as they adapt and integrate digital finance in their daily business activities.

This paper reviews the evolution of Nigeria's financial inclusion policy and strategy to present-day digital finance and discusses small business' access to and use of existing digital finance options. The opportunities for small businesses to improve operational efficiency and growth as well as the obstacles and limitations that hinder their full realization are examined. Consequently, the paper outlines key policy imperatives for tackling the identified obstacles and limitations and leveraging digital finance for efficiency gains and enterprise growth among Nigeria's small businesses.

Pre-Existing Methods of Financial Transaction for Small Businesses in Nigeria:

Prior to the advent of digital finance, most small businesses used the traditional method, which relied heavily on cash transaction, and sometimes, a record of such transaction is kept in a book (Olayemi, Adebiyi, Oyelakun & Ibrahim, 2025). This is understandable because cash transaction is easier and faster, and does not attract additional cost of transaction. However, small business owners face many challenges using the traditional method. These challenges include theft, inability to identify counterfeit paper money, risk of moving cash from one place to the other, and inability to keep proper financial records. Moreover, the low level of educational attainment of most of the small business owners, particularly, the nano and micro enterprises posed greater challenge in their ability to keep and manage business finances (PWC Survey, 2020). As a result of these, it was a herculean task reaching this special sector of the economy despite the indispensable role they play in driving socio-economic activities of the economy.

Evolution of Financial Inclusion Policies in Nigeria:

Financial inclusion is a broad concept that does not have a universally accepted definition, instead its definition is based on country specific. Different countries define the term from strategic viewpoint. Hence, a country's definition of the term provides the basis for a shared vision that will help in setting goals, as well as framework for achieving them (AFI, 2017). But still, these definitions generally refer to availability and accessibility of financial services to the adult population of a country. It includes quality and cost of financial services (Barajas, Beck, Belhaj & Naceur, 2020; Han, Qian, Adam, Karimov & Zhang, 2025; Sharma & Path, 2024). Consequently, Nigeria in its revised 2018 National Financial Inclusion Strategy (NFIS) defined financial inclusion to mean, when adult Nigerians have easy access to a broad range of formal financial services that meet their needs at affordable costs (NFIS, 2018).

The Policy Era of Community Banks

Community bank by the Central Bank of Nigeria as a "self-sustaining financial institution owned and operated by a community or a group of communities to provide financial services to members of its community" (Aydi, Hyman & Williams, 2008, p. 163). Similarly, by Decree 46 of 1992, Federal Government of Nigeria granted power to license community banks to the National Board for Community Banks. By this decree, a community or a group of communities are allowed to establish a community bank. The objective was to incorporate the informal financial sector into the traditional financial institutions in Nigeria. The functions of community bank were to: provide finance and banking services in order to promote rural development; provide credit facilities to its

customers; operate equipment leasing facilities designed to enhance customers access to farm inputs; improving the economic status of small-scale producers in rural and urban areas; and promote grass-root development within the geographical area of the bank (Community Bank Act, 1992).

Despite the promising opportunities of community banks to galvanize socio-economic activities, especially in the rural areas, the banks were faced with huge challenges that affected their operation. These challenges ranged from inadequate infrastructure, low literacy level, overhead cost to the conservative nature of the rural dwellers (Okoye & Okpala, 2001). Moreover, community banks faced such problems as poor and ineffective management, lack of automated processing system, poor credit administration, insider-related credits, and low capital base (Ayadi, Hyman & Williams, 2008). Even, the poor understanding of the bank having a unique and distinct operating environment, different from commercial banks also affected their operations and ability to succeed. Another problem leading to the collapse of community banks in Nigeria was the inability of National Board for Community Banks to monitor and enforce the regulatory frameworks of community banks, which was one of the key functions of the Board (Ayadi, Hyman & Williams, 2008).

The Regime of Microfinance Bank Policy

Globally, microfinance began as a necessary means of addressing poverty and financial exclusion. Similarly, in Africa, the emergency and institutionalization of microfinance began as a response to the inability of commercial banks to reach low-income, rural, and informal sector populations. Nigeria formalized its approach to microfinance with the Central Bank of Nigeria (CBN)'s launch of the National Microfinance Policy in 2005 (Afolabi, 2025). According to Ochonogor (2020), Microfinance banks were created to provide micro credit to the poor in order to alleviate poverty. The poor, globally are referred to those whose basic earnings are below the minimum wages, and those whose sources of income are inadequate to finance their basic needs of food, shelter and clothing. By enabling the poor and financially marginalized people to have access to financial services, their social status and standard of living will be enhanced (Reeves & Sabharwal, 2013; cited in Ochonogor, 2020).

Before the era of microfinance bank, other numerous programme initiatives were taken by different governments aimed at providing financial services to the active poor and the unbanked in Nigeria. These programmes are: Agricultural Development Programs (ADPs), National Directorate of Employment (NDE), Better Life for Rural Dwellers (Family Support Programmes), the Directorate of Food, Roads and Rural Infrastructure (DFRRI). Other attempts made by government to provide micro-credit services to the citizens include the banking scheme (1977-1990), People's Bank (1987-1990), and Community Bank (1990-2007) (Ochonogor, 2020). These programmes had potentials to improve the economy, create employment, and reduce poverty. But they could not make meaningful impact as a result of numerous challenges they were confronted with, and hence were scrapped by the government, replacing them with the establishment of microfinance banks through the launch of microfinance policy in 2005 (Zulkhibri, 2014).

Microfinance banks in Nigeria faced mammoth challenges that greatly impinged on their ability to achieve the policy goals of establishing them in the first place. These challenges include: (i) absence of basic infrastructure, which were linked to high operation cost; (ii) lack of banking

culture amongst the rural dwellers and the urban poor; (iii) corruption and misappropriation of microfinance bank funds; (iv) withdrawal of license of 224 community banks in 2010, leading to dent on public confidence in microfinance banks; (v) paucity of human capacity; (vi) Inadequate funding; and (vii) inability to distinguish microfinance bank from commercial banks (Nwoke & Chukwu, 2023; Yusuf & Dodo, 2017).

The National Financial Inclusion Strategy (NFIS 2012) by CBN

The first National Financial Inclusion Strategy (NFIS) was launched by the Central Bank of Nigeria in 2012, with the sole aim of significantly reducing the number of financially excluded adults in Nigeria by the year 2020. The Strategy enunciated the easing of demand-side, supply-side and regulatory barriers to financial inclusion, identified areas of focus, set targets and key performance indicators (KPIs), and established the implementation structure. The NFIS focused on four strategic areas: agency banking, mobile banking/mobile payments, linkage models and client empowerment. Also, it identified four priority areas for guideline and framework development, which are: Tiered Know-your-Customer (T-KYC) regulations, Agent Banking regulations, National Financial Literacy Strategy and Consumer Protection (CBN, 2018).

In line with the 2012 NFIS monitoring plan, there was need for the review of the 2012 NFIS, hence, a review was carried between October 2017 and June 2018. The purpose was to understand the current state of financial inclusion in Nigeria, assess past approaches, identify lessons learnt in order to prioritize the most critical interventions to achieve the NFIS objectives. Key finding from the review showed that Nigeria had made significant progress in the implementation of the 2012 NFIS. A notable achievement was that 58.4% of 96.4 million adult population in Nigeria were financially included including 38.3% banked, and 10.3% served by other formal institution and 9.5% served by information service providers (CBN, 2018).

Despite these achievements, observable issues were identified. For instance, the status and progress report on financial inclusion in Nigeria as at 2016 showed that 40.1 million adult Nigerians, representing 41.6% of the adult population were financially excluded. The report also shows that 55.1% of the financially excluded adult population were women, and 61.4% of excluded population were in the age bracket of 18 and 35 years, with 34.0% having no formal and 80.4% residing in rural areas (CBN, 2018). This is an obvious disparity in the financial inclusion success rate distribution based on gender, age and residency. Interestingly, small businesses are the major source of livelihood for women, and understandably, many of these women live in rural communities, with no social and technology infrastructure, nor presence of financial institutions. Wezel and Ree (2023) corroborated this finding when they observed that the financial inclusion in Nigeria is not only relatively low but uneven when compared to what is obtained from peer countries and Sub-Saharan Africa (SSA). These issues showed the need for new strategy and approaches to achieving financial inclusion in Nigeria.

The CBN Revised 2018 National Financial Inclusion Strategy

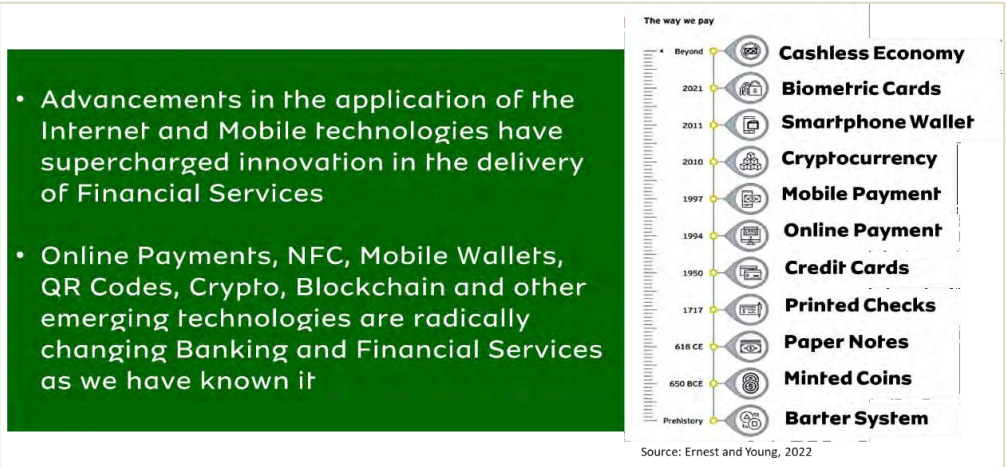
The review of the 2012 NFIS revealed that: (i) some components of the 2012 NFIS, such as POS terminals were no longer the most efficient channel of distributing financial services; (ii) innovative models used in other countries that have increased financial inclusion were yet to be incorporated as a result of policies and regulations restriction; (iii) there has been low adoption rate of agent banking due to lack of understanding of the banking agents works and the

opportunities therein for consumers/customers; (iv) changing macroeconomic and security situation based on the review period. These and more were the rationale that informed the need for a revised NFIS (NFIS, 2018).

The revised 2018 NFIS has the prospects of significantly improving financial inclusion within two years (2018-2020). Hence, the key priority of the revised 2018 NFIS was to consider the identified constraints, the importance of innovation, as well as the need to create an enabling environment that will promote financial inclusion. These prospects were attributed to the following initiative by CBN: signing of an MoU in 2018 with Nigerian Communications Commission (NCC); collaborative efforts with Nigeria Inter-Bank Settlement System (NIBSS) to create a regulatory sandbox for innovative financial services; entering into partnership with Committee of Bank CEOs and the private sector to roll out a 500,000-agent networks all over the country (NFIS, 2018).

Key stakeholders were identified and brought together by the Central Bank of Nigeria because the various relevant roles they were expected to play in both the development and implementation of the NFIS (CBN, 2018). They include ministries and agencies of government, private sector representative, financial institutions representative namely: Federal Government of Nigeria, Federal Ministry of Finance, Central Bank of Nigeria, Deposit Money Banks (DMBs), Development Finance Institutions (DFIs), Bankers' Committee, Microfinance Banks (MFBs), Committee of Microfinance Banks in Nigeria (COMBIN), National Insurance Commission (NAICOM), Insurance Companies, National Pension Commission (PenCom). Others are Pension Fund Administrators (PFAs), National Communication Commission (NCC), Licensed Mobile Payment Operators (LMPOs), Nigeria Postal Service (NIPOST), Ministry of Education, National Bureau of Statistics (NBS), Development Partners, and Financial Services Regulation Coordination (FSRCC). Other stakeholders that participated include: Apex associations (ALMPOM, CFAN, FMAN, NIA, PENOP, etc.), Nigerian Interbank Settlement System (NIBSS), and Financial Inclusion Secretariat (FIS).

Each stakeholder had its roles well spelt out in the NFIS document all geared towards the overall objective of achieving financial inclusion by 2020 (CBN, 2018). As critical stakeholder to the achievement of the 2018 NFIS, the CBN ensured that they participated in the process of developing the revised NFIS and are viewed as co-owners of the NFIS document.



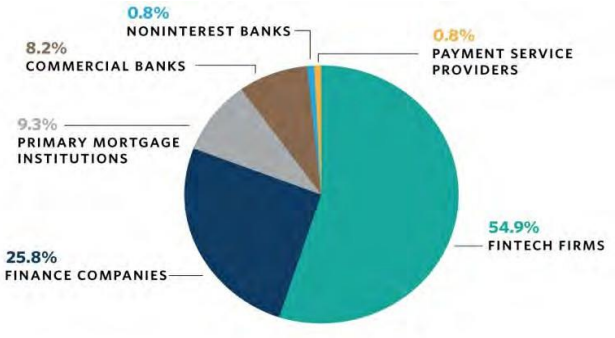
The Emergence and Spread of Digital Finance

Nigeria like any other country in the world is experiencing unprecedented increase in connectivity and data flows, which is as a result of the touted fourth industrial revolution. The revolution is characterized by end-to-end digitization of assets and integration into a digital ecosystem (Ajambo, n.d.), and supported by financial technologies. Financial technologies (Fintech) are broadly used to describe range of technological innovations in the financial sector that enhance the way financial services are provided. It helps businesses and consumers to better manage their financial operations and processes using specialized software and algorithms. The services are provided through advanced technologies such as mobile banking, mobile money, internet banking and digital payment platforms. It also enables individuals access financial services using their mobile phones (Appah, Tebepah & Newstyle, 2023).

Fintech is widely accepted because it uses lean and very scalable technology that reduce or eliminate the cost of financial intermediation; and increase in the spread of technology-driven firms, offering financial services. (Iriobe, Tega, Ayodele & Taofeek, 2021). The Fintech evolution experienced some challenges, particularly during its first level of innovations. For instance, the acceptance rate was poor until the COVID-19 pandemic period, when it became obvious that technology would be the way forward as well as new driver of business transactions globally (Iriobe, Tega, Ayodele & Taofeek, 2021).

Digital finance is a product of Fintech. There would be no digital finance without Fintech. It was the wave of technological innovations in the financial industry that engendered digital finance. Thus, advancements in technology created new possibilities and pathways for financial products and service delivery. The evolutionary journey of trade and business transactions from the time of barter system to this new era of digital finance, is marked by various stages of technological advancement, which significantly enhanced service delivery, efficiency and customer experience within the financial services industry in Nigeria (Usoro, 2022).

Fig. 1: Evolution of Financial Services



Source: Ernest and Young (2022), adopted from Usoro (2022)

The term digital finance describes the delivery of traditional financial services digitally, through devices such as computers, tablets and smartphones. By leveraging on technology and data, digital finance ensures that a much larger proportion of the adult population in Nigeria have easier access to several financial products and services. Specifically, these services are provided through several channels, such as, mobile phones, point-of-sale (POS) devices, and networks of agents. Despite the fact, that Nigeria has not achieved it target for financial inclusion, the adoption and use of digital financial services has played significant role the milestones achieved by the country in that regard. Figure 2 shows an overview of the financial space in Nigeria, with Fintech having more than 50% of the share (Nkechika, 2022).

Similarly, the Worldpay Global Payments Report cited in Bello (2025) notes that Nigeria has witnessed a spectacular drop in total cash transactions since embracing digital finance. Total cash transaction decreased from 91% in 2019 to 55% in 2023, with a projected decline to 42% by 2027, showing a fundamental shift in consumer payment behaviour. The driving factors of the decline in

cash transactions, is the growth of digital payment platforms, which created easy access to more people - including the small businesses.

Fig. 2: An Overview of Nigeria's Financial Space

Source: Central Bank of Nigeria, cited in Nkechika (2022).

Status of Digital Finance and Financial Inclusion in Nigeria

Financial inclusion is achieved when adult Nigerians have easy access to formal financial services that meet their needs at affordable costs (CBN, 2018). EFInA (2023) asserts that Nigeria has recorded significant achievement since the launch of the revised 2018 NFIS. EFInA 2023 A2F Report revealed the following:

- Nigeria's total financially included population rose to 74%, while 26% remained financially excluded in 2023 from 67% in 2020.
- Nigeria's formal financial inclusion rose to 64% in 2023 from 54% in 2020 while informal financial inclusion stood at 10% in 2023, showing a 1%-point fall from 11% in 2020.
- Financial exclusion improved from 32% in 2020 to 26% in 2023.
- 1 in 4 Nigerian adults remained financially excluded in 2023.
- 37% of rural Nigerians are financially excluded compared to 17% of urban Nigerians.
- Financial exclusion is most severe in Northern Nigeria, with the Northeast (47%) and Northwest (47%) remaining the most excluded regions in Nigeria.
- The banked population increased from 51% in 2020 to 52% in 2023, while the population adopting non-bank financial services rose from 5% to 10%.
- Mobile phone adoption rose to 93% in 2023 from 90% in 2020 with use of smart phone dropping to 27% from 28% in 2020.
- The gender gap is widening, from 8% in 2020 to 9% in 2023, demonstrating the need to focus on interventions that support female inclusion intentionally.
- Challenges related to fraud incidence, poor service, high banking costs, and a lack of clarity in financial information reduce the quality of financial services in Nigeria.
- one-third of adults report low financial capability, and relatively low access to formal efficient mechanisms to meet financial needs.

Despite these achievements, the CBN governor, represented by Mr. Chibuike Nwagerue, during that presentation of the Access to Finance (A2F) highlights, on 13 December, 2023 explained that a lot more work needs to be done, when he said that *"Nigeria's drive for financial inclusion has been a long, sometimes arduous journey. We have monitored the trend …. As an ecosystem, we must redouble our efforts to develop innovative solutions to enable inclusion and be intentional about how we do it.*" (EFInA, 2024).

Digital Finance Options Available to Small Businesses

According to Igudia (2018), small businesses play dual roles in e-payment adoption process. They function as both the consumer and merchant at all times; either they are making payments or passing payment information for goods and services. Hence, the adoption and use of digital finance is viewed as a catalyst for the growth and prosperity of small businesses in Nigeria. The digital finance options available to small businesses include: point of sale (POS), automated teller machine (ATM), mobile banking/payments, internet banking (Appah, Tebepah & Newstyle, 2023).

(a) Point of Sales (POS): POS serves as a retail shop, a checkout counter in a shop, or the location where a transaction occurs. They are electronically deployed devices deployed that facilitate the exchange of value between a cardholder and a merchant.
(b) Automated Teller Machine (ATM): This is a computerized telecommunications device that offers access to financial transactions services to customers of a financial institution in a public space without the need for a human clerk or bank teller.
(c) Mobile Banking/Payments: Mobile banking describes services delivered by financial institutions that allows customers to use a mobile device such as smart-phones or other cellular devices to access banking services and execute financial transactions.
(d) Internet Banking: Internet banking, also known as online banking or web banking refers to an online platform through which customers of the bank can access their account and perform financial transactions using the internet. Internet banking makes use of electronic card infrastructure to accomplish payment instructions and final settlement of goods and services over the internet.

Impact of Digital Finance on the Efficiency and Growth of Small Businesses

Digital financial services have impacted positively on both the supply and demand sides. The supply side representing the financial institutions, while their customers and those in need of these services denote the demand side.

From the supply side, Access to Finance (A2F) survey report by EFInA (2023) highlights the following benefits:

- From 2008 to 2023, the proportion of formally served adults more than doubled, while the proportion of adults who rely on informal providers only and the financial excluded more than halved.
- In 2023, usage of mobile phones increased to 93% (103 million) from 90% in 2020.
- The formal financial service usage grew from 30% in 2016 to 57% in 2023.
- The adoption of financial service agents witnessed and exponential hike from 4.4% in 2018 to 54% in 2023.
- Usage of informal financial service providers also increased by 39% from 2020, with sizeable increase in the use of village associations predominantly in the South East.
- Also, 45% of Nigerians used Digital Financial Services in the year compared to 34% in 2020.

On the demand side, the following are some of the notable impacts of digital payment systems on small businesses (Janet, 2022):

(i) Enhanced Accessibility and Customer Base: With digital payment systems, small businesses are able to cover wider reach of their customers, attracting tech-savvy customers to small business holders.
(ii) Improved Cash Flow Management: Digital systems offer online and real time services, which enables businesses to manage their cash flow more effectively.
(iii) Cost Savings: Digital financial services reduce cost associated with handling of cash. Besides, digital tools often have lower transaction fees compared to traditional banking methods.
(iv) Reduced unemployment rate: The adoption of digital financial services has reduced unemployment rate by creating jobs for many people. Many new businesses started as POS agents, and others, particularly those that can not afford the start-up capital, are now employees at these POS shops.
(v) Enhanced Customer Experience: Digital payments provide smoother transactions than traditional banking methods. It is more convenient for customers to digital payments platforms, which enhances customer satisfaction and retention as well.
(vi) Access to Financial Services: More and more small businesses now have access to financial services, promoting financial inclusion.
(vii) Global Reach: Digital financial services also make it easy for small businesses to have cross-border transactions, opening doors to international markets.

Hindrances in Utilising Digital Finance by Small Businesses

The following are some of the hindrances or challenges affecting the utilization of the digital financial systems (Janet, 2022; Lottu, Abdul, Daraojimba, Alabi, John-Ladega, & Daraojimba, 2023):

(i) Cybersecurity Threats: Cyberattacks, data breaches, and malicious activities pose substantial risks to banks and their customers. Opting for digital financial services set sensitive and private customer data, financial transaction information and critical infrastructure as prime targets for cybercriminals. Often times, small businesses are more targeted by cybercriminals owing to their perceived weaker defenses.
(ii) Initial Setup Costs: Acquiring the digital payment infrastructure can be expensive. It is not all small businesses that can afford the initial cost of purchasing hardware and software needed, and even cost of training.
(iii) Poor Internet Connectivity: Digital payment platforms require reliable and strong internet connection, which may not be available in certain regions, especially the rural areas.
(iv) Technological Literacy: Digital finance system is a technology driven platform, and many of the small businesses owners are not well educated, which may create a barrier to the adoption of digital financial system.
(v) Incidence of Fraud: As highlighted by EFInA (2023), a significant proportion of formally served Nigerians face challenges related to fraud incidence, poor service, and a lack of clarity in financial information.
(vi) Transaction failure/Incomplete transaction: One of the serious issues faced by users of digital financial services is unsolicited transaction failure or even incomplete transaction. Imagine a situation whereby a customer receives a debit alert for payment made and the other party could not confirm the corresponding credit alert. The time and financial cost of trying to reverse the transaction can be discouraging. Sometimes, this can lead to conflict between the two parties.

(vii) Transaction Fees: The cost of transaction, even though lower than the traditional banking, can still pose a challenge for small businesses with small profit margins. Sometimes, charges are imposed on customers without explanation or clear financial information.

(viii) Insufficient awareness of products offered by digital finance: Many people, including small businesses are not updated with information on all the services that can be obtained using digital financial services. The limited information on the services provided by digital finance platforms continue to hamper trust in other formal (non-bank) products.

(ix) Resistance to Change: Sometimes, small business owners may prefer to be doing their businesses in the way they are used to, thereby refusing to try the digital financial system option. Many of those in the rural areas may be unwilling and resistant to any form of innovation.

Policy Imperatives to Enhance Use of Digital Finance by Small Business in Nigeria

There is no doubt that the adoption and use of digital financial systems by Nigerians have improved significant, thereby leading to a reduction in the number of the adult population that are financially excluded. Nonetheless, more work is still required to ensure that the target set by the 2018 NFIS is achieved.

To further enhance the financial inclusion of the adult population and enable more small businesses adopt the use of digital financial platforms, the paper makes the following recommendations as policy options:

1. CBN in collaboration with NCC should conduct baseline survey to identify geographical areas in Nigeria where digital finance platforms are not used by small businesses. The findings of which will assist them in making policies that will enhance financial inclusion.
2. The paper has revealed that technological infrastructure is critical in the smooth use of digital financial services, hence, it is recommended that government should ensure that technological infrastructures are provided in areas, particular remote rural areasbthat do not have networks or internet services.
3. CBN should also work with Deposit Money Banks and Fintech companies to develop a digital app, where issues of failed or incomplete transactions can be reported and resolved within 24 hours without the individual needing his or her home.

Abstract
This paper explores blue energy strategy adoption and sustainability of quoted industrial goods companies in Nigeria. The study adopted a descriptive survey design. The target population was 12 twelve quoted industrial goods companies from the Nigerian Exchange group (XGN, 2025). The study adopted a census on all the industrial goods companies targeting three 3 respondents: general Manager, Operations Manager, and Finance Managers from each company totaling 36 respondents. The study collected primary data using a structured copy of questionnaire designed in a 5-Point Likert Scale. Data were analyzed using descriptive statistics and inferential statistics. The study conducted a Multiple Regression analysis with the aid of statistical package for social science version 26. The Cronbach Alpha Coefficients value obtained was meet the bench mark of 0.7. The findings revealed that tidal energy strategy has a weak influence on environmental and economic sustainability in the industrial goods companies in Nigeria. The findings revealed that wave energy strategy has a strong influence on environmental sustainability and a weak influence on economic sustainability in the industrial goods companies in Nigeria. The study concludes that tidal energy strategy has a weak influence on environmental, economic sustainability in the industrial goods companies in Nigeria. The study recommends that industrial goods companies in Nigeria should adopt tidal energy as a strategy to neutralize carbon, greenhouse gas in production process. This will improve climate change action; reduce carbon, eco-friendly measures by recycling and reusing material for sustainable development.

Key Words: *Blue Energy Strategy Adoption, Blue Energy Strategies, Sustainability, Tidal Strategy, Wave Strategy.*

Introduction

The most urgent mission of the world in the second half of the 21st century is to neutralize carbon by 2050, and the United Nations Secretary General (Guterres, 2020), posits that "by next month, countries representing more than 65 per cent of harmful greenhouse gasses and more than 70 per cent of the world economy will have committed to achieve net zero emissions by the middle of the century". ***Thus, the theme of the 19th Academy of Management Nigeria Conference*** is routed on the 13th sustainable development goals (SDGs). The goal focuses on taking urgent action to tackle climate change and its impacts by reducing greenhouse gas emissions, enhancing climate resilience

and supporting climate adaptation efforts. This has triggered scholars and researchers to find SMART economies tools to improve sustainability of industries in developing economies and Nigeria is not exempted.

The emergence of sustainable theory and practice in strategic management and other spheres of management strategy is said to have been initiated by three key groups: the Ecologists, Business Strategists and the United Nation's World Commission on Environment and Development (1987), known as the Brundtland Commission. Therefore, these three groups established what is in the recent time regarded as the triple bottom line of sustainable goal which are: the environmental, the social and the economic perspectives (Ehnert, Parsa, Roper, Wagner & Muller-Camen, 2016). These triple bottom line in the literature are considered the three core dimensions of sustainability (Melorose, Perroy & Careas, 2015).

However, the discussed regarding sustainability in the 21st century has continues to involved integrating long-standing concern on economic growth and social equity for the carrying capacity of natural eco-system (Gutterman, 2022). In the words of Dyllick and Hockerts (2018) sustainability embodies the promise of societal evolution towards a more equitable and wealthy world in which the natural environment and our cultural achievements are preserved for generations to come. This has been the drive for sustainable development that has led to international treaties relating to the protection of biodiversity, climate change and governmental programs focusing on energy conservation and blue energy integration.

Ihonvbere (2023) defined sustainable development as the process, mechanisms, policies, programmes that enables and empowers communities and constituencies to continuously improve on their environment and existential conditions to assure continuous progress for each member and organization or the community. More so, sustainability requires maintaining natural capital as both a provider of economic inputs (sources) and an absorber (sinks) of economic outputs (wastes). Emotongha and Bayo (2024) posits that at the source site', harvest rates of resources must be kept within regeneration rates; at the 'sink site', waste emissions from industrial activities must be controlled so as to not exceed the capacity of the environment to assimilate them without harm.

Apparently, sustainability of existing business models in the turbulence environment has raised concern in recent time (Owaga, 2021). More so, the recent strategies of climate change have posed unparalleled threats to humanity and the UN 13th SDGs, for climate change action. Although, there are growing response addressing the global issues and building a sustainable economy that requires companies to change and adapt the 13th SDG strategies in the corporate world (Miano & Wamalwa, 2021). Hence, an urgent reduction in production and consumption of fossil fuel before 2050, in order to reach the 13th sustainable development goals (Climate Action) and the Paris Agreement (Simila, Niko & Paukku, 2022) is needed. Apparently, European Union countries have raced to establish targets for carbon neutrality, with Finland leading the pack by aiming to be carbon neutral by 2035 (Governmental Programme 2019).

Furthermore, Africa Union Countries have also formulated climate change policies that aiming to reduce greenhouse emissions, fossil fuel production and consumption with Nigeria leading the frontier to achieve minimum greenhouse gas emission by 2055. Blue energy strategy as a ***SMART economies tool*** focuses on reducing dependency on fossil fuels consumption by leveraging ocean-

based energy sources and hydro power turbine to achieve sustainable economic while preserving marine ecosystems (Schutter et al., 2021). It's a core component of sustainable blue economy strategic framework that emphasizes ecosystem restoration (mangroves, coral reefs), food security through sustainable fisheries and aquaculture, climate resilience, and the promotion of innovation in coastal communities.

Thus, the industrial goods and chemical industry is the largest industrial energy consumer and the third biggest industry subsector in terms of direct carbon dioxide emissions (IEA 2022; Emotongha & Bayo, 2024). Air emission and greenhouse gases, such as carbon dioxide, are emitted at every stage of a chemical's lifecycle, including production, use and waste. Naidu (2021) suggested that chemical pollutants can migrate globally in air and water, in human and animal vectors, in waste materials, and in nanoparticles, such as microplastics while the environment has a certain capacity to biodegrade some toxic substances, others are resistant to decomposition processes and cause long-term environmental damage, as well as accumulating in food chains. According to Emotongha and Bayo (2024), chemical emissions have a serious and lasting detrimental impact on the climate, environment and ecosystems. Industries are now facing a problem of broad production in their organizations thus resulting to lots of carbon footprint. This has seen in industrial goods companies experience problems of greenhouse gas emission along the production chain and the liability to make the right products for consumers in the market.

Additionally, Adepoju and Akinwale (2019) noted that despite Nigeria's wealth of renewable energy resource (geothermal, solar, wind, biomass, hydro, and others) most of them go unused, despite their potential to drive the growth of the country's industrial goods industry (Sunday, Uwem, & Ubong, 2024). Insufficient availability of dependable and enduring electricity presents a significant obstacle in Nigeria's industrial goods industry. Presently, the Nigerian industrial goods industry significantly depends on fossil fuels to generate energy, resulting in the release of carbon emissions, pollution, and substantial operational cost. This is mostly attributed to the recent enforcement of the downstream petroleum products policy (Ibanga, 2022).

A study by Bennett, et al., (2019) stated that marine and coastal ecosystems offer an extensive array of goods and services to humanity, encompassing nourishment, raw materials, renewable energy, transportation and tourism. Moreover, they play a fundamental role in confronting the challenges posed by climate change. Additionally, Harder (2012) argued that transitioning to sustainable energy solutions will not only decrease greenhouse gas emissions and safeguard the environment, but also lower production cost, provide additional employment, and foster economic prospects. The industrial goods industry in Nigeria has not fully utilized these potentials. Thus, there are several policies in place regarding renewable energy, including the Nigeria Blue Economy Strategy 2024, National Renewable Energy and Energy Efficiency Policy (NREEEP) from 2014 and the National Energy Policy from 2003.

Also, recent studies witnessed a surge in the presence of the blue economy in the international arena, linking it to traditional economic activities to foster its efficiency and sustainability and mitigating the greenhouse effect and global warming generated by industrial goods companies (Voyer et al., 2020; March et al., 2023). In the related literature, there are studies with different orientations, which include analyzing the impact of the blue economy on aquaculture activities

(Campbell et al., 2021), maritime transport (Tijan et al., 2021), fishing (Sihombing et al., 2022), tourism (Karani & Failler, 2020) and marine biotechnology (Venugopal, 2022).

Hence, following this line of thought, this paper examined the impact of blue energy adoption on sustainability of industrial goods companies in Nigeria. Specifically the objectives are to:

1. Determine the impact of tidal energy strategy on environmental sustainability of Industrial Goods Companies in Nigeria.
2. Determine the impact of wave energy strategy on environmental sustainability of Industrial Goods Companies in Nigeria

Conceptual Framework

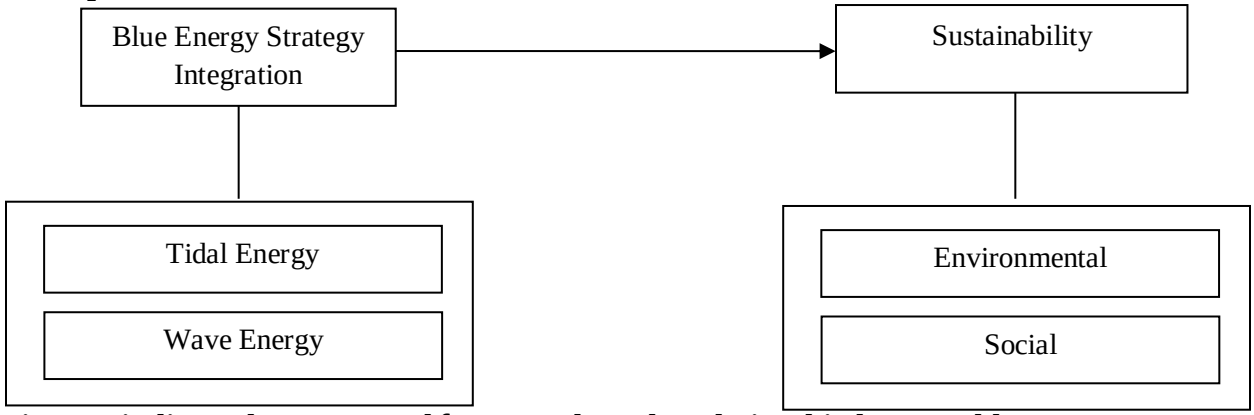

Figure 1 indicate the conceptual framework on the relationship between blue energy strategy adoption and sustainability of Industrial Goods Companies in Nigeria
Source: Desk Research, (2025)

Research Questions

1. To what extent does tidal energy strategy affect sustainability in the Industrial Goods Companies in Nigeria?
2. To what extent does wave energy strategy affect sustainability in the Industrial Goods Companies in Nigeria?

Literature Review

Blue Energy

Blue energy refers to the renewable natural energy contained in the ocean, mainly including tidal energy, wave energy, ocean current energy, tidal current energy, temperature difference energy, salt difference energy, etc. In a broader sense, blue energy also includes offshore wind energy and solar energy on the ocean surface. Similarly, the International Energy Agency's (2002), posits that renewable energy encompasses a wide range of energy sources, including solar, wind, ocean, hydropower, biomass, geothermal, biofuel, and hydrogen. Wang, Wu, and Wang (2023) posits that blue energy refers to energy obtained from sources that are almost inexhaustible, such as hydroelectric power, tidal power, and wave power. Similarly, Yemi (2023) defines renewable energy as energy sources that are unlimited, naturally replenish-able, and incapable of being depleted.

Additionally, blue energy has the components of green and clean, wide distribution, nearby consumption, accurate prediction, and customization on demand. It can provide green energy solutions according to the needs of islands, ocean development, and energy consumption of offshore equipment. It is a typical smart energy. Compared with wind energy, solar energy and other renewable energy, blue energy has the characteristics of diversified utilization forms and many additional products. Seventy-one percent of the earth's surface is covered by seawater, and oceans contain 97 percent of the planet's water, according to the Ocean Energy Vision released by the International Energy Agency's Ocean Energy Systems Technical Cooperation Program (OES). Its conception rests upon the sustainable exploitation of oceanic resources to stimulate economic expansion, enhance employment opportunities, improve living conditions and safeguard the integrity of the ocean's ecosystem (Elegbede, et al., 2023). Ehlers (2016) posits that blue economy aimed to promote economic growth, and improve life and social inclusion without compromising the oceans' environmental sustainability and coastal areas.

Blue Energy Strategy Adoption

Blue energy strategy adoption focuses on integrating ocean-based renewable energy technologies, such as tidal and wave power, to reduce greenhouse gas emissions and enhance energy security, requiring significant investment in R&D, supportive regulatory frameworks, maritime spatial planning, and international cooperation. Aprizal, Wiranatakusuma, and Razak (2025) study contends that the transition to blue energy sources can enhance the nation's economy, employment rates, and environmental conservation, while also ensuring a pollution-free environment and energy stability in the manufacturing sector.

Tidal Energy: tidal energy refers to the energy that is produced by the to and fro movement of the tides (Shetty, & Priyam, 2022). The tidal flows that are responsible for the generation of tidal energy are produced from the centrifugal and gravitational forces between the Earth, Moon, and Sun. Therefore, these inter-attractive forces between them cause the periodic motion of the waters of the sea which are Tides. The tides are mainly caused due to gravitational force of the Moon as it creates a force of 2.2 times higher than that of the Sun because the distance of the Moon from the Earth is lesser than that of the Sun from the Earth. Aprizal, Wiranatakusuma, and Razak (2025) posits that tidal range energy generation strategy is a technology that uses the difference of water level formed by the height between the high and the low tide to make the tide with a certain head flow through the turbine installed in the dam and drive the generator to generate electricity. The principle is similar to that of hydroelectric power generation. As the most mature hydro power generation strategy, traditional dammed tidal range energy technologies have been commercially available for decades.

Wave Energy: wave energy strategy is a technological device that converts the kinetic energy of sea surface waves into another form of energy, such as electricity. Wave energy is a kind of energy converted from wind energy (Guo, & Ringwood, 2021). The wind blows over the ocean and transfers energy to the sea through the sea-air interaction, forming waves and storing energy as potential energy (the potential of water mass away from the sea level) and kinetic energy (in the form of water movement). The total reserves of wave energy are huge and the wave energy density is low. The resources are widely distributed, but the distribution is obviously uneven. Energy has the characteristics of multi-directivity, and changes with time and region (Aprizal, Wiranatakusuma, & Razak (2025).

Sustainability

Thus, the Ecologists' interpretation on sustainability is alleged to have been invented by German aristocrat Hans Carl von Carlowitz, (1712) who centred his thought on the sustainable production of wood in Saxony-Germany as a deterrent to scarcity of wood (natural resources required by the mining and ore smelting industry). The basic tenet of sustainability then was a concern over the protection and conservation of natural /environmental resources from excessive exploitation and environmental degradation. The business strategist scholars on the other hand, view that organizations primarily exists for grasping a sustained profitability/return on investment (Goldman, Nienaber & Pretorius, 2015), focused on the traditional goal of economic sustainability of organizations with a major concern about sustainable competitive advantage, creativity and innovation in private and public sectors plus cleaner production processes of business organizations. The Brundtland Commission, in the 1980s progressively inculcated the social dimension of sustainability thereby postulating sustainability to be a form of development that satisfies the present needs without jeopardizing the ability of future generations to satisfy their own needs (Zacher, Chan, Bakker & Demerouti, 2015). This social perspective arose to tackle marginalization of a substantial number of social groups and as a form of protest against capitalism and trampling on human rights and well-being.

However, the study took interest on the first and second group which aimed to protect the future without jeopardizing the sustainable return on investment and the conservation of natural resources from excessive exploitation. According to Mellalson (2003) sustainability is a process of change in which the explosion of resources, the direction of investments, the orientation of technological development, and institutional change are all in harmony and enhance both current and future potential to meet human needs and aspirations. Schaltegger (2003) defined sustainability as a business approach that is designed to shape the environmental and social setting.

Environmental: environmental sustainability involves ecosystem integrity, carrying capacity and biodiversity emission initiatives. According to Emotongha and Bayo (2024), posit that natural capital be maintained as a source of economic inputs and as a sink for wastes, resources must be harvested no faster than they can be regenerated, wastes must be emitted no faster than they can be assimilated by the environment. Environmental sustainability refers to the conservation, management and rational utilization of natural resources in such way to maintain the integrity of ecosystem, support all life, ensure the preservation of biodiversity and prevents environmental degradation (Gbenda, 2012). Environmental sustainability is a responsive interaction with the environment with a view to conserved natural resources through developing alternative sources of power and reducing pollution or any negative impact for the long environmental quality. Environmental sustainability appears to follow three stages in an organization (Jabbour & Santos, 2006). These are reacting to environmental legislation and product requirements, prevention of harm to the environment such as preventing pollution, ensuring proper waste disposal and voluntary proactive actions and change to ensure long term sustainability.

Economic: economic sustainability involves achieving a balance in all sectors of services. It tackles social issue as poverty reduction, low per capital income, inequality distribution, and inefficiency in the mobilization of resources, unemployment issues, and inflation. The economic sustainability aims at cleaner production by optimizing usages of resources, decrease wastages, so as to attain sustainability (Severo, De Guimaraes, Dorion & Nodari, 2015). Thus, striving for economic efficiency and effectiveness is a primary goal of every business organisation and it is

not annulled by the sustainability dimension (Bányai, 2019). Economic sustainability is primarily concerned with monetary capital and human capital. Economic sustainability' implies a system of production that satisfies present consumption levels without compromising future needs. Economic sustainability, by way of growth, development, and productivity, has guided conventional development science in the past (Azapagic, 2023).

Empirical Review

Aprizal, Wiranatakusuma, and Razak (2025) investigated the relationship between the blue economy and sustainable development through a mapping study and systematic literature review (SLR) adhering to the PRISMA framework. An examination of 57 Scopus indexed journal papers indicates a robust correlation between the blue economy and sustainability, highlighting significant developing topics such as innovation, the doughnut economy, environmental legislation, regenerative systems, digitization, and Sustainable Development Goals (SDGs). The results highlight the interdisciplinary aspect of this connection, especially in incorporating innovation, digitalization, and doughnut economy ideas into marine economic policies.

Emotongha and Bayo (2024) examined lean production strategies and environmental sustainability of industrial goods companies in Nigeria. The study adopted a descriptive survey research design. The population of the study comprised of (45) senior management staff of industrial goods companies listed on the Nigeria Business Directory in Southern Nigeria. The study used primary data. The study employed Multiple Regression Coefficients to test the hypotheses. The findings showed that traditional production lean strategies has more predictive influence compare to modern lean production strategies on environmental sustainability in Dangote petro chemicals. Also, the findings showed that modern strategy has more predictive influence compare to traditional strategies on environmental sustainability in Indoroma Eleme Chemicals. Furthermore, modern lean strategy has more predictive influence compare to traditional lean strategy on environmental sustainability in Nigeria LNG Limited.

Kahingo (2018) studied the effect of competitive strategies on sustainability of microfinance institutions in Murang'a County, Kenya. The study employed a descriptive survey research design. The target populations were the senior managers in the 20 MFIs in the county, Descriptive analysis was done to summarize the data; while inferential analysis such as Pearson's Product-Moment correlation and multiple regression analysis was used. The correlation analysis revealed that cost leadership, focus, differentiation and differentiation and product development strategies all had a positive and moderate relationship with sustainability of microfinance institutions in murang'a county, Kenya. Based on the aforementioned relationship between blue energy strategies and sustainability, the study proposes the following hypotheses:

Ho_1 *Tidal energy strategy has no significant influence on environmental sustainability of Industrial Goods Companies in Nigeria*

Ho_2 *Wave energy strategy has no significant influence on environmental sustainability of Industrial Goods Companies in Nigeria*

Ho_3 *Tidal energy strategy has no significant influence on economic sustainability of Industrial Goods Companies in Nigeria*

Ho_4 *Wave energy strategy has no significant influence on economic sustainability of Industrial Goods Companies in Nigeria*

Methodology

This paper adopted a descriptive survey design. The target population was the 12 industrial goods companies listed and trading in Nigerian Exchange group (XGN, 2025) from which the general Manager, Operations Manager, and Finance Managers were targeted a respondents. The study adopted a census on all the industrial goods companies targeting three 3 respondents from each companies totaling 36 respondents. The study collected primary data using a structured copy of questionnaire designed in a 5-Point Likert Scale. The field data collected was checked for consistency, cleaned, coded and then analyzed using SPSS version 26. Data were analyzed using descriptive statistics and inferential statistics. The study conducted a Multiple Regression analysis to establish the relationship between blue energy strategy adoption and sustainability of industrial goods companies in Nigeria. The regression model is as follows:

Functional Form

$Y_i = f(X_i)$ i

Represeted to accoodate the topic;

$SBT_i = f(BESA)$ ii

$SBT_i = f(\beta 0 + \beta_1 TES + \beta_2 WES + \mu$ iii

Decoupled to express the various measures of organizations structure;

$EVS_i = f(\beta 0 + \beta_1 TES + \beta_2 WES + \mu)$ iv

$ECS_i = f(\beta 0 + \beta_1 TES + \beta_2 WES + \mu)$ v

Where;

SBT = Sustainability
BESA = Blue Energy Strategy Adoption
TES = Tidal Energy Strategy
WES = Wave Energy Strategy
EVS = Environemental Sustainability
ECS = Economic Sustainability
$\beta 0$ = is the constant term or Intercept
β_1 and β_2 = The parameters that were estimated (Beta Coefficients)
μ= Error or random term

while the coefficients βii = 1…….2 were used to measure the sensitivity of the criterion variable (Y) to unit change in the predictor variables X1, and X2 while ε is the error term which captures the unexplainable variations in the model.

Data Analyses and Results

Descriptive Statistics Analyses

The study delineated blue energy strategy adoption as predictor variable and sustainability as criterion variable. The predictor variable has tidal energy and wave energy strategy as empirical referents, while environmental and economic sustainability as measures. This section of the study focuses on descriptive statistics

Summary of Response Rate on Blue Energy Strategy

Table 1 Showed Descriptive Statistics on Blue Energy Strategy

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	Kurtosis

	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Std. Error
Tidal Energy Strategy	33	1.00	5.00	3.1111	1.34543	-.359	.409	-1.195	.798
Wave Energy Strategy	33	1.00	5.00	3.3737	1.05987	-.757	.409	-.067	.798
Valid N (listwise)	33								

Source: SPSS Version 26.0 Result, 2025

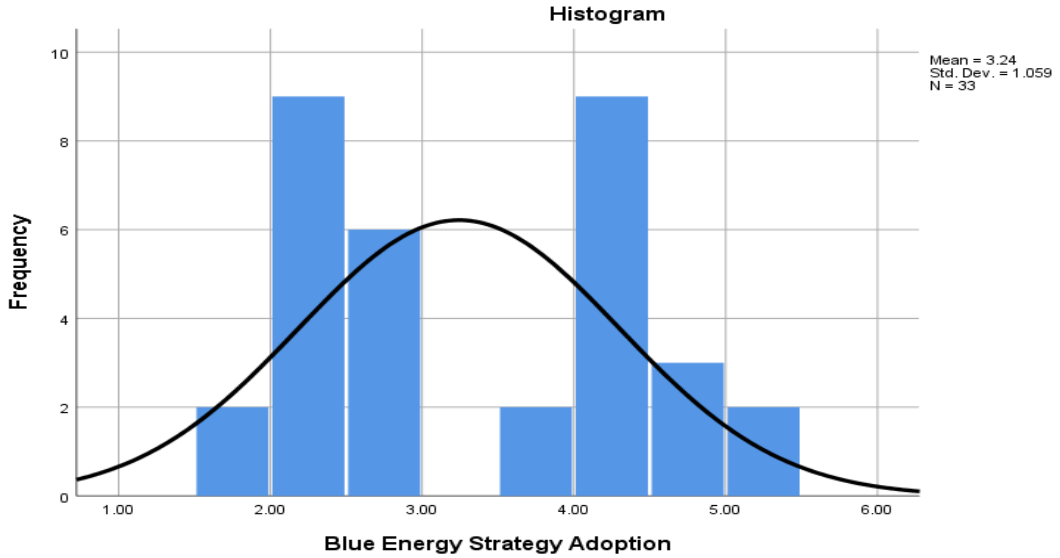

Figure 2 indicates the group mean of histogram distribution for blue energy strategy adoption in the industry

This section asked respondents on the adoption of blue energy strategies such as: tidal energy and wave energy strategy in the industrial goods companies in Nigeria. The distribution indicates all the mean scores and standard deviation for each latent variable: tidal energy strategy with moderate mean score of x-3.11, and std. =1.34; wave energy strategy with moderate mean score of x-3.37, std. =1.05. The evidence and manifestations from each of the variable illustrates that adoption of blue energy strategy has a moderate group mean value of (ẋ=3.24 and std. =1.069) explanatory power in industrial goods industry in Nigeria. Therefore, from the manifestation in the scale; blue energy strategy was observed to be a moderate phenomenon in the quoted industrial goods companies in Nigeria. Furthermore, the above table also showed a skewness and kurtosis statistic of (+0.268 and -1.392) respectively for each variable; thus, skewness and kurtosis value indicates that the predictor variables: blue energy strategy adoption in the industry was positively skewed while kurtosis value indicates that blue energy strategy in the industry was leptokurtic and had a fat tail in the distribution.

Summary of Response Rate on Sustainability

Table 2 Showed Descriptive Statistics on Sustainability

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Kurtosis	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Std. Error
Environmental Sustainability	33	1.00	5.00	3.6263	.93822	-.513	.409	.340	.798
Economic Sustainability	33	1.00	5.00	3.2626	.75350	-.739	.409	2.049	.798

Source: SPSS Version 26.0 Result, 2025

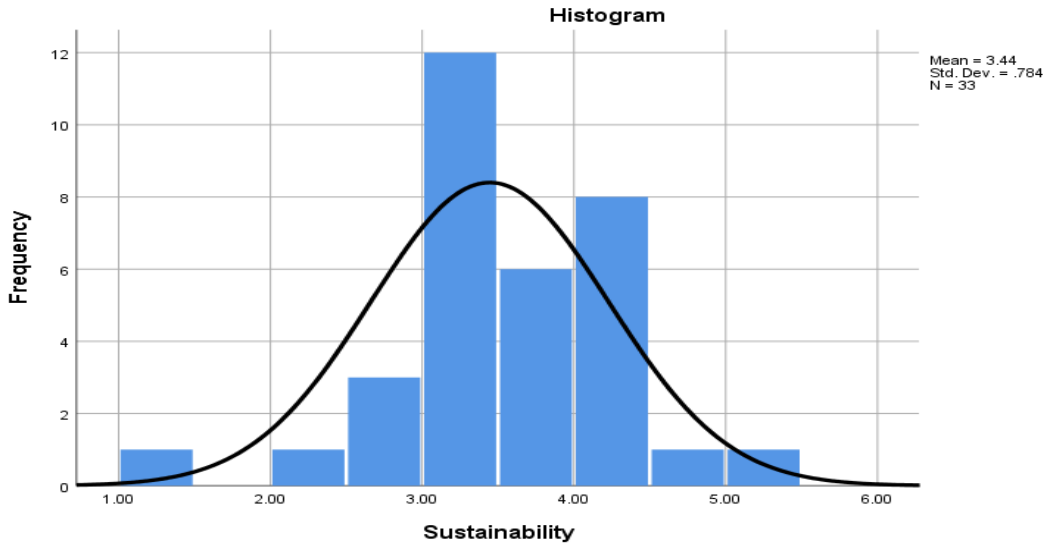

Figure 3 indicates the group mean of histogram distribution for sustainability in the industrial goods industry

This section asked respondents on the prevalent of environmental and economic sustainability such as: (causes of climate change), in the industrial goods companies in Nigeria. The distribution indicates the mean scores and standard deviation for each manifest variable: environmental sustainability with high mean score of x-3.62, and std. =0.938; economic sustainability with moderate mean score of x-3.26, std. =0.756. The evidence and manifestations from each of the variable illustrates that sustainability has a moderate group mean value of (ẋ=3.44 and std. =0.784) in the industrial goods industry in Nigeria. Therefore, from the manifestation in the scale; sustainability was observed to be a moderate phenomenon in the quoted industrial goods companies in Nigeria. Furthermore, the above table also showed a skewness and kurtosis statistic of (+0.268 and -1.392) respectively for each variable; thus, skewness and kurtosis value indicates that the criteriion variables: sustainability in the industry was positively skewed while kurtosis

value indicates that sustainability in the industry was leptokurtic and had a fat tail in the distribution.

Inferential Statistics Analysis

The study adopted a multiple regression analysis to determine the relationship between the variables as well as achieve the research objectives after proof that one of the assumptions had been violated. The findings indicated the model summary, ANOVA and model coefficients as discussed below.

Model Summary

Table 3: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.953[a]	.909	.903	.29269

a. Predictors: (Constant), Wave Energy Strategy, Tidal Energy Strategy

Source: SPSS Result, 26.0 (2025)

The results in Table 3 showed the (R value of 0.953) indicated that all predictors been held constant blue energy strategies adoption has a very strong positive influence on environmental sustainability. The (R^2 = .909) revealed that 90.9% of the variation in environmental sustainability of industrial goods companies is attributed to blue energy strategies while the 9.1% of account for extraneous factors.

ANOVA[a]

Table 4 ANOVA

ANOVA[a]

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	25.598	2	12.799	149.409	.000[b]
	Residual	2.570	30	.086		
	Total	28.168	32			

a. Dependent Variable: Environmental Sustainability

b. Predictors: (Constant), Wave Energy Strategy, Tidal Energy Strategy

Source: SPSS Result, 26.0 (2025)

The ANOVA results in Table 4 show the numerator df (2), which indicates the number of predictor variables in the study (blue energy strategies adoption). The value of the F test is F(2, 30) = 149.409, (p 0.00 < .05). The F-value indicates that the relationship between the variable in the regression model was fit; hence it has some explanatory value in the industrial goods companies.

Model Coefficients

Table 5 Model Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.722	.176		4.101	.000
	Tidal Energy Strategy	.228	.046	.327	4.969	.000

	Wave Energy Strategy	.651	.058	.735	11.180	.000

a. Dependent Variable: Environmental Sustainability
Source: SPSS Result, 26.0 (2025)

Ho_1 Tidal energy strategy has no significant influence on environmental sustainability of Industrial Goods Companies in Nigeria.

The model coefficients results revealed that tidal energy strategy has a weak positive and significant influence on environmental sustainability (β = 0.228; P-value =0.000 < 0.05%) in the industrial goods companies in Nigeria. Therefore, the null hypothesis is hereby rejected. This implies that adoption of tidal energy strategy can enhance sustainability of environment in terms of air emission, energy use, land use, solid waste, toxic chemicals use by the industrial goods companies in Nigeria.

Ho_2 Wave energy strategy has no significant influence on environmental sustainability of Industrial Goods Companies in Nigeria.

The model coefficients results revealed that wave energy strategy has a strong positive and significant influence on environmental sustainability (β = 0.651; P-value =0.000 < 0.05%) in the industrial goods companies in Nigeria. Therefore, the null hypothesis is hereby rejected. This implies that adoption of wave energy strategy can enhance sustainability of environment in terms of air emission, energy use, land use, solid waste, toxic chemicals use by the industrial goods companies in Nigeria.

Model Summary
Table 6: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.758[a]	.575	.546	.50756

a. Predictors: (Constant), Wave Energy Strategy, Tidal Energy Strategy
Source: SPSS Result, 26.0 (2025)

The results in Table 6 showed the (R value of 0.758) indicated that all predictors been held constant blue energy strategies adoption has a strong positive influence on economic sustainability. The (R^2 = .575) revealed that 57.5% of the variation in economic sustainability of industrial goods companies is attributed to blue energy strategies while the 42.5% of account for extraneous factors.

ANOVA[a]
Table 7 ANOVA

ANOVA[a]						
Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	10.440	2	5.220	20.263	.000[b]
	Residual	7.728	30	.258		
	Total	18.168	32			

a. Dependent Variable: Economic Sustainability
b. Predictors: (Constant), Wave Energy Strategy, Tidal Energy Strategy
Source: SPSS Result, 26.0 (2025)

The ANOVA results in Table 7 show the numerator df (2), which indicates the number of predictor variables in the study (blue energy strategies adoption). The value of the F test is F(2, 30) = 20.263, (p 0.00 < .05). The F-value indicates that the relationship between the variable in the regression model was fit; hence it has some explanatory value in the industrial goods companies.

Model Coefficients
Table 8 Model Coefficients[a]

Model			Unstandardized Coefficients		Standardized Coefficients		
			B	Std. Error	Beta	t	Sig.
1	(Constant)		1.540	.305		5.044	.000
	Tidal Energy Strategy		.286	.080	.511	3.597	.001
	Wave Energy Strategy		.247	.101	.347	2.446	.021

a. Dependent Variable: Economic Sustainability
Source: SPSS Result, 26.0 (2025)

Ho_3 Tidal energy strategy has no significant influence on economic sustainability of Industrial Goods Companies in Nigeria.

The model coefficients results revealed that tidal energy strategy has a weak positive and significant influence on economic sustainability (β = 0.286; P-value =0.000 < 0.05%) in the industrial goods companies in Nigeria. Therefore, the null hypothesis is hereby rejected. This implies that adoption of tidal energy strategy can enhance sustainability of economic in terms of cost minimization, economic scale, and profit maximization in the industrial goods companies in Nigeria.

Ho_4 Wave energy strategy has no significant influence on economic sustainability of Industrial Goods Companies in Nigeria.

The model coefficients results revealed that wave energy strategy has a weak positive and significant influence on economic sustainability (β = 0.247; P-value =0.000 < 0.05%) in the

industrial goods companies in Nigeria. Therefore, the null hypothesis is hereby rejected. This implies that adoption of wave energy strategy can enhance economic sustainability in the industrial goods companies in Nigeria.

Discussion of Findings

The findings revealed that tidal energy strategy has a weak influence on environmental and economic sustainability in the industrial goods companies in Nigeria. This implies that the company has not fully diversified its energy source from fossil fuel to tidal energy. The companies' dependent on tidal energy strategy is still involving in recent time. Thus, the adoption of tidal energy has improved the company's reputation for sustainability. The study also established that tidal energy source is the solutions to reduce greenhouse carbon emission and ecosystem preservation. This is in line with Martínez-Vázquez et al. (2021) they emphasized that maintaining a balance in the capacity and resilience of ocean systems supports a sustainable environment. The findings corroborate with Emotongha and Bayo (2024) conclusions that traditional production lean strategies has more predictive influence compare to modern lean production strategies on environmental sustainability in Dangote petro chemicals. Also, the findings showed that modern strategy has more predictive influence compare to traditional strategies on environmental sustainability in Indoroma Eleme Chemicals. Furthermore, modern lean strategy has more predictive influence compare to traditional lean strategy on environmental sustainability in Nigeria LNG Limited. Gielen et al. (2019) also posit that the future of energy lies in technologies associated with renewable energy resources and energy efficiency. They predicted that these technologies will become the leading tool by 2050. Similarly, Guo, and Ringwood, (2021) established that the benefits of investing in wave energy are many, including (i) environmental benefit, achieving carbon neutrality; (ii) broadening of the energy mix and provision of greater energy security; and (iii) economic benefit, for, industry growth and job creation, blue economy. The findings revealed that wave energy strategy has a strong influence on environmental sustainability and a weak influence on economic sustainability in the industrial goods companies in Nigeria. This implies that utilization of wave energy source has potential to enhance the company's image as a stakeholder of sustainable business. Also, revealed that the adoption of wave energy has result in long-term cost saving strategy for production. The findings thus, indicate that the adoption of wave energy has met a substantial portion of the company's energy source. Similarly, Aprizal, Wiranatakusuma, and Razak (2025) established that blue economy and sustainable development indicates a robust correlation between the blue economy and sustainability, highlighting significant developing topics such as innovation, the doughnut economy, environmental legislation, regenerative systems, digitization, and Sustainable Development Goals (SDGs).

Conclusion

The paper determined blue energy strategy adoption and sustainability of quoted industrial goods companies in Nigeria. The study concludes that tidal energy strategy has a weak influence on environmental, economic sustainability in the industrial goods companies in Nigeria. This implies that the company has a weak potential in diversifying its energy source from fossil fuel consumption to tidal energy source. It concludes that companies' dependent on tidal energy strategy is still involving in recent time. Thus, the adoption of tidal energy has improved the company's reputation for sustainability practice. The study also established that tidal energy source is the solutions to reduce greenhouse carbon emission and ecosystem preservation. The study also

concludes that wave energy strategy has a strong influence on environmental sustainability and a weak influence on economic sustainability in the industrial goods companies in Nigeria. This implies that utilization of wave energy source has a strong potential to enhance the company's image as a stakeholder of sustainable business practice. This has established that adoption of wave energy has result in long-term cost saving strategy for production. Also, by improving process efficiency, companies can reduce their overall environmental footprint, including lower emissions and less carbon generation.

Recommendations

The study recommends that industrial goods companies in Nigeria should adopt tidal energy as a strategy to neutralize carbon, greenhouse gas in production process. This will improve climate change action; reduce carbon, eco-friendly measures by recycling and reusing material for sustainable development.

The study recommends that industrial goods companies in Nigeria should invest in wave energy as a strategy for cost minimization improves economic of scale in production, in order to meet long-term profitability in the industry. This will meet the urgent need to reduce greenhouse gas, eliminate fossil fuel consumption which will improve sustainable development in developing countries.

Abstract
This study analyzes a combination of Sustainable Human Resource Management and Artificial Intelligence on employee well-being with an aim to enhancing employee engagement for workers in Fintech Organizations in Rivers State, Nigeria. We conducted Chi-Square and Rasch Model analyses on data acquired from a cross-sectional survey of 366 employees. The findings show a strong positive correlation between employee engagement and the sustainability of HRM practices, as well as between engagement and well-being. However, it also pointed out that by lowering burden and improving decision-making support, integrating AI technology improves employee engagement. These results therefore highlight the necessity of implementing sustainable HRM policies that seek to ensure the welfare and well-being of employees, leading to a more engaged and productive staff. Addition to the body of literature: Future research directions could also be suggested, such as longitudinal studies and a broader approach to sampling, which would enhance generalizability across diverse contexts. A multifaceted model of employee engagement that integrates the role of sustainability, well-being, and technology. Practical implications include organizations investing in holistic HRM strategies that are commensurate with their sustainability goals and using AI to leverage value-added responses in employees.

Introduction

Employee well-being extends beyond financial pay; it encompasses measures that promote work-life balance, career growth, and mental health support. The Fintech Organizations Workforce Hopes and Fears 2024 Survey (Obinna, 2024) suggests that many Nigerian employees express high job satisfaction and feeling valued by their businesses. But there are issues with insufficient assistance for skill development, which can be detrimental. The Fintech Organizations Workforce Hopes and Fears Survey 2024 shows that high job satisfaction and a sense of being valued among Nigerian workers (Obinna, 2024), but major gaps in career growth opportunities could hinder employee retention (Obinna, 2024), (Radu, 2023). Research consistently shows that employee engagement is crucial to productivity and overall company performance. Organizations that invest in holistic well-being tend to achieve better performance and higher retention rates. Effective well-being strategies significantly enhance workplace culture, leading to sustained competitive advantages (Obinna, 2024). A positive work environment boosts employee morale and productivity. Therefore, integrating comprehensive well-being programs is essential for fostering

employee engagement and facilitating company growth in an evolving business landscape (Obinna, 2024), (Radu, 2023), (Obinna & Jaja, 2023).

Both opportunities and problems for improving engagement and productivity are presented by the growing use of artificial intelligence (AI) in business operations (Obinna & Princewill 2022), (Milton & Al-Busaidi, 2023). At the nexus of employee engagement, well-being, and sustainable HRM, AI is moderating. AI may greatly improve conventional HR procedures by emphasizing employee welfare and long-term sustainability. Through precise data analysis and sophisticated, individualized recommendations, it enhances staff development, training, and organizational performance management. AI-driven insights, for example, can customize career development plans, boosting worker happiness and engagement (Rožman et al., 2022), (Wang & Wang, 2022). In this regard, AI creates technological ecosystems that complement human contributions without taking their place, thereby moderating the relationship between sustainable HRM and employee well-being. This study aims to investigate the effects of sustainable Human Resource Management (HRM) practices on employee engagement and well-being, as well as how AI can support these initiatives. Organizations that successfully integrate AI to support their employees are more likely to achieve long-term HRM goals, ultimately enhancing employee engagement and well-being [6, 7, 9]. However, integrating AI with sustainable HRM practices is still largely unexplored.

Literature Review

The Association between Employee Engagement and Sustainable Human Resource Management By taking into account their preferences, requirements, and viewpoints, Sustainable Human Resource Management (SHRM) sees employees as important resources. Individual workers are given priority in this strategy, which highlights job satisfaction and engagement as important results (Sypniewska et al., 2023). Effective SHRM may greatly boost engagement and job satisfaction, which are the framework's main objectives, by creating a positive work environment, providing chances for growth, and improving employee retention. According to research, feeling appreciated, having faith in management, and thinking that their efforts are essential to the success of the company are the main causes of high employee engagement (Obinna & Princewill 2022). Through open, equitable, and consistent practices that encourage communication and collaboration among employees, SHRM strengthens this relationship.

Since effective HR strategies foster engagement, which in turn supports the organization's long-term success (Obinna & Bekwe, 2024), the relationship between SHRM and employee engagement is mutually reinforcing. Accordingly, the hypothesis that has been put forth is

H1: There is a significant correlation between sustainable HRM and employee engagement.

The Correlation of Well-Being and Employee Engagement

Employee well-being, covering both physical and psychological dimensions, is vital for maximum performance. High well-being among employees is associated with higher levels of engagement, which helps the firm succeed (Obinna & Bekwe, 2024). According to research, highly engaged workers feel good about their wellbeing, which boosts their output (Jamali et al., 2022). By addressing organizational, social, psychological, and physical aspects that support workers in completing tasks and reducing working demands, well-being programs serve as job resources.

These tools promote a cooperative workplace culture, which creates a happy atmosphere. Increased performance, productivity, and effort are all associated with having access to these resources (Obinna & Jaja, 2023).

Employee well-being also includes autonomy, competence, relatedness needs, work-life balance, respect within the company, and job satisfaction. Enhancing well-being is essential for enhancing job engagement; if it is neglected, engagement may decline, which will have a detrimental effect on productivity and raise expenses (Abun et al., 2020). Effective performance is the outcome of processes that healthy organizations adopt to improve employee well-being (Obinna & Jaja, 2023). Long-term employee engagement is fostered by a supportive work environment that places a high priority on psychological well-being; therefore, well-being is essential to sustaining high levels of engagement (Obinna & Bekwe, 2024). Consequently,

H2 is the hypothesis that is proposed: Employee engagement and well-being are significantly correlated.

Dwi and Hidayatullah, (2024); Duran and Sanchez, (2021) highlights that successful AI-driven systems rely on collaborative interactions between employees and AI, suggesting that proper integration can augment human capabilities and enhance overall engagement (Dwi & Hidayatullah, 2024). The relationship between Artificial Intelligence (AI) technology and work engagement encompasses both potential benefits and challenges associated with AI integration in the workplace. AI can enhance work engagement by fostering a symbiotic relationship between employees and technology, which improves performance by reducing cognitive load and streamlining tasks, enabling employees to concentrate on more complex and creative work (Dwi & Hidayatullah, 2024).

H3: There is a clear association between AI technology and employee engagement

Methods of Research

Methods and Design of the Research

The purpose of this study is to assess how sustainable HRM, employee engagement, AI technology, and well-being relate to Nigerian workers in Rivers State, the country's vibrant metropolis and Treasure Base. The study employs a methodical approach, providing a theoretical framework for the formulation of hypotheses. After that, it gathers the sample data needed to evaluate these theories. This study used a quantitative approach and a cross-sectional survey to evaluate the recently created conceptual model and its hypothesized relationships through Rasch Model Analysis and Chi-Square Analysis.

Information Gathering

All information pertaining to the subject of the study is included in the data sources, which are divided into primary and secondary sources. Techniques like experimentation, interviews, and observation were used to gather primary data [24]. To collect primary data for this project, a Google Forms questionnaire was disseminated between January and June 2024. To expand on what was already known, secondary data—such as books, journals, articles, and different internet sources—was also used.

Employees at businesses in Rivers State, Nigeria, are the subject of the study. However, it is still unknown how many employees there are in Rivers State. Thus, the Lemeshow formula will be used to calculate the sample size (von Davier, 2007).

This study uses a 5% error level, which corresponds to a 95% confidence level and a maximum estimate of 25%. The Z-score for a 95% confidence level is 1.96. These calculations indicate that a sample size of 288 respondents is needed, and the sample size is rounded up to 300 respondents to account for possible errors in questionnaire completion. Due to the lack of a sampling frame, this study used a convenience sampling procedure, which also expedited the process. Despite the inherent limitations of this method, we reached out to 450 employees in Rivers State via email, LinkedIn, and WhatsApp groups, ensuring that participation was voluntary. A total of 388 questionnaires were returned and taken into consideration for statistical analysis. We eliminated 22 incomplete questionnaires and outliers using the Rasch Model and Person Measure Analysis with WINSTEPS software version 5.2.1.0 (Boone, Yale, and Staver, 2014), (Sumintono, 2014). This left a final sample of 366 respondents, yielding a relatively high response rate of 82%.

The following table (Table 1) illustrates how the questionnaire items were developed based on the works of a few scholars.

Table 1. Research Instrument

Variables	Code	Items
Sustainable HRM [12], [27], [28]	SHRM 1	In my company, employees who voluntarily behave to preserve the ecosystem receive support.
	SHRM 2	My company's work is organized so that employees can interact with stakeholders.
	SHRM 3	In my company, there are opportunities for employees to make decisions that benefit the company and stakeholders
	SHRM 4	In my company, employee performance evaluation includes the ability to balance profit, people, and the environment
	SHRM 5	In my company, building internal and external relationships is considered in the employee selection process.
	SHRM 6	In my job, the ability to build internal and external relationships is considered in the employee selection process.
	SHRM7	In my company, employee training focuses on developing skills and attitudes to manage stakeholder interests
Well-Being	WB 1	Promotion opportunities are open for my job
	WB 2	I am satisfied with the company's benefits package
	WB 3	I receive recognition when I perform well

Variables	Code	Items
	WB 4	I like my friends at the office
	WB 5	My job is meaningful
	WB 6	Promotion opportunities are fair for high-performing employees.
	WB 7	My supervisor treats their subordinates fairly.
	WB 8	My colleagues are competent.
	WB 9	Promotion opportunities are open for my job

	WB 10	I am satisfied with the company's benefits package
	WB 11	I receive recognition when I perform well
	WB 12	I like my friends at the office
	WB 13	My job is meaningful
	WB 14	Promotion opportunities are fair for high-performing employees.
	WB 15	My supervisor treats their subordinates fairly.
	WB 16	My colleagues are competent.
AI Technology [1], [19]	AI 2	AI provides opportunities to learn new skills
	AI 3	AI has a positive impact on my job
	AI 4	AI creates new opportunities for me
	AI 5	I can learn new things with AI
	AI 6	AI will harm my job
	AI 7	AI can replace my job
	AI 8	AI provides new ways for me to work
Work Engagement [30]	EE 1	I feel enthusiastic about work
	EE 2	My job is meaningful
	EE 3	Time passes quickly when I work
	EE 6	My job is inspiring

Validity and Reliability of Research Instrument

The validity and reliability of the research instrument are assessed using the Rasch model analysis, and according to Table 2, the reliability of the instrument is indicated by the Cronbach's Alpha values, which are 0.76, 0.84, 0.62, and 0.75.

Table 2. Validity and Reliability Testing Results (Rasch Model).

Variable	Alpha Cronbach	Reliability		Result
		Person	Item	
SHRM	0.76	0.75	0.76	Valid and reliable
Well-Being	0.84	0.83	0.74	Valid and reliable
AI Tech	0.62	0.53	0.84	Valid and reliable
EE	0.75	0.72	0.79	Valid and reliable

Source: Primary Data, 2025

Notes: SHRM (Sustainable Human Resource Management); EE (Employee Experience)

With scores of 0.75, 0.83, 0.53, and 0.72, the participant comprehension responses show moderate dependability. Conversely, the item responses, which have values of 0.76, 0.74, 0.84, and 0.79, show good reliability. These results point to a high degree of consistency and a robust relationship between the respondents' responses and the questionnaire's items. With a respectable level of reliability, the tools used to evaluate the research variables successfully capture the desired data. (Boone, Yale, and Staver, 2014), (Sumintono, 2014).

Data Analysis

With WINSTEPS software version 5.2.1.0, the Rasch Model was used to analyze the data collected for this study. The Rasch Model is especially well-suited for quantitative analysis in the human

sciences, primarily when the research instruments produce ordinal data (Boone, Yale, and Staver, 2014), (Sumintono, 2014). Rasch model analysis is based on probability and accurately predicts respondents' responses to all items. Additionally, the Rasch Model converts ordinal data, such as Likert rating scale item scores, to an interval scale called unit of opportunity logarithms (logit) (Boone, 2014), (Sumintono, 2014). With the aid of IBM SPSS Statistics 27, two different statistical methods—Rasch Model Analysis and Chi-Square Analysis—will be used to investigate the research hypotheses. Finding correlations between variables categorized in a matrix of rows and columns is the goal of the Chi-Square test. Particularly, this test works well with either nominal or ordinal data (Hope et al., 1977), (Kraska-Miller, 2013).

Results and Discussion

Demographics of Respondents

The demographic and professional characteristics of the respondents in this study are varied; the gender distribution shows a greater percentage of male respondents (60.1%) than female respondents (39.9%), indicating a significant male dominance in the sample; the majority of respondents (48.4%) are in the 21-30 age group, followed by 32.2% in the 31-40 age group; 11.2% are in the 19-20 age group; and the smaller percentages of respondents (77.7%) are in the 41-50 and over-50 age groups, respectively. These findings suggest a relatively young sample, with many in the early to mid-career stages.

The majority of respondents have high levels of education; 95.9% have a bachelor's degree, while only 4.1% have finished high school (SMA/SMK). This suggests that the responders are highly qualified and probably have the abilities required for their positions. In terms of work experience, 29.5% of respondents have less than five years, and 54.4% have less than ten years. The workforce appears to be mostly fresh to the labor market, since only 0.3% have more than 20 years of experience.

Officers (54.4%) make up the largest percentage of the workforce, followed by supervisors (23.5%), interns or contract employees (12%), managers (7.1%), and senior or general managers (2.5%). The majority of respondents hold entry- to mid-level roles, as seen by the lowest representation of associate directors or directors (0.5%).

Research Model Analysis

The Rasch analysis is being run across several subgroups, with subtotal values representing the sum of raw scores for each category. Table 2 summarizes the findings from the Rasch Model Analysis about work engagement in relation to sustainable HRM, well- being, and AI technology. Significant correlations between a number of important variables, including AI technology, well-being, and sustainable human resource management, are shown by the Rasch model's results (Table 3). Every one of these variables exhibits distinct measurements. With high and low group measures of 2.68 and 1.04, respectively, the metric for Sustainable HRM is 1.67 logit. A statistically significant difference in the high and low groups' participation with sustainable HRM practices is indicated by the Welch two-sided test's p-value of 0.000.

Similarly, Well-Being also has a measure of 1.67 logit, with high and low group measures at 2.78 and 1.05. The continuous p-value of 0.000 demonstrates a substantial association, demonstrating that well-being plays a major role in affecting engagement levels.

Table 3. Rasch Model Analysis Results

Variables	Measure (logit)			Welch-2sided Rasch (< 0.05)	Differences
	All	High	Low		
Sustainable HRM	1.67	2.68	1.04	0.000	Significant
Well-Being	1.67	2.78	1.05	0.000	Significant
AI Technology	1.67	2.68	1.04	0.000	Significant

Source: Primary Data, 2025

The uniform logit measure of 1.67 across these three variables implies an interrelated effect on engagement levels, and the higher group scores indicate a stronger positive association with engagement for individuals who experience greater levels of sustainable HRM practices, well-being, and AI technology integration. These findings highlight the importance of these factors in enhancing employee engagement, and firms can use the significant differences identified to improve their engagement strategies. The measure for AI technology is again 1.67 logit, with high and low group measures of 2.68 and 1.04; this too demonstrates significance, as indicated by the p-value of 0.000.

Hypothesis Testing

This study intends to assess the relationship between sustainable human resource management (HRM), employee well-being, AI technology, and employee engagement among employees in Greater Jakarta, Indonesia.

Table 4. The Chi-Square Analysis Results

Variables	Chi-Square (< 0.05)	Results
There is a significant correlation between sustainable HRM and Employee Engagement	0.000	H1 Supported
There is a significant correlation between well-being and employee engagement	0.000	H2 Supported
There is a significant correlation between AI technology and employee engagement	0.000	H3 Supported

Source: Authors, 2025

With a reported p-value of 0.000, well below the significance threshold of 0.05, the results of the chi-square tests show a significant positive correlation between sustainable HRM and employee engagement (H1), supporting H1 and aligning with previous research, further validating the established findings of (Mariappanadar, 2022) and (Sypniewska et al., 2023), highlighting the relationship between sustainable HRM and employee engagement. As for well-being and employee engagement (H2), the p-value is likewise 0.000, indicating a significant positive correlation between employee well-being and engagement at work, leading to the acceptance of H2. The findings add to the increasing amount of evidence supporting earlier studies by (Jamali et al., 2022) and (Salas-Vallina et al., 2021), regarding the relationship between well-being and employee engagement.

Finally, the p-value for the relationship between AI technology and employee engagement (H3) is 0.000 once more, suggesting a strong positive association. H3 is therefore also accepted. This study supports the body of knowledge already available in the field of human-computer interaction, especially with regard to the connection between AI technology and employee engagement, and is consistent with previous research by (Fukumura et al., 2021) and (Malik et al., 2021).

Discussion

While traditional HRM models have primarily focused on performance management, these findings show that sustainable practices, which emphasize long-term employee well-being and social responsibility, are essential for fostering engagement. This supports a shift toward viewing sustainability as a core component of HRM theory, challenging older models that may have overlooked environmental and social factors. The findings have important theoretical implications since they link sustainable HRM practices, well-being, and AI technology to employee engagement, advancing the literature on the topic. The findings expand the theoretical scope of HRM by directly connecting sustainability to engagement, implying that the organization's ethical and sustainable practices as well as internal policies and incentives have an impact on employee engagement. The strong correlation between well-being and engagement validates the idea that well-being is a fundamental mechanism in engagement models, which is consistent with theories like self-determination theory (SDT), which holds that people are more likely to be engaged in their work when psychological needs like autonomy, competence, and relatedness are met. By placing well-being at the center, the findings expand on existing engagement theories, highlighting the significance of integrating well-being not just as an outcome but as a core driver of engagement.

This method provides a more comprehensive view of involvement, mirroring organizational studies' growing emphasis on mental health and wellbeing. Furthermore, AI is introduced as a new dimension in engagement theories due to the strong correlation between AI technology and employee engagement. While past models have focused addressed psychological and social issues, these results imply that technology, particularly AI, might facilitate involvement by enhancing decision-making, reducing effort, and creating chances for learning and cooperation. This result contradicts traditional beliefs that have focused too little on how technology affects engagement. By suggesting that AI is more than just a tool but a crucial component affecting engagement, it adds to the growing conversation around AI and human-technology interactions.

Theoretically, this calls for updated models that take into account the technological environment as a significant factor shaping employee behavior and engagement. These three factors sustainable HRM, well-being, and AI technology support a more integrated approach to understanding employee engagement, suggesting that engagement cannot be fully explained by focusing on isolated aspects of the work environment. Instead, a unified framework that incorporates personal well-being, organizational practices (sustainability), and technological integration offers a more thorough explanation of what drives employee engagement.

The findings support the creation of multidimensional engagement models that integrate social, psychological, and technological factors, pushing engagement theory beyond conventional psychological frameworks and suggesting a more systemic view where engagement is the result of the interaction of various organizational and technological elements. Sustainable HRM emphasizes fair treatment, employee development, and environmentally responsible policies; to implement this, organizations should invest in long-term development programs that promote growth and align with sustainable practices; implementing policies that prioritize fairness, diversity, and inclusivity in the workplace is crucial; and integrating sustainability into the company's mission can motivate employees to engage with its goals and values, ultimately

improving engagement and retention. These findings have practical implications for organizations looking to improve employee engagement, and each one offers specific applications that can drive positive outcomes.

Workers are more likely to feel engaged and committed when they believe their organization is accountable and focused on the future, which boosts output and lowers attrition. Employee well-being has a significant impact on employee engagement, indicating that companies that put employee well-being first will have more engaged workers. Both physical and mental health as well as a positive work-life balance are components of well-being. To complement this, organizations might build well-being programs that cover many areas of health, including gym memberships, stress management classes, and mental health days. It's also critical to promote a work-life balance by offering remote work choices, flexible work schedules, and personal time off. Engaging workers can be greatly increased by fostering a culture of support where managers and leaders show concern for them.

When AI technology is properly integrated, it can reduce workloads and create more meaningful work experiences, increasing employee engagement and satisfaction. However, it is important to integrate AI to support employees rather than replace human roles. Employers can automate repetitive tasks, allowing employees to focus on more creative and meaningful work. Using AI tools that provide data-driven insights will help employees make informed decisions. When AI technology is implemented properly, it can reduce workloads and create more meaningful work experiences, increasing employee engagement and satisfaction. Healthier and happier employees tend to be more engaged, which leads to higher job satisfaction, productivity, and organizational commitment.

A more creative and progressive workplace is produced by the careful integration of AI. Organizations should embrace a comprehensive approach that incorporates sustainable HRM, well-being, and AI technologies, acknowledging that employee engagement is multifaceted. This strategy addresses the professional growth and well-being of employees while ensuring that HR procedures are in line with more general sustainability objectives. When AI is thoughtfully incorporated, it should improve rather than diminish the employment experience. To track the effects of these activities and make any necessary strategy adjustments, it is imperative to continuously measure engagement using surveys, employee feedback, and data analytics.

Conclusion and Limitations

This study investigates how artificial intelligence, employee well-being, and sustainable human resource management interact to encourage employee engagement of Fintech Organizations in Rivers State, Nigeria. The results indicate that employee engagement and sustainable HRM practices have a significant positive correlation, which makes it pertinent to integrating sustainability into the HRM framework. A focus on the well-being of employees and enabling organizational policies will lead to improved engagement, which again will contribute to productivity and better retention rates.

Additionally, the study demonstrated that wellbeing actively mediates the engagement process. Higher levels of engagement are likely to be displayed by workers who believe their company cares about their well-being, supporting the claim made by the self-determination theory that

psychological needs are met in order to foster engagement. Another significant factor influencing engagement was the incorporation of AI technology, which demonstrated that businesses can boost employee engagement and job satisfaction by utilizing AI to assist staff members rather than replace them. By putting out a multifaceted model of employee engagement linked to well-being, sustainable behaviors, and technology integration, these findings contribute to the body of literature. An organizational plan to improve employee experiences for long-term organizational outcomes will be provided by this all-encompassing approach.

Even if a great understanding was acquired, numerous study limitations need to be mentioned. While the research has adopted a cross-sectional design, it can only contain data at one moment in time and might not represent the dynamic nature of employee engagement and well-being over time. For a thorough analysis of these interactions, longitudinal research is advised. The use of a convenience sample, which is useful but may limit generalizability to the Nigerian workforce, is one of the study's inherent drawbacks. To improve the study's external validity, future research would employ a more effective sampling strategy. However, because participants may give answers in a way that is socially acceptable, relying solely on self-report measures of employee engagement, well-being, and perceived sustainable HRM practices may introduce biases. This constraint may be addressed by adding objective measurements and/or third-party ratings. Finally, even though the organizations in Rivers State were the focus of this study, geographical variations and cultural backgrounds should be taken into account in future studies. More significant insights into these processes across many businesses and geographical areas would result from this, including the intricate relationships between AI, employee engagement, and sustainable HRM.

Abstract
This study investigates the relationship between human resource management (HRM) practices and deviant workplace behaviour (DWB) among academic staff at the University of Benin, Nigeria. Drawing upon Social Exchange Theory (SET), Organizational Support Theory (OST), and General Strain Theory (GST), the research examines how job security, performance appraisal, and internal career opportunities influence the prevalence of deviant behaviour in a university context. Using a structured questionnaire administered to 327 lecturers, data were analyzed through descriptive, correlational, and regression techniques. The findings reveal a paradoxical positive relationship between job security and deviant behaviour, suggesting that excessive employment protection may inadvertently foster misconduct. Conversely, internal career opportunities emerged as a significant negative predictor of deviance, indicating that transparent and accessible advancement pathways can reduce negative workplace behaviours. Performance appraisal systems showed no significant influence, highlighting systemic weaknesses in current evaluation frameworks. These results underscore the need for Nigerian universities to balance job stability with accountability, redesign appraisal systems for fairness and developmental value, and invest in structured career development initiatives. By aligning HRM practices with institutional goals, universities can foster ethical conduct, organizational commitment, and sustainable academic performance.

Key words: *Deviant Workplace Behaviour (DWB), Human Resource Management (HRM), Job Security, Performance Appraisal, Career Development Opportunities*

Introduction

Deviant workplace behaviour (DWB) is an increasingly worrisome issue within organizations globally (Robinson & Bennett, 1995; Kadiri & Umemezia, 2019; Bennett & Robinson, 2000). It refers to intentional acts or behaviours that violate established organizational norms, posing a

threat to the well-being of both organizations and their employees (Robinson & Bennett, 1995; Bennett & Robinson, 2000). Research indicates that DWB can manifest in various forms, including absenteeism, insubordination, workplace sabotage, and interpersonal aggression (Greenberg, 1990; Spector & Fox, 2005).

In academic institutions, DWB has been shown to undermine the quality of teaching and learning, diminish research productivity, and weaken the overall credibility and effectiveness of universities (Adeoti, Shamsuddin & Mohammad, 2021; Omar, Halim, Zainah, Farhadi, Nasir & Khairudin, 2011). Furthermore, public universities in Nigeria, which already grapple with systemic challenges such as underfunding, infrastructural decay, and bureaucratic inefficiencies, are particularly vulnerable to the disruptive effects of workplace deviance (Christiana & Ogbogu, 2013). A growing body of evidence indicates that workplace deviance behaviour (DWB) is not random; rather, it is influenced by a combination of individual and organizational factors, particularly human resource management (HRM) practices. For example, job insecurity has been shown to exacerbate workplace deviance by fostering stress, dissatisfaction, and employee disengagement (De Cuyper & De Witte, 2006; Probst, 2005). Consequently, employees who perceive their jobs as threatened are more likely to withdraw from responsibilities, exhibit absenteeism, or resist organizational directives, which in turn undermines institutional performance.

Similarly, performance appraisal systems play a critical role in shaping workplace behaviour. Ideally, these systems should offer fair evaluations, constructive feedback, and opportunities for career advancement (Folger & Konovsky, 1989). However, when employees perceive these appraisals as unfair or biased, they may develop resentment, decrease their organizational commitment, and increase deviant behaviours (Greenberg, 1990; Skarlicki & Folger, 1997). In contrast, transparent and equitable appraisal systems enhance perceptions of justice and accountability, thereby reducing misconduct (Colquitt, Conlon, Wesson, Porter & Ng, 2001).

Another important HRM factor that influences workplace behaviour is the availability of internal career opportunities. Ng, Eby, Sorensen, and Feldman (2005) observed that universities that offer staff clear career paths, promotion prospects, and opportunities for professional development tend to foster greater motivation, loyalty, and engagement. In contrast, a lack of growth and advancement opportunities can lead to frustration, disengagement, and, in some instances, even sabotage or withdrawal from critical institutional responsibilities (Narayanan & Murphy, 2017). Recent empirical study in Nigeria further corroborate that the absence of career development frameworks intensifies workplace deviance, whereas well-defined growth opportunities enhance organizational commitment and institutional harmony (Fashogbon, Funso-Adebayo & Ukpabi, 2025).

Despite the importance of these HRM factors, there is a notable scarcity of systematic research investigating their relationship with workplace deviance in Nigerian universities. Existing studies in Nigeria typically concentrate on broader themes such as employee job satisfaction, leadership styles, or general organizational behaviour related constructs (Akinyemi, Ofem, & Ikuenomore, 2012; Christiana & Ogbogu, 2013; Yusuf-Habeeb & Ibrahim, 2017; Fashogbon, Funso-Adebayo, & Ukpabi, 2025). There has been limited focus on how specific HRM practices—namely job security, performance appraisal systems, and internal career opportunities—interact to either mitigate or worsen deviant behaviours, particularly in public universities across Nigeria.

Objectives of the Study

The primary aim of this study is to investigate the relationship between human resource practices and deviant workplace behaviour among lecturers at the University of Benin, located in Benin City. The specific objectives are as follows:

i. To assess the relationship between job security and deviant workplace behaviour among lecturers at the University of Benin.
ii. To evaluate the relationship between performance appraisal and deviant workplace behaviours among lecturers at the University of Benin.
iii. To examine the relationship between internal career opportunities and deviant workplace behaviour among lecturers at the University of Benin.

Research Hypotheses

The research hypotheses formulated in this study are presented in their null form as follows:

H01: There is no significant relationship between job security and deviant workplace behaviour among lecturers in Benin City.

H02: There is no significant relationship between performance appraisal and deviant workplace behaviours among lecturers at the University of Benin.

H03: There is no significant relationship between internal career opportunities and deviant workplace behaviour among lecturers at the University of Benin.

Literature Review

Workplace Deviance

In recent decades, workplace deviance has emerged as a significant concern in organizational studies due to its negative impact on employee performance, organizational culture, and overall well-being. It is defined as voluntary behaviour that contravenes organizational norms and can adversely affect the organization's or its members' interests (Bennett & Robinson, 2000). Deviant workplace behaviour can undermine organizational values through acts such as theft, absenteeism, harassment, or the misuse of resources. Given its potential to disrupt organizational activities, lower morale, and tarnish the organization's reputation, workplace deviance has become a central focus in research on management and organizational behaviour (Kadiri & Umemezia, 2018; Bennett & Robinson, 2000).

Workplace deviance is a multidimensional concept that encompasses behaviours directed toward both individuals and the organization as a whole. Interpersonal deviance refers to negative actions aimed at colleagues, including gossip, social undermining, incivility, verbal abuse, and aggression. Such behaviours undermine trust and cohesion among organizational members (Robinson & Bennett, 1995; Aquino & Thau, 2009). Henle, Giacalone, and Jurkiewicz (2005) connect deviant workplace behaviour (DWB) to job stress, low morale, and diminished psychological well-being. In contrast, organizational deviance directly harms the organization itself. This includes actions such as workplace theft, the misappropriation of organizational resources, absenteeism, and a consistent decline in employee productivity over time. These behaviours pose a threat to financial stability, reduce efficiency, and damage the organization's reputation (Bennett & Robinson, 2000).

The consequences of deviant behaviours permeate various levels of an organization. For individuals, experiencing verbal and physical harassment, incivility, or aggression can lead to emotional exhaustion, heightened anxiety, decreased job satisfaction, and an increased turnover rate (Pearson & Porath, 2005; Henle, Giacalone, & Jurkiewicz, 2005). Team dynamics also suffer as mistrust and fear undermine collaboration and morale, while the overall organizational culture deteriorates due to the erosion of ethical standards and integrity. At the organizational level, production deviance hampers efficiency, while acts such as theft or fraud jeopardize financial stability and stakeholder trust (Bennett & Robinson, 2000). Consequently, workplace deviance not only impacts immediate productivity but also diminishes long-term organizational resilience and sustainability.

Tackling workplace deviance requires comprehensive strategies that combine ethical, cultural, and structural approaches. Clear codes of conduct and policies set expectations, while ethical leadership fosters integrity and demonstrates compliance (Brown & Mitchell, 2010). Fair, transparent performance evaluation systems help prevent perceived injustice, which can lead to deviant behaviour (Colquitt, Scott, & LePine, 2007). Employee engagement programs, open communication, and supportive organizational cultures build trust, aligning staff with core values (Saks, 2006). Additional measures include ethics training, whistleblowing channels, and internal audits for early detection (Treviño, Weaver, & Reynolds, 2006). Taken together, these strategies help create organizational environments that discourage deviance, protect productivity, and promote employee well-being.

Human Resource Practices

Human resource (HR) practices encompass structured activities that enable organizations to manage their personnel effectively, aligning employee needs with organizational goals (Guest, 1997; Noe, Hollenbeck, Gerhart & Wright, 2009). Core HR practices—such as staffing, training, performance appraisal, and compensation—are widely acknowledged as vital for enhancing employee outcomes, including satisfaction, commitment, and productivity (Gould-Williams, 2003; Wright, Gardner, & Moynihan, 2003). In the context of universities, where competitiveness, regulation, and innovation are crucial, HR practices not only maintain workforce effectiveness but also act as mechanisms to mitigate workplace deviance.

Effective recruitment and selection processes play a crucial role in aligning candidates' competencies with organizational culture, which in turn fosters commitment and mitigates behavioural risks (Boxall & Purcell, 2008). In dynamic business environments, continuous training and development are essential, as they equip employees with necessary regulatory knowledge and technical skills while also signaling a long-term commitment from the organization (Noe, 2013). Transparent performance management systems that offer constructive feedback and acknowledge contributions promote motivation and accountability, thereby reinforcing positive workplace behaviours (Aguinis, 2019). Additionally, competitive compensation and benefits are vital for attracting talent, rewarding performance, and cultivating loyalty, especially in industries characterized by high mobility (Milkovich & Newman, 2021). This study focuses on three key HR practices: job security, performance appraisal, and internal career opportunities.

Job Security: This is a critical factor influencing workplace deviance. Insecure environments lead to increased stress, feelings of powerlessness, and counterproductive behaviours (De Witte, 2005;

Greenberg, 2002). In contrast, transparent recruitment processes, ongoing training, and opportunities for career advancement foster a sense of stability and help mitigate misconduct (Rousseau, 2015). Furthermore, promoting open communication and employee engagement builds trust, which reduces the likelihood of deviant behaviour stemming from insecurity (Eisenberger & Stinglhamber, 2010).

Performance Appraisal: Another important factor in understanding deviant workplace behaviour is performance appraisal. Biased or unfair evaluations can generate feelings of resentment and lead to retaliatory actions (Colquitt, 2011; Aquino & Bommer, 2003). Utilizing transparent and objective appraisal criteria, along with collaborative goal-setting, enhances perceptions of fairness and boosts employee engagement (DeNisi & Kluger, 2000). Providing constructive feedback that emphasizes development rather than punishment strengthens motivation, while training evaluators to conduct unbiased assessments fosters accountability and trust (Fletcher, 2011; Grote, 2012).

Internal Career Opportunities: This also play a significant role in influencing behavioural outcomes within organizations. Limited mobility or unclear promotion processes can result in employee dissatisfaction and deviant behaviour (Perry-Smith & Blum, 2010). In contrast, transparent criteria for advancement, effective succession planning, and talent management help to align employee aspirations with organizational objectives (Rothwell, 2010). Additionally, investments in skill development enhance readiness for internal mobility, reinforcing a sense of fairness and reducing the risk of deviant behaviour (DeRue & Wellman, 2009).

Collectively, HR practices function as levers for both performance enhancement and behavioural regulation. By fostering fairness, transparency, and development, they not only strengthen employee commitment but also provide systemic safeguards against deviant workplace behaviours, making them indispensable for sustainable success in Nigerian universities.

Theoretical Framework

The present study is underpinned by three interrelated theoretical frameworks that offer a comprehensive perspective for analyzing the link between human resource (HR) practices and deviant workplace behaviour (DWB) among academic staff: Social Exchange Theory (SET), Organizational Support Theory (OST), and General Strain Theory (GST).

Social Exchange Theory (SET), as articulated by Blau (1964), posits that workplace relationships are founded upon reciprocal exchanges between employees and their organizations. When employees perceive their treatment as fair, respectful, and considerate—elements manifesting through organizational practices such as job security, equitable performance evaluations, and transparent career advancement pathways—they are more inclined to exhibit positive affective and behavioural outcomes. Within the context of the university system, lecturers who view HR practices as supportive are predisposed to engage in organizational citizenship behaviours, thereby decreasing the likelihood of deviant conduct.

Organizational Support Theory (OST), developed by Eisenberger et al. (1986), builds upon SET by incorporating the concept of perceived organizational support (POS). OST posits that employees form generalized beliefs regarding the extent to which their organization values their contributions and prioritizes their well-being. HR practices such as secure employment

arrangements and structured career development opportunities serve as critical indicators of this support. A high level of POS has been consistently correlated with increased affective commitment, heightened job satisfaction, and a reduction in counterproductive or deviant behaviours.

General Strain Theory (GST), proposed by Agnew (1992), introduces a psychological and emotional dimension to the examination of deviant behaviours within the workplace. GST asserts that individuals exposed to stressors or who perceive injustices—such as job insecurity, inadequate recognition, or constrained professional growth—are likely to experience negative emotional responses, including frustration, resentment, or anger. Such emotional reactions can subsequently elevate the likelihood of deviant behaviours as mechanisms of coping or retaliation against perceived organizational deficiencies.

In summary, these theoretical perspectives collectively suggest that the quality of HR practices is pivotal in shaping employee behaviour. Supportive and equitable practices are likely to cultivate prosocial conduct, while perceived inequities and organizational stressors may act as catalysts for deviant workplace behaviour.

Empirical Review

The research conducted by Teimouri, Jenab, Dezhtaherian, and Aghaei (2019) establishes a foundational understanding of how human resource management (HRM) practices—including recruitment, training, evaluation, and compensation—enhance productivity and concurrently mitigate workplace deviance. Further extending this analysis, Malik and Lenka (2020) focused on the Indian public sector, employing qualitative content analysis to identify and prioritize ten HRM practices that effectively counteract destructive deviance. Their findings advocate for an integrated approach, whereby job design, reward systems, and performance management collaboratively function to optimize outcomes.

Advancing this discourse, Daryono, Gunawan, and Udin (2025) explored the interplay of personality traits, organizational culture, and perceived organizational support within the Indonesian context. Their results indicated that traits such as extraversion and agreeableness, when situated within a robust organizational culture, significantly diminish instances of deviant behaviour; however, the perceived support only moderated the culture's influence. In a parallel study, Mullendore (2019) illuminated the inverse relationship between positive perceptions of HRM practices—particularly those promoting employee involvement—and levels of organizational and interpersonal deviance, noting that older employees tend to engage less in harmful behaviours.

In the investigation of emotional and behavioural antecedents to deviance, Goga, Bashir, and Aliyu (2022) identified emotional exhaustion as a precursor to increased deviant behaviour, while Madan, Srivastava, and Gupta (2025) demonstrated that incivility from supervisors exacerbates deviance through mechanisms of exhaustion and retaliatory aggression. Research within univerities by Hidayah, Ayuni, Minrohayati, and Wibowo (2023) reported generally low deviance rates, although such behaviour emerged in environments marked by injustice, dissatisfaction, or poor communication. Conversely, elements like fairness, transparency, and organizational commitment were noted to mitigate the adverse impacts of deviant behaviour.

A study by Adeoti, Oluremi, and Samuel (2020) linked job satisfaction and self-control, derived from social exchange and self-control theories, to a significant reduction in counterproductive work behaviours among faculty members in Nigerian universities. Nura, Lawal and Zayyanu (2024) cautioned that without adequate institutional support, deviance could compromise research quality. A related investigation by Obalade, Obalade, and Mtembu (2023) revealed that honesty-humility and emotionality traits negatively correlate with deviance, suggesting potential utility in incorporating personality assessments into HR practices to diminish misconduct.

Other studies have delved into the motivational and personality dimensions influencing workplace behaviour, as seen in the work of Albusaidi, Islam, Jaaffar, and Ateeq (2024), which indicated that deviance negatively impacts job satisfaction in Omani universities, albeit motivation somewhat mitigates this relationship. In contrast, Alhasnawi and Abbas (2021) posited that narcissistic leadership tends to incite deviance through organizational aggression, with workplace hostility exacerbating this effect.

Sector-specific inquiries have illuminated the multifaceted nature of deviance. Abiona, Adesanya, Oyekanmi, and Ajayi (2021) noted that political and personal deviance in Nigerian research institutes detracts from job performance, whereas production deviance exhibited an unexpectedly positive short-term correlation. Research in the healthcare sector by Okhakhu and Adekunle (2021) discovered that forms of emotional labor, both surface and deep acting, are linked to increased deviance, while authentic emotional expression serves as a protective factor. Tarurhor and Opatayo (2022) identified predictors of deviance among non-academic university staff, citing stress, personality traits, and weak HR systems, while Kareem, Ojeleye, and Sodamade (2022) posited that workplace civility diminishes deviance through enhanced work engagement. Additionally, Obalade and Akeke (2020) asserted that job characteristics, including autonomy, feedback, and role relevance, are significant in reducing deviant behaviours.

The prevailing influence of organizational and interpersonal dynamics on deviant behaviour has also been documented across various Nigerian studies. For instance, Otuaga, Onokala, and Ametepe (2023) highlighted how interpersonal aggression can predict deviance within the telecommunications sector, moderated by honesty-humility traits. Meanwhile, Etodike, Joe-Akunne, and Obibuba (2020) found that unmet psychological contracts often exacerbate deviance, particularly in high power-distance settings. Fatoki and Kobiowu (2020) provided insights into deviance among secondary school students, linking it to demographic influences and family structures. Abang, Okafor, Udu, and Ndidi (2024) illustrated how detrimental HR practices such as salary deductions and delayed promotions disrupt academic stability, fostering deviance. Gadi, Mailumu, and Wash (2024) further affirmed that perceived external prestige enhances job satisfaction, which mediates reductions in workplace deviance.

Additional significant contributions include the work of Odiri (2024), who indicated that forms of workplace incivility, including discrimination and harassment, diminish productivity in Nigerian government sectors, with organizational culture serving as a moderating influence. Ibrahim, Na'ibi, and Usman (2021) highlighted the ramifications of mobbing and bullying on environmental health workers, noting that such practices undermine trust and escalate deviance, thereby adversely affecting public health outcomes. Similarly, Akinwale, Shadare, and Aliyu (2021) found that breaches of psychological contracts tend to magnify deviant behaviour more significantly than

their supportive counterparts, underscoring the complex interplay between organizational practices and employee behaviour.

Materials and Methods

The study was carried out in the University of Benin, Benin City, Edo State, Nigeria. The population of academic staff as of June 9, 2025, for the University of Benin is 1826 (Record & Statistics Unit, 2025). Using Yamane's (1967) formula, which is given as $n = \frac{N}{1+N(0.05)^2}$, the sample size of the study is 327. Therefore, the study was carried out among 327 respondents. A convenience sampling technique was used to select the respondents for the study. Questionnaires were distributed to academic staff in their respective offices, staff cafeterias, union meetings, and at their various departmental and faculty meetings in the university. The data for the study were obtained using a structured questionnaire.

The questionnaire was structured into sections A and B. Section A comprised questions to generate information about personal demographics of respondents, such as gender, age, marital status, educational qualifications, work experience, and job status. Section B comprises questions aimed at eliciting information on deviant workplace behaviour and the HR practices, i.e., job security, performance appraisal, and internal career opportunities. Workplace deviance was measured with the DWB scale developed by Bennett and Robinson (2000). It is an 11-item scale that identifies two broad categories of workplace deviance, i.e., interpersonal deviance (5 items) and organisational deviance (6 items). The human practices scale was adapted from Delery and Doty (1996). The scale contains 12 items that measure the human resources practices dimensions of job security (7 items), performance appraisal (2 items), and internal career opportunities (3 items). All items on the scale were measured using a 5-point Likert-type rating scale: Strongly agree = 5, agree = 4, undecided = 3, disagree = 2, and strongly disagree = 1. Descriptive and inferential statistics were used for data analysis. Descriptive statistics included frequencies and percentages. Correlational and regression analyses were used to determine the relationship between human resources practices (i.e., job security, performance appraisal, internal career opportunities) and workplace deviance on employees' job performance.

Results and Discussions

Table 1: Demographics Characteristics of the Respondents

S/n	Variable	Category	Responses	
			Frequency	Percentage (%)
1	Gender	Male	62	59.05
		Female	43	40.95
		Total	105	100
2	Age	Less than 25 years	0	0
		25 – 40 years	50	47.62
		41-65 years	55	52.38
		66 and above	0	0
		Total	105	100
3	Marital Status	Single	8	7.62

		Married	77	73.33
		Divorced/Separated	20	19.05
		Total	105	100
4	**Educational Qualification**	HND/B.Sc	0	0
		M.Sc/MBA	43	40.95
		Ph.D	62	59.05
		Others	0	0
		Total	105	100
5	**Work experience**	1-5 years	0	0
		6-10 years	0	0
		11-15 years	62	59.05
		16 years and above	36	34.29
		Total	105	100
6	**Job Status**	Graduate assistant	0	0
		Assistant Lecturer	0	0
		Lecturer I	43	40.95
		Lecturer II	30	28.57
		Senior Lecturer	32	30.48
		Associate Professor	0	0
		Professor	0	0
		Total	105	100

Gender Distribution
Out of 105 respondents, **62 (59.05%) were male**, while **43 (40.95%) were female**. This indicates a **male-dominated workforce**, although the gender gap is not extremely wide. The distribution reflects existing trends in Nigerian academia, where males are often more represented in lecturing positions.

Age Distribution
The data reveals that **no respondents were below 25 or above 65 years**, with all participants falling between **25–40 years (47.62%)** and **41–65 years (52.38%)**. This suggests that the workforce is **middle-aged**, with a slight dominance of senior academics. Such a distribution implies a relatively **experienced and mature workforce**, crucial for academic stability and productivity.

Marital Status
The majority of respondents were **married (73.33%)**, followed by **divorced/separated (19.05%)**, and a small proportion were **single (7.62%)**. The dominance of married respondents suggests a workforce with **family responsibilities**, which may influence workplace behaviour, organizational commitment, and job stability.

Educational Qualification
The educational qualifications indicate a highly educated workforce, with 62 respondents (59.05%) holding Ph.D. degrees, and 43 (40.95%) with M.Sc./MBA degrees. No respondents reported holding only a bachelor's degree or HND. This reflects the academic requirement in

Nigerian universities, where postgraduate qualifications (particularly Ph.D.) are a prerequisite for lecturing positions.

Work Experience
The majority of respondents had **11–15 years of work experience (59.05%)**, followed by **16 years and above (34.29%)**. None had less than 10 years of experience. This indicates that the respondents were **highly experienced professionals**, suggesting a **mature and stable workforce** with significant exposure to the academic environment.

Job Status
The job designation distribution shows that **Lecturer I (40.95%)**, **Lecturer II (28.57%)**, and **Senior Lecturer (30.48%)** made up the entire respondent pool. Notably, there were **no Graduate Assistants, Assistant Lecturers, Associate Professors, or Professors** in the dataset. This reflects a **mid-career concentration**, suggesting that the sample was drawn primarily from **lecturers in transition to senior academic ranks**.

The analysis shows that respondents are **predominantly male, middle-aged, married, highly educated, and experienced academics** concentrated at mid-level positions (Lecturer I, Lecturer II, Senior Lecturer). The absence of junior (Graduate Assistant/Assistant Lecturer) and senior (Professor/Associate Professor) ranks indicates a **sample skewed towards mid-career staff**, which may influence findings on workplace deviance, HR practices, and organizational behaviour in Nigerian universities.

Correlation Analysis and Interpretation
This section carried out correlation analysis to examined the relationships between deviant workplace behaviour (DWB), job security, performance appraisal, and internal career opportunities.

Table 2: Correlational Analysis for the study variables

	Deviant Workplace Behaviour	**Job Security**	**Performance Appraisal**	**Internal Career Opportunity**
Deviant Workplace Behaviour	1			
Job Security	0.220	1		
Performance Appraisal	-0.007	0.177	1	
Internal Career Opportunity	-0.311	0.227	0.166	1

Results reveal that job security is positively correlated with DWB (r = 0.220), indicating that higher perceptions of job security may be associated with increased deviant behaviour. While this finding appears counterintuitive, prior research suggests that excessive job protection may reduce accountability and foster complacency, potentially encouraging negative behaviours (De Witte,

2005; Greenberg, 2002). In the Nigerian university context, such a dynamic may emerge from tenure-like systems that make dismissals difficult, thereby weakening deterrence mechanisms.
By contrast, performance appraisal shows a negligible and negative correlation with DWB (r = -0.007), suggesting that appraisal systems in their current form exert little influence on deterring deviance. This aligns with Colquitt (2011), who argued that only fair, transparent, and developmental appraisal systems have meaningful behavioural impacts. Where appraisal processes are perceived as formalities or biased, they fail to shape employee behaviour significantly.

Notably, internal career opportunities demonstrate a moderate negative correlation with DWB (r = -0.311). This implies that when employees perceive fair chances for advancement and mobility, they are less likely to engage in deviant acts. This is consistent with Perry-Smith and Blum (2010), who highlighted that transparent promotion structures reduce dissatisfaction and resentment, fostering constructive behaviours instead of deviance. In the Nigerian university system, where promotion bottlenecks and opaque career pathways are common, strengthening internal career development may serve as a key lever to mitigate deviance.

Further, the interrelationships among HRM practices indicate that job security correlates positively with both performance appraisal (r = 0.177) and internal career opportunities (r = 0.227), suggesting that these HRM practices are interdependent and may reinforce perceptions of organizational support (Eisenberger & Stinglhamber, 2010). A holistic HRM system that integrates security, fairness, and growth opportunities is therefore more likely to cultivate positive behavioural outcomes.

In summary, the findings suggest that while job security may paradoxically foster some degree of deviance, transparent appraisal systems and career advancement opportunities are crucial in mitigating negative behaviours. These results resonate with broader literature emphasizing that HRM practices must be carefully balanced to avoid unintended consequences while promoting fairness and growth within organizations.

Regression Analysis and Interpretation

Table 3: Regression result for the study variables

Variable	Coefficient	Std. Error	t-Statistic	Prob.
Job Security	0.333159	0.101315	3.288355	0.0014
Performance Appraisal	0.001196	0.080812	0.014796	0.9882
Internal Career Opportunities	-0.334612	0.081772	-4.092025	0.0001
C	2.679112	0.447634	5.985048	0.0000
R-squared: 0.185630			Prob(F-statistic): 0.000114	
Adjusted R-squared: 0.161440			Mean dependent var: 2.642424	
S.E. of regression: 0.640510			S.D. dependent var: 0.699453	
Sum squared residual: 41.43552			Akaike info criterion: 1.984246	
Log likelihood: -100.1729			Schwarz criterion: 2.085349	
F-statistic: 7.674067			Hannan-Quinn criterion: 2.025215	
Durbin-Watson stat: 1.56505				

The regression analysis examined the influence of selected human resource management practices—job security, performance appraisal, and internal career opportunities—on deviant work behaviour among academic staff. The model was statistically significant ($F = 7.67$, $p < 0.001$), confirming that these HR practices jointly contribute to explaining variations in deviant workplace behaviour. However, the explanatory power of the model was modest, with an R-squared value of 0.19, indicating that approximately 19 percent of the variance in deviant behaviour is accounted for by the predictors. This suggests that while HR practices are important, other unmeasured organizational and psychological factors also play a substantial role.
The results revealed a significant positive relationship between job security and deviant behaviour ($\beta = 0.333$, $p < 0.01$). This finding implies that employees who perceive their jobs as highly secure may be more inclined to engage in deviant acts, possibly due to a reduced fear of dismissal or disciplinary consequences. In this sense, excessive job security, without corresponding accountability systems, may inadvertently encourage misconduct.

Performance appraisal, on the other hand, did not show a significant effect ($\beta = 0.001$, $p > 0.98$). This lack of significance suggests that appraisal systems within the studied institutions may lack credibility, fairness, or effective enforcement, thereby limiting their capacity to influence employee conduct. In practice, this finding calls for a redesign of appraisal systems to ensure transparency, fairness, and developmental orientation if they are to play a meaningful role in shaping behaviour.

Conversely, internal career opportunities demonstrated a strong and significant negative effect on deviant behaviour ($\beta = -0.335$, $p < 0.001$). This indicates that employees who perceive clear opportunities for promotion and career advancement are less likely to engage in misconduct. Career growth pathways thus appear to function as motivational mechanisms, discouraging deviant behaviour by fostering a sense of fairness, commitment, and future orientation among staff.

In summary, the findings highlight the paradoxical role of HR practices in shaping workplace deviance. While job security may unintentionally promote deviance, internal career opportunities reduce its incidence. Performance appraisal, however, fails to exert any meaningful influence, underscoring the need for institutional reform. For policy and practice, this suggests that institutions must strike a balance between providing job security and ensuring accountability, strengthen appraisal mechanisms, and expand career development opportunities to mitigate workplace deviance and foster organizational integrity.

Discussion of Findings

Our investigation of HRM practices and workplace deviant behaviour revealed three important findings. First, job security showed a modest positive correlation with deviance, indicating that excessive employment stability may inadvertently create conditions for opportunism. This supports Greenberg's (2002) claim that high security, without accountability mechanisms, reduces employee discipline. In Nigerian universities, Abang, Okafor, Udu and Ndidi (2024) found a similar trend: entrenched employment protection combined with weak sanctions led to absenteeism and disruptive behaviours. While job security is crucial for employee well-being, the evidence suggests that in contexts where performance monitoring is limited, stability can paradoxically support deviant behaviour.

Second, the performance appraisal showed no significant relationship with deviance. This finding aligns with long-standing criticisms that appraisal systems often fail to change behaviour when seen as biased or irrelevant. According to Colquitt (2011) and Fletcher (2011), fairness and transparency are crucial to appraisal effectiveness, while ritualistic or politicized systems lack credibility. In African universities, Obalade, Obalade and Mtembu (2023) found that staff view evaluations as just administrative formalities, reducing their motivational power. Similarly, Iqbal, Akbar and Budhwar (2015) discovered that politically influenced appraisal practices in the public sector undermined legitimacy and behavioural impact. The null result here highlights systemic weaknesses in evaluation design and delivery within Nigerian universities, where appraisals often fail to serve as developmental tools.

Third, internal career opportunities came out as a strong negative predictor of deviance, highlighting the importance of growth and advancement pathways. Clear promotion practices are widely linked to lower workplace dissatisfaction and misbehaviour (Perry-Smith & Blum, 2010). Research by Rothwell (2010) and DeRue and Wellman (2009) shows that structured succession planning strengthens employee commitments, helps retain talent, and discourages deviance. Albusaidi, Islam, Jaaffar and Ateeq (2024) found that training and promotion systems improved teamwork and reduced conflict in universities, while Nura, Lawal, and Zayyanu (2024) showed that structured career development reduced the negative impact of deviance on research productivity. This study's strong negative link between career opportunities and deviance suggests that opportunities for progression may be more influential in shaping behaviour than security or appraisal mechanisms.

Overall, these findings show how HRM practices have different effects on workplace behaviour. While job security is important, it needs to be balanced with accountability for performance to prevent moral hazards. Performance evaluations need to be revamped to ensure they are fair, transparent, and relevant for development. On the other hand, internal career opportunities aid in mitigating deviant workplace behaviour, reinforcing commitment and alignment with university goals. For universities in Nigeria, where problems with deviance persist in teaching and research, the results point to the need for targeted HR reforms. Key priorities include strengthening accountability, improving the credibility of evaluation methods, and creating transparent career paths. By taking these steps, universities can reduce deviance and promote a culture of commitment, fairness, and professional growth.

Conclusion, Recommendations, and Policy Implications

Conclusion

This study examined how human resource management (HRM) practices—such as job security, performance appraisal, and internal career opportunities—affect deviant workplace behaviour (WDB) in Nigerian universities. The results show a paradoxical effect of job security, which positively predicts deviant behaviour, implying that too much job stability without accountability can encourage misconduct. Performance appraisal was found to have no significant impact on deviance, pointing to systemic flaws in how performance is evaluated. In contrast, internal career opportunities served as a strong negative predictor of deviance, emphasizing the need for transparent and fair promotion processes to reduce workplace misconduct. Overall, the findings highlight that HRM practices play an important but different role in influencing employee behaviour, with consequences for institutional effectiveness and long-term sustainability.

Recommendations

1. **Balance Job Security with Accountability:** While safeguarding academic staff from arbitrary dismissal is crucial, universities should enhance job security policies with strong accountability measures, such as clear performance standards and disciplinary actions for misconduct.
2. **Reform Performance Appraisal Systems:** Institutions should adopt transparent, objective, and development-oriented appraisal frameworks. Training evaluators, involving academic staff in goal setting, and linking appraisals to professional growth rather than punitive measures can increase credibility.
3. **Strengthen Career Development Opportunities:** Providing clear promotion pathways, succession planning, and continuous training programs can reduce frustration and foster commitment, thereby curbing deviant tendencies.
4. **Enhance Communication and Engagement:** Open communication channels between management and staff, alongside participatory decision-making, can reduce perceptions of unfairness and build trust.
5. **Adopt a Holistic HRM Approach:** Integrating recruitment, training, appraisal, and career development. Balance Job Security with Accountability: While protecting employees from arbitrary dismissal is essential, universities should supplement job security policies with strong accountability systems, including clear performance metrics and sanctions for misconduct.

Policy Implications

1. University Governance: Policymakers and university governing councils should develop HR frameworks that balance protecting staff rights with accountability for professional misconduct.
2. Institutional Sustainability: By emphasizing credible appraisal systems and transparent career development structures, universities can reduce deviant behaviour, improve productivity, and protect research quality.
3. National HRM Policy: Findings highlight the need for a national HRM policy in the Nigerian university system that encourages fairness, equity, and accountability in staff management.
4. Capacity Building Investments: Government and educational regulators should require and support ongoing professional development programs, ensuring academic staff stay engaged and aligned with institutional goals.
5. Anti-Deviance Interventions: Incorporating mechanisms such as ethics training, whistleblowing systems, and grievance redress frameworks into HRM policies can enable early detection and management of deviant practices.

Limitations of the Study and Future Directions

While this study provides valuable insights into the relationship between human resource management (HRM) practices and deviant workplace behaviour (DWB) among academic staff at the University of Benin, certain limitations must be acknowledged. First, the research was confined to a single public university in Nigeria, which may restrict the generalizability of the findings. Different universities—especially private institutions or those in other regions—may have unique organizational cultures, HR structures, and administrative processes that influence workplace behaviour differently.

Secondly, the use of a cross-sectional research design limited the ability to establish causal relationships. Since data were collected at a single point in time, the study cannot account for changes in behaviour or HRM practices over time. A longitudinal approach would have provided a more dynamic understanding of how HR interventions influence workplace deviance in the long term.

Another notable limitation lies in the reliance on self-reported data, which can introduce bias. Respondents may have underreported deviant behaviour due to social desirability or fear of being judged, despite assurances of anonymity. Additionally, the sample did not include senior academic ranks such as professors and associate professors, thereby narrowing the range of perspectives and possibly excluding behavioural patterns unique to those in higher administrative or leadership roles.

Moreover, the study focused on only three HRM variables—job security, performance appraisal, and internal career opportunities. Although these factors are significant, other HR practices such as compensation, employee training, leadership support, and organizational justice were not explored, even though they may equally influence workplace deviance.

To build upon the current research, future studies should consider broadening the scope to include multiple institutions across diverse regions in Nigeria. Comparative studies involving both public and private universities would enhance the generalizability of results and reveal institution-specific dynamics. Longitudinal research designs are also recommended to examine behavioural trends over time and assess the long-term impact of HRM reforms.

Furthermore, incorporating qualitative methods—such as interviews or focus group discussions—could offer deeper insights into the motivations behind deviant behaviours and provide a more nuanced understanding of how HRM practices are perceived by academic staff. Future studies should also include senior academic staff and non-teaching personnel to gain a more comprehensive view of HRM effectiveness and organizational behaviour across different employee categories.

Expanding the range of HR variables is another important direction for future research. Examining areas such as reward systems, leadership style, psychological contract fulfillment, and perceived organizational justice may help uncover additional drivers or inhibitors of deviance. Lastly, future investigations could explore mediating and moderating variables—such as job satisfaction, emotional exhaustion, or personality traits—to better understand the mechanisms through which HRM practices influence deviant workplace behaviour.

Addressing these limitations and exploring the proposed directions will contribute to a more holistic and actionable understanding of workplace deviance in Nigerian universities and inform the development of more effective human resource strategies in the higher education sector.

Abstract
This study examined the relationship between reusable packaging and supply chain sustainable performance in the Lagos State consumer goods industry. The study adopted an explanatory research design; and surveyed seventy- seven management staff of 21 consumer goods companies in Lagos State. The Spearman's correlation was used to analyze data retrieved from respondents. The results indicate that reusable packaging has a strong positive and significant relationship with the measures of supply chain sustainable performance (social performance, environmental performance and economic performance) in the Lagos State consumer goods sector. Therefore, we concluded that the consumer goods sector companies in Lagos State should adopt reusable packaging in order to maintain supply chain sustainable performance in the long run. It was recommended that managers of companies should create product packaging that can easily be reused to lessen the environmental harm that packaging does, as well as plan their manufacturing procedures to provide ecologically friendly products in sustainable packaging.

Keywords: *Reusable packaging, social performance, Environmental performance, Economic performance.*

Introduction

Environmental problems have become increasingly urgent as a result of the expanding influence of global supply chains, particularly in densely populated regions like Lagos State, Nigeria. Consumer goods companies heavily depend on packaging to preserve goods, enhance shelf appeal, and provide necessary product information, which is why this thriving West African commercial and economic hub is experiencing an increase in environmental problems. Unfortunately,

packaging makes up a large portion of environmental waste, which affects pollution levels, waste management systems, and ecological balance. Furthermore, one of the main uses of virgin materials nowadays is packaging (Coelho et al., 2020). Packaging in Europe uses 50% paper and 40% plastic (European Commission, 2022; Geyer et al., 2017). Nowadays, packaging is recognized as a significant source of non-biodegradable, environmentally hazardous garbage. The World Economic Forum (2016) estimates that 4–8% of the world's oil production is used to make plastic. With approximately 161 million tonnes generated yearly, single-use plastic packaging makes almost 40% of all plastic manufactured (Parker, 2018). Over the next few decades, it is anticipated that the usage of single-use plastic packaging will rise in tandem with the explosive growth of e-commerce (Escursell et al., 2021). There are significant worries about the effects that trash generation has on the ecosystem (Isa & Yao, 2013). Planetary limits are seriously threatened by plastic packaging that seeps into the environment, changing the cycles of carbon and nutrients as well as the habitats of aquatic ecosystems, soils, and sediments (MacLeod et al., 2021). Paying attention to packaging that needs to be environmentally friendly is one of the crucial aspects of practicing environmentally friendly behavior (Priambudi & Deliana, 2021).

Achieving UN Sustainable Development Goals (SDG) 12 on enabling sustainable consumption and production (United Nations, 2022), SDG 14 on protecting seas and oceans, SDG 15 on repairing land ecosystems, and SDG 12 on facilitating a shift to the circular economy all depend on preventing needless single-use plastic packaging waste. Sustainable packaging, sometimes referred to as eco-friendly packaging or green packaging, uses environmentally friendly materials for packaging without ever sacrificing the product's quality and guaranteeing the environment's and people's safety. By using environmentally friendly materials for packaging without ever compromising the quality of the product itself, eco-friendly packaging safeguards the environment and public health (Ackaah, Kanton, & Osei, 2022). Reusable packaging methods, like returnable and refillable packaging, are becoming more popular as a way to reduce needless plastic packaging and the pollution it causes. Reusable packaging is packaging which has been created, designed and promoted to carry out several trips in its lifetime by being refilled or reused for the same purpose for which it was conceived. Reusable packaging solutions' ability to cut waste has spurred amazing innovation and heated up discussions. Integrating sustainability into supply chain management can help consumer products companies improve their social and environmental performance and outperform their competitors. Organizations must then successfully rethink their current supply chain activities in order to achieve this sustainability, as well as integrate a sustainability aim into their daily company operations (Akintokunbo & Obom, 2021). Therefore, by investigating the relationship between reusable packaging and supply chain sustainable performance, this study chooses to add to the body of literature. It does this by using consumer goods companies in Lagos State as its data base and measuring supply chain sustainable performance using social, environmental, and economic performance metrics. The main goal of the study was to evaluate experimentally the relationship between reusable packaging and supply chain sustainable performance of consumer products companies in Lagos State.

Concept of Reuseable Packaging

Reusable packaging is packaging which has been conceived, designed and marketed to carry out multiple trips in its lifetime by being refilled or reused for the same purpose for which it was conceived. Over 161 million tonnes of plastic packaging is produced annually, yet only a small fraction of plastic packaging is recycled. "To help eliminate unnecessary plastic packaging and its

associated pollution, interest is growing in reusable packaging systems, such as returnable and refillable packaging. Reusable packaging is packaging which has been designed to accomplish and proves its ability to accomplish a minimum number of trips or rotations in a system for reuse. Designing reusable packaging entails (i) complying with the requirements of all stages in the value chain, (ii) the application of multiple eco-design principles and (iii) acknowledging the intertwined ness of these principles throughout the value chain (Baruffaldi et al., 2019). This results in a complicated design process, where the designer is confronted with multiple trade-offs and balancing stakeholder interests (Long et al., 2020).

Reusable packaging necessitates a value chain approach and the implementation of eco-design principles, in contrast to single-use packaging (Ragaert et al., 2020; Varzinskas et al., 2020). Reusing things instead of recycling them or making new items or packaging from virgin materials saves energy, cuts down on waste, and can even stop littering. Reuse can change the way people think about how they use natural resources and how they relate to the things they buy. This can lead to more conscious consumption and push companies to make products that last longer and can handle as many cycles as possible. Bradley and Corsini (2023) say that there are three primary types of reusable packaging: (1) Refillable packaging that is the main type. People either refill their packaging on the go (in stores or public places) or buy pouches that they may pour into their reusable packaging at home. (2) Main packing that can be returned. After using the packaging, customers send it back to the brand or store so that it can be sorted, cleaned, and restocked. (3) Returnable packaging for secondary and tertiary use. This packing is used to keep things safe while they are being shipped, and it is returned after delivery so that it can be filled again.

Concept of Supply Chain Sustainable Performance

Schaltegger and Burritt (2014) assert that the incorporation of sustainability principles into supply chains necessitates the mitigation of adverse environmental impacts on the natural ecosystem, including resource consumption and the effects of operational processes. Additionally, it entails preventing adverse effects on society at large, while concurrently safeguarding the profitability of enterprises and the supply chain economy (Jiang et al., 2019). Sustainability is a big issue in the business world today, and it's an important way for many companies to stay competitive in the market. Sustainability in the supply chain has three parts: environmental, social, and economic. Purvis et al. (2019) and Svensson and Wagner (2015) talk about how these factors are used in triple bottom line (TBL) methods. The goal of supply chain sustainability is to keep improving the balance of the three bottom lines (TBL). So, any improvements in the performance of a sustainable supply chain may be considered as improvements in the performance of the environment, society, and the economy.

Globalization has changed the economy and the need for development that lasts. This means that firms are responsible for the triple bottom line. Because of this, new standards have been set for how well supply chain management works. These criteria say that supply chain management should not just look at how well the economy is doing, but also how well the environment and society are doing. When managing the supply chain, sustainability should always be a top priority. To reach long-term goals, it's important to have a strong system in place to keep an eye on and manage the performance of supply chain operations. The purpose of adding environmental, social, and economic goals to the supply chain organization's main business activities is to better manage the flow of information, logistics, and money. This means coordinating the buying, making, and

delivering of goods and services to meet the needs of stakeholders and improve the organization's profitability and competitive advantage in the short and long term (Ahi & Searcy 2013). Formentini and Taticchi (2016) asserted that to improve sustainable performance, firms must establish strong integration with their supply chain partners. To keep the supply chain going, all of its members must follow certain social and environmental requirements. Also, being able to accommodate consumer needs and economic needs is also important for keeping the supply chain competitive. This study identified environmental, social, and economic performance as measures of sustainable supply chain performance.

Environmental Performance: According to Longoni and Cagliano (2018), sustainable supply chain managements environmental performance is often times associated with green supply chain management. Environmental performance of the supply chain is necessary for the achievement of green cycle growth mode with low energy consumption as well as low pollution. Environmental sustainability has become a top issue for businesses and governments around the world, as stakeholders recognize that unsustainable practices can have long-term negative consequences for ecosystems, public health, and economic resilience. Environmental performance encompasses practices employed to reduce adverse environmental impacts. Environmental performance measures an organizations capacity to minimize waste pollution, air pollution and degradation of the soil, as well as its ability to implement appropriate waste management practices and reduce or eliminate the use of hazardous and toxic materials. It also includes the capacity to use any advancements aimed at lessening the frequency of environmental disaster and achieving energy savings.

Social Performance: The social bottom line or social performance is the accomplishment of the social mission of the organization in terms of societal interests through the integration of recognized social values and the fulfillment of social obligation. A supply chain that is socially sustainable is aimed at preserving and enhancing social factors while also taking necessary precaution to protect the larger society and various stakeholders in the supply chain (Adesanya *et al.,* 2020; Das, 2017). Das (2017) categorized practices of social performance into employee-centered social performance (ESP) and community-centered social performance (CSP) practices.

Economic Performance: Reducing supply chain cost and improving responsiveness are two major goals of supply chain management that ensures the achievement of increase in profit. From an economic perspective, the primary areas of interest are how businesses manage their cash flow and how goods and services are produced and distributed in relation to needs and desires. (Juan *et al.,* 2019). Sandeepa (2018) stated that elements such as flexibility, reliability, cost of transportation and selection of routes are the important basis for achieving economic profit and customer demand, and they are more closely linked to realizing sustainable development. Also, Fan *et al*. (2016) stated that the emphasis on generating and maintaining long term profits are the main aspects of the economic dimension of sustainable supply chain.

Empirical Review

Eco-friendly packaging has gained global attention as companies strive to align with sustainable practices that address sustainability concerns. Two hundred and seventy-nine (279) questionnaires were administered to the respondents, out of which two hundred and seventy (270) were properly filled and retrieved. Data obtained from the study respondents were analyzed using correlation and

regression analysis. The findings of the study revealed that there is a positive and significant effect of green packaging on consumer buying behavior. Hasan, Islam and Shanta (2024) identified the key factors that actually help enhance the buying intention of consumers towards green packaged convenience goods in terms of mini-pack shampoo, chips, and wallet tissue in Bangladesh. A survey was conducted using a self-structured questionnaire, with data collected from 150 respondents among the users of green packaging using the convenience sample approach. The study's reliability, validity, regression, and correlation were tested with the help of SPSS version 21. Findings of the study revealed that the variables named environment concern, environmental knowledge of green packaging, green trust, and availability have positive impact on consumers' purchase intention towards green packaged convenience items in terms of mini-pack shampoo, chips and wallet tissue. Anucha, Grant and Okechukwu (2018) explored the relationship between green packaging and environmental sustainability in Nigeria. Data were collected from 112 managers and marketers from 14 green companies that packaged their products in biodegradable and recyclable containers. A structured questionnaire was used to obtain data from the respondents. The data collected were analyzed using Spearman Rank Order Correlation with the aid of SPSS version 21.0. The findings showed that there is positive and significant relationship between biodegradable packaging and environmental sustainability. The study also found a positive and significant relationship between recyclable packaging and environmental sustainability. A positive and significant relationship was equally found between packaging optimization and environmental sustainability. Similarly, Caniato et al. (2017) conducted a study on green supply chain management practices among consumer goods companies in Italy, aiming to understand the interplay between eco-friendly packaging and overall environmental performance. A mixed-method approach**,** combining survey data from 200 managers and case studies of three major consumer goods companies actively implementing eco-friendly packaging. The survey data allowed for a broad understanding of trends and common practices, while the case studies provided detailed accounts of best practices and the integration of eco-friendly packaging within supply chain strategies. The study underscored the critical role of regulatory frameworks in encouraging eco-friendly practices. Based on the foregoing, the study hypothesizes that:

H_{01}: There is no significant relationship between reusable packaging and social performance.
H_{02}: There is no significant relationship between reusable packaging and environmental performance.
H_{03}: There is no significant relationship between reusable packaging and economic performance.

Theoretical Foundation

The study is predicated on the natural resource-based view (NRBV) which is an extension of the resource base view (RBV) and is used extensively in the explanation of the reason why firms take up green initiatives and have long been used to explain variations in intra- and inter-firm performance by Barney and Griffin (1992) as cited in Mutua (2023). The NRBV argues that competitive. advantage and strategy can be fashioned from capabilities facilitating economic activities, which are environmentally sustainable (Hart, 1995) as cited in Mutua (2023). It is a competitive advantage theory that suggests that the growth of a company and its ability to stay ahead depend on its relationship with the natural environment. Mutua (2023), posits that for a resource to be rare, valuable, no substitutable and inimitable, it has to be firm-specific, socially complex and causally ambiguous. Therefore, this study is applicable to the study because, the effective integration of reverse logistics, which is an external resource with the sole aim of

reducing pollution as well as ensuring effective product management and a sustainable environment, and can be combined with supply chain competitiveness so as to strengthen the SMEs performance (Li et al., 2019; Wong et al., 2012). This theory provides a framework for Lagos- based companies to view sustainable packaging as an asset that differentiates them in the market while enhancing their environmental impact (Hart, 1995).

Methodology

The study adopted an explanatory research design to examine the relationship between reusable packaging and supply chain sustainable performance of companies in the consumer goods industry. The examination of this study was done at the organizational level. 21 operating companies in the consumer goods constitute the population of the study. The study took a census, and surveyed a total of 81 respondents on a sample frame of 4 respondents per consumer goods company. 77 copies were considered fit for the study. The questionnaire appeared in the form of 5- point Likert scale and data gathered were analyzed using mean, standard deviation, frequency distribution and percentage for the univariate analysis; and the Spearman's correlation for bivariate analysis. The SPSS aided all the analyses.

Data Analyses and Results

Table 1 Distribution for properties of Reusable Packaging

		N	Mean	Std. Deviation
Reusable Packaging X = 3.6494 SD = 1.06910	Our customers use our packages multiple times before been returned.	77	3.6494	1.22223
	Our company enable the collection and resale of reuse packages.	77	3.5714	.97911
	We provide reusable takeout containers and tracking technology to restaurants and homes as a sustainable alternative to single use takeout packaging.	77	3.7273	1.24220

Source: SPSS Output from Survey Questionnaire, (2025)

Table 1 shows the description for reusable packaging. It shows that all the items have a high mean score above 3.0, and also a good standard deviation, resulting in a high variance amongst the measurement items. It also reflects the number of respondents, seventy- seven (77). The high mean score above 3.0 indicates that the consumer goods companies in Lagos State are involved in the practice of reusable packaging to a great degree. Moreso, from the table, among the three (3) question items used to measure the variable it can be seen that question three (3) has the highest mean score of 3.7273. this means that, question 3 has the strongest influence on the variable.

Supply chain sustainability

Table 2: Distribution for properties and measures of supply chain sustainability

		N	Mean	Std. Deviation
Social Performance X = 3.7792 SD = 0.76014	We have improved health and safety practices.	77	3.7532	.94807
	We engage in consistence employee training.	77	3.6364	.48420

	Our company shows concern for visual aspects of the organization's facilities and operations.	77	3.9481	1.06247
Environmental Performance X = 3.9307 SD = 0.79718	Our company has reduced its carbon footprint.	77	3.8312	1.00528
	We have reduced our energy usage.	77	3.8571	.86928
	Our company has lessened the use of toxic and dangerous materials.	77	4.1039	.86731
Economic Performance X = 3.8658 SD = 0.98269	Our company have reduced the cost of energy consumptions.	77	3.9481	1.23433
	Our company has reduced fine on waste discharge.	77	3.7273	.91243
	Our customers are satisfied with the level of service we provide	77	3.9221	1.04839
	Valid N (listwise)	77		

Source: SPSS Output from Survey Questionnaire, (2025)

The distribution for the properties and measures of supply chain sustainability (Table 2), illustrates the extent to which the companies are able to effectively engage in behavior or activities that reflect their social, environmental and economic sustainability considerations and their performance in ensuring related outcomes. From the analysis, it is evident that most of the participants affirm to their experience of the properties, given the mean distributions (x = 2.5) observed for each of them. The evidence indicates that participants identify all stated items as true, thus agreeing to these as characterizing the companies of interest. The analysis on the summaries shows that the related measures of social performance (x = 3.7792), environmental performance (x = 3.9307) and economic performance (x = 3.8658), are clearly reflected in the behavior of the organization; demonstrating that the companies are moderately engaged in activities of social, environmental and economic performance.

Reusable packaging and supply chain sustainable performance

Table 3: Reusable packaging and supply chain sustainable performance

			Reusable Packaging	Social Performance	Environmental Performance	Economic Performance
Spearman's rho	Reusable Packaging	Correlation Coefficient	1.000	.577**	.779**	.772**
		Sig. (2-tailed)	.	.000	.000	.000
		N	77	77	77	77
	Social Performance	Correlation Coefficient	.577**	1.000	.778**	.628**
		Sig. (2-tailed)	.000	.	.000	.000
		N	77	77	77	77
	Environmental Performance	Correlation Coefficient	.779**	.778**	1.000	.765**
		Sig. (2-tailed)	.000	.000	.	.000
		N	77	77	77	77

	Economic Performance	Correlation Coefficient	.772**	.628**	.765**	1.000
		Sig. (2-tailed)	.000	.000	.000	.
		N	77	77	77	77

**. Correlation is significant at the 0.01 level (2-tailed).

From Table 3, it can be observed that there is a correlation coefficient of 0.577** between reusable packaging and social performance, indicating a strong positive and significant relationship between reusable packaging and social performance. Moreso, the probability value (0.000) is less than the critical value (0.05), this shows that there is a strong positive and significant relationship between reusable packaging and social performance. This further shows that reusable packaging can be used to achieve social performance among consumer goods companies in Lagos State. Based on this, we reject the null hypothesis that there is no significant relationship between reusable packaging and social performance of consumer goods companies in Lagos State and accept the alternate hypothesis that there is a strong positive and significant relationship between reusable packaging and social performance of consumer goods companies in Lagos State.

Also, in Table 3, it can be observed that there is a correlation coefficient of 0.779 between reusable packaging and environmental performance, indicating a strong, positive and significant relationship between reusable packaging and environmental performance. Moreso, the probability value (0.000) is less than the critical value (0.05), this shows that there is a strong, positive and significant relationship between reusable packaging and environmental performance. This implies that reusable packaging can be used to achieve environmental performance among consumer goods companies in Lagos State. Based on this, we reject the null hypothesis that there is no significant relationship between reusable packaging and environmental performance of consumer goods companies in Lagos State and accept the alternate hypothesis that there is a strong, positive and significant relationship between reusable packaging and environmental performance of consumer goods companies in Lagos State.

A correlation coefficient of 0.772** between reusable packaging and economic performance, which indicate a strong, positive and significant relationship between reusable packaging and economic performance, can be seen in Table 3. Furthermore, the probability value (0.000) is less than the critical value (0.05), demonstrating that reusable packaging and economic performance are significantly correlated. This suggests even more that consumer goods companies in Lagos state may use reusable packaging to increase economic performance. As a result, we reject the null hypothesis, according to which there is no relationship between reusable packaging and economic performance of consumer goods companies in Lagos State, and accept the alternate hypothesis which states that there is a strong positive and significant relationship between reusable packaging and economic performance of consumer goods companies in Lagos State.

Discussion of Findings

This study examined the correlation between reusable packaging and supply chain sustainable performance of consumer goods companies in Lagos State. The statistical analysis conducted show that reusable packaging relates to supply chain sustainable performance in terms of social performance, environmental performance and economic performance. These findings are in line with the position of Hasan, Islam and Shanta (2024) who identified the key factors that actually

help enhance the buying intention of consumers towards green packaged convenience goods in terms of mini-pack shampoo, chips, and wallet tissue in Bangladesh. The study also supports the view of Igbomor (2024) that there is a positive and significant effect of green packaging on consumer buying behavior.

In the same vein, the current findings are in consonance with the view of Caniato et al. (2017) who underscored the critical role of regulatory frameworks in encouraging eco-friendly practices. Similarly, Anucha, Grant and Okechukwu (2018) posits that there is a positive and significant relationship between recyclable packaging and environmental sustainability. Hence, focusing on the environmental dimension, reusable packaging systems will be most sustainable when packaging loss rates are minimized, and supply chains are localized. The overall economic sustainability of reusable packaging systems requires balancing operational and infrastructural costs, and driving growth through customer retention."

Conclusion and Recommendations

Based on the findings of this study and the findings of previous studies examined, this study concluded that reusable packaging positively and significantly relates with supply chain sustainable performance of consumer goods companies in Lagos State. Implying that reusable packaging supports sustainability gains in terms of social, environmental and economic performance. Thus, by adopting reusable packaging, consumer goods companies in Lagos State will be able to improve social performance, environmental performance and economic performance. Therefore, it is recommended that, managers of companies should create product packaging that can easily be reused to lessen the environmental harm that packaging does. Also, firms should plan their manufacturing procedures to provide ecologically friendly products in sustainable packaging.

Global Sourcing and Supply Chain Performance: A Literature Review

IDADOKIMA, Samuel
Department of marketing
Ignatius Ajuru University of Education
Port Harcourt
Samuel.idadokima.iaue.edu.ng

Abstract
Firms in today's operating environment analyze competition from a supply chain perspective, rather than the tradition individual firm-based view. This paradigm shift is fuelled by the conviction that competition today is no longer about or between individual firms, but between supply chains. Therefore, firms seek to achieve and maintain improved performance and sustained competitive advantage through well-orchestrated and coordinated supply chains, and adopting well-crafted procurement strategies, including global sourcing. The aim of this paper is to determine the link between global sourcing and supply chain performance in terms of supply chain efficiency, supply chain flexibility, supply chain resilience, and supply chain responsiveness. The paper, through an extensive review of literature found out that global sourcing is not just a maneuver activated to gain short term benefits, but a strategic orientation that guides firms' operation. The literature review also reveals that global sourcing confer several advantages on firms, including opportunities to exploit new technologies, and alternative sources of supplies and markets around the world; substantial cost and waste reduction and opportunities to leverage partnerships; achievement of improved business health and sustainability; and enables the consolidation of market positions. The paper thus concludes that global sourcing is a strategic procurement practice that enables supply chain performance; and recommends that firms that require flexible and adaptive, responsive and resilient and efficiently effective supply chains to succeed in the contemporary globalized, manifestly competitive and volatile environment should implement global sourcing strategy to achieve improved supply chain performance.

Introduction

Survival and sustainability in the contemporary business environment progressively requires firms to be competitive and flexible. The challenges of the operating environment require companies to contrive strategic procurement practices that support supply chain performance and confer remarkable competitive advantage. Global sourcing is one such procurement practice. Global sourcing aims to take advantage of global efficiencies in the acquisition and use of raw materials, component parts and finished products. Firms source for several different materials and equipment's in their routine operations; as there is no one firm that have the capacity to "make" everything they require. They rely on suppliers in different parts of the world for essential inputs; and the trend is expected to continue to grow (Zainol, Abas, & Ariffin 2016). This is because globalization and information and communication technology (ICT) has enhanced companies' ability to source offshore; and has highlighted the relevance of sourcing as a driver of competitive

advantage by unraveling how value is often created more efficiently by outside suppliers (Mueni & Moronge, 2018). Firms use external suppliers so that they can fully focus on their own areas of competitive advantage; and reallocate scarce resources to strengthen their core product and market position.

Global sourcing becomes an attractive strategy when required supplies are unavailable in the local market; when the firms' desire to gain access to offshore vendors' capabilities to refine product designs or develop major components according to specification; and to gain better appreciation of cost and quality implications of supplier relationships (Kotabe & Murray, 2004). Thus, global sourcing decisions are designed with a consideration of the interaction between firms' operational requirements and the relative advantage of sourcing from various global locations for long-term gains. Global sourcing is driven not simply by price, but also by quality, reliability, and technology of components and products to be procured (Nitsche, Straube, & Verhoeven 2019).

In this paper, effort is made to explore the concept of global sourcing and also identify its roles in enhancing supply chain performance. The following sections of the paper presents the theoretical foundation of the study, literature on global sourcing, supply chain performance and measures of supply chain performance. Empirical and anecdotal evidence of the influence of global sourcing on supply chain performance is also presented. The paper concluded by summarizing and making inferences based on the positions and reports of prior scholars and made a recommendation for firms that desire improved supply chain performance in today's manifestly challenging business environment.

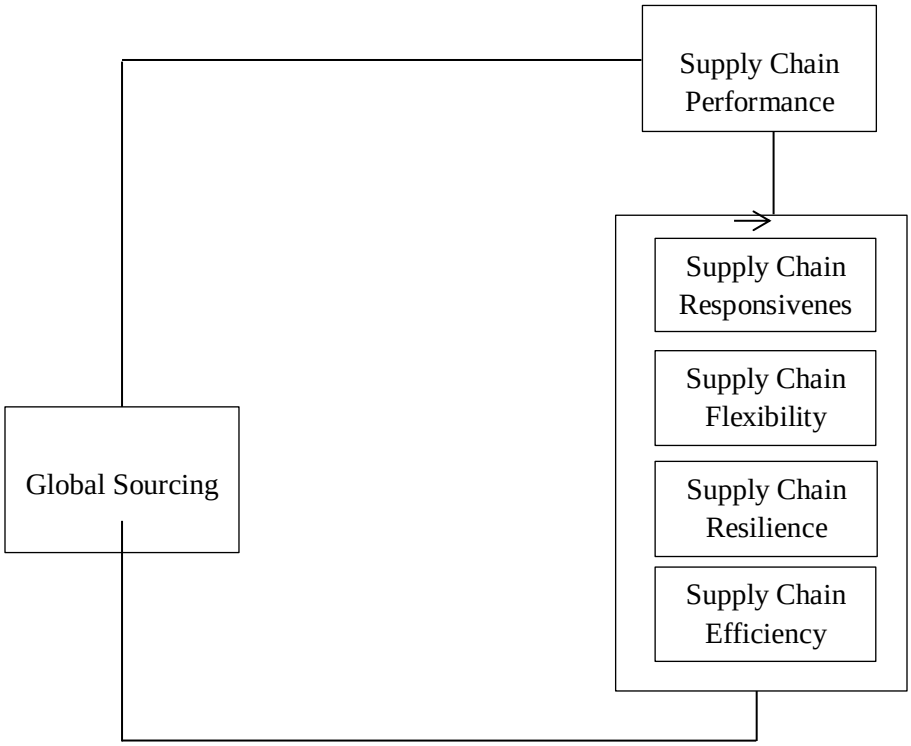

Fig. 1.1: Conceptual model of Global Sourcing and Supply Chain Performance.

and Safety Authority. *International Academic Journal of Human Resource and Business Administration,* 3(9), 434 – 463.

Baseline Theory of the Study

This study on global sourcing and supply chain performance is premised on the absorptive capacity theory (Cohen & Levinthal, 1990) which proposes that firms' amplify their competitiveness through their ability to make sense out of new information or intelligence, internalize the information and incorporate it into their operations, and deploy it in their effort to achieve stated objectives. The theory postulates that companies' innovativeness, ability to adapt and performance improves when they include new knowledge in their operations. The theory implies that firms that are experts in identifying, assimilating and applying new knowledge out-compete firms that are not endowed with such capabilities.

Absorptive capacity theory is founded on the idea that assimilating and utilizing new knowledge requires the firms to build knowledge by: (1) investing in research and development; (2) deriving new knowledge from its present activities, processes and practices; (3) borrowing new knowledge from other companies or research institutes; (4) buying new knowledge by procuring new equipment or technology, hiring new talents, or up-skilling current staff in the use of new methods. Absorptive capacity is helpful to firms because it creating an absorptive capacity for new knowledge in one period helps the absorption of new knowledge in another period; and the successful application of new knowledge is self-reinforcing and motivates firms to continue to absorb new knowledge indefinitely (Miles, 2012).

Zahra and George (2002) in their contribution to absorptive capacity theory identify acquiring, assimilating, transforming, and exploiting as four critical capabilities; and classed them as potential absorptive capacity (acquiring and assimilating) and realized absorptive capacity (transforming and exploiting). Zahra and George (2002) further describe acquisition capability as prior expenditures; existing knowledge base; and intensity, speed, and direction for obtaining new knowledge. Assimilation capability describes operational processes that enable assessment, interpretation, understanding, and learning of new knowledge. Transformation capability is the ability to add, delete, recombine, and reconfigure new knowledge for use; while exploitation capability is the ability to change operational processes and apply new knowledge (Miles, 2012; Zahra & George, 2002).

Absorptive capacity theory is used as an adequate theoretical baseline in the present study because of its bias on the need for firms to "identify, incorporate and utilize new knowledge in their operations intended to facilitate the attainment of preset goals. Essentially, the possession of the ability to sense, incorporate and use new knowledge enable firms to build strong knowledge base. It also facilitate the setting up of a knowledge culture in which individuals, teams and groups conceive the relevance of continuous improvement and using new knowledge to attain goals; perform environmental scanning to identify innovative ways of performing tasks; equip or select experts to adapt and modify new knowledge for the firm; cultivate teams that promote acceptance and use of new knowledge; and monitor the progress of new knowledge, track success, and use that knowledge to maintain the cycle.

Concept of Global Sourcing

Sourcing is an essential aspect of firms' operations that provides value-added benefits. It is a major activity in the procurement process; and involves identifying and selecting suppliers that fulfill the firm's preferences regarding cost, quality, timeliness, dependability and support service (Ayoyi & Odunga, 2015). Advances in technology and globalization have given firms the leverage of increasingly sourcing required input resources abroad; and the term "global sourcing" is used to describe this practice. A company sourcing needed items abroad may be inspired by the desire for knowledge, expertise, and better quality and standards in their operations and in the products they make (Handfield et al., 2015). The search for more competitive prices and efficiency in the acquisition of required resources also increase the pace of global sourcing and has made it an important procurement practice ((Alagarsamy et al., 2021).

Wynstra et al. (2019) observe that the procurement function has become a central and strategic business activity that handles the firm's supply base and supplier relationship; as well as the multitude of stakeholders in multi-tier supply networks (Choi & Krause, 2006). The job of the procurement manager is made even more complex and tasking, as advancements information and communication technology and rapid globalization renders national boundaries useless in insulating firms from global competition. These trends have also orchestrated a "shortened life cycle for most products" and no longer give companies the latitude to remain ethnocentric in their efforts to secure the best sources of supplies of required materials and services at the most competitive prices and terms of business (Mani et al., 2016; Handfield et al., 2015). Companies therefore assume a polycentric orientation in their sourcing efforts, and approach the entire world as a market from which to identify, select and engage with suppliers. The concept of global sourcing allow firms to "slice up activities" in their value networks and distribute them to locations where they can be sourced more efficiently. The idea of global sourcing has thus gained wide acceptance and application among firms, especially in developed countries (Lin, 2020) and has been accorded several aliases, including, global value chain, offshoring, globally distributed activities, and global factory.

The critical role of global sourcing in causing radical changes with respect to how companies undertake business operations is well-documented (Lin, 2020). Cost reduction (Ellram et al., 2008), access to global knowledge, skill and innovation (Lewin et al., 2006), and organizational flexibility (Massini et al., 2010) have been acknowledged as key benefits that entice firms to engage in global sourcing. Nonetheless, companies are increasingly come to terms with the fact the global sourcing engender complexities and drives up costs and fails to capture the value expected from global value networks (Jha et al., 2018; Larsen et al., 2012). Mihalache and Mihalache (2020), Fainshmidt et al. (2020, as cited in Lin 2020) and Larsen (2016) provides that global sourcing strategy involves an optimal degree of disaggregation of value network activities and dispersion of those activities geographically and organizationally. Sako (2006) suggests that a "decision on the degree of disaggregation is informed mostly by the traditional classification of core vs. non-core activities and the concept of modularity in business processes," while studies on the "degree of global dispersion and location choices draw on the international business literature concerning a thorough consideration of managing across physical, cultural, linguistic and institutional distance." Mihalache and Mihalache (2020) and Nieto and Rodríguez (2011) on their part states that governance decisions (outsourcing versus sourcing internally) are mostly examined from the lenses of transaction cost economics.

Supply Chain Performance

The performance of businesses firms, which essentially, is a reflection of how they performed, or are a performing, with respect to attaining objectives, fulfilling missions, and operating based on core values has consistently been a focus of business theorists and practitioners. This is largely due to the notion that a firm's ability to survive, prosper and attract investors' interest is hinged on its performance records and future performance potentials. A company's performance could be measured in both financial and non-financial terms, and such measurement criteria are expected to represent key performance indicators that are universal in the firm's industry (Chen & Paulraj, 2004; Gawankar et al., 2013). Nevertheless, companies realize that the goodness or badness of their business performance is strongly linked to the performance wellness of the supply chain they depend on. Hence, increased attention is accorded supply chain performance.

A supply chain is a network of independent businesses and individuals that undertake critical activities that are directly or indirectly instrumental to fulfilling customers' requirements by facilitating movement of product from sources of supplies of input material to the delivery of finished products to users. Supply chains are galvanized to satisfy customers' needs and in the process, generate profits for the participants in the chain (Marwah et al., 2014). Supply chain performance is thus conceived as the level of effective efficiency with which a supply chain meets customers' needs of product availability, responsiveness, ability to deliver desired variety, capacity utilization, and on-time delivery of customers' orders (Wachira et al., 2022; Gunasekaran et al., 2004). Supply chin performance crosses company boundaries because it includes basic materials, components, subassemblies and finished products, and distribution through various channels to the end customer and also crosses traditional functional lines. Supply chains are pliant; they consistently adjust to changing supply and demand structure of the products they handle (Douglas, 2004). A firm's supply chain is cardinal to its business wellness; this is truer now that competition in the business world is increasingly shifting from a focus on individual firms to supply networks.

Supply chain performance also measures the overall operation level of a supply chain, the nodes within the supply chain, and the cooperation between nodes in the supply chain (Hervani et al., 2005). A comprehensive approach to supply chain performance appraisal thus embraces a wide array of performance parameters at the strategic, tactical, and operational levels. Strategic level indicators of performance look at the level of conformance to the firm's supply chain goals, stimulate decisions-making at the top echelon of the firm, and determine the adoption or modification of corporate policies; tactical level metrics of performance focus on optimal resource allocation and comparing actual performance against expected performance levels; while operational level metrics are concerned with the daily or routine activities of the firm (Wachira et al., 2022; Wagner & Bode, 2008).

However, Deshpande (2012, as cited in Alagarsamy et al., 2021, Aggarwal et al., 2020) summarized supply chain performance measures into operational, tactical and strategic levels measures; and grouped optimal capacity utilization, flexible systems, material accuracy, short lead time, quality assurance, defect-free deliveries, and product availability and delivery capability as operational level measures; inventory management, cost control, responsiveness to customers' demands, coordinated product flow, inventory optimization, product development cycle time, and process planning as tactical level measures; and effective distribution planning, supply chain responsiveness, supply chain flexibility, supply chain costs and assets management as strategic

level measures. Thus, the current study adopts supply chain responsiveness, supply chain flexibility, supply chain resilience and supply chain efficiency as operational, tactical and strategic level measures of the supply chain performance.

Supply Chain Responsiveness

Satisfying the requirements of buying firms is one of the many challenges supplying firms face in today's volatile business environment (Jagan et al., 2019). This challenge is amplified by the shift in focus of competition from individual firms to entire supply chains. Thus, supply chain management takes on a vital role in sustaining firms by more effectively organizing activities from supplier to the end-users (Gunasekaran & Kobu, 2007). Since a supply chain is concerned with coordinating the full gamut of the business operations of firms from sourcing and obtaining raw materials to manufacturing, and distribution and customer service; supply chains are challenged to improve their performance in order live up to the expectations of customer firms. This however, requires the supply chain to be responsive to customers' requirements. Responsiveness is an emergent supply chain management notion that spans multiple factors included in a firm's business activities which enable firms to exploit business opportunities, build brand vitality, and expeditiously meet customers' demands in a rapidly shifting environment (Helt et al., 2005, cited in Arimie & Nadube, 2019).

Responsiveness is the ability of a firm to respond to customers' needs in terms of quality, speed and flexibility (Asree et al., 2010); which represents a competitive capability of a firm (Nwulu & Ateke, 2018). Responsiveness may be viewed from service marketing and operations management perspectives. The service marketing perspective looks at responsiveness as the willingness to assist customers or provide timely solutions to customers' needs or problems; while from the operations management perspective, responsiveness is relates to the speed and variety of products offered to customers. Herein, we adopt an integrated perspective, and adopt the definition of responsiveness as a firm's capacity to exhibit flexibility in providing customers' requirement timeously, while maintaining quality; as well as a willingness to help customers in the value delivery processes (Nwulu & Ateke, 2018).

Responsiveness, in general terms, has been shown to positively improve overall firm performance by increasing market share and financial performance (Aslam et al., 2018). Meanwhile, some studies have included responsiveness measures in operationalizing firm operational performance (Huo et al., 2018). Nevertheless, Wong and Hvolby (2007) question firms' reactive approaches in cases of extreme demand variation, uncertainty, and seasonality, and called for "coordinated response" to manage and shape customer demand patterns. Overall, extant literature converges on (i) the effectiveness of actions, (ii) timeliness, and (iii) response to market stimuli as three essential properties of responsiveness. In the current study however, responsiveness is treated unidimensionally; and as a measure of supply chain performance.

Supply Chain Flexibility

To achieve improved visibility, minimize uncertainty and facilitate informed decision-making in good time (Williams et al., 2013), companies that form nodes in a supply chain develop supply chain-wide flexibility that facilitates better response to changing buyers' requirements and other environmental vagaries. Upton (1994, as cited in Jafari et al., 2022) provides that supply chain flexibility is the ability of the supply chain to react seamlessly to change without suffering

outstanding time, effort, cost and performance penalties. Supply chain flexibility is a viable supply risk management tool that enables adequate and appropriate response to endogenic and exogenic uncertainties, and which possess the potential to disrupt business operations in the supply chain (Reichhart & Holweg, 2007). The earliest constructions of flexibility regard it mostly as an internal capability that enables firms to optimize their production capabilities in reaction to customers' requirements (Delic & Eyers, 2020). Flexibility emerged as a mainstream manufacturing strategy to address the rapid and dramatic changes in customer expectations that characterized 1990s (Jafari et al., 2022); and from that time, the concept got wide adoption due to its linkage to successful response to challenges emanating from product customization (Novais et al., 2019) and demand volatility (Song et al., 2018).

Flexibility is a multidimensional construct (Singh & Sharma, 2014) that has evolved from a product centered idea to a process and system-wide concept (More & Babu, 2011) and, now used in the domain of supply chain management (Rojo et al. 2018). In manufacturing contexts, flexibility is pivotal to achieving customer responsiveness (Delic & Eyers 2020), while in supply chain management contexts, flexibility is developed to as a capability to facilitate firms' rapid reaction to internal and external vagaries (Williams et al. 2013). Flexibility development efforts in supply chain management traverse internal functional areas and activities organisational boundaries (Gosling et al., 2013). It is a combination of different types of flexibility that customers and is a shared responsibility of various functional units and different nodes in the supply chain.

Supply chain flexibility has been viewed as a proactive strategy adopted by manufacturing firms to support processes and improve product availability in a fast changing marketplace (Li, et al., 2017; Purvis et al., 2014). Choi and Krause (2006) contend that when handling demand and seasonality related challenges, firms often scarcely find solution within their internal systems; rather, solution is mostly found with suppliers. A flexible supply chain allow firm in the chain to swiftly and effectively create new products to anticipate market needs, minimize stock-outs, reduce lead-time, and support product customization (Wagner et al., 2018). Jafari et al. (2022) states that supply chain flexibility contributes to developing flexibility competences in other processes across the supply chain, which results to better performance of all the partners in the supply chain. Tachizawa and Gimenez (2010, as cited in Jafari et al., 2022) suggests that a flexible supply chain that stems from either a diversified supply base or long-term resilient relationship with a single supplier could enable firms respond swiftly and effectively environmental vagaries.

Supply Chain Resilience

Supply chain resilience is an infant, and yet to be fully explored aspect of supply chain management research, even though Christopher and Peck (2004) state that it is currently ascending rapidly. Rodríguez-Sánchez et al. (2019) contend that continuous shifts in market forces have challenges firms to equip for survival and prosperity in the face of uncertainty. The turbulence of business contexts have further accentuated the imperatives of building resilience within firms that desire to understand and respond to crisis and disruptive situations (Kantur & Iseri-Say, 2012). Resilience is a word derived from the Latin "resilere" which means "to spring back." Resilience is thus used to describe the capacity to rebound or stage a "come back" from adversity, uncertainty, conflict, failure etc. (Linnenluecke, 2017). Thus, resilience is a capability that enables organism, systems, materials, entities, firms, etc. to react to stressors, adverse conditions or unexpected disruptions and emerge stronger or better (Lengnick-Hall et al., 2011).

The concept of resilience has become central to several other fields of study including cultural and social anthropology, psychology, economics, emergency management, organizational studies, behavioural studies, healthcare systems (Ateke & Nwulu, 2018) and supply chain management. The concept first appeared in organizational studies in the late 1980s through the seminal work of Wildavsky in 1988 and became widely used in various aspects of organizational studies (Akhigbe & Onuoha, 2019; Ateke & Nwulu, 2018; Ebenuwa, 2022). In organizational studies literature, resilience has been constructed as the ability of a firm, its units, and systems to reinvent themselves after adverse conditions occasioned by change, their capacity to respond to, and rebound from uncertain conditions (Ebenuwa, 2022; Ateke & Nwulu, 2018; Harcourt & Ateke, 2018); s well as their ability to react rapidly to disruptions. This implies that resilient firms anticipate, prepare for, respond and adapt to gradual and abrupt disruptions in the operating environment without losing their functional capabilities and remain fit for purpose over the long term (Ateke & Nadube, 2017). Britt et al. (2016) inferred that resilience is an essential competence for modern firms and one of the inherent characteristics that determine success in today's business world.

In the present study, resilience is used to mean the ability of supply chains to cope with changing requirements of buyers and environmental disruptions, overcome adversity and operate adaptively, and rebound from serious set-backs. Put differently, supply chain resilience is the positive ability of supply chains to recover rapidly, overcome, respond or otherwise adapt to disruptions, and withstand disturbance without suffering remarkable misalignment in self-organized processes and structures. This is line with the conception of resilience as "a system's ability to continue to perform and meet its objectives amidst adverse conditions" (Barasa *et al*., 2018, cited in Ateke & Nwulu, 2018). The business environment is challenging, and present threats and opportunities. Firms therefore require resilient supply chains that could enable them remain gain or maintain desired competitive positions (Harcourt & Ateke, 2018). Furthermore, supply chain operations frequently encounter sudden and dramatic shifts that often register far reaching adverse effects. Resilience is thus required to keep them fit for purpose, regardless of changing conditions that create uncertainties and disrupt operations.

Resilience is multidimensional, and scholars identify situation awareness (Lee *et al*., 2013), coping with change (Zhang & Liu, 2012), adaptability and resilient ethos (Stephenson et al., 2010) as indicators of the concept. This according Qrunfleh and Tarafdar (2014) implies that a truly resilient supply chain must be conscious of its operating environment and be able to build and maintain profitable relationship with partners. A truly resilient supply chain must also be highly adaptive. Its operational processes and practices must be nimble and capable of responding seamlessly and timeously to environmental shifts. Additionally, a resilient supply chain must be able to cope with change and maintain its operational capabilities under different circumstances. Furthermore, true resilience will require that supply chains to function effectively, irrespective of disruptions in the operating environment; they must be able to create and deliver consistent value to supply chain partners always. Finally, a supply chain must develop a culture of resilience that enables it to cope with shocks and rebound from setbacks better and stronger; and drive or enhance the robustness of firms in its network.

Supply Chain Efficiency

Efficiency in supply chain operations relates to optimal resource utilization and cost and waste reduction (Nwokah, 2006). Efficiency is a metric used to measures the output of a system from each unit of input (Maheswari et al., 2006). Output is what is produced, while input represents the resources that go into the production. Traditionally, efficiency is an aspect of the productivity discourse; and addresses attempts to minimize cost of operations and reduce wastages (Sodhi et al., 2009). In the view of Weber (2002, as cited in Nwokah, 2006) by improving efficiency, costs of operations are controlled in order to cause an increase of return to shareholders. The concept of efficiency thus focuses on improving a system's processes to run on less cost, minimize resource consumption, and reduce wastage, while providing consistent quality of services. It is not just about achieving goals but streamlining operations to deliver better products at better prices and to reduce unnecessary expenses (Vereecke & Muylle, 2006). Efficiency is paramount to the success of a supply chain. Through efficiency, processes are simplified; resources are freed for alternative used, while growth and profitability is achieved (Youn et al., 2013).

Companies strive to become more efficient and less wasteful in their operations. One avenue through which they pursue this goal is their supply chain; and to measure the performance of their supply chains, companies resort to several key performance indicators (Vereecke & Muylle, 2006). Efficiency, an essentially internal standard of performance that measures of how best, financial, human, technological and material resources are harnessed is one of such metrics (Arawati, 2011). In supply chain contexts, efficiency is the ability of a supply chain to use resources, technology, and expertise in ways that minimize costs and wastages and maximize profits. The goal of an efficient supply chain is to save money and maximize profits by optimizing processes and stages.

Globally, supply chains gear up to operate efficiently. But efficiency alone is not enough; they must also be effective. Effectiveness refers to outward activities and results of the company and its responsiveness. Sudden events like change in consumer requirements and natural disasters have the capacity to undermine even the most efficient operations. Therefore, operational effectiveness and responsiveness provides a supply chain with the flexibility required to respond swiftly to dramatic events and remain strong (Vereecke & Muylle, 2006). In essence, a supply chain's efficiency can hardly be improved, without a consideration of its effectiveness.

Efficiency is a desired goal of supply chains and partner firms in the supply chain. Efficiency is thus an important factor that affects a supply chain's ability to deliver profits and ensure sustainability of partner firms (Jafari et al., 2019; Youn et al., 2013). This implies that a supply chain's overall efficiency and performance are intertwined. Efficiency is multidimensional, and comprises productive or technical, allocative and cost or economic efficiencies (David & Ernest, 2017, cited in Abiodun et al., 2022) as first tier indicators. Single or multiple inputs and outputs are required to compute technical efficiency; while the prices of inputs are required to compute allocative efficiency (Concetta *et al*., 2018). To determine economic efficiency, technical efficiency and allocative efficiency are multiplied. At a lower level, indicators of efficiency include cost reduction, reduced lead or order cycle time, waste reduction, optimal resource utilization (Maheswari et al., 2006) among other. This study however uses efficiency unidimensionally, and as a measure of supply chain performance.

Empirical Review

Strategic procurement management practices are many, and they are varied. Every reasonable long-term oriented broad-based policy a buying organization institute or action a procurement professional undertake with the hope of causing significant improvement in the firm's supply chain may be deemed a strategic procurement practice. Such practices must however, also inform improved business performance and confer competitive advantage (Li et al., 2007). The commonest of these practices include partnership with global sourcing, outsourcing, lean inventory, use of technology, supplier rationalization, information sharing, supply risk mitigation, among others (Giathi et al., 2021). Scholars converge in the view that efficiently executed strategic procurement practices build supplier relationships, facilitate logistics integration, and encourage inter-firm communication (Zainol et al., 2016).

Global sourcing for instance, which emerged in response to increased globalization that has upped the competitive pressure on firms everywhere; and has transformed the way businesses operate, is being practiced by firms with the expectation of achieving competitive differentials. The challenge to respond swiftly to customers' need for product variety, and rush to adopt technologies that facilitate customer acquisition has all conspired to intensify competition among various players (Zainol et al., 2016). In this unfolding milieu, the performance of firm's supply chain constitutes a significant factor that enables the firm stay ahead of competition. Thus, sourcing required materials abroad to take advantage of opportunities to cut cost, access better quality materials, as well as enjoy timely delivery of materials, dependability and support service from offshore suppliers (Ayoyi & Odunga, 2015) has been a major motivation for global sourcing.

Companies increasingly implement global sourcing as a procurement strategy to obtain required inputs from the global market in the expectation of obtaining higher levels of efficiency (Kotabe & Murray, 2004). Global sourcing aims to reduce production costs and wastages while maintaining or improving quality of products, and achieving long-term sustainable deliveries (Lin, 2020). Thus, global sourcing stretches beyond just searching for global suppliers of required materials and services to include all efforts made to improve disparate aspects of the firm's operations, including supplier selection and performance, speed to market, estimation of product costs, trade compliance and auditing (Jha et al., 2018; Larsen et al., 2012).

Global sourcing enables the exploitation of new technologies, alternative sources of supplies and markets around the world (Kotabe & Murra, 2004). Loftus (2007) substantiates the role of global sourcing in supply chain performance by stating that frontline firms on the journey to superlative performance accelerate global sourcing strategies with a view to substantially reducing costs and wastages; and leveraging partnerships to expand the value of their brands. They exploit sourcing opportunities in low-cost countries to improve their gross margins; and combine low-cost contract manufacturing and "buy-brand-sell" strategies to spur new growth by extending into complementary business interests. Tan (2001, as cited in Alagarsamy et al., 2021) states global sourcing provide firms the opportunity to access knowledge, expertise, and better quality materials. Global sourcing is fuelled by the ideas that improved performance of firms in today's business world depends on clear and effective procurement management practices (Mani et al., 2016) that explore all possible avenues to achieve improved business health and sustainability. More so, literature further provides that global sourcing improves supply chain performance in terms of

efficiency, responsiveness, resilience and flexibility and enable consolidation of market position (Mani et al., 2016; Handfield et al., 2015).

Summary, Conclusion and Recommendations

Sudden and gradual events often reveal supply chain vulnerabilities, disrupt companies' operations, and birth economic dislocations. Companies desire to operate within efficient, flexible, adaptive, resilient and responsive supply chains that foster survival and sustainability. They have therefore become highly motivated to undertake concerted efforts to build and develop networks of upstream suppliers and downstream distributors to evolve truly performing supply chains. Today's buyers are fickle; their preference, values and interests change rapidly. Firms must however, be calibrated to always respond promptly and adequately to changing buyers' requirements amidst the dynamism and volatility of the competitive operating environment. Firms are increasingly coming to terms with the reality of the contemporary business world, and are appreciating the fact that the competition to achieve better business health now mostly contested through their supply chains than on individual firm basis. So, they contrive various initiatives and engage in several procurement practices, including global sourcing, to boost the standing of their supply chains, and then, garner the benefits of the supply chain to improve their own business performance.

Global sourcing is spurred by globalization of markets that has opened up emerging markets for exploitation by both buying and selling firms. Companies engage in global sourcing strategies in their business activities; and focused on building collaborations with value chain partners in the hope of achieving superlative supply chain performance. Through global sourcing, companies improve the performance of their supply chains and fulfill their individual need for adaptive and responsive business operations. The advent of global sourcing has not only bestowed the ability to marshal required technology, knowledge, expertise, materials, components, and subassemblies, but has also provided firms with opportunities to reduce cost, optimize inventory and maximize capacity utilization. In view this submission and the positions and reports of prior scholars, the paper concludes that global sourcing as a strategic procurement practice enables supply chain performance in terms of responsiveness, flexibility, resilience and efficiency; and recommends that firms that require flexible and adaptive, responsive and resilient and efficiently effective supply chains to succeed in the contemporary globalized, manifestly competitive and volatile environment should implement global sourcing strategy to achieve improved supply chain performance and overall competitiveness.

Abstract
The study examined the influence of Data Accuracy on Information Value of Telecommunication Firms in South-South, Nigeria. The target population for this study comprised all Telecommunication Firms in South-South, Nigeria while the accessible population for the study comprised four (4) Telecommunication Firms in South-South, Nigeria. The study adopted a census study because of the small size of the study population hence; there was no need for sampling. However, five (5) managers were drawn from each of the Telecommunication Firms in South-South, Nigeria that constituted the study respondents. In all, one hundred and twenty (120) managers constituted the respondents for the study. One hundred and twenty (120) copies of structured questionnaire were administered to the respondent while one hundred (100) copies were retrieved. The simple Regression Analysis was used in testing the various hypotheses in other to ascertain the influence of the predictor variable (Data Accuracy) on the criterion variable (Information Value). The result of the analysis revealed that Data Accuracy significantly and positively had an influence on Information Value of Telecommunication Firms in South-South, Nigeria. Remarkably, sequel to the obtained findings, the researcher concluded that Data Accuracy significantly and positively influenced Information Value and thus recommended that Telecommunication Firms in South-South, Nigeria should improve on the accuracy of their data sets in other to enhance the value of their information.

Keywords: *Data Accuracy, Information Value, Decision Value and Usability Value*

Introduction

Information value is defined as the increase in expected value or benefit that the manager gets for having obtained the right information. The value of information (VoI) is a decision analytic method for quantifying the potential benefit of additional information in the face of uncertainty. Simply put, your data today holds more value than your data tomorrow. This is the principle behind the time value of information. The user of information gives value to the piece of information when the information is used. The purpose of testing, computer modeling, or any other information generator is to provide information and analysis so that a sound decision can be made. When the information does not match the decision, or the information is not available in a timely fashion, bad decisions are made (Baio & Russo, 2009).

Value of information is a methodology with formal definitions in the field of decision analysis that can be particularly useful in identifying desirable ways to improve the prospective outcomes for the chosen course of action. While basic decision analysis with expected utility approaches allows decision makers to identify the best course of action when faced with a situation of uncertainty, Value of information provides guidance on how decision makers might invest in reducing that uncertainty before selecting a course of action. Furthermore, Value of information is defined as the increase in expected value that arises from making the best choice with the benefit of a piece of information compared to the best choice without the benefit of that same information. Value of information is the amount that could be paid to obtain the information, whereby the decision with information would result in the same certain equivalent value as the decision without information and without incurring the cost of obtaining it. It is possible for information to have value even if no specific decision problem has been modeled. For example, information can have entertainment value, or information can help to keep order. The value of information is defined as the expected utility gain by obtained (conditional) or predicted (expected) information including their costs and consequences with the difference of the costs and consequences of the information (Raiffa & Schlaifer, 1961).

In theory, value of information can be used to assess the value of any piece of information that helps to improve the estimate of one or more alternatives' performance on one or more criterion. In some cases, resolving uncertainty prior to making decisions has little or no actual value in a particular context, while in other cases, resolving uncertainty may be the primary enabler of value in a situation and not necessarily in a way that is intuitively obvious. Value of information improves the ability to manage that risk by focusing resources on monitoring those parameters whose value might most affect the relative desirability of alternative strategies to secure the system. Furthermore, by guiding decision makers to obtain information that reduces negative surprises when practical, value of information can improve the robustness of the selected alternative.

Data Accuracy is one of the main dimensions of Data Quality; it measures the degree to which data are correct. Knowing the accuracy of an organization's data reflects the level of reliability it can assign to them in decision-making processes. Several studies have identified Accuracy as the key dimension of Data Quality and the hardest to assess (Motro & Rakov, 2018, Batini, & Scannapieco, 2016). Knowing beforehand the Accuracy of their data brings many benefits to organizations. Indeed, the decision-making process is improved when we know the degree of confidence that can be attributed to the data. On the other hand, inaccurate data can lead to

erroneous conclusions and can significantly compromise a range of decision-making processes which can lead to lost opportunities, lost revenue, strategic mistakes, etc. Thus, evaluating data accuracy is a process that requires planning before any data exploitation (Mylavarapu, Thomas, & Viswanathan, 2019). This paper therefore examined data accuracy and information value of telecommunications firms in South-South, Nigeria.

Theoretical Foundation (Absorptive Capacity Theory)

Absorptive capacity theory examines the extent to which a firm can recognize the value of new external information, assimilate it, and apply it toward achieving organizational goals (Liu, Zhang, & Hu, 2005). The theory assumes that absorbing new knowledge can help an organization become more innovative and flexible and achieve higher levels of performance than it would without absorbing new knowledge. The theory also assumes that firms that have higher abilities for absorbing new knowledge will have a competitive advantage over firms with lower abilities. A firm's technical knowledge tends to come from four sources. (1) The firm conducts its own research and development (R&D). (2) The firm derives new knowledge from its own current manufacturing operations. (3) The firm borrows new knowledge from other organizations or other sources. (4) The firm purchases new knowledge, such as through buying new equipment, hiring new knowledgeable people, or paying a consultant to train individuals in the use of a new method.

The theory assumes that organizations require a knowledge base to be able to absorb and use new knowledge. Firms that have no knowledge base may never be able to absorb new knowledge, no matter how they obtain it or how much they spend to obtain it. Firms that have never developed a knowledge base are said to be "locked-out" for subsequent knowledge and technological developments, a situation that can result in the creative destruction of an organization (Schumpeter, 1942). The possession of prior knowledge is helpful for organizations in two ways. First, creating an absorptive capacity for new knowledge in one period will help the absorption of new knowledge in the next period. Second, the successful use of new knowledge can be self-reinforcing and can motivate a firm to continue to absorb new knowledge indefinitely. Firms with higher absorptive capacities tend to proactively search for and absorb new knowledge regardless of current performance, but firms with lower absorptive capacities tend to reactively scrounge for new knowledge in response to some failure or decline in performance.

Concept of Data Accuracy

Data Accuracy is one of the main dimensions of Data Quality; it measures the degree to which data are correct. Knowing the accuracy of an organization's data reflects the level of reliability it can assign to them in decision-making processes. Several studies have identified Accuracy as the key dimension of Data Quality and the hardest to assess (Motro & Rakov, 2018, Batini, & Scannapieco, 2016). Knowing beforehand the Accuracy of their data brings many benefits to organizations. Indeed, the decision-making process is improved when we know the degree of confidence that can be attributed to the data. On the other hand, inaccurate data can lead to erroneous conclusions and can significantly compromise a range of decision-making processes which can lead to lost opportunities, lost revenue, strategic mistakes, etc. Thus, evaluating data accuracy is a process that requires planning before any data exploitation (Mylavarapu, Thomas, & Viswanathan, 2019).

A Plethora of definitions for data accuracy exist in literature. Each definition involves aspects of the context in which it was given. Generally, there is a reasonable consensus that the accuracy of the data is linked to a specific concept, namely the magnitude of an error (Haegemans, Snoeck, & Lemahieu, 2016). For Ballou and Pazer (2015), data are accurate when their value stored in a database corresponds to the real value. Motro & Rakov, (2018) link the accuracy of data to the percentage of objects that do not contain errors in the data such as misspellings, value outside the allowed range, and so on. Scannapieco, Missier and Batini, (2015) define accuracy as a measure of the proximity of a given value ν to another value ν' considered to be correct. Therefore, the researcher defines data accuracy as that which reflects the degree of correctness at which the data in an information system represents the real world.

Real-world data is often dirty, i.e., containing inconsistencies, conflicts and errors. A recent survey reveals that enterprises typically expect data error rates of approximately 1%–5%. (Redman, 2008). The consequences of dirty data may be severe. For example, it is reported that wrong price data in retail databases alone costs US consumers $2.5 billion annually (L. English, 2000). With this comes the need for effective methods to improve the quality of data, or to clean data. Inconsistencies, errors and conflicts in a database often emerge as violations of integrity constraints (Rahm & Do, 2000). A central problem for data cleaning is how to make the data consistent: given a dirty database, the company would want to minimally edit the data in such that it satisfies certain constraints.

Research has demonstrated that the overall quality of a business decision or service is dependent on the quality of the data or information in use (Belhiah, Bounabat, & Achchab, 2015; Dragan & Metz, 2017; Wagaman, 2015). Decision making in most organizations is usually based on available business intelligence, which has proved to be a useful competitive differentiator. The accuracy of business intelligence, in turn, is dependent on the availability, completeness, consistency, precision, accuracy, and quality of customer data or information (Abumandil & Hassan, 2016). Studies have shown that decision makers, from teachers in the classrooms (Wagaman, 2015), to executives in the boardroom (Tamir et al., 2015) usually rely on data to make decisions. For teachers, decision making on the basis of data allows them to customize their lessons to meet the needs and specific learning targets of the learners (Wagaman, 2015). The challenges of data accuracy in business analytics that affect managers' decision making is not a subject that has been explored widely, but the literature on the subject are growing. For instance, previous research has identified damage to brand reputation, drop in customer loyalty, and financial loss as some of the adverse effects of relying on inaccurate data (Dragan &Metz, 2017). Inaccurate data also wastes corporate resources spent correcting the data (Cai, 2015).

Concept of Information Value

In theory, value of information can be used to assess the value of any piece of information that helps to improve the estimate of one or more alternatives' performance on one or more criterion. In some cases, resolving uncertainty prior to making decisions has little or no actual value in a particular context, while in other cases, resolving uncertainty may be the primary enabler of value in a situation and not necessarily in a way that is intuitively obvious. Value of information improves the ability to manage that risk by focusing resources on monitoring those parameters whose value might most affect the relative desirability of alternative strategies to secure the system. Furthermore, by guiding decision makers to obtain information that reduces negative

surprises when practical, value of information can improve the robustness of the selected alternative. Decision makers are faced with ever-growing information sources, but there is no commensurate growth in human cognitive abilities or in research budgets that would help in leveraging those sources, while decision makers also face growing scrutiny, political pressure alongside calls for transparency. Thus, the need to understand the value of information is greater than ever, and thus so is the need to understand value of information application

Value of information (VOI) is the amount a decision maker would be willing to pay for information prior to making a decision. VoI is sometimes distinguished into value of perfect information, also called value of clairvoyance (VoC), and value of imperfect information. They are closely related to the widely known expected value of perfect information (EVPI) and expected value of sample information (EVSI). Note that VoI is not necessarily equal to "value of decision situation with perfect information" - "value of current decision situation" as commonly understood. It is important to recognize that information is not the same as knowledge and should not, therefore, be used interchangeably (Glynn et al., 2017). Knowledge is internalized information (tacit or explicit) that aligns with given beliefs (conscious or unconscious) and/or acquired behaviors, and that thereby enables decisions and actions. Given our definitions, information does not have any value unless it can become internalized and transformed into knowledge. But at the same time, human recognition, seeking, and structuring of data and observations into information implies that some potential value was, at a minimum, innately expected given the human agency in the creation and consideration of information.

Decision Value

Decision value is defined as the benefit that a manager gets for having taking an appropriate decision to undertake certain tasks and responsibilities himself or deliberately delegating such responsibilities to others who will deliver the expected outcomes. In addition, value-based decisions are decisions that involve subjective preferences for example, (whether an individual want an apple or an orange?). These may be contrasted with perceptual decisions that involve decisions related to an objective state of the world which entail asking the question (whether what is been held is an apple or an orange?) People differ in whether they like to be in control of a decision or whether they would happily delegate a decision. People often make decisions which not only affect their own outcome but also the outcome of others. These decisions are prevalent in many areas, e.g. choosing a vacation destination/ restaurant/ leisure activity for a group of friends, firms deciding whether to move to a new city, athletes taking the decisive shot, or representatives opting in or out of committees. Some people might strive to be in control in these decisions while others see these decisions as a burden and would prefer to give up the decision-making power (Owens et al., 2014).

Some studies investigated the value of keeping control of tasks such as choosing a project or answering knowledge question. The usual finding is that the person in charge often keeps the decision-making power beyond a cost-benefit optimum (Bartling et al., 2014; Bobadilla-Suarez et al., 2017; Fehr et al., 2013; Owens et al., 2014). However, when people have to choose between a fair and an unfair allocation, the valuation of decision-making power can be affected by a multitude of factors such as the own distributive preferences, the own outcome or the belief about the potential delegate's preference. There is also evidence that some people become responsibility averse even when the payoffs within a group are aligned (Edelson et al., 2018). It could be that

this responsibility aversion is even stronger when the allocation choice could result in unequal outcomes across people.

Usability Value

Usability value is defined as the ability of an information to enable a specified user to achieve his or her desired objective with good level of effectiveness, safety and security with the period in use. Evaluation of information systems (IS) represents an important topic among practitioners and researchers of information systems development (ISD) field. The evaluation of an IS may regard different aspects of the system, for example, performance, cost-benefit analysis, user acceptability, usability, reliability, functionality, efficiency job satisfaction, etc. In this paper, we will focus on usability evaluation (UE) of information systems. According to Kirwan (2012), a product can be said to be efficient if the user can use the product by specific time to meet their objectives accurately and completely when using the system. According to ISO (2018) usability is the level of adoption of a product from the user's perspective to achieve an objective effectively, efficiently, and satisfactorily. Usability evaluation needs to be done to ensure that a product can be run without giving confusion to the user.

Methods

The study population consisted of all registered and functional telecommunication firms in South-South, Nigeria, while the accessible population for the study comprised four (4) Telecommunication Firms in South-South, Nigeria. These telecommunication service providers are the ones predominantly involved in the delivery of voice call services even though they provide data support services. The researcher adopted the entire population (census) as the sample size considering the fact that the study population is not large. However, five (5) managers were drawn from each of the four telecommunication firms in each state that constituted the study population. Preliminary investigation revealed that there are five most important managerial positions in these telecommunication firms. Specifically, the study respondents include: The ICT and Security Operations Manager, Marketing Manager, Research, Innovation and Development Manager, and Service Manager. In all, one hundred and twenty (120) managers constituted the respondents for the study. The study used structured-close ended questionnaire as a means of generating primary data from the respondents of the study. The validity of the instrument was determined by the team of supervisors and other experts in measurement and evaluation studies. Reliability in this study was determined using pilot-testing or pre-testing the instrument on 16 other managers of these firms who were not originally included in the study. The researcher also used the Cronbach's Alpha technique to ensure the reliability and internal consistency of the measurement instrument. One hundred and twenty (120) copies of structured questionnaire were administered to the respondent managers while one hundred (100) copies were retrieved, cleaned and qualified for use. Measures of central tendencies and measures of dispersions were used in analyzing the respondent's demographics. More so, the simple Regression Analysis was used in testing the various hypotheses in other to ascertain the influence of the predictor variable (Data Accuracy) on the criterion variable (Information Value). The result of the analysis revealed that Data Accuracy significantly and positively had an influence on Information Value of Telecommunication Firms in South-South, Nigeria.

Table: 1 Reliability Coefficients of Variable Measures

S/No	Dimensions/Measures of the study variable	Number of items	Number of cases	Cronbach's Alpha
1	Data Accuracy	5	100	0.789
2	Decision Value	5	100	0.859
3	Usability Value	5	100	0.891

Results

Data Accuracy and Information Value Measures

This section shows the result of Pearson Product Moment correlation matrix obtained for data accuracy and information value measures. The correlation coefficient (rho) result in table 2, and 3 were used to answer research question 1.

RQ1: To what extent does data accuracy influence information value of telecommunication firms in South - South Nigeria?

Table 2 Correlations for Influence of Data Accuracy on Decision Value

		Data Accuracy	Decision Value
Data Accuracy	Pearson Correlation	1	.861**
	Sig. (2-tailed)		.000
	N	100	100
Decision Value	Pearson Correlation	.861**	1
	Sig. (2-tailed)	.000	
	N	100	100

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Output

Table 2 shows a Pearson Product Moment Correlation (rho) of 0.861 on the influence of data accuracy on decision value. This value implies that a strong relationship exists between the variables. The direction of the relationship indicates that the influence is positive; implying that an increase in decision value was as a result of the adoption of data accuracy. Therefore, data accuracy has a very strong influence on decision value of telecommunication firms in South - South Nigeria.

Table 3 Correlations for Influence of Data Accuracy on Usability Value

		Data Accuracy	Usability Value
Data Accuracy	Pearson Correlation	1	.955**
	Sig. (2-tailed)		.000
	N	100	100
Usability Value	Pearson Correlation	.955**	1
	Sig. (2-tailed)	.000	
	N	100	100

**. Correlation is significant at the 0.01 level (2-tailed).

Source: SPSS Output

Table 3 shows a Pearson Product Moment Correlation (rho) of 0.955 on the influence of data accuracy on usability value. This value implies that a strong relationship exists between the variables. The direction of the relationship indicates that the influence is positive; implying that an increase in usability value was as a result of the adoption of data accuracy. Therefore, data accuracy has a very strong influence on usability value of telecommunication firms in South - South Nigeria.

Discussion of Findings

The findings showed that there is a significant positive relationship between data accuracy and information value of telecommunication companies in South-South, Nigeria. This finding corroborates the earlier finding of Nutley *et al.* (2014), for data to become a regular component of decision making at all organization levels, the essential personnel must possess the capabilities to review, interpret, analyze, and use the data. Indeed, if decision makers lack knowledge or understanding of how to review and interpret available data, then, regardless of whether the data is accurate or not, the decision maker is unlikely to make the best decision. Some of the measures of ensuring data accuracy include; edit checks, cross-checking of dependent value, and knowledge of source of data (Grossmann & Rinderle, 2015). Also, Wagaman (2015) contend that data accuracy can also be enhanced through use of technology and verification of data with similar data from other evidence sources before making decisions.

Similarly, the current finding is in agreement with Kellen and Namusonge (2014) who investigated the role of data accuracy on decision value in Kenya and found that the adoption of accurate data is a major requirement for efficient decision value. The study recommends continued adoption of accurate data as necessary requirement for better value of decision making. Also, Mohamed (2018) investigated the effect of data accuracy on information usability in manufacturing companies in Mogadishu and it was found that data accuracy had positive and significant influence on information usability in Mogadishu manufacturing companies. The positive relationship between data accuracy and information value aligns with previous research emphasizing the critical role of data quality in enhancing the perceived value of information. Accurate data leads to better decision-making and higher confidence among users, thereby increasing the perceived value of the information (Kahn, Strong, & Wang, 2002). In telecommunication companies, accurate data supports efficient network management, customer satisfaction, and strategic planning.

Conclusion

This study examined the influence of data accuracy on information value of telecommunication companies in South-South, Nigeria. Data accuracy (predictor variable) was tested against the proxies of information value (criterion variable) decision value and usability value. The hypotheses were tested using the Simple Regression Analysis. The tests were carried out at a 95% confidence interval and a 0.05 level of significance.

The major findings revealed that data accuracy has a strong positive influence on information value of telecommunication firms in South-South, Nigeria. Based on discussion and conclusion drawn; it was recommended that;

i. The leadership of telecommunication firms in South-South, Nigeria should work assiduously in ensuring that their data sets are accurate, in order to have the much-needed usability and decision values.

Abstract
The long-awaited Petroleum Industry Bill has been passed into law by the Buhari administration. One of the expectations of the law was the provision of 10 percent of oil resources mined in the Delta for the host communities. This has been dashed. Rather, 30 percent of the profit of NNPC ltd is provided for frontier exploration. This was dramatic. This study which is doctrinal in method was mainly anchored by newspapers and parliamentary reports. It looked at the circumstances that informed the delay of the passage of the bill for over 20 years and those surrounding the passage. The study finds that the State and the Multinational Oil Companies have continued to act in concert to shortchange host communities. This led to the expansion of the definition of host communities; the provision of Frontier Exploration Fund and the restriction of import license to oil refineries. It concludes that the passage of the bill into law did not meet the agitations of the host communities. Rather, it has exacerbated them even when several efforts have been made in the past to assuage them but to no avail. It recommends that the Act should be reviewed to reflect the aspirations of the host communities by increasing their percentage to ten while bringing down the percentage for frontier exploration fund to ten.

Keywords: *Petroleum Industry Act, Nigerian Petroleum Bill, Host Communities, Frontier Exploration Fund, Nigerian National Petroleum Corporation Limited.*

Introduction

It has been argued that after former Governor Attah wrote 'Attah on Resource control' and fought for higher percentage for derivation from oil and gas leading to thirteen percent, only former Governors Wike and Akeredolu have kept agitation in the region alive. The others have rested on their oars and were therefore caught off-guard when the passage of the Petroleum Industry Act at the National Assembly occurred. In the main, it was the opinion of Sobowale (2021, p. 11) that the rest Governors exhibited 'cowardice apparently willing to sacrifice their people to please the transient holder of power at Abuja'. Ijaw Professional Association believes that history will remember them as cohorts who let their people down at a point they were needed most.

The misgivings that have been expressed above are intended to be examined in this study in order to determine whether they were properly founded and supported by the factual, existential conditions of the people of the Niger Delta who are always in focus whenever petroleum exploration and exploitation issues are conversed in Nigeria. This is rather than the frontiers that have benefited from the Act without clear economic justification for fossil fuel find in the past, present or in the future. A critical look at the Nigerian petro-state's business relationship with multinationals of the seven-sisters (Shell-BP, Agip, Exxon-Mobil, Gulf, Chevron, Gulf, and Texaco) in the face of emerging nationalist petty-bourgeois oil companies is also necessary.

These indigenous nationalist petty-bourgeois companies are the Tinubu family which has edged out Agip through purchase (Adewale Tinubu (Oando Plc 1.8 billion) as soon as he came to power; the Danjuma family (Sapetro $750 million); the Alakija family (Famfa Oil $1 billion); and the Dangote family (Dangote Refinery; $12.56 billion). Others are Arthur Eze family (Atlas Oranto Petroleum with 22 licenses across 12 African countries); Orjiako and Avuru families (Seplat Oil); Obateru family (Obat Oil Company $300 million); Azudialu-Obiejesi family (Nestoil); Mohammed Indimi family (Oriental Energy $500 million); Mike Adenuga family (Conoil $6.7 billion); and Femi Otedola family (Forte Oil $1.3 billion). Others are Emeka Okwuosa family (Oilserv Limited); Yinka Folawiyo family (Yinka Folawiyo Petroleum Company Limited); Benedict Peters family (Aiteo Group); Bola Shagaya family (Practoil Limited); and Tunde Afolabi family (Amni International Petroleum). Some others are Elumelu family (Heirs Oil & Gas Limited); Joe-Ezeigbo family (Falcon Corporation Limited); Alhaji Dantata family (MRS Oil Nigeria Plc); Tope Shonubi family (Sahara Energy); Winifred Akpani family (Northwest Petroleum & Gas Company Limited) and Gabriel Ogbechie family (Rainoil Limited) (Chisom, 2024).

All these family oil blocs were handed out to cronies during the Babangida-Abacha military regimes which were noted for massive corruption while pretending to be on national assignment for Nigerian masses called 'Fellow Countrymen'. The legal regime on the economy shows constitutional-paper ownership of oil by the Nigerian State, multi-national ownership by operations and production sharing contracts and national bourgeois ownership in emerging appropriation templates. The Nigerian State guarantees the conditions through which the common weal of the people is allegedly owned by the State under constitution law. But in practical contractual terms, the technology is owned by the multinationals while the appropriation of the national wealth is done by the national bourgeoisie which adds little or nothing to the economic production equation but sits on the common wealth of the Niger Delta (as middlemen). This capitalist oil imperialism is a three pronged exploitation of the Niger Delta by the national bourgeois petro-state, multinational oil companies and the national bourgeois oil companies.

Methodology

This study was based on argumentative and conflict method. They were structural, interest, and relationship conflicts. Its thrust was critical of the relationships between multinational and petty-bourgeois oil companies and the Nigerian petro-state on the one part and the existential state of host oil communities on the other part; and how the communities were impacted by legislation on oil. It was rested mainly on the qualitative analysis of secondary data and resource materials culled from periodicals on legislative reports; and focused group opinions. Hard-core academic literature on the subject is scarce, sparse but developing as can be found, for instance, in 'Laws on Oil and

Gas Exploration and Production in Nigeria: A Text in Honour of Austin Avuru' (Ogwezzy, 2020). Several contributors in this copious text presaged the bill in glowing terms. But the post-passage reality has not doused tension.

Statement of Problem

The agitation for resource control in the Niger Delta mineral oil host communities had been rife since the return of civil rule so much so that it morphed into militancy. In order to stave it off the region, a strong advocacy for ten percent derivation was proposed for the host communities with amnesty for the militants. While amnesty was swiftly granted to the militants during the Shehu Yar'Adua administration, the case for ten percent for the host communities was factored into a Petroleum Industry Bill to be presented and pasted into law through the National Assembly. The bill gained so much traction that all conceivable remedies where expected to emanate from it. But in the final analysis, it became a 'cure-all bill' for the sector that never came to be. After the passage, the region is beginning to look for another bill.

Theoretical Framework

Colonial Marginalization Theory

The historical foundation for the continued marginalization of the Niger Delta and its peoples of the south can find expression in the main stream negotiation before independent Nigeria. Charles Ayeni-Botu (cited in Amaize & Ahiuma-Young, 2021, p. 10 and Amaize et al, 2021, pp. 10 – 12)) states that the 30 percent Frontier Exploration Fund provided in the Petroleum Industry Act is an unguarded daylight robbery and a secret re-annexation of the oil and gas producing communities of Niger Delta. He believes that the British had enslaved the south to the north by handing over political power to the north through a phantom election in 1959 and that after 69 years the colonization process has persisted as demonstrated by the Act. The British Colonialist had argued that the amalgamation of southern and northern Nigeria in 1914 was spurned by no better utilitarian value than offsetting the administrative cost of the north with the economic surplus of the south. This Osuntokunian thesis (Kumolu, 2021, p. 15) that the southern bride exists to defray the expenses of the northern groom also informs the dogmatism that advocates of one-Nigeria exudes when they assert that 'to keep Nigeria one is a task that must be done'.

Self-Determination Theory

Writers like Anele (2021, p. 9) argue that the use of force to suppress agitation for self-determination and resource control without addressing in a civilized manner, the root causes of discontentment in the south particularly the east can only engender more vicious agitation. The policy behind the passage of the Petroleum Industry Bill into law is in the nature of those that inform and drive self-determination. The Buhari years have largely undermined the latent fault lines in the Nigerian polity. Each time an opportunity presented itself for demonstrable show of even-handedness in handling divergence in legislative enterprise as presented in the Petroleum Industry Bill, the administration blew up its historic chance at the altar of incompetence, nepotism and 'relentless pursuit of global domination based on Islamic theocracy'.

For Anele (2020, p. 15), only confederation or peaceful dismemberment can resolve the perennial national question on a long term basis by providing the foundation upon which geographically contiguous and culturally related ethnic nationalities can build viable Countries than being asphyxiated in a contraption dominated by a Fulani oligarchy. He argues that insisting on one-

Nigeria is flawed as two options are open in the worst case scenario: the completion of the Fulani conquest of Nigeria or the disintegration of the 'Niger Area' into smaller national units.

Anele has ilk in Danjuma, Asemota and Lekwot (cited in Vanguard, 2019, p. 7). They believe that Nigeria is a democratic state under invasion of Islamic ideology and under the burden of two contradictory ideologies pulling it in opposite directions into permanent turmoil: the 1999 Constitution and Islamism. The common law and Islam are the two antithetical forces at play. The latter was suppressed during colonialism but re-instituted during the Babangida regime when the country joined the Organization of Islamic Countries. They argue that the Nigerian polity is conflict laden due to the untiring desire to supplant the tested and accepted liberal democratic ideals of common law with Islamism and its attendant restrictive, sectional, discriminatory and subjective theocratic bias.

They believe that national development has been hampered and stultified by the institutionalization of conflict through the unilateral infusion of Islamism into the body politic of the 1999 Constitution. They argue that although Islam as a religion is personal to a Muslim, Islamism and Islamists manipulate Islam as a political ideology. Islamism is a conscious attempt to manipulate religion as a tool for political and cultural domination. While Islam is a religion, Islamism is politics. It is a set of ideologies that holds the view that Islam is not only a religion but a political system. It insists that it dominates the environment in which it is practiced.

The foregoing framework came to play during the consideration and passage of the Petroleum Industry Bill into law by the Buhari administration. Amechi Mbazulike (cited in Okoli et al., 2020) believes that the north played the card the way it did because a northern dictator was in control of the reins of power positing that dictators are not interested in peace, equity and balance. The Buhari regime is not a stranger to the scenario that led to the passage of the Bill into law. Exercises such as the passage of the Petroleum Industry Bill into law with three percent for the oil bearing communities and thirty percent for frontier exploration are geared towards stoking crisis to divert attention and deny the south of the chance to rule and develop on the basis of its minerals endowment.

Fascist Ideological Theory

In an '*Open Letter'* to His Excellency, Dr. Ahmad Lawan, the President of the Senate of the Federation of Nigeria, on the demand of the Niger Delta Communities for 10 percent for the Host Communities in the Petroleum Industry Bill, Chief Edwin Clark (2021, p. A2) had pointed out that in 2009 Lawan had called for the relocation of the people of Niger Delta to allow for the unhindered operations of multi-national oil companies if Niger Delta militants had become an obstacle. He further pointed out Lawan's disdain for the host communities and the re-definition of the concept of a host community.

Irredentism begins to rear its ugly head when Lawal claims to speak for a whole nation but is utterly unconcerned with the rights of others, as in Niger Delta, and is willing to deploy force and displace population whenever necessary to achieve the goal. Fascism promotes the concept of innate inequality and inescapable social hierarchies between groups. In its state, rank in society is determined by aspects of identity that are beyond a citizen's control such as ethnicity, religion and gender. Once in power, it suppresses individual and group rights and liberties; opponents may be

imprisoned without lawful or with orchestrated trials. Unlimited police power in the guise of national unity and terrorist aggression hold sway (Albright, 2019, Shane, 2021, Fascism Today, 2017, Paxton, 2005). Indeed, in lieu of displacement as called by Lawal, oil bearing States are now to include any community or a State that a pipeline bearing pathway had traversed thereby betraying the 'lofty dreams and vaunted expectations of the people over two decades' that the agitation for 10 percent had spanned.

Whilst demonstrating that the data from 1967 to date show that the rights and welfare of the Niger Delta peoples have been sacrificed at the altar of the sustenance of the Nigerian State and that International Oil Companies are in cahoots with the north not only to deny the south of the 10 percent host community funds, Clark claims that the north had taken full control of the activities in the oil sector and the ownership of the oil blocks with the south completely shortchanged. He believes that the south would take its destinies in its own hands and that International Oil Companies may be denied access to the fields. Consequently, a focused group, Niger Delta Revolutionary Crusaders ordered it commanders to return to the creeks awaiting further directives believing that the three percent granted host communities in the law was 'provocative, an instrument of expropriation, oppression' and passed to further weaken the socio-economic lives of the people of the region (Amaize, 2021, p. 15).

Literature Review

Group Reactions

The most noticeable reactions to the passage of the Bill into law seem to come from groups. They could be classified into hawks and doves. Ijaw Youth Congress claimed that the Act was a rape of justice for the Niger Delta Communities. Itsekiri National Youths Council claimed that the law was barbaric and a slap on the face of oil communities (Akpan et al., 2021, p. 12). Pan Niger Delta Forum represented by Ken Robinson (Amaize & Ihemnachor, 2021, p. 19) believed that the region was a set of people the Nigerian State could exploit and neglect. Furoebi Akene, Chair, Board of Trustees, Centre for Environmental Preservation and Development, believed that the law was not only a snare to the host communities producing oil and gas, but very hazardous to their survival (Oyandonga, 2021, p. 26). Bringing to the fore, an Ogoni perspective to the disapproval of the legislation, Legborsi (2021, p. 16) urged the leaders of the region to reject the law as it was a re-enforcement of the slavish treatment over the last decades.

He argued that even the three percent that was granted the host communities would not be controlled by them yet they were to be held responsible and accountable for third party sabotage of oil infrastructure in the region to be paid out of the same three percent fund. He opined further that while the communities would be unable to ascertain and determine what would be three percent of the annual investment of oil companies in the region or the country, it would be easier to determine the 30 percent of the profit of NNPC ltd that would accrue to the Frontier Exploration Fund.

In fact, it was revealed in the course of this study that the idea of the Frontier Exploration Fund was never on the cards since the Yar'Adua's administration when the agitation for 10 percent for host communities began over two decades ago. It cropped up within 24 hours when it dawned on a woolly Northern Lobby Group that the passage of the Bill had become inevitable due to loss of direct foreign investments. The Group, on the prompting of Multi-national Oil Companies, was

guided into staging a request for 'a new fraudulent jargon' called frontier oil exploration fund in the northern basins and troughs and same was granted 30 percent of NNPC ltd annual profits; whereas the 24 year old agitation got only three percent. In fact, it was conspired to be reduced to two and half percent by the Minister of State for Petroleum Resources, Timipreye Slyva, who is a Niger Deltan (Oyandongha et al., 2021, p. 12).

Sylva's conspiracy against his people was indicted by the Ijaw Peoples Development Initiative. The group gave the Minister for State four days within which to defend the allegation leveled against him by Austin Ozobo and Senator Seriake Dickson that he misled the Senate Committee into approving three instead of five percent equity share for host communities. Ozobo declares, 'We will pass a vote of no confidence on Sylva if within four days he fails to explain his role and thereafter he should be relieved of his national assignment' (Amaize & Ihemnacho, 2021, p. 5).

On the floor of the Senate, Dickson came under Order 43 of the Rules to state that history should note that he was not part of the obnoxious decision against his people of the Niger Delta. Their ilk argued that it was against national interest to reduce the clamour from 10 to five to three and two and half percent as such a disposition could engender negative implications on the management of national security in the region. Moreover, the fund being agitated for was not to come from the coffers of the State but multi-national oil companies which were not overtly opposed to the proposition. However, the opinion that the oil companies were not against the proposal is lame because behind all the negative consequences the region had suffered since the finding of oil had been the handiwork of the multi-nationals. They argue that it is 'sorrowful rather than inducing anger' because the passage of the 'petroleum intimidation bill' into law displayed the 'evidence of selfishness' of the actors behind the 'legislative holocaust' (Amaize et al., 2021, p. 5).

Leaders and stakeholders of the south-south believed that their Governors and Representatives ought to be berated because they did not live up to expectation. Although, the Legislators of the south-south would have been out-numbered in a legislative setting if the issue had been put to vote, it had been argued by Amaize et al., that if the 27 Senators and 78 House of Representatives members from the Niger Delta and oil producing States had presented a common front, the host communities would have had a better deal of five if 10 percent was not feasible. They characterized the result of the two or more decades' agitation as an 'elephant begetting a rat'.

Bringing a moral tinge to the negative reactions, Dr. Kingsley Oroh et al. (2021, p. 12) of Isoko Monitoring Group believed that the Senate in passing the Bill into law was 'wicked, evil, ungodly, unreasonable and hated justice.' He saw the action of the Senate as a call for anarchy and total unrest in the country. Dan-Princewill (cited in Oyandongha et al., 2021, p. 12) believes that Nigerian despots have always tried to deprive the region of its dues regarding rents. He argues that what happened to the region is emblematic of the type of injustice the region had been receiving since the finding of oil at Oloibiri in 1959. For the hawks therefore, the passage of the Bill into law by the National Assembly was a ploy to further rob the south that produces oil to pay the north that does not produce a single drop (Ajayi, 2021, p. 7).

So much for the hawks; for doves on the other hand, the Arewa Leader in southern Nigeria, Musa Saidu (cited in Onoyume, 2021, p. 7) believes that those condemning the passage of the bill into law ought to realize that it had taken over 20 years for the bill to become law. That the Minister of

State ought to have been commended while the lobbying process continues at the National Assembly and the Presidency. In other words, 'it was better to start with something than nothing; if spent judiciously, we can advocate for increment' according to Samson Ewajane, Chair, Federation of Ugbo Kingdom Youths Association (cited in Dayo, 2021, p. 6). To the doves, the question should not be posed in vacuum. It should be three percent of what? It is relative depending on the capital cost or operational cost or profit. Thus for Agbakwuru (2021, p. 8), given the estimate of what multi-national oil companies spend annually, three percent 'is a good starting point provided the funds are not looted or diverted.'

Basking in the earlier thinking that development in the sector had been stymied by the non-passage of the bill over the years, Organization of Petroleum Exporting Countries, OPEC, hailed the passage of the long awaited legislative reform as an instrument capable of strengthening institutions, solidifying regulatory frameworks to attract foreign investment. It is believed that it would open the sector for greater investment and guarantee transparency. It was in the light of the foregoing, Mohammed Barkindo (cited in Akpan et al., 2021, p. 12) hailed the Lawanian 9th Assembly for 'engraving itself in gold'.

Circumstances of Passage

In what circumstances was the bill passed into law? Research has shown that the bill was passed into law in the most bizarre and obscure circumstances leaving those who had felt over the years that the bill would act as panache of the under-development of the Niger Delta with a bad taste in their mouths. Vanguard Comment (2021, p. 18) had argued that political, economic and sectional interests had scupper the passage of the bill since its introduction by the Yar' Adua administration as an executive bill into the National Assembly. Controversy continued to dog the bill during the Jonathan administration to the extent that more than ten versions of the bill came into existence on the legislative template.

In fact, the Buhari administration had earlier refused to assent to a version of the bill on constitutional grounds. Although the original objective percentage was ten, five percent was approved during the clause to clause consideration on the floor of the National Assembly and five percent was further dropped to three despite the spirited efforts of some southern Senators in the likes of George Sekibo and James Manager. The Senators were justifiably appalled when the Minister of State from their region was nose-diving to two and half percent (Amaize et al., 2021, p. 24). Even though Pandef tried to absolve the Minister of State from blame believing that he was merely playing the scripts of the President who doubles as the Minister of Petroleum Resources, Senator Biobarakumo Degi-Eremionyo retold the ignoble role allegedly played by Sylva with the 13 percent derivation fund which he had used to develop his non-oil producing communities while he was Governor of Baylesa State as such, he was nonchalant to the struggle for 10 percent for host communities' fund.

Yet Senator Daniel Asuquo believes that the bill was smuggled into law. He reveals that the due process of legislative procedure was not followed. That the National Assembly exploited the opportunity of the walk-out staged by the Niger Delta representatives on e-transmission of electoral result which was then equally raging in the House to pass the bill into law. It was further revealed that Mohammed Tahir Monguno (Chief Whip) who led the Committee came to the floor

of the House to state that he was threatened by his Governor and Emir not to concede anything above three percent (Amaize et al., 2021, pp. 11 – 12).
A more radical constitutional circumstance in which the bill was passed into law has been raised by Adegboruwa (2021, p. 32). He has argued that the constitutional provision that all minerals exploration fall within the confines of the exclusive legislative list under the 1999 Constitution of the Federal Republic of Nigeria (as amended) has been doggedly followed by the Federal Government's denigration of the rights of host communities in the oil bearing Niger Delta. But the constitutional provision is not similarly followed with respect to mining of gold in Zamfara State in the north. The evidence that there is ambivalence in the legal regime in the minerals sector has not been rebutted convincingly. Both the elder Statesman, Chief Edwin Clark and Adegboruwa believe that if Zamfara can sell its gold the Niger Delta can also sell its oil. Therefore, the question of three percent ought not to arise.

Oil Nationalism
The uncertainty that has followed the regulation of oil business in Nigeria can be back-dated to Resolution 1803 of the United Nations which gives sovereignty to national governments over mineral resources and management. Though the law also recognizes that the management should be for the welfare of the people, experience in the third world has not borne out any good the communities have gained from national control of minerals. Rather, it has generated more hardship and crises of monumental proportions in such areas as the Congo basin and Niger Delta.

But what makes Nigerian experience less palatable is that even though varied minerals resources are found throughout the land mass of the Country, not much success has been made in finding oil in the northern region of the Country. This has given rise to complications and misgivings in the regulation of the sector. It is even felt and suspected that the exploration of other minerals apart from oil is being stayed until the oil find of the Niger Delta is fully mined and exhausted. It has also been canvassed that the agricultural sector has been un-revolutionized because cheap oil is being mined to run and sustain the Nigerian state craft. Because the discovery of oil has been sectional, so much crisis of explanation has come to the fore up to the belief that the last civil war was fought because of oil.

In an attempt to balance the cleavages, so much effort and resources have gone down the drains in search for oil in the northern fields of the Niger Benue trough and the Lake Chad basin. The hope that oil can be found in those areas has not been lost on the northern oligarchy controlling the political levers of power in Nigeria. In fact, it has become a monumental challenge that the north is characterized as a barren predating on the oil of the south. The economic reasons given by the British for the 1914 amalgamation seem to still hold water till date. All the laws being fashioned out in the oil sector appear to be guided by these fundamental misgivings and cleavages.

It was not surprising therefore that Akpan (2021, p. 13) in 'How Kyari-led NNPC boosts exploration, gas development in 2 yrs' stated that the Group Managing Director of NNPC was so determined to increase the nation's oil reserves to 40 billion barrels. This was to be done by galvanizing NNPC to rev-up exploration work in the inland basins with the drilling of the Kolmani River 11 Well culminating in oil find in commercial quantity in the Upper Benue Trough.

As soon as the find was made, the north appeared to have woken up from lumber and the agility with which the Buhari administration got up to unveil the national oil company, NNPC, into a limited liability was unprecedented. The north and the Buhari administration appeared to have broken the jinx in which the north had been kept since modern Nigeria as a 'barren women.'

Frontier Exploration Fund

It is therefore in the context of the foregoing that the passage of the Petroleum Industry Act had to been understood. It is also in these regards that the sudden appearance of the concept of the Frontier Exploration Fund should be understood. Bitterly opposed to it, antagonist of the fund termed it a 'fraudulent jargon' meant to rob Peter to pay Paul. The Frontier Exploration Fund which became charged on the profit of NNPC Ltd was hiked from 10 percent to 30 percent without the consent of the members of the Senate Joint Committee on Petroleum (downstream and upstream) and Gas Resources according to Umoru and Nwabughiogu, (2021, p. 12).

They argue that throughout deliberations and consultations with host communities in Niger Delta, which Mohammed Tahir Muguno chaired, the issue and concept of Frontier Exploration Fund never came up on the cards. It came from the blues! However, to have acknowledged that it was 'hiked from 10 percent to 30 percent' betrays the fact that it was not entirely new. Or, it could be consider as being within the thematic agitation of 10 percent for host communities.

It is also clearly deducible that while no encumbrances were tied to the frontier exploration fund, the three percent charged on the annual operational expenses of multinational oil companies in the host communities of the Niger Delta is not only to be paid into a trust fund which the communities have no control over, it is also to cover all manner of third party criminal activities. These are in the garb of oil theft, vandalism and sabotage which are inevitable and rampant in the region. The danger in this is that it will make no meaningful impact on the lives of the communities because of motley of diverse militant groups which are not subject to communal control. In the light of these, dovish stakeholders like Mike Emuh, Chair of Host Communities of Nigeria (HOSTCON) had called for the reduction of the frontier basin exploration fund to 10 percent while the provision which seeks to make host communities liable for any damage to infrastructure should be struck out (Akpan, 2021, p. 12). For Mailafia (2021, p. 17), 30 percent of NNPC ltd profit for exploration activities was way too high. 20 percent would have been adequate.

But for the hawks, 30 percent is provocative and indicative of the exposition of what had been happening for decades on the sterile oil fields in the north (Vanguard, 2021, p. 18). However the hype being made of the exploration fund has been largely de-shined in the sense that the term frontier basins are all over the Country and thus not restricted to the north. They are merely new acreages being sought to be worked upon to increase the national reserves. And more critically, exploration is a business which is hinged on a cost-benefit analysis of a given field or prospect. No investor can be easily manipulated or cajoled into working a field or basin without the sure prospect of finding oil in commercial quantity. And given the empirical evidence that most of the northern fields had been worked upon unsuccessfully in the past, the concept of frontier exploration ought not to constitute a nightmare (Amaize, et al., 2021, p. 10 – 12).

Legal Drawbacks of the Act

Perhaps the worst draw back in the provisions of the new law is the monopoly which became created for only oil refiners to hold import license for refined products to the exclusive of other commercial entities (Esiedesa, 2021, p. 7). The motive of the restriction is to deny a level playing field and disentitle concerns other than refineries from importing petroleum products. The issue is: How many oil refineries in the country are able to meet the energy need of a nation of 200 million? The national refineries in Warri, Kaduna and Port-Harcourt have never been unable to refine a drop of fuel in recent times. They have become moribund with several failed 'turn around maintenance' attempts that gulped billions.

The Dangote refinery has come-up-stream with the decision of the Federal government to acquire 20 percent of its equity. But monopoly would be enacted for it by the Act. The passage of the Act has reinforced the believe that the Country is no more than a 'fossil fuel economy' without any aspiration to develop beyond a rent and cliental economy (Fasan, 2021, p. 16). This prebendal clientalism stresses the fraudulent use of national resources by politicians to engage in practices such as pseudo privatization of national enterprises. It also involves clandestine give away of oil blocs to bestow favour, benefits and privileges on specific elitist petty-bourgeois capitalists in order to consolidate on their material aggrandizement and political grip on state power (Dibua, 2012, pp. 314 & 317).

Furthermore, the agitation for 10 percent for host communities that has culminated in the law with three percent had always been viewed with a hostile disposition from the north (Olukoju, 2012, p. 33). Attempts at making the host communities of the Niger Delta to develop through its minerals endowment has always been scuttled and misinterpreted by the northern oligarchy. They become paranoid whenever issues concerning resource control benefits are raised. Agitations in the direction are viewed as revolutionist or 'coup strategies' aimed at increasing the 'weight and relevance' of the States and the regions against those of the Federal government. These are in order to gradually pave way for separation, de-amalgamation and disintegration of the Federal Republic of Nigeria.

To deconstruct Abdul-Azeez Sulaiman (cited in Kumolu, 2021, pp. 37 – 38) the cultured north would not support legislations that seek to transfer economic power away from the centre to the zones or communities using legislative subterfuges as a means of political and economic ascendency. The 'cultured north' believes that the Country has been driven to the precipice by 'authors of mindless violence and separatism' who seek to use the legislative alternative to continue and actualize 'what their fathers started' but could not finish before 1966 by Adaka Boro, in 1966 by Odumegwu Ojukwu and Ken Saro Wiwa in the 1990s.

The 'cultured north' can hardly be floored in its perception of the three percent provision in the law. This is as a result of previous legislative, institutional and administrative measures which have been put in place to address the minority and marginalization questions of the Delta to no avail. 13 percent derivation had been granted in the past leading to the State Oil Mineral Development Authorities in the nine oil producing States of the Federation.

At the Federal level, Oil Mineral Production Development Commission had been replaced by Niger Delta Development Commission and Amnesty granted to militants. A Ministry of Niger Delta had also been created to address these same issues concerning resource control and

allocation. The north may therefore seem justified that to whom 13 percent derivation had been given, a Commission has been setup. An amnesty Programme has been granted and a regional Ministry has been created. 10 percent for host communities would appear as one too many a request and might just decide to scuttle it by agreeing to a pittance of three percent and tying it to onerous and nebulous conditions while giving away 30 percent of the profit of the national oil company, NNPC ltd, to itself since it has the leverage to grant or decline to grant.

If all the above avenues have been used to address the agitations of the oil producing States and Communities and respite has not been found by them through the avenues, 10 percent host community trust fund may neither fob off the militant agitations nor bring them to bail. The impression being created in the region, and which has been difficult to erase is that the funds being channeled through these Institutions, Agencies, Programmes, Commissions and Ministries have not found expression in physical, infrastructural development of the region (Unumen, 2012, pp. 64 – 65). They have either been diverted, stolen or misappropriated. In fact, the desire to put its foot down to pass the Act was not actuated by altruism of the Buhari administration for the south. It was rather for the north. The Administration may have taken a hard look at the historical opportunity it had to make the legislative decision and put its knife on the ice to break the jinx in northern favour.

It is because the Jonathan administration had had all the opportunity to pass the bill into law in favour of the region from which he hailed from but failed to actualize the dream that motivated the Buhari administration to do so. If therefore the Buhari administration had failed to pass the bill into law before leaving office in 2023, chances would be that the next administration would become an opportunity for a 'southern' President to take over the ball in the game of the consideration of the bill. It was one law which was needed but was stymied by political considerations of the north, the bourgeois petro-state, the multinationals and the petty-bourgeois national oil companies (Okoro, 2020, p. 361 and Ole, 2020, p.527).

It has been stated frontally by multi-national oil companies that they are not in business for the development of the oil communities; that the business of the development of the host communities falls within the province of the government. Therefore, the act of releasing three percent of their annual expenditure into a host community trust fund is not entirely one of goodwill and cheers. But it is necessitated by economic consideration and the desire to have relative peace in the environment of business. They also do not want to be involved in any line of activities that are capable of inducing strong linkages in economic development of the oil sector. The core value of the host communities to the multi-nationals is relative peace to mine oil and gas and take them abroad to their refineries to meet their energy needs. What trickles back into the Country and host communities as imported products are finished for conspicuous consumption (Singh, 2017, p. 424).

Observable Mixed Reactions

The mixed reactions that have greeted the passage of the bill into law are abnormal indicating that the hawks are justified that the original aspiration of the agitators for the law to enable host communities administer 10 percent equity share has been dashed. The doves have always been the section working in tandem with State institutions and multi-nationals. They have always grabbed at the crumbs that fall from the tables of the State, multi-national and national bourgeois Oil

Companies in form of contracts which are poorly executed or menial jobs and social benefits. Given the history of militant agitations in the region, it is not hoped that it will abate. It is equally not hoped that it is the way to go because the previous agitators ended as glorified self-seeking billionaire thugs without ideological briefs or depth. The hope that militancy in the creeks will engender development in the Delta has been lost. When the Obasanjo administration characterized them as criminals and thieves in the guise of advocacy of the betterment of the people of the Delta, the statement was hardly considered charitable. After many years, these agitators in the likes of Tompolo, Boyloaf, Asari Dokubo and Tom Ateke etc have moved on in self-glorification. The region they claimed they were fighting for has remained backward without any hope of the people believing in their genre of militancy again.

The representatives of the region in the State governments and the National Assembly have also been divided against themselves. There is no hope of a common front in the agitation for the region in the future, the Act having made provision for a paltry three percent. The conduct of the region's representatives in the Federal executive was most un-inspiring. The fact that several instruments and agencies had been put in place to impact positively on the region in the past to not much avail also signifies that the region has a long way to go before there can be overall improvement in its socio-economic development.

The grouse that has greeted the 30 percent provision for frontier exploration fund from the annual profit of NNPC ltd is not entirely misplaced or hyped. It has ulterior motive of the development of the northern basins in mind to the detriment of the Niger Delta. It can still be subsumed within the thesis of the desire of the north to use the resources of the Delta to find oil in the north and develop same to catch up with the south. But bearing in mind that all previous efforts at finding oil in commercial quantity in the northern basins had proved abortive should not kill the initiative. Although it is not uncommon for such funds to be diverted, stolen or misappropriated corruption, having gained roots on the structural fabrics of the nation. But it must not be the reason for un-planning or lack of expansion of exploration and increment of the national reserves.

Conclusion

The passage of the Petroleum Industry Act has failed to meet the aspiration of the peoples of Niger Delta. The provision of thirty percent Frontier Exploration Fund is suspicious and tying the three percent for host communities fund to third party work out-lay of multinationals or national bourgeois oil companies excluding the NNPC Limited is dubious. The restriction of import license to only oil refineries is equally un-called for as it is restrictive to commerce. The passage of the Act may trigger further violent agitation in the creeks of the Niger Delta instead of abetting it and may call for further legislative amendment of the Act in the National assembly.

Recommendation

- The three percent provision for host communities should be increased to ten percent.
- The ten percent should be tied to both the profits of NNPC limited and the work-outlay of both multinational and national bourgeois oil companies.
- The thirty percent provided for the Frontier Exploration Fund from the NNPC Limited should be slashed down to ten percent.

- Instead of resorting to violent militancy and agitation, the people of the Niger Delta can, through their leaders and representatives in the legislative arm, call for the review of the Act through constitutional amendment.

Abstract
The broad objective of this study is to examined the effect of green financing on the performance of selected SMEs in Kogi State, Nigeria. The study employed survey research design. The study covered a period between 2023-2025. The population of this study consist of 22,715 selected SMEs owners in Kogi State. The sample size was determined using Krejcie and Morgan sampling technique. The study arrived at a sample size of 379. The hypotheses of the study were tested using multiple regression analysis with the aid of SPSS 22.0. Findings revealed green innovation has positive and significant effect on performance of selected SMEs in Kogi State, Nigeria, while green marketing has positive and significant effect on performance of selected SMEs in Kogi State, Nigeria. The study concludes that green financing affects performance of selected SMEs in Kogi State, Nigeria. The study recommended that SMEs should prioritize the integration of green innovation into their core business strategies by adopting eco-friendly production processes, investing in renewable energy solutions, and utilizing sustainable raw materials. SMEs should be encouraged to actively embrace green marketing strategies by clearly communicating the environmental benefits of their products and services to consumers.

Psychological Well-Being and Ethical Leadership: Foundational Pillars for Organisational Sustainable Transitions In Nigeria

[1]Prof. Nwakaego Chukuigwe, [2]Dr. Raphael Sotonye Uranta & [3]Dr. Madighi Jacob
[1,2,3]Department of Business Administration
Faculty of Administration and Management
Ignatius Ajuru University of Education, Port Harcourt, Nigeria

Abstract:
This paper explored the interconnected roles of psychological well-being and ethical leadership as foundational pillars for organisational sustainable transitions in Nigeria. Drawing on empirical literature, the review examines how dimensions of psychological well-being—such as employee mental health, job satisfaction, and engagement—contribute to workforce adaptability and commitment during sustainability initiatives. Similarly, ethical leadership, defined by integrity, transparency, and fairness, fosters trust and cultivates pro-environmental behaviours necessary for long-term organisational change. Evidence from Nigerian studies highlights that organisations prioritising these human-centred elements are more likely to succeed in implementing sustainable business models, circular practices, and ESG-aligned governance. However, structural and cultural barriers persist, emphasizing the need for holistic strategies that integrate employee well-being and ethical leadership into sustainability frameworks. The paper concludes with practical recommendations for policy and practice aimed at reinforcing these pillars in the Nigerian organisational landscape.

Keywords: *Psychological well-being, Ethical leadership, Organisational sustainable transitions.*

Introduction

In today's turbulent global business environment, organisational sustainable transitions have become essential for long-term viability. Sustainable transitions refer to systematic shifts in strategy, operations, culture or structure that ensure organisations can adapt, survive and thrive amidst economic, technological, social or environmental pressures. These shifts may include digital transformation, adoption of environmental, social and governance (ESG) practices, or major strategic realignments. Much of the contemporary literature (e.g. Wiyono et al., 2025) emphasises that sustainable transitions must be anchored not only in organisational systems, but in human and ethical foundations. Organisations face accelerating forces such as climate crises, shifting stakeholder expectations, volatile markets and regulatory demands, and these are tied to sustainable development goals (SDGs) (UN□2030 Agenda). In Nigeria, for instance, the national strategy to achieve SDGs (e.g. Lagos SDGs

Youth Alliance) underscores the need for resilient institutions that embed sustainability into organisational DNA (United Nations, 2021; Wiyono et al., 2025). Without structured transitions, firms risk competitive decline, resource misalignment, stakeholder mistrust and failure to comply with broader sustainability mandates.

In the Nigerian context, failed or poorly managed transitions often stem from systemic weaknesses: limited leadership capacity, scarce psychological support for employees, and absence of ethical frameworks. Studies in Nigeria's private and public sectors have linked organisational change with elevated stress and reduced psychological well-being among employees (Jimoh, 2016). Stress arising from unplanned change, lack of support and role ambiguity undermines performance, leading to resistance, low morale, absenteeism, and even higher turnover intentions (Amao & Uwannah, 2024). In many Nigerian firms, leadership moves toward change without due attention to employee mental health or ethical oversight, resulting in fragmented transitions and poor outcomes. Organisational sustainable transitions are comprehensive shifts that balance economic viability, environmental stewardship, and social responsibility. In practice, this means integrating ESG-driven HR practices, ethical governance, flexible resource allocation, and employee-centered change processes (Wiyono et al., 2025). Successful transitions are not merely technical, but psychosocial and moral: they require nurturing trust, fairness, resilience, and shared values.

Emerging theories and evidence suggest that psychological well-being and ethical leadership serve as foundational supports for sustainable transitions. Psychological well-being which encompasses employee mental health, engagement and resilience provides the human capital for resilient change. Meanwhile, ethical leadership fosters trust, justice and moral clarity, creating environments where employees embrace transitions. Together, they act synergistically: a leader behaving ethically reduces stress, enhances psychological safety, and boosts well-being; psychologically well individuals are more committed, adaptable, and aligned with core organisational values, enabling sustainable change. Within organisational psychology, psychological well-being refers to multi-dimensional outcomes such as autonomy, competence, relatedness, positive affect, resilience and life/work satisfaction. In Nigeria, research confirms that emotional intelligence predicts psychological well-being among civil servants (Olah & Utibe, 2022), and that organisational support significantly shapes well-being among university staff (Amao & Uwannah, 2024). Stressful organisational change has been shown to predict lower well-being among private sector workers in southwest Nigeria (Jimoh, 2016).

Ethical leadership is defined as leadership directed by respect for ethical beliefs, values, dignity and rights of others; it emphasizes fair, honest, caring behaviours and role modelling (Brown, Treviño & Harrison, 2005 as summarized in Northouse, 2016). Within Nigeria, ethical leadership has been shown to significantly reduce counter-productive work behaviours and foster ethical climate in the insurance industry (Isimoya & Bakarey, 2020). Another study in the public sector found ethical leadership improves leader-member exchange and boosts employee performance (Oladimeji et al., 2022).

Recent research in agro-allied firms confirms that ethical leadership positively predicts organisational sustainability, especially under dynamic environments (Ogaga et al., 2023).

Empirical evidence indicates that many transitions in Nigeria fail due to neglect of psychosocial and ethical dimensions.

Jimoh (2016) found organisational change without sufficient employee support engenders stress and lowered well-being in private organisations. In the local government setting, employees' perceptions of unfairness significantly reduce well-being (Ajala & Bolarinwa, 2015).

Across sectors, factors such as heavy workload, low support, and unstable leadership undermine psychological resilience and organisational commitment (Amao & Uwannah, 2024; Nwibere & Worlu, 2023). Without ethical leadership to cultivate trust and procedural justice, transitions lack stakeholder buy-in, transparency, and moral legitimacy, leading to resistance, token compliance and eventual failure.

Despite substantial research on psychological well-being, organisational commitment, and ethical leadership individually in Nigeria, very few studies integrate these constructs within the context of organisational sustainable transitions. While Jimoh (2016) and Amao & Uwannah (2024) examine well-being under change, they do not explicitly link these to leadership ethics or sustainability of the transition process. Likewise, ethical leadership studies (Isimoya & Bakarey, 2020; Oladimeji et□al., 2022; Ogaga et□al., 2023) confirm performance and sustainability outcomes, but seldom examine psychological well-being as a mediating or moderating variable. The conceptual model that positions psychological well-being and ethical leadership as foundational pillars for enabling, sustaining and legitimizing organisational transitions remains untested in the Nigerian context. Moreover, the dynamic interplay which has to do with how ethical leadership enhances well-being which then supports adaptive change represents an important theoretical and empirical gap.

By addressing this gap, the current study proposes to examine how psychological well-being and ethical leadership jointly support organisational sustainable transitions in Nigerian organisations. It seeks to clarify the mechanisms linking leaders' ethical conduct, employee mental health, and successful transitional outcomes, thereby offering both theoretical contributions and practical guidance for organisational change actors in Nigeria.

Literature Review

Stakeholder Theory

Stakeholder theory, as originally advanced by Freeman (1984), posits that organizations must account for the needs and interests of all parties who affect or are affected by their activities, not just shareholders. Donaldson and Preston (1995) elaborated this by framing stakeholder theory in three intertwined dimensions: normative, descriptive, and instrumental. Normatively, it establishes moral guidelines; descriptively, it explains organizational behaviors; and instrumentally, it links stakeholder management to desired corporate outcomes. Mitchell et al. (1997) introduced the stakeholder salience framework which denotes identifying stakeholders by attributes of power, legitimacy and urgency, adding analytical precision to stakeholder identification. More recent scholarship highlights that the stakeholder value-creation role has evolved: stakeholders are no longer passive recipients but

active contributors to organizational performance and innovation (Donaldson & Preston, 1995; Jones & Wicks, 1999; Freeman et al.). Empirical reviews reveal that firms managing a broader, more inclusive set of stakeholders tend to demonstrate improved environmental, social, and governance (ESG) outcomes, enhanced reputation, and more sustainable performance.

Stakeholder theory bridges well with psychological and organizational behavior research, especially regarding how ethical leadership and employee well-being shape transitions. Ethical leadership, in turn, can be viewed as a way of honouring stakeholders, particularly internal ones such as employees, through fair treatment, transparency, and moral accountability. Recent empirical work shows ethical leadership promotes psychological empowerment, which then enhances employee well-being, engagement, innovative behavior, and organizational citizenship behavior (Asif et al., 2019; Sattar et al., 2020). For example, Sattar et al. (2020) found ethical leadership in Pakistani banks positively influenced psychological empowerment, which mediated effects on organizational citizenship and innovative work behavior. From a stakeholder perspective, employees are key internal stakeholders whose psychological welfare and voice matter. Ethical leadership encourages constructive voice behaviors and psychological safety—both critical for navigating change and transition. Yousaf et al. (2019) identified voice behavior as a mediator between ethical leadership and employee psychological well-being, further supporting the idea that stakeholders' input is essential for both ethical governance and well-being.

Psychological Well-Being

Psychological well-being (PWB) as comprising six dimensions: autonomy, environmental mastery, personal growth, positive relations, purpose in life, and self-acceptance (Ryff, 1989, as cited in Babalola et al., 2023). Other authors in Nigerian settings often portray PWB as the individual's capacity to maintain life satisfaction, resilience, and emotional balance amid stressors (Olah, 2022; Ezaka et al., 2024). In Osun State local government employees, Ajala and Bolarinwa (2015) studied organisational justice and psychological well-being. They found that distributive, procedural, and interactional justice perceptions were significantly associated with employees' well-being in a cross-sectional survey of 317 staff. Olah (2022) in Abuja examined emotional intelligence and psychological well-being among 354 civil servants. Using regression, emotional intelligence significantly predicted psychological well-being (p□<□.05), leading to recommendations that employers build EI among staff.

In Ogun State university employees, Amao and Uwannah (2024) used Ryff's PWBS-SF alongside measures of organisational support and workload. Their study showed organisational support accounted for 74.6% of variance in PWB, workload explained 30.2%, and jointly they explained 81.8%. In southwest Nigeria banks, Jimoh (2016) investigated the effects of organizational change and occupational stress on bankers' psychological well-being. He found that stress generated by change negatively impacted well-being, though precise effect sizes were not reported. In manufacturing organizations in Lagos, Edosomwan, Oguegbe, and Joe-Akunne (2023) tested the effects of employee green behaviour, core self-evaluations, and empowering leadership on workplace well-being. Regression analyses revealed all three predictors positively and significantly predicted well-being. Similarly, Babalola et al. (2023) studied undergraduates in Southwestern Nigeria, finding that

self-regulation is a significant predictor of psychological well-being among students, gaining insight into self-management as a dimension of well-being.

In Port Harcourt oil and gas firms, Nwibere and Worlu (2023) found that employees' psychological resilience (a related construct to well-being) positively related to organisational commitment (affective, normative, continuance) across 280 respondents. In Niger Delta companies, this suggests that well-being or resilience fosters stronger organisational attachment and loyalty. Emotional intelligence studies in Nigerian healthcare and civil service likewise highlight downstream effects: high EI and self-efficacy correlate with better psychological well-being, which can support job performance, lower turnover intentions, and greater job satisfaction (Olah, 2022; Iherobiem & Iherobiem, 2023). Amao and Uwannah (2024) findings implicitly carry organisational implications: since organisational support is a powerful predictor of PWB, and workload lowers it, management can enhance PWB via workload moderation and support systems, likely reducing absenteeism and boosting retention.

Ethical Leadership

Brown et al. (2005) originally defined ethical leadership as the demonstration of normatively appropriate conduct through personal actions and interpersonal relationships, and the promotion of such conduct to followers through two-way communication, reinforcement, and decision making. That general model underlies much Nigerian research today (Brown et al., 2005, as cited in Georgeson-Agege, 2020). Northouse (2016), often cited in Nigerian scholarship, characterises ethical leadership as leadership directed by respect for ethical beliefs and values and for the dignity and rights of others encompassing fairness, honesty, trust, and consideration. Georgeson-Agege's (2020) doctoral research with Nigerian public officials adapts Brown et al.'s model by embedding Nigerian normative values—law, governance norms, respect, responsibility, communication, and values-based training—for operationalizing ethical leadership praxis in Nigeria's public context.

Isimoya and Bakarey (2020) investigated the ethical leadership–ethical climate–counterproductive work behaviour nexus in Nigerian insurance companies. Ethical leadership had a significant negative association with deviant behaviours and a robust positive relationship with ethical climate; mediation analyses confirmed that ethical climate mediated the effect of leadership on counterproductive work behaviour. Oladimeji, Abdulkareem, Akindele, and Adejumo (2022) studied Nigeria's federal public sector and found that ethical leadership positively and significantly impacted employee performance, with leader–member exchange (LMX) mediating the relationship. High levels of ethical conduct from leaders improved LMX quality and boosted productivity. Avwerhonyo and Sokoh (2024) drew a sample of 328 workers in Ughelli North and South local councils. They reported that ethical guidance, fairness, role clarity and trust which are composite ethical leadership measures significantly and positively predicted employee performance (via regression and correlation analyses).

Egbiki et al. (2024) surveyed 288 senior managers across banking and insurance public-interest entities (PIEs). Ethical leadership influenced four key dimensions of corporate governance effectiveness namely board practices, transparent disclosure, board commitment

and control environment. Nwanzu and Babalola (2025) examined ethical leadership and psychological ownership in selected Delta State organisations. They found that ethical leadership significantly enhances employees' voluntary pro-environmental behaviours, mediated by psychological ownership—the greater the ethical leadership exposure, the more likely employees engage in eco-friendly voluntary actions. Adaiwo (2024) studied Nigeria's primary healthcare system. Transparent and ethical leadership (integrity, transparency) was a strong predictor of employee performance in healthcare delivery, maintaining that ethical leadership as core organizational values improves productivity in resource-constrained contexts.

Organisational Sustainable Transitions

In Nigeria, organisational sustainable transition refers to the strategic shift of firms and institutions from conventional, linear models (extract–produce–dispose) toward integrated, long-term sustainability frameworks that align environmental, social, and economic objectives (i.e. the "triple bottom line"). According to circulatory economy thinking, this includes transitions from a linear to circular value chain, introducing renewable energy, resource efficiency, ESG-compliant governance, and sustainable business models (Okafor et al.,□2024; Onwere et al.,□2025). Ilesanmi (2025) frames organisational sustainable transition as the process by which eco-entrepreneurial enterprises adopt sustainable business-model innovation, ESG integration, and decarbonisation strategies in internal governance, procurement, and financial management to achieve net-zero and climate resilience goals.

Okafor et al. (2024) surveyed business practitioners in manufacturing firms in Southeast Nigeria. Their study showed that sustainable business models incorporating environmental and social dimensions significantly enhanced organisational performance metrics, especially the corporate bottom line and stakeholder information flows. This suggests that embedding sustainability into core operations can drive competitive advantage. Onwere et al. (2025) analysed sustainability practices of 30 non-financial firms listed in Nigeria (2013–2022) and found environmental and social practices significantly reduced business risk, whereas governance practices paradoxically increased market risk, underscoring the nuanced challenges of organisational transition. Ilesanmi (2025) examined eco-entrepreneurship and sustainable innovation among Nigerian eco-ventures. She identifies internal capacity gaps such as weak ESG knowledge, misaligned business models, unsustainable procurement and resource constraints, that hinder transitions, and highlights the importance of transformative sustainable business model innovation for successful decarbonisation and growth.

In the SME sector, a detailed qualitative study reviewed barriers to circular and environmental sustainability adoption. SMEs cited lack of finance, technical know-how, infrastructure, awareness, government support, and perceived cost-benefit trade-offs as chief hurdles. Sajuyigbe et al. (2024) investigated green finance mechanisms such as green loans, green training and green investment in Lagos-based manufacturing SMEs. They found green loans and green technology had significant positive effects on environmental performance, while training and investment effects were positive but not statistically significant, suggesting finance and tech access as key enablers for sustainable transition.

SMEs and larger organisations struggle with access to green financing; high upfront technology and procurement costs discourage adoption of sustainable practices (Sajuyigbe et al.,□2024; qualitative SMEs study). Onwere et al. (2025) also note that ESG governance practices may raise perceived business risk absent strong enabling frameworks. Multiple reviews cite fragmented or weak legislation, poor enforcement of climate policies, and lack of government incentives such as tax relief or subsidised credit for ESG-agile firms as major impediments (Ilesanmi,□2025). Firms lack internal know-how on circular design, ESG implementation, green technology use, and sustainability reporting. SME respondents emphasised a need for training, education, and awareness (Sajuyigbe et al.,□2024). Resistance to change, low awareness of sustainability benefits, poor consumer demand for green products, and leadership inertia limit the transition process.

Psychological Well-Being and Ethical Leadership: Organisational Sustainable Transitions Pillars

Psychological well-being in Nigerian organisational studies typically encompasses employees' mental health, meaningful engagement, job satisfaction, resilience, and organisational commitment. Nwibere and Worlu (2023) empirically linked psychological resilience which is a core component of positive mental health, to organisational commitment among oil and gas employees in the Niger Delta, showing significant positive correlations across affective, normative, and continuance commitment. Though not explicitly framed around sustainability, high organisational commitment is a key behavioural resource that supports long-term change, including sustainable transitions. In Nigeria's manufacturing sector, Edosomwan et al. (2023) found that employee green behaviour, core self-evaluations, and empowering leadership significantly predicted workplace well-being, indicating that employees who value environmental practices and possess high self-worth experience better psychological well-being. Such employees are more inclined towards sustainable transitions, as their wellbeing aligns with green values and enables sustained change.

Another Lagos-based study by Akinbode and Osisioma (2024) explored the mediating effects of job satisfaction and employee voice on the relationship between ethical leadership and employee well-being in the financial sector. They found a significant positive effect of ethical leadership (characterised by integrity, fairness, transparency) on well-being, mediated by job satisfaction and employees expressing their views (i.e. voice). Higher well-being fosters motivation, engagement, and willingness to support sustainability initiatives in organisations. Although specific studies linking psychological well-being to organisational sustainable transitions in Nigeria remain limited, these findings offer compelling indirect evidence: employees with solid mental health, engagement and satisfaction, particularly when encouraged by ethical leadership are the human capital foundation for sustainable organisational change. They are more likely to support green practices, compliance with ESG policies, and continuous improvement aligned with sustainability transitions.

Ethical leadership, conceptualised in Nigeria largely through values such as integrity, transparency, fairness, and accountability, directly shapes organisational culture and outcomes. Adaiwo (2024) examined transparent and ethical leadership within Nigeria's primary healthcare system, finding that integrity and transparency significantly predicted employee productivity, with high explanatory power (large R^2). A culture rooted in such

ethical values supports sustainable transitions by enhancing trust, reducing corruption, and enabling adaptive staff engagement with sustainability changes. Nwanzu and Babalola (2025) specifically investigated ethical leadership's impact on employees' voluntary pro-environmental behaviour in Delta State organisations. They found that ethical leadership through fairness, trust, and ethical guidance enhanced psychological ownership, which mediated positive environmental behaviour at work. These results are directly relevant to organisational sustainable transitions: when staff feel responsible and ethically aligned, they engage in green practices, support circular economy measures, and sustain sustainability momentum.

In a broader cross-sectoral Nigerian study, marketing ethical value (integrity, transparency, accountability) was found to significantly influence sustainable leadership practices across public and private sector employees particularly in North Central and Southwest Nigeria, indicating positive effects on leadership style that supports long-run sustainability values and organisational culture. This underpins how ethical leadership drives sustainable organisational ethos. Additionally, literature from Africa emphasises that ethical leadership is critical to sustainable development: Ibe (2025) maintains that without leaders guided by moral principles and accountability, organisations and nations cannot achieve long-term sustainable outcomes. This theoretical backbone reinforces empirical Nigerian findings.

In Integrating Psychological Well-Being and Ethical Leadership in Sustainable Transitions, these Themes were Identified as Mechanisms Linking Psychological Well-Being and Ethical Leadership to Sustainable Transitions:

1. **Social exchange and empowerment**: Akinbode and Osisioma (2024) showed that ethical leadership increases job satisfaction and voice, thereby improving employee well-being. When employees feel empowered and satisfied, they are more motivated to participate in sustainability initiatives.
2. **Psychological ownership and pro-environmental behaviour**: Nwanzu and Babalola (2025) demonstrated that ethical leadership enhances psychological ownership, which in turn drives green workplace behaviours (e.g., resource conservation, recycling). This creates grassroots momentum for sustainable transitions within organisations.
3. **Resilience and commitment**: Nwibere and Worlu (2023) show that psychological resilience fosters organisational commitment, enabling employees to endure change and contribute to long-term transition strategies.
4. **Green behaviour-wellbeing nexus**: Edosomwan et□al. (2023) highlight that employees already engaged in green behaviour experience higher workplace well-being when supported by empowering leadership. Thus, sustainable transitions reinforce wellbeing while wellbeing sustains ongoing sustainable change.

Together, these pathways outline a virtuous cycle: ethical leadership cultivates trust, fairness, and transparency, which enhance job satisfaction, voice, and psychological ownership. These in turn boost psychological well-being, engagement, and resilience. Employees are then more likely to enact and sustain sustainable transition practices, such as green operations, ESG integration, and organisational innovation.

Conclusion and Recommendations

Conclusion

This paper has critically examined how psychological well-being and ethical leadership serve as foundational pillars for organisational sustainable transitions in Nigeria. Drawing on empirical studies, the review demonstrates that employee mental health, job satisfaction, and engagement, which indicates psychological well-being directly influence organisational readiness for sustainability. Similarly, ethical leadership characterised by integrity, fairness, and transparency, cultivates trust, promotes voluntary pro-environmental behaviours, and reduces resistance to change. Together, these human-centred constructs foster organisational cultures that are resilient, adaptive, and aligned with sustainability goals. However, despite their demonstrated importance, Nigerian organisations still face structural, cultural, and leadership-related constraints in fully integrating these pillars into sustainability strategies. For sustainable transitions to be successful, organisations must prioritise both employee well-being and ethical governance as strategic imperatives.

Recommendations

1. **Institutionalise Mental Health Support Systems**: Organisations should develop structured well-being programs, including mental health counselling, workload management, and employee assistance services, to enhance psychological resilience and engagement during sustainability transitions.
2. **Embed Ethical Leadership in Organisational Development**: Ethical leadership training should be incorporated into all levels of leadership development and succession planning to promote transparency, fairness, and stakeholder trust across the organisation.
3. **Link Sustainability KPIs to Employee Engagement Metrics**: Companies should integrate sustainability goals with HR performance indicators, ensuring that employee engagement, satisfaction, and well-being are tied to the success of organisational sustainability initiatives.
4. **Promote Cross-Sector Collaboration on ESG Literacy**: Government agencies, academic institutions, and private organisations should collaborate to raise awareness and build capacity around ethical leadership and psychological well-being as enablers of sustainable development.

Abstract
This research is an empirical investigation to ascertain the exact nature of connection between Performing Art entrepreneurship and Nigeria's Economic Development. The goal of performing arts entrepreneurship is to create sustainable businesses through creative ideas, funding, and audience interaction in order to provide cultural, social, and economic value. This includes applying commercial principles to artistic activities in music, dance, theater, and other fields. In order to create relevant initiatives, create original distribution models, and cultivate audiences, it entails fusing artistic originality with strategic thought. In the end, this helps to close the gap between artistic expression and commercial feasibility. A descriptive survey research design was adopted for the study. The sample of the study was achieved using a random sampling technique. The sample for this study was 69 respondents. These selected sixty-nine (69) respondents were performing art professionals which include Nollywood actors and musicians, dancers in Asaba Delta State, Nigeria. The instrument used to collect data was the questionnaire. The data collected were analyzed using simple percentage, mean, standard and chi-square. The overall findings of the study are that there is a significant and positive connection between performing Art Entrepreneurship through payment of fees for performing at Events, including festivals. This can be ticketed performance art shows or events or it can be within wider events or earned fees from acting in a Nollywood movie, Intellectual property earning for celebrities and sales of art products and services as well as production of artefacts and dancers performance fees or earnings and Nigeria's Economic development. The study also revealed that there is a significant and positive connection between Performing Art entrepreneurship and profitability and it was also discovered that entrepreneurial innovation made Performing Art entrepreneurship a viable business model. High demand for entertainment, global acceptance of performing Art Nigeria's Afrobeat music and entertainment products have made performing Art a viable business model for Nigeria's economic development and transformation. The study recommends that for theatre practice to be feasible and for the personal talents, ideas, and creative contributions of the artists to be effective and contribute to the economic development of Nigeria, entrepreneurial skills are necessary and a prerequisite.

Keywords*: Performing Art. Entrepreneurship Potential, Economic Development, Creativity, Innovation.*

Introduction

In order to give cultural, social, and economic value, performing arts entrepreneurship aims to establish long-lasting companies through innovative concepts, capital, and audience engagement. This involves incorporating business concepts into artistic endeavors in dance, theater, music, and other disciplines. It involves combining creative creativity with strategic thinking to develop audiences, develop original distribution platforms, and develop pertinent activities. Ultimately, this contributes to bridging the gap between business viability and artistic expression (Chukwuka & Iyamah 2024). Essentially, a number of social, behavioral, and psychological characteristics that successful businesspeople usually display are connected by entrepreneurial potential. According to Krueger and Brazeal (2000), these characteristics are believed to combine to explain a representative construct for a possible behavior: launching one's own company. According to Carvalho (2016), as stated in Chukwuka & Amahi (2021), "entrepreneurial potential" refers to the desire to start a business, as well as the tendency to act, perceived feasibility, considered desirability, and perceived self-efficacy. Another name for it is a collection of behavioral, social, and environmental characteristics that are part of every individual's character as an entrepreneur (Chukwuka & Amahi, 2021).

The goal of performing arts entrepreneurship is to create sustainable businesses through creative ideas, funding, and audience interaction in order to provide cultural, social, and economic value. This includes applying commercial principles to artistic activities in music, dance, theater, and other fields. In order to create relevant initiatives, create original distribution models, and cultivate audiences, it entails fusing artistic originality with strategic thought (Chukwuka & Iyamah 2024). In the end, this helps to close the gap between artistic expression and commercial feasibility. The performing arts In order to produce worthwhile and long-lasting initiatives in dance, music, theater, and other live artistic undertakings, entrepreneurship blends artistic originality with business acumen. The historical relevance of the arts as both cultural and economic forces is part of its background, and the contemporary idea emphasizes the creation of creative funding, production, and marketing techniques to attain both financial and cultural success. There was frequently an entrepreneurial element to the act of performing art itself, such as music and storytelling, as artists looked for patrons and support.

The economic importance of the arts was acknowledged by the late 20th century, and statistics such as those from the National Endowment for the Arts demonstrate a significant increase in public interest, drawing more people to arts events than to conventional entertainment locations. The rise of well-known centers such as Broadway in New York and the entertainment industry in California demonstrated how arts-related endeavors may forge unique regional identities and stimulate local economies and tourists. The realization that artists needed to combine their creative abilities with smart business thinking in order to flourish gave rise to performing arts entrepreneurship. The emphasis turned to creating sustainable economic models for the arts, incorporating a variety of revenue-generating ventures in addition to traditional grant financing.

Since artists discover new ways to finance, create, and share their work, they are able to employ their creativity to create value that is cultural, societal, or economic. This makes the concept intrinsically original. This encompasses a variety of activities, such as musicians starting their own record labels, digital artists making money online, and sculptors getting hired for commercial installations or public areas. Given the difficulties that artists encounter, entrepreneurship education programs that provide performers the analytical, strategic, and creative thinking abilities they need to succeed in the workplace are becoming more and more important.

Problems and the Justification for this Study

In order to effectively implement sustainable development, the Nigerian economy has fallen behind in terms of resource diversification, natural resource enhancement, and the utilization of the natural talents of its people as human resources. Massive unemployment and foreign exchange crises have plagued the Nigerian economy, and the country's foreign reserve has been depleted due to a lack of exports brought on by an excessive reliance on crude oil. Meanwhile, other areas of entertainment and human development, such as performing arts, have been neglected despite the fact that they have the potential to become one of Nigeria's top exports to the world and have the ability to revive the already damaged economy. The arts and the inheritance of nature are gifts and talents that have added to people's individuality and refinement. The combination of the two resources must undoubtedly be important to the contemporary economy. According to Micropaedia (2003), the arts attempt to address the root causes of unemployment. Furthermore, it is a good idea to attack the problem using a novel strategy, according to Deregon (2008). Performing art has the potential to be Nigeria's largest export to the globe, but over the years, the country has not taken advantage of its business potential. Without government assistance, Nigeria's top export to the globe at the moment is the performance art of Afrobeat music. Musicians like Davido, Bourna Boy, Wiskid, and others are bringing pride to Nigeria on a global scale. They also return a large portion of their millions of dollars, which strengthens the Nigerian economy.

Nigeria's performing arts sector has a lot of untapped potential. This serves as the rationale for this study, which aims to determine the precise nature of the relationship between performing arts entrepreneurship and Nigeria's economic growth. This study aims to close this gap in the literature.

Literature Review

The Concept of Performing Art Entrepreneurship

Performing art entrepreneurship is the strategic and creative creation of value from artistic performing arts through the application of entrepreneurial principles to create viable projects, manage creative endeavors, and maintain artistic careers. This approach combines artistic creativity with business acumen to produce economic, social, and cultural returns. Making the arts a viable economic sector entails seeing opportunities, taking chances, and creating sustainable models for artistic output, such as digital material, paid performances, or artistic goods and services (Chukwuka & Iyamah 2024).

The phrase "performing arts" refers to artistic disciplines like as dance, theater, and music that are performed live for an audience (Muscato, 2020). They are not the same as the visual arts, which create real, static works of art using paint, canvas, and other materials. But according to Esuh (2015), the performing arts include a range of disciplines that are performed live for an audience, including dance, music, and theater. Every human culture features a variety of performances, such

as theater, dance, music, and object manipulation. Music and dancing have been around since the prehistoric era, but circus skills have been there since at least Ancient Egypt. The performing arts are frequently presented by professionals. Stages outside during festivals, in specially constructed buildings like theaters and opera houses, in tents like circuses, or on the street can all host performances (Iyamah & Chukwuka 2024). Live performances in front of an audience are one type of entertainment. People can now enjoy performing arts in private thanks to advancements in audio and video recording technologies. One frequent objective is to use the performing arts to express one's thoughts and feelings (Oyewo, 2000).

When trying to evaluate the entrepreneurial approach to business, especially in the performing arts, it is helpful to remember that entrepreneurial activities, methods, tactics, and modes vary greatly depending on the type of organization and creativity involved. Carl (2009, p. 19) notes that "the scope of entrepreneurship encompasses everything from individual endeavours to substantial endeavours that generate numerous employment prospects." One may argue that, regardless of the size or type of creative enterprise, a valid result of proactive entrepreneurship in the arts is meeting and agreeing to the demands of a demanding audience. As per the earlier description, a variety of elements may be contributing to a practical comprehension of entrepreneurship through style and approach, all of which are safeguarded by distinct entrepreneurial characteristics. The following traits are probably the primary elements of what constitutes a successful entrepreneur: Risk-taking propensity, ability to find and use information, ability to set goals, physical and mental agility, degree of education, training, or work experience, initiative and opportunity seeking, networking and persuasion skills, systematic planning and monitoring, dedication, endurance, and commitment. Notably, by setting itself apart from other industries, Nigeria's performing arts sector has thrived commercially over the years.

In the widest sense, "arts entrepreneurship" refers to entrepreneurship in the arts. Due to the hard nature of administrative responsibilities, including those related to theater arts, this field of the arts requires an entrepreneur who is industrious, patient, and passionate. The manager's managerial and entrepreneurial function is crucial to the survival and growth of the theater practice. Since theater entrepreneurs must negotiate the particulars of the theater industry, creativity and innovation are generally valued in theater praxis. Zulu Sofola (1979), one of the forerunners of Nigerian theater, regarded theater as a form of artistic expression that mirrored societal changes. It is a metaphor for reality that embodies the entire cosmological, moral, and metaphysical order of people's lives in a vibrant and dynamic form. People are portrayed in this arena as a cosmic whole that reacts to forces both internal and external to them. Both the audience members who share in the mystery of humanity's shared fate and the others who engage with them also perceive and are perceived by them. The text above accurately describes the many duties performed in theaters, how they are carried out, and the individuals who perform them. In order to achieve the goals of social mediation, reflection, and refraction, it modified the function of a theater manager in the art and act of managing the theater.

Since theater is the result of multiple performances by different actors in a specific order and setting in front of an audience, it is recognized as the management of living and non-living phenomena, including people, structures, and other abstractions. In the past, theater was seen to be a combination of people, ideas, and artistic productions that came forth as a result of their collaboration (Cohen, 1999). According to this definition, theater is basically a place where plays

are performed as well as a group of people working together to create a planned, organized activity, event, or theatrical production.

This study embraces the notion of art from the standpoint of political economy in order to further elucidate the connection between the arts and economics in academic and professional activity. Max Weber (1864–1920) described art from a sociological standpoint as the application of knowledge, competence, and taste developed in production in line with aesthetic principles, as well as the methodical use of information and expertise determining the intended output. Weber's approach to economics is straightforward; he thinks that skills, tastes, and beauty should be used to the production of goods and other things that people can use. Weber's philosophy states that since customers desire a specific degree of aesthetic quality, all products must have pleasing shapes and an aesthetic quality applied by a qualified person or persons.

Nigeria's Economic Development

Nigeria's economy is expected to develop at a moderate rate in 2025—roughly 3.4%—due to the country's oil and gas, services, and agricultural sectors, as well as increased foreign exchange (FX) market stability. However, there are still issues, especially with high inflation, which should go away with stricter monetary policy and better foreign exchange stability. While ongoing government reforms, higher foreign exchange inflows, and initiatives to diversify the economy into industries like ICT are important improvements, infrastructure problems and security concerns continue to limit the growth of the crucial agriculture sector. Each word has been defined separately for the sake of clarity, and its combined and contextual meanings have been examined. The economy, according to Encarta (2001), is (1) thrift, or the prudent use of resources to prevent waste or extravagant expenditure, and (4) financial affairs, or the production and consumption of products and services by a community as a whole. Using sociological terminology, Hogan (2006) defines economy as "the dominant form of economic activities characterizing a society." He goes on to provide examples of economies, such as the nomadic, settled agricultural, modern industrial, and collecting and hunting economies. Iwe (1979) examines two different definitions of the economy and defines development as the shift from less human situations to those that

The Role of Performing Art in Economic Development

Economic development is fueled by the performing arts because they generate income from ticket sales and cultural merchandise, create jobs, draw tourists, and encourage innovation in allied industries. They also improve national identity and social cohesiveness, boost the economies of both urban and rural areas through cultural initiatives and events, and provide artists new chances in a worldwide, digital marketplace. The performing arts industry greatly lowers unemployment, especially among young people, by providing a variety of job opportunities for musicians, dancers, artists, playwrights, and technical personnel (Iyamah & Chukwuka 2024). Tourists are drawn to local economies by cultural festivals, music concerts, and theatrical productions, which raise demand for goods and services. Through the selling of tickets, intellectual property rights, art product sales, and the creation of related artifacts, the performing arts support national economies. The expansion of the performing arts encourages creativity and advancement in a number of associated fields, including film, music production, set design, and handicrafts. The digital creative economy is growing because online streaming and virtual performances give artists new sources of revenue and increase their exposure to people around the world.

Most people think that if you want to work as a professional artist, you have to study the visual arts. This is inaccurate, but citizens' knowledge and experiences in the arts will surely make them more creative in a wide range of professions, such as architecture, engineering, medicine, and many more. According to Blakeslee (1994), we have long since concluded that a person cannot rightfully claim to be educated if they lack the basic skills and understanding in the arts. However, Blakeslee discusses the American experience; there are significant distinctions in Nigeria. The fact that the majority of influential individuals and opinion leaders were not exposed to the arts in school may not be far from the reality; despite their odd disdain for them, they nonetheless utilize their products or act in an artistic way. Labeling it "fetish," "juju," and "incognito," they openly express their superstitions and fears. Additionally, they are very sensitive to religious and artistic subjects. Most people who act like this might be schizophrenic; they might have been afraid of art and toys since they were young, which eventually caused them to become superstitious.

Even though I didn't take fine arts classes in school, is it still true that I lack creativity? Some might inquire. The answer is simple: you would have offered more creative answers to the nation's numerous problems, such as personal "refinement." When the proposal to make the creative arts mandatory was first made, parents and guardians who had no artistic training objected and kept even talented children from taking art classes (Ekong, 2000). According to Boyer, the arts should be a fundamental part of every child's education since they provide significance and knowledge that can't be learned through the study of other subjects (Idiong, 2000). The potential and benefits of the arts are demonstrated by the activities of the world's most prosperous economies and the expressions created over them. Legislation in the United States has required all children to learn the arts (Chappman 1978; Eisner and Ecker 1966). In the early 1870s, a group of Massachusetts manufacturers pushed the state government to mandate art education, including drawing. The manufacturers' realization that highly qualified craftspeople and designers were required to make American goods competitive in the international market contributed to America's economic dominance. Because of the steps made in response to that vision, America was the center of the global economy prior to the emergence of the Asian markets. It is clear from Achebe's (1986) observation that the arts are not the international economy's weak link, but rather its source of energy. The Americans are fully aware of this fact and have taken advantage of it. Pittsburgh is the world's top center for arts education, according to Newsweek's (1991) list of the top ten foreign schools globally. Howard Gardner, a psychologist at Harvard University and the founder of the PROPEL program, presented confusing theories about creativity and the arts in his 1983 book "Frames of Mind." Gardner argued that "artistic," "skilful," or "talent" abilities are basically different types of intelligence that should be taught in schools alongside more traditional subjects. Through experimentation, students learned how to solve problems and express themselves creatively and independently in a range of media. This view holds that the skills and abilities that students learn in the classroom may have a significant positive impact on the industry and emerging global marketplaces.

Theoretical Framework

Chukwuka's Entrepreneurial Wealth Creation Theory served as the theoretical cornerstone of this study (2025). Chukwuka (2025) pioneered a new entrepreneurial attitude that is reflected in the entrepreneurial wealth creation philosophy. According to Chukwuka (2025), rather of concentrating only on financial transactions, entrepreneurs generate wealth by recognising societal issues and coming up with creative ways to address them. He claims that this process entails

turning societal issues into opportunities, coming up with innovative solutions, making money by presenting innovative solutions as valuable, and eventually increasing societal wealth—often by using what he called the POSMOW MODEL OR FRAMEWOR: Problems, Opportunity, Solutions, Monetary rewards which result in sustained wealth. Through resource allocation, innovation, and the creation of new value, entrepreneurs generate income that ultimately benefits society as a whole.

Instead of focusing solely on financial transactions for individual benefit, this strategy emphasizes that wealth creation comes from identifying and coming up with creative solutions to societal issues. In order to generate wealth, it highlights how important it is to recognize opportunities, devise solutions, and generate profits. Entrepreneurs distribute and manage resources effectively so they can develop and implement their ideas. The cornerstone of wealth creation is the capacity to create new value that meets a need or fixes a problem. Financial advantages are made when solutions are successfully executed, and this helps to further accumulate wealth. The creation of entrepreneurial wealth benefits the entrepreneur as well as the greater community by generating jobs, economic growth, and improved living standards. According to the thesis, entrepreneurs need to recognize societal issues and come up with creative solutions to solve them if they want to build generational wealth that transcends themselves. This is more than just business dealings for financial gain. In order to create and execute their ideas, entrepreneurs efficiently distribute and oversee resources. The ability to produce new value that addresses a need or solves an issue is the cornerstone of wealth creation. When solutions are successfully implemented, money is made, which contributes to the wealth creation process. By generating jobs, stimulating the economy, and improving living standards, entrepreneurial wealth creation grounded in this philosophy benefits both the entrepreneurs and the larger community. In essence, entrepreneurial wealth creation theory emphasizes a positive feedback loop whereby identifying and addressing societal problems creates wealth, which in turn spurs further innovation and problem-solving, ultimately benefiting both the individual entrepreneur and society at large.

Methodology

Since questionnaires were used, a descriptive survey research design was used for the investigation. This kind of survey gathered and examined information from musicians, dancers, and Nollywood actors in Asaba in order to study a population. The 108 Nollywood actors, musicians, and dancers in Asaba and Delta State, Nigeria, make up the study's population. Randomness, normalcy, and representativeness are the presumptions that underpin the sample approach in this investigation. This is regarded as a well representative sample of the population. A five-point Liker's scale was used to examine the structured questionnaire, and the SPSS statistical software version 20.0 was utilized to test the three hypotheses utilizing the t-test statistical tool.

Result and Discussions

The 108 Nollywood actors, musicians, dancers, and other performing arts professionals in Delta State received 108 copies of the questionnaires. Only sixty-nine (69) copies, nevertheless, were successfully recovered. Consequently, this indicates a 60.5% success rate, which equals the sample size.

According to Table 2's demographic information, 42 respondents—or 61.8% of the sample—were men, and 26 respondents—or 38.2% of the sample—was women. This suggests that there are more men than women participating in the study.

Table 1: Gender distribution of respondents

Sex	No. of respondents	Percentage (%)
Male	42	61.8%
Female	26	38.2%
Total	**68**	**100**

Source Field Survey 2025

Table 2. Age distribution of respondents

Age	No. of respondents	Percentage (%)
19-28yrs	3	4.4%
29-39yrs	35	51.5%
40yrsandabove	30	44.1%
Total	**68**	**100**

Source Field Survey 2025

According to Table 2, 35 (51.5%) of the respondents are between the ages of 29 and 39, making up the simple majority. Thirty (44.1%) are between the ages of 40 and older, while those between the ages of 19 and 28 make up 4.4%. No respondent is younger than 18 years old.

According to Table 3, the simple majority of respondents—36, or 52.9%—have an HND, BSc, or MBBS; 31 respondents, or 44.1%, have an MA or MSc; and 2 respondents, or 2.9%, have a PhD. None of the responders, however, hold an FSLC, SSCE, or ND/NCE.

Table 3: Educational qualification distribution of respondents

Educational Qualification	No. of respondents	Percentage (%)
HND/BSc/MBBS	30	44.1%
MA/MSc	36	52.9%
PhD	2	2.9%
Total	**68**	**100**

SourceFieldSurvey2025

According to Table 4 above, the simple majority of respondents—36, or 52.9%—have an HND, BSc, or MBBS; 30 of them, or 44.1%, have an MA or MSc; and two, or 2.9%, have a PhD. None of the responders, however, hold an FSLC, SSCE, or ND/NCE.

Analysis of Research Question

Research Question One: What is the exact nature of connection between Performing Art Entrepreneurship and Nigeria's Economic Development?

Table 4: To determine the exact nature of connection between Performing Art Entrepreneurship and Nigeria's Economic Development

S/N	Statement	SA	A	D	SD	MEAN	Remark
1.	There is a positive and significant connection between Performing Art Entrepreneurship and Nigeria's Economic Development	24 35.29(%)	28 41.18(%)	12 17.65(%)	4 5.88(%)	3.1	Agreed
2.	Earned fees from Acting in Nollywood movies, Fees or ticket sales for performing at Events, including festivals is the performing Art Entrepreneurship potential for Performing Art. Are the Entrepreneurial potential for Performing Art	16 23.53 (%)	40 58%	2 2.94 (%)	10 14.71 (%)	3.3	Agreed
3.	Sales of art products and services as well as the production of artefacts are the performing Art entrepreneurship activity	30 44.12(%)	26 38.24 (%)	3 4.41 (%)	9 13.24 (%)	3.1	Agreed
4.	Intellectual property	26	23	10	9	3.2	Agreed

	earning for celebrities for the production of DVDs, CDs and royalties paid for using artists' intellectual properties are the Entrepreneurial potentials for Performing Art	38.24(%)	33.82(%)	14.71(%)	13.24(%)		

Source: *Field Survey, 2025*

Table 4 showed that respondents with mean scores of 3.1, 3.3, 3.1, and 3.2, respectively, agreed with items 1, 2, 3, and 4. These mean scores were far higher than the benchmark of 2.5, which is used to rate a mean score as agreed. The findings suggest that Performing Art Entrepreneurship has a favorable and significant connection to Nigeria's economic growth in addition to Performance fees or ticket sales at events, such as festivals, The performing art entrepreneurship activities, goods, and programs include royalties paid for using artists' intellectual property, sales of art-related goods and services, sales of artefacts and intellectual property earned by celebrities for the creation of DVDs and CDs, and acting fees from Nollywood films.

Test of Hypothesis

H1: There is significant and direct positive connection between Performing Art Entrepreneurship and Nigeria’s Economic Development

Decision rule

At the 5% level, we contrast the computed chi-square value (x2) with the tabulated X2 value. Accept H1, the alternative hypothesis, and reject H0, the null hypothesis, if the obtained X2 is higher than the tabulated (critical) X2. The alternative hypothesis is rejected and the null hypothesis is accepted if the chi-squared value is smaller than the threshold X2 value. We calculate the X2 value, which is displayed in the table below and shows the observed and expected, using the chi-square result obtained from the answers to the question of whether there is a significant and direct positive connection between performing art entrepreneurship and Nigeria's Economic Development.

Table5: Performing Art Entrepreneurship and Nigeria’s Economic Develoment

	Observed N	**Expected N**	**Residual**
Strongly disagree	49	100.0	-51.0
Disagree	59	100.0	-41.0
Agree	92	100.0	-8.0
Strongly agree	200	100.0	100.0
Total	400		

Table 6. Test statistics

	performing art entrepreneurship and Economic development
Chi-Square	143.460a
Df	3
Asymp. Sig.	.000

a. 0 cells (.0%) have expected frequencies less than5.The minimum expected cell frequency

Based on the result, df=3, 143.46 is the computed chi-square. At the 5% level of significance, the crucial X2 is 14.860. According to the decision rule, we accept the alternative hypothesis H1, which claims that there is a substantial, positive, and direct relationship between performing art entrepreneurship and Nigeria's economic development, and reject the null hypothesis H0 because the tabulated X2=14.860 at 0.05 is less than the computed value of 143.46.

Discussion of Results

A descriptive survey was used in the study, and 69 respondents made up the sample. Nollywood actors and musicians from Asaba Delta State, Nigeria, were among the sixty-nine (69) responders who were chosen because they were professionals in the performing arts. The questionnaire was the tool utilized to gather information. The acquired data was analyzed using chi-square, mean, standard, and basic percentages. According to the study's general conclusion, Nigeria's economic development and performing arts entrepreneurship are significantly and directly positively correlated. The ability to make money from performing art by charging for appearances at festivals and other events is another aspect of this.

The study also revealed that there is a significant and positive connection between Performing Art entrepreneurship and profitability and it was also discovered that entrepreneurial innovation made Performing Art entrepreneurship a viable business model. High demand for entertainment, global acceptance of performing Art Nigeria's Afrobeat music and entertainment products have made performing Art a viable business model for Nigeria's economic development and transformation

This includes selling tickets for performance art events or other events, earning money by acting in Nollywood films, obtaining intellectual property for celebrities, selling art-related goods and services, and creating artifacts. Performing art is a viable business model because of the high demand for entertainment and the widespread acceptance of performing art products worldwide, which has made it a viable business model for Nigeria's economic development and transformation, according to the study. It also found a significant and positive correlation between performing art entrepreneurship and profitability. We verified, based on the study's findings, that performing arts support Nigeria's economic growth.

The study also discovered that Nigerian Music significantly generates income for the country through foreign remittances, especially from its rising Afrobeats genre which has achieved substantial global streaming and chart success**.**

Conclusion

The overall findings of the study are that there is a significant, direct and positive connection between performing Art Entrepreneurship and Nigeria's economic development. This findings

means that Performing Art Entrepreneurship is greatly contributing to Nigeria's Economic Development through generate income from ticket sales and cultural merchandise, create jobs, draw tourists, earned fees from acting in a Nollywood movie, sales of art products and services as well as production of artifacts, dancers performance fees or earnings and encourage innovation in allied industries. They also improve national identity and social cohesiveness, boost the economies of both urban and rural areas through cultural initiatives and events, and provide artists new chances in a worldwide, digital marketplace. The performing arts industry greatly lowers unemployment, especially among young people, by providing a variety of job opportunities for musicians, dancers, artists, playwrights, and technical personnel. Tourists are drawn to local economies by cultural festivals, music concerts, and theatrical productions, which raise demand for goods and services. Through the selling of tickets, intellectual property rights, art product sales, and the creation of related artifacts, the performing arts support national economies.. The study also concludes that Nigerian Music significantly generates income for the country through foreign remittances, especially from its rising Afrobeats genre which has achieved substantial global streaming and chart success.

Recommendation

Based on the above findings, the study recommends that for theatre practice, performing arts entrepreneurship to be feasible and for the personal talents, ideas, and creative contributions of the artists to be effective and contribute to the economic development of Nigeria, entrepreneurial skills are necessary and a prerequisite and government must encourage it.

Data Preservation and Efficiency of Managers' Functions in the Public Sector of Rivers State

Dr Beauty L. Gbafah
Department of Office and Information Management,
Faculty of administration and Management Rivers State University
E-Mail: beautygbafah@ust.edu.ng

Abstract
This study investigates the impact of data preservation on the efficiency of managerial functions within public sector organizations in Rivers State, Nigeria. In an era where information is central to governance, the ability to preserve, retrieve, and utilize accurate data is fundamental to effective public administration. The study aims to identify existing data preservation practices, assess the extent of digital tool adoption, and explore challenges hindering effective data management. Anchored on the Resource-Based View (RBV) theory, which positions information as a vital organizational resource, the research adopts a descriptive survey design. Data were gathered through structured questionnaires administered to managers in selected public institutions. Findings reveal that effective data preservation enhances managerial efficiency by improving decision-making, accountability, planning, and service delivery. However, the study also identifies persistent barriers, including inadequate technological infrastructure, insufficient training, and weak policy implementation. The study concludes by recommending increased investment in digital infrastructure, capacity building, and the establishment of robust data governance policies as strategies to enhance public sector performance in Rivers State.

Keywords: *Data preservation, Managerial Efficiency, Public Sector, Digital Infrastructure, Rivers State, Nigeria*

Introduction

In the digital age, effective data management has become a cornerstone of institutional success across the globe. Nowhere is this more critical than in the public sector, where efficient administrative processes are necessary for the delivery of essential public services, transparency, accountability, and policy continuity. Data preservation—the process of maintaining data in a usable form over time—is an integral aspect of modern information management. It ensures that data remains authentic, reliable, and accessible for future reference (Conway, 2010). For public sector managers in Rivers State, Nigeria, the ability to access and utilize preserved data is crucial to the effective execution of their functions, including planning, budgeting, decision-making, monitoring, and evaluation. Public institutions in Rivers State, like many in other developing regions, are under increasing pressure to improve their operational efficiency and service delivery amid rising public expectations and limited resources. Managers within these institutions often serve as decision-makers and intermediaries between government policies and their implementation. Their performance is greatly enhanced when they can retrieve historical data, understand organizational trends, and evaluate program outcomes based on accurate records (Yusof et al., 2012). Therefore, data preservation plays a pivotal role in enhancing the efficiency

of managerial functions by supporting informed decisions, promoting institutional memory, and ensuring compliance with statutory obligations.

Despite the importance of data preservation, many public sector organizations in Rivers State still grapple with poor data management practices, resulting in data loss, duplication, inconsistency, and inaccessibility. These challenges hinder the ability of managers to perform their roles effectively and contribute to administrative bottlenecks, financial irregularities, and poor service delivery (Olatokun & Ayanbode, 2009). Inadequate funding, lack of digital infrastructure, and limited awareness about data preservation techniques further exacerbate the problem in the state's ministries, departments, and agencies (MDAs). In a well-structured public administration system, data serves as a vital input for effective planning and performance evaluation. Managers require access to reliable data to track project timelines, monitor resource usage, and evaluate policy outcomes. According to Alhassan, Sammon, and Daly (2016) the absence of preserved data negatively impacts the quality of decisions, disrupts continuity, and undermines institutional accountability. In Rivers State, where public projects often span multiple years and administrations, preserved data ensures that new managers can build upon previous records rather than repeating tasks or making uninformed choices.

Moreover, effective data preservation enhances compliance with local and international data protection regulations, such as Nigeria's Data Protection Regulation (NDPR), which requires public institutions to ensure the confidentiality, integrity, and availability of data (NITDA, 2019). Compliance not only safeguards sensitive government and citizen information but also enhances public trust in government institutions. For public sector managers, preserved data provides the audit trail necessary to defend decisions and demonstrate adherence to regulatory frameworks. Technological innovations offer an opportunity for public institutions in Rivers State to modernize their data preservation practices. Digital storage systems, cloud computing, and electronic document management systems (EDMS) allow for secure and efficient storage and retrieval of information. However, the successful adoption of these technologies depends on institutional readiness, availability of skilled personnel, and policy support (Bassiliades et al., 2015). Unfortunately, many public institutions in the state lack the technical capacity and political will to implement such solutions, leaving managers to rely on outdated, manual record-keeping systems that are vulnerable to damage, theft, and loss. Furthermore, public sector efficiency is closely tied to organizational learning and knowledge transfer. Data preservation enables knowledge retention, which is essential in mitigating the effects of workforce turnover—a common challenge in the public sector. As personnel move or retire, preserved data ensures continuity by allowing new managers to review historical records and reports to guide their actions (Katuu, 2015). In the absence of such data, institutional knowledge is lost, and public institutions may suffer from repetitive mistakes, reduced innovation, and inefficiency.

Empirical studies have shown that public institutions that implement structured data preservation frameworks experience improved coordination, transparency, and accountability (Lee et al., 2011). In the context of Rivers State, where development efforts are often undermined by poor project tracking and weak monitoring mechanisms, data preservation can serve as a tool to enhance project implementation and public resource management. It can also support inter-agency collaboration by enabling data sharing and coordination across ministries and departments. However, challenges persist. A study by Ogbole, Arawomo, and Omoregie (2020) indicates that many Nigerian public

institutions are yet to develop a comprehensive strategy for long-term data preservation. Factors such as fragmented data policies, lack of standardization, inadequate ICT investment, and insufficient training of personnel hinder the realization of an efficient data preservation system. In Rivers State, addressing these challenges will require a deliberate effort by both state and federal government actors to strengthen data governance, invest in digital infrastructure, and promote a culture of information preservation.

Ultimately, the efficiency of managers in the public sector of Rivers State is inextricably linked to the quality of data they can access and utilize. Data preservation not only supports day-to-day administrative operations but also strengthens the foundations of good governance, public accountability, and development planning. Therefore, there is a compelling need to prioritize data preservation as a strategic objective within public administration in Rivers State. Doing so will empower public managers to execute their functions more effectively and contribute meaningfully to the socioeconomic development of the state.

Purpose of the Study

The primary purpose of this study is to examine the impact of data preservation on the efficiency of managerial functions within public sector institutions in Rivers State, Nigeria. Specifically, the study seeks to explore how effective data preservation practices contribute to informed decision-making, organizational continuity, transparency, and overall administrative efficiency. In an era characterized by rapid digitization and information overload, public sector managers require access to accurate and timely data to plan, implement, and evaluate government policies and programs effectively. This study aims to uncover the extent to which current data preservation practices support or hinder these managerial responsibilities.

Furthermore, the study intends to identify the major challenges confronting data preservation efforts in the public sector of Rivers State, including infrastructural deficits, lack of policy implementation, inadequate training, and poor awareness among personnel. It will also explore the role of digital technologies and institutional frameworks in enhancing data preservation systems that support efficient managerial functions. By doing so, the research aims to provide actionable insights that can inform policy formulation, capacity-building programs, and investment in digital infrastructure to strengthen public sector performance in the state. Ultimately, this study contributes to the body of knowledge on public administration and information management by emphasizing the strategic importance of data preservation in achieving effective governance and sustainable development in Rivers State.

Objectives of the Study

The specific objectives of this study are to:

i. Examine the relationship between data preservation practices and the efficiency of managerial functions in public sector institutions in Rivers State.
ii. Identify the current data preservation strategies and systems adopted by public institutions in Rivers State.
iii. Assess the challenges faced by public sector managers in preserving and retrieving data for effective decision-making.
iv. Evaluate the extent to which digital technologies are utilized in data preservation within public sector organizations.

v. Recommend practical strategies for improving data preservation practices to enhance managerial efficiency in the public sector.

Literature Review

Theoretical Framework

In the context of examining the efficiency of managerial functions in the public sector. **Classical Management Theory (Fayol's Principles of Management), Contingency Theory and Resource-Based View (RBV)** theories were applied.

One of the foundational theories in understanding managerial efficiency is **Henri Fayol's Classical Management Theory,** specifically his principles of management, which emphasize efficiency and effectiveness in organizational operations. Fayol proposed that managers should engage in five core functions: planning, organizing, commanding, coordinating, and controlling. These functions provide a systematic approach to management, which helps in streamlining activities, reducing inefficiencies, and ensuring that the resources are used optimally (Fayol, 1949). Fayol's principles, such as division of labor, unity of command, and scalar chain, contribute to improving managerial efficiency by ensuring clear roles and responsibilities, well-defined hierarchical structures, and effective communication within the organization. These principles are applicable in the public sector, where hierarchical and bureaucratic structures are common, and clear guidelines are necessary for maintaining order and accountability in the management of resources (Ogbole, Arawomo, & Omoregie, 2020).

Contingency Theory, proposed by Fred Fiedler, argues that managerial efficiency is not a one-size-fits-all concept; instead, it is contingent upon the specific circumstances or context in which management functions occur. This theory posits that the effectiveness of management practices depends on various external and internal factors, including organizational structure, culture, task complexity, and the environment (Fiedler, 1964). In the public sector, the contingency approach is highly relevant. For example, the efficiency of public managers may vary depending on the political environment, available resources, the complexity of public services being provided, and the level of bureaucratic control (Yusof & Ismail, 2012). Therefore, managers must adapt their strategies and practices to fit the unique needs of their organizations. For example, a public sector manager in a rural area may face different challenges compared to one in an urban environment, requiring different managerial approaches to maximize efficiency.

The Resource-Based View (RBV), introduced by Barney (1991), emphasizes that organizational efficiency is dependent on the resources and capabilities that a firm or institution controls. According to the RBV, managers achieve efficiency by leveraging their organization's unique resources, such as human capital, technology, and financial assets, to create a competitive advantage. In the public sector, the RBV suggests that managerial efficiency can be enhanced when public sector managers effectively utilize available resources. For example, managers can improve efficiency by effectively allocating personnel, using advanced technology for data management, and optimizing financial resources to achieve organizational goals (Alhassan, Sammon, & Daly, 2016). Public sector managers are also tasked with maintaining transparency and accountability in the use of public resources, making the efficient management of resources even more critical. The RBV underscores the importance of investing in resource development, such as training programs for employees, acquisition of state-of-the-art technologies, and fostering

organizational capabilities. These resources, when properly managed, enhance the efficiency of managerial functions in the public sector (Adebayo & Adeleke, 2018).

The theoretical framework for understanding managerial efficiency in public sector organizations incorporates various management theories that highlight the role of leadership, resource management, organizational structures, and external factors. Classical management theory, contingency theory, systems theory, the resource-based view, and leadership theories all offer unique insights into how managerial functions can be optimized for greater efficiency. By integrating these theories, public sector managers can better understand the dynamics of their roles and improve their ability to deliver quality services while utilizing resources effectively.

Data Preservation

Data preservation refers to the process of maintaining and safeguarding data over time to ensure its integrity, accessibility, and usability for future use. It is a critical aspect of data management, especially in organizations and institutions where the longevity and reliability of data are essential for decision-making, research, legal compliance, and operational continuity. In the context of public sector organizations, data preservation plays a vital role in ensuring transparency, accountability, and efficient governance. Data preservation is defined as the systematic approach to ensuring that data remains intact, accessible, and usable over time, regardless of the technological or environmental changes that may occur. It encompasses a range of activities, including the storage, backup, archiving, and protection of data against loss or corruption. The ultimate goal is to maintain the value and usability of data for as long as it is required for institutional, legal, or historical purposes (Kramer, 2015). The future of data preservation is closely tied to advancements in technology, particularly in areas such as cloud computing, artificial intelligence, and blockchain. Cloud storage offers scalable and cost-effective solutions for preserving large volumes of data, while AI can assist in data classification, backup automation, and the detection of anomalies in data integrity (Alhassan et al., 2016). Blockchain technology holds promise for enhancing data security and providing immutable records, making it an exciting development for future data preservation practices.

Importance of Data Preservation

The importance of data preservation can be understood in several key areas:

i. **Continuity and Availability**: Ensuring that data is preserved over time guarantees that it remains available when needed, even in the face of system failures, natural disasters, or other unforeseen events (Yusof & Ismail, 2012). Public sector organizations, for instance, rely on preserved data for day-to-day operations, policy-making, and legal processes.

ii. **Legal and Regulatory Compliance**: Many public sector organizations are required by law to preserve certain types of data for extended periods. This includes records related to financial transactions, public health, personnel, and other administrative functions. Failure to preserve such data may result in legal consequences or non-compliance with government regulations (Ogbole, Arawomo, & Omoregie, 2020).

iii. **Historical and Research Value**: Data preservation is also essential for historical records and research purposes. Public sector data, including government decisions, public health data, and other administrative records, can be of great value for future analysis, research, and policy development (Conway, 2010).

iv. **Operational Efficiency**: Well-preserved data improves the efficiency of organizational functions by providing accurate and timely information. For managers in the public sector, having reliable data at their disposal is crucial for decision-making and accountability (Bassiliades et al., 2015).

Data preservation is a critical function for ensuring that data remains accessible, secure, and usable over time. In the public sector, effective data preservation is essential for operational efficiency, legal compliance, historical research, and governance. By implementing strategies such as data storage and backup, digital archiving, data integrity management, and metadata management, public institutions can enhance their data preservation efforts. However, challenges such as technological obsolescence, infrastructure limitations, and data security risks must be addressed to ensure the long-term success of data preservation practices.

Efficiency in Managerial Functions

Efficiency in managerial functions refers to the ability of managers to achieve organizational goals and objectives using the least amount of resources, such as time, money, and human effort. It emphasizes the optimal utilization of available resources to achieve desired outcomes with minimal waste or inefficiency. Managerial efficiency is crucial in both public and private sector organizations as it directly influences performance, productivity, and the overall effectiveness of the organization. In this context, managerial functions include planning, organizing, leading, and controlling—four core activities that are critical for ensuring organizational success. Managerial efficiency is often defined as the ability of managers to accomplish tasks effectively while minimizing resources used in the process (Fayol, 1949). It is not merely about doing things right but about achieving the best results with the least effort or cost. The efficiency of managerial functions is typically measured in terms of output produced per unit of input. In other words, it reflects how well a manager can translate resources—whether human, financial, or technological—into desired outcomes.

Importance of Managerial Efficiency

Managerial efficiency is critical for the success of any organization, whether in the public or private sector. In the public sector, where resources are often limited and public accountability is paramount, efficiency is especially important. Some key reasons why managerial efficiency is crucial include:

i. **Cost Reduction**: Efficient managers can significantly reduce costs by minimizing waste and ensuring that resources are used effectively. This is particularly important in the public sector, where budgets are constrained, and there is increasing pressure to ensure that taxpayer money is used wisely (Yusof & Ismail, 2012).
ii. **Improved Service Delivery**: Managerial efficiency directly impacts the quality and speed of service delivery. In public sector institutions, efficient management ensures that public services are delivered promptly and meet the needs of the citizens (Ogbole, Arawomo, & Omoregie, 2020). For instance, in government agencies, efficient data processing and response times improve overall public satisfaction.
iii. **Enhanced Decision-Making**: Managers who operate efficiently can make better decisions because they have access to reliable data, have streamlined processes, and can assess situations quickly. This improves their ability to respond to changing environments and emerging issues (Conway, 2010).

iv. **Increased Organizational Performance**: Organizations with efficient managers tend to outperform others because their management processes are optimized. Efficient management practices lead to higher productivity, faster goal attainment, and better utilization of resources (Adebayo & Adeleke, 2018).

Managerial efficiency is essential for the effective functioning of any organization, particularly in the public sector where limited resources must be optimized to serve the public effectively. By focusing on key areas such as decision-making, leadership, resource management, and technological adoption, managers can enhance their efficiency and contribute to improved organizational performance. Overcoming challenges like bureaucracy, political interference, and resource limitations is crucial for ensuring that public sector managers can work efficiently and deliver high-quality services.

How Data Preservation Influences the Efficiency of Managerial Functions in the Public Sector of Rivers State

Data preservation significantly influences the effectiveness and efficiency of managerial functions in the public sector by enhancing information accessibility, decision-making accuracy, accountability, and continuity in administrative processes. In the context of Rivers State, Nigeria—where public sector organizations often struggle with inconsistent record-keeping, lack of digitization, and poor documentation practices—data preservation becomes a vital element in supporting managerial performance.

i. **Improved Decision-Making:** Effective data preservation ensures that managers have continuous access to accurate, complete, and timely historical data. This enables them to make informed decisions based on empirical evidence rather than assumptions or anecdotal information. For instance, budget managers in ministries can analyze past expenditure patterns to develop realistic future budgets, thereby avoiding misallocation of resources (Yusof et al., 2012).

ii. **Enhanced Administrative Continuity:** Frequent personnel changes in the public sector can disrupt the flow of institutional knowledge. Preserved data bridges this gap by offering new managers access to project histories, reports, and administrative records. This reduces the learning curve and prevents redundancy or repetition of errors, which often delay public service delivery (Katuu, 2015).

iii. **Efficient Monitoring and Evaluation:** Preserved data enables systematic monitoring and evaluation (M&E) of government programs. Managers can use archived information to assess project milestones, track key performance indicators, and generate reports for stakeholders. This promotes a results-oriented culture in public administration and fosters evidence-based reporting and accountability (Lee et al., 2011).

iv. **Transparency and Accountability:** One of the key expectations of public sector managers is to maintain transparency in the use of public resources. Properly preserved data supports audit processes and public scrutiny by providing verifiable records of decisions, expenditures, and outcomes. In Rivers State, where accountability challenges persist, data preservation contributes to institutional integrity and citizen trust in government (Ogbole et al., 2020).

v. **Support for Policy Implementation:** Data preservation helps managers follow through with policies and development plans initiated by previous administrations. With access to past plans and progress reports, managers can align current strategies with long-term

objectives. This consistency in policy implementation enhances the effectiveness of governance across political transitions.

vi. **Time and Cost Efficiency:** Retrieving information from well-organized digital archives or physical record systems reduces the time spent searching for documents and re-creating lost data. This leads to time savings and operational cost reduction. In contrast, poor data preservation leads to delays, inefficiencies, and increased costs due to duplication of efforts.

vii. **Compliance with Regulatory Standards:** Preserved data helps managers ensure compliance with local and international regulations, such as Nigeria's Data Protection Regulation (NDPR). It enables them to retain required records for statutory periods, respond to data access requests, and maintain data confidentiality and security (NITDA, 2019).

Existing Data Preservation Practices in Public Institutions in Rivers State

In Rivers State, as in many other regions of Nigeria, data preservation within public institutions remains an evolving challenge. While there is a growing recognition of the importance of data management in enhancing public sector performance, practices surrounding data preservation in many institutions still face significant obstacles, including inadequate infrastructure, inconsistent implementation, and limited capacity building. However, some public institutions in Rivers State have adopted certain practices aimed at ensuring better data management and preservation. Below are the existing data preservation practices observed in the public sector of Rivers State.

i. Manual Record Keeping

Despite the global shift toward digitalization, many public institutions in Rivers State still rely heavily on manual record-keeping methods. This practice often involves storing physical documents, files, and reports in cabinets or warehouses. While these records are essential for documenting past decisions and actions, the reliance on physical storage presents several limitations:

- **Risk of Loss or Damage**: Physical records are vulnerable to environmental factors, such as fire, flooding, or pest infestations, all of which have been concerns in some government offices (Olatokun & Ayanbode, 2009).
- **Space Constraints**: Manual records require significant physical space for storage, making it difficult to manage large volumes of documents, particularly in ministries with extensive archives.
- **Time Inefficiency**: Searching for and retrieving information from paper-based systems is time-consuming, and there is often duplication of records.

ii. Ad-Hoc Digitization Efforts

In some institutions, there have been efforts to digitize paper-based records as a way of improving efficiency and accessibility. This is often done on an ad-hoc basis, where certain departments digitize critical documents or reports, such as budgets, financial statements, or procurement records. These records are then stored in local databases or shared folders on institutional servers. While this digitization effort helps reduce the reliance on paper and makes information more accessible to managers and staff, the process is often not standardized. As a result:

- **Lack of Consistency**: Digitization efforts vary from one institution to another, and even within institutions, resulting in inconsistent practices and difficulty in managing electronic records.

- **Limited Access**: The digitized records are often stored on isolated servers or departmental drives, making it difficult for other departments to access or share critical data (Bassiliades et al., 2015).

iii. Use of Basic Software for Data Management

Some public institutions in Rivers State use basic office software such as Microsoft Excel and Word for maintaining records. These applications are often used to track financial transactions, manage personnel records, or store operational data. However, this practice has several limitations:

- **Lack of Scalability**: As data volumes grow, Excel spreadsheets become difficult to manage and prone to errors. This can lead to data inconsistencies and loss of valuable information.
- **Limited Security**: The lack of specialized record management software means that data is often stored in an unsecured environment, exposing sensitive information to risks of unauthorized access or loss.
- **Absence of Backup Systems**: In many cases, data stored in basic software does not have automated backup systems, making it more prone to accidental loss or corruption (Conway, 2010).

iv. Cloud-Based Storage Solutions (Emerging Trend)

A growing trend in some ministries and public agencies in Rivers State is the adoption of cloud-based storage solutions. These platforms provide secure storage, backup, and data retrieval services through the internet. Cloud services such as Google Drive, Microsoft OneDrive, and local Nigerian cloud providers are increasingly being used to store both financial and administrative data.

While this practice offers several advantages:

- **Remote Access**: Cloud storage enables remote access to data, facilitating collaboration among public sector employees, particularly in the context of decentralization.
- **Enhanced Security**: Most cloud services come with encryption and backup features that reduce the risk of data loss due to server malfunctions or local disasters (Alhassan, Sammon, & Daly, 2016).

However, the adoption of cloud services is still limited, as many institutions lack the required infrastructure, internet connectivity, or technical skills to manage cloud-based solutions effectively. There is also hesitation around data privacy and compliance with national data protection regulations, which have not been fully implemented in many parts of Nigeria (NITDA, 2019).

v. **Record Management Systems (RMS)**

A few public institutions in Rivers State have adopted specialized Record Management Systems (RMS) or Electronic Document and Records Management Systems (EDRMS). These systems are designed to automate the storage, retrieval, and management of digital records. They allow public sector managers to organize, search, and retrieve data efficiently, making record management more systematic and less error-prone.

The use of RMS or EDRMS offers several benefits:

- **Improved Efficiency**: Data can be quickly retrieved, reducing the time spent on manual searches.

- **Better Security and Access Control**: These systems come with built-in security measures, such as access restrictions and audit trails, which help protect sensitive information (Bassiliades et al., 2015).
- **Compliance with Regulations**: RMS help ensure compliance with regulations governing record retention and management, which is particularly important for public sector institutions under scrutiny for transparency and accountability.

However, these systems are not yet widespread in Rivers State. Their adoption remains limited due to factors such as high initial setup costs, inadequate training, and insufficient technical support (Ogbole, Arawomo, & Omoregie, 2020).

vi. Paperless Initiative (Limited Implementation)

A limited but emerging practice in Rivers State's public sector is the "paperless" initiative, where digital technologies are leveraged to replace paper-based communication, filing, and documentation. This approach is seen as a cost-saving measure and is intended to streamline processes and reduce the environmental impact of paper usage.

Though still in its nascent stages, the paperless initiative has the potential to reduce paper clutter, improve data retrieval times, and ensure that records are safely backed up. However, its full implementation is hindered by:

- **Insufficient Training**: Staff members often lack the technical expertise to transition to digital platforms effectively.
- **Infrastructure Deficits**: Many public institutions lack the necessary technological infrastructure (computers, internet, software) to support a fully paperless system (Yusof et al., 2012).

Challenges Faced by Managers in Preserving and Accessing Data for Administrative Functions

Managers in the public sector of Rivers State, Nigeria, face several significant challenges in preserving and accessing data for their administrative functions. These challenges hinder the efficient management of public resources, slow down decision-making processes, and impact the overall effectiveness of public sector operations. The following are the key challenges:

i. Inadequate Infrastructure

One of the primary challenges faced by managers is the lack of adequate technological infrastructure to store, preserve, and retrieve data. Many public sector offices in Rivers State lack modern computers, servers, or cloud-based systems for effective data storage and management. Instead, many departments continue to rely on outdated or obsolete equipment that cannot support sophisticated data preservation systems (Adebayo & Adeleke, 2018).

- **Limited Access to Digital Tools**: In many instances, managers do not have access to the necessary software or tools that can facilitate efficient data preservation and retrieval. Without reliable technology, even the most basic tasks of organizing and storing data become cumbersome.
- **Inadequate Internet Connectivity**: Poor or unreliable internet connectivity further exacerbates the problem, especially for institutions that attempt to use cloud-based systems for data storage and access.

ii. Lack of Data Preservation Policies

In many public institutions in Rivers State, there is a lack of formalized data preservation policies or frameworks. Without clear, consistent guidelines on how data should be managed, stored, and preserved, managers often resort to ad-hoc methods, leading to inconsistencies and inefficiencies.

- **No Standardization**: There is no uniformity in data preservation practices across departments or agencies, which leads to fragmented record-keeping systems and makes it difficult for managers to access relevant data from different sources (Arowolo & Adebayo, 2014).
- **Inadequate Regulatory Compliance**: Public sector managers often struggle to comply with national regulations and international standards concerning data preservation, such as Nigeria's Data Protection Regulation (NDPR), due to the absence of formal guidelines.

iii. Limited Staff Training and Capacity Building

Many public sector employees, including managers, lack the necessary skills to manage data effectively. This is particularly true in relation to the use of modern digital tools, database management systems, and data preservation strategies.

- **Low Technological Proficiency**: Many public sector managers and staff members have limited understanding of digital data management tools, which hampers their ability to implement proper data preservation strategies. Additionally, inadequate training on how to use advanced record management systems or databases leaves employees ill-equipped to preserve or retrieve critical data (Okoye & Obi, 2019).
- **Lack of Data Literacy**: There is also a general lack of data literacy, where many managers do not understand the full implications of data preservation for their functions, such as how poor data management can lead to loss of information, inefficient decision-making, and policy implementation failures.

iv. Data Fragmentation and Silos

In many public institutions in Rivers State, data is stored in multiple, disconnected systems or departmental silos. This fragmentation makes it difficult for managers to access and aggregate data from different sources, hindering their ability to make well-informed decisions.

- **Uncoordinated Record-Keeping**: Departments often maintain their own separate systems for record-keeping, and these systems are not integrated or coordinated. As a result, managers may have to search through multiple systems, files, or physical storage locations to find the information they need.
- **Data Duplication and Inconsistencies**: Without a centralized system or standardized data management protocols, there is often duplication of data across different departments, leading to inconsistencies, errors, and confusion (Bassiliades et al., 2015).

v. Security Concerns and Data Privacy

In the digital age, concerns about data security and privacy are paramount. Managers in Rivers State face significant challenges in ensuring that sensitive and confidential data is protected from unauthorized access, theft, or cyberattacks.

- **Cybersecurity Weaknesses**: Many public institutions lack robust cybersecurity frameworks, leaving their data vulnerable to breaches or theft. Managers face difficulties in safeguarding data from internal and external threats, especially when data is stored digitally without adequate encryption, access controls, or backup systems.

- **Lack of Data Privacy Compliance**: The failure to fully comply with data protection regulations, such as Nigeria's NDPR, further exacerbates the risks of data mismanagement and legal liabilities. Inadequate knowledge of privacy laws among public sector managers contributes to weak data protection practices (NITDA, 2019).

vi. Resource Constraints

Another major challenge facing managers is the limited financial and human resources available to implement and maintain proper data preservation systems. Due to budgetary constraints, public institutions often prioritize other administrative functions, leaving data preservation initiatives underfunded and unsupported.

- **Insufficient Budget Allocation**: In many cases, public institutions in Rivers State do not allocate enough funding for technological upgrades, staff training, or data preservation tools. Without adequate resources, managers are unable to invest in modern data management solutions or improve existing systems.
- **Overburdened Staff**: Public sector employees, including managers, are often tasked with multiple roles and responsibilities, which leaves them with limited time and capacity to focus on efficient data preservation and management (Olatokun & Ayanbode, 2009).

vii. Data Loss and Inaccessibility

Public sector managers often face the risk of data loss, whether due to physical damage (e.g., fires or floods) or technical issues (e.g., system crashes or corruption). When data is lost or corrupted, it becomes difficult for managers to fulfill their administrative functions, leading to inefficiencies in service delivery and decision-making.

- **Lack of Backup Systems**: Many institutions do not have reliable backup systems in place to ensure that data is securely duplicated and can be restored in case of an emergency. This leaves critical data vulnerable to loss (Conway, 2010).
- **Inefficient Retrieval Processes**: Even when data is preserved, retrieval can be slow or cumbersome, especially when proper indexing systems or metadata tagging are not implemented.

viii. Political and Institutional Instability

Frequent changes in political leadership and institutional restructuring in Rivers State have led to a lack of continuity in data management practices. This instability often results in the loss of institutional knowledge, as new officials or managers may not prioritize data preservation or may fail to understand the importance of existing data systems.

- **Policy Inconsistencies**: Changes in government leadership often lead to shifts in priorities, and data preservation may not be seen as a critical function. As a result, managers face difficulty in implementing long-term data management strategies that can withstand changes in leadership (Okoye & Obi, 2019).

The Extent of Digital Tools and Technologies Employed in Data Preservation within Public Sector Organizations

The use of digital tools and technologies in data preservation within public sector organizations, particularly in Rivers State, Nigeria, has been evolving but remains inconsistent. While some organizations have embraced digitalization, many still face challenges in fully adopting and integrating digital tools into their data preservation practices. The extent of digital technology

adoption in data preservation in the public sector is influenced by factors such as infrastructure availability, policy support, resource allocation, and staff training.

Adoption of Electronic Document Management Systems (EDMS): In recent years, some public sector organizations have begun to adopt Electronic Document Management Systems (EDMS) to better preserve and manage data. These systems allow for the electronic storage, retrieval, and archiving of digital records. EDMS platforms are designed to streamline document storage and make data retrieval faster and more efficient compared to traditional paper-based systems.

- **Extent of Adoption**: The adoption of EDMS in Nigerian public institutions is still in its early stages, with only a few government agencies using these systems to manage official records. In Rivers State, while some ministries have attempted to implement EDMS, challenges such as inadequate infrastructure, high costs of setup, and limited technical expertise have hindered broader adoption (Bassiliades et al., 2015).
- **Challenges**: Although there are positive signs of adoption, the implementation of EDMS has been fragmented, and many organizations still struggle to manage the large volumes of data they generate (Adebayo & Adeleke, 2018). Moreover, these systems are often not integrated across different departments, leading to inefficiencies in data access and collaboration.

Use of Cloud-Based Storage Solutions: Cloud computing offers an efficient solution for data preservation by enabling public sector organizations to store and access data remotely. Cloud-based storage allows for better data security, disaster recovery, and scalability compared to traditional on-site storage solutions.

- **Extent of Adoption**: The adoption of cloud-based storage in public institutions in Rivers State is still at a nascent stage. Some organizations have embraced platforms such as Google Drive, Microsoft OneDrive, or locally available Nigerian cloud services to store documents and data. However, the overall adoption rate remains low due to concerns about data security, lack of adequate internet infrastructure, and the cost of cloud services (Alhassan, Sammon, & Daly, 2016).
- **Benefits and Barriers**: Cloud storage offers advantages in terms of remote access, collaboration, and data backup, but many public sector organizations are reluctant to fully embrace it due to concerns about data privacy, regulatory compliance, and the technical challenges associated with managing cloud-based systems (NITDA, 2019).

Integration of Data Preservation Tools in Government Systems: Some public institutions in Rivers State have integrated digital tools into their core operations, such as financial management systems, human resources information systems, and e-government portals. These tools help in the preservation of data related to finances, personnel records, procurement, and other administrative functions.

- **Extent of Adoption**: The use of digital tools such as Integrated Financial Management Information Systems (IFMIS) and e-government portals has been increasing in public institutions, though they are not universally implemented. Ministries responsible for budgeting, tax collection, and social services have seen some level of integration of these systems into their operations (Conway, 2010).
- **Challenges in Integration**: Despite some successful cases, many public sector organizations still lack the necessary infrastructure and staff training to implement and

maintain these integrated systems effectively. The absence of standardized protocols and system interoperability remains a significant barrier to the widespread use of these digital tools (Ogbole, Arawomo, & Omoregie, 2020).

Barriers to Full Digitalization of Data Preservation: Despite the availability of digital tools and technologies, several barriers hinder the full-scale implementation of data preservation technologies in the public sector of Rivers State:

- **Inadequate Infrastructure**: The lack of reliable internet access, electricity, and modern computing facilities in many public institutions makes it difficult to adopt digital preservation technologies effectively (Olatokun & Ayanbode, 2009).
- **Financial Constraints**: Many public sector organizations face budgetary constraints that limit their ability to invest in the required technology for digital data preservation. This issue is compounded by the high cost of implementing and maintaining such technologies (Arowolo & Adebayo, 2014).
- **Lack of Technical Expertise**: A shortage of skilled personnel who are capable of managing and utilizing digital data preservation tools remains a significant challenge. Many managers and staff members lack the necessary technical training to adopt and maintain these systems effectively (Yusof et al., 2012).
- **Resistance to Change**: In some cases, employees and managers may resist the adoption of digital tools due to a lack of familiarity with new technologies, or fear of disruption to established workflows. This resistance to change can slow down the digitalization process (Ogbole et al., 2020).

Government Initiatives and Policy Support: To promote the use of digital technologies for data preservation in the public sector, the Nigerian government has introduced several initiatives aimed at improving e-governance and the use of information and communication technology (ICT) in public administration. The Nigerian government has recognized the importance of data preservation in enhancing governance and accountability.

- **National ICT Policy**: The National Information Technology Development Agency (NITDA) has launched several initiatives to promote the use of digital tools in government, including the development of e-government policies and the National Data Protection Regulation (NDPR), which is designed to ensure secure data management and privacy (NITDA, 2019).
- **Challenges in Implementation**: While these initiatives are commendable, the implementation of national policies at the state level, including Rivers State, has been slow. Public sector organizations often face challenges in adapting national policies to their local contexts, especially when it comes to allocating adequate resources and training staff (Alhassan et al., 2016).**:**

Strategies to Improve Data Preservation and Enhance Managerial Efficiency in the Public Sector

Improving data preservation practices in public sector organizations is critical to enhancing managerial efficiency. Effective data preservation ensures that managers have access to accurate, up-to-date, and reliable information, which aids in decision-making, accountability, and performance. To achieve this, several strategies can be implemented at the organizational,

technological, and policy levels. These strategies aim to overcome the existing barriers to effective data management and to align public sector institutions with best practices in data preservation.

Investment in Modern Technological Infrastructure: One of the fundamental strategies for improving data preservation is to invest in modern technological infrastructure. This includes upgrading computer systems, servers, databases, and cloud services. Reliable infrastructure is essential for ensuring the secure storage, backup, and retrieval of data, which are critical for the preservation of public sector records.

- **Cloud Computing**: Embracing cloud computing as a data storage solution offers scalability, accessibility, and security. Cloud-based systems can provide off-site backups, which protect against data loss due to natural disasters or system failures (Alhassan, Sammon, & Daly, 2016).
- **Integrated Management Systems**: Implementing integrated data management systems (such as Enterprise Resource Planning systems) can enable better coordination between departments and create a central repository for public sector data. This ensures that data from different departments is standardized, easily accessible, and preserved effectively (Yusof & Ismail, 2012).

Investing in such infrastructure ensures that public institutions can handle large volumes of data and provide managers with real-time access to accurate information.

Standardization of Data Management Practices: Standardizing data management practices across public sector organizations can significantly enhance the quality of data preservation. This involves creating uniform procedures for data entry, storage, retrieval, and disposal, which reduces data fragmentation and ensures consistency across departments.

Data Standards and Protocols: The establishment of clear data standards and protocols helps ensure that data is collected, stored, and managed consistently. Public institutions should adhere to international standards for data quality and preservation, such as ISO 15489, which sets guidelines for records management (Conway, 2010).

- **Data Classification**: Data should be classified according to its level of sensitivity and importance. This classification will help determine how data is stored, who can access it, and how it is disposed of once it is no longer needed (Ogbole, Arawomo, & Omoregie, 2020). Clear data classification protocols are critical for ensuring the integrity and security of data.

Staff Training and Capacity Building: Investing in staff training and capacity building is essential to ensure that public sector employees, including managers, are capable of using data preservation tools and following proper data management procedures. Well-trained staff are more likely to adopt digital tools and perform data management tasks efficiently.

- **Training Programs**: Regular training programs on digital data management tools, such as document management software, databases, and cloud systems, should be organized for public sector employees (Okoye & Obi, 2019). This will enhance their technical skills and data literacy, enabling them to preserve and manage data more effectively.
- **Data Governance Education**: Managers should be educated on the importance of data governance and its relationship to organizational performance. This includes understanding data protection regulations, privacy issues, and the ethical handling of public sector data (Yusof & Ismail, 2012).

Adoption of Data Backup and Disaster Recovery Systems: One of the most critical strategies for ensuring the preservation of data is the implementation of robust backup and disaster recovery systems. These systems ensure that in the event of data corruption, system failure, or disasters, data can be restored quickly and accurately.

- **Regular Backup Schedules**: Public sector organizations should implement regular data backup schedules to ensure that all critical data is backed up in real-time or at least daily. This minimizes the risk of data loss and ensures that managers can access the most recent data (Bassiliades et al., 2015).
- **Disaster Recovery Plans**: A disaster recovery plan should be established, outlining procedures for recovering data from both physical and digital disasters. This includes having backup copies stored in secure off-site locations, either physically or via cloud-based storage services (Alhassan et al., 2016).

Improvement of Data Security and Privacy Measures: Improving data security and privacy is crucial for ensuring that sensitive public sector data is protected from unauthorized access, theft, or loss. With increasing concerns over data breaches and cyberattacks, strengthening security measures should be a priority.

- **Encryption and Access Control**: Data should be encrypted during storage and transmission to prevent unauthorized access. Implementing access controls, such as role-based access management, ensures that only authorized personnel can access specific data (Adebayo & Adeleke, 2018).
- **Compliance with Data Protection Regulations**: Public institutions must comply with national data protection regulations, such as Nigeria's National Data Protection Regulation (NDPR), to ensure that they handle data securely and in compliance with legal standards. This includes regular audits and assessments of data security practices (NITDA, 2019).

Promoting E-Government and Digital Transformation: E-government initiatives play a critical role in enhancing the digitalization of public sector operations. The promotion of e-government tools facilitates digital records management, data sharing, and online services, thereby improving data preservation and managerial efficiency.

- **E-Government Platforms**: Implementing e-government platforms that enable the online submission of forms, applications, and records can significantly improve data preservation practices. These platforms allow for the digital storage of documents and provide managers with easy access to real-time information (Conway, 2010).
- **Public Sector Digital Transformation**: Governments should prioritize the digital transformation of public sector institutions by investing in modern IT infrastructure, developing integrated systems, and fostering a digital culture among public servants (Ogbole et al., 2020).

Strengthening Policy and Legal Frameworks: A supportive policy and legal framework is essential for ensuring that public sector organizations comply with data preservation best practices. Establishing clear policies that mandate the adoption of digital tools and proper data management techniques will help improve data preservation across the public sector.

- **Regulatory Frameworks**: Governments should implement and enforce comprehensive regulations on data preservation, including setting standards for data storage, retention, and

destruction. This ensures that public sector organizations adhere to best practices in data management (NITDA, 2019).

- **Clear Guidelines**: Clear data governance guidelines should be developed to ensure consistent data management practices across all public institutions. These guidelines should address data ownership, security, retention, and disposal policies (Olatokun & Ayanbode, 2009).

Empirical Findings on the Relationship Between Data Preservation and Managerial Efficiency

A study by Ogbole, Arawomo, and Omoregie (2020) found that effective data preservation practices significantly enhance the decision-making capabilities of managers in public sector organizations. The study, which focused on Nigerian government agencies, revealed that managers who had access to well-preserved and accurate data made quicker, more informed decisions, leading to better outcomes in resource allocation, planning, and policy formulation. In contrast, organizations with poor data preservation practices often faced delays in decision-making, inaccuracies in reports, and inefficiencies in managing resources.

Similarly, Adebayo and Adeleke (2018) found that data preservation, particularly through the use of digital tools like cloud storage and secure databases, improved the speed and accuracy of managerial decisions. Public sector managers in organizations with integrated data management systems reported greater confidence in their decision-making processes, as they could rely on up-to-date and accurate information. This, in turn, enhanced their efficiency in executing their functions.

Empirical research by Mowla and Azim (2016) highlighted that data preservation practices positively correlate with overall organizational performance, particularly in public sector organizations. The study conducted in Bangladesh public offices showed that the implementation of secure data storage and preservation systems led to a reduction in data errors, faster retrieval times, and increased collaboration among departments. As a result, managers could allocate resources more effectively, streamline operations, and improve service delivery to citizens. The researchers concluded that organizations with robust data management systems exhibited better performance in terms of service quality and operational efficiency.

In another study, Sharma and Soni (2018) examined public sector agencies in India and found that the implementation of modern data preservation techniques, such as electronic records management systems, led to improved operational efficiency. The study showed that when managers had access to reliable and preserved data, they could make well-informed decisions, minimize errors in execution, and enhance their organizational outcomes. The researchers further noted that public institutions with poor data preservation practices struggled with inefficiencies, including delays in service delivery and ineffective use of resources.

The relationship between data preservation and managerial accountability is explored in the work of Mhlanga and Vivas (2020), who focused on the role of data management in public sector governance. Their findings indicated that effective data preservation enhances managerial accountability by providing a reliable audit trail for decision-making processes. Public sector managers who used digital data preservation tools were more transparent in their operations and could easily justify their decisions to stakeholders. The study also revealed that when data was

poorly preserved, managers struggled to provide evidence of their decisions, leading to a lack of accountability and decreased trust in the management process.

Moreover, Mhlanga and Vivas (2020) argued that public sector organizations with strong data preservation systems were better able to track the allocation of resources and ensure that funds were used efficiently. This, in turn, contributed to greater transparency and improved public trust in government operations.

A study by Adeyemi and Aluko (2017) examined the role of digital tools in enhancing managerial efficiency in Nigerian public sector organizations. The study revealed that the use of modern data preservation tools, such as cloud-based storage, big data analytics, and data encryption systems, significantly improved the efficiency of managers. Managers in organizations that adopted these tools were able to access real-time data, perform data-driven analyses, and collaborate with other departments more effectively. This led to better decision-making, more accurate planning, and greater overall efficiency in their managerial functions.

The study further highlighted that digital tools not only preserved data but also facilitated the automation of routine managerial tasks, such as report generation and resource tracking. This automation allowed managers to focus on more strategic aspects of their roles, leading to improved overall efficiency.

Despite the benefits of data preservation, several studies have also identified challenges in public sector organizations that hinder the full realization of these benefits. According to Chukwu (2019), many public sector organizations in Nigeria face challenges such as inadequate technological infrastructure, lack of skilled personnel, and insufficient funding for data management systems. These challenges result in poor data preservation practices, which in turn negatively affect managerial efficiency. Managers in such organizations often experience delays in accessing critical data, leading to slower decision-making and inefficiencies in operations.

Similarly, Oladipo (2015) identified that data loss, poor data security, and inconsistent data backup practices are significant challenges in Nigerian public sector organizations. These issues make it difficult for managers to trust the data they use for decision-making, which can reduce their efficiency in managing public resources and implementing policies.

The positive impact of data preservation on public service delivery is highlighted in a study by Sulaimon, Olatunde, and Adebayo (2020), which explored the role of data management in improving the efficiency of public service delivery in Nigerian local government offices. The study found that local government managers who utilized electronic data preservation systems were able to streamline service delivery processes, reduce paperwork, and improve responsiveness to citizens' needs. Data preservation allowed for quicker response times and more accurate service delivery, directly enhancing the efficiency of managerial functions in these organizations.

Sulaimon et al. (2020) concluded that the integration of digital data management systems in public sector organizations not only improved managerial efficiency but also resulted in better service outcomes for the public. By reducing the time spent on manual data handling and improving data

accessibility, managers were able to focus more on strategic decision-making and improving public services.

Study	Context/Location	Findings	Impact on Managerial Efficiency
Ogbole, Arawomo, & Omoregie (2020)	Nigerian government agencies	Data preservation improves decision-making speed and accuracy.	Enhanced decision-making efficiency by enabling quick, informed decisions.
Adebayo & Adeleke (2018)	Nigerian public sector	Use of cloud storage and secure databases improves decision-making.	Increased managerial confidence in decisions, leading to better resource management.
Mowla & Azim (2016)	Bangladesh public sector	Effective data management reduces errors, increases collaboration, and enhances performance.	Improved organizational performance through accurate data access and interdepartmental collaboration.
Sharma & Soni (2018)	Indian public sector	Adoption of electronic records management systems boosts operational efficiency.	Faster service delivery, better resource allocation, and fewer errors in operations.
Mhlanga & Vivas (2020)	General public sector governance	Well-preserved data enhances transparency and accountability.	Increased managerial accountability and transparency in resource use.

Chukwu (2019)	Nigerian public sector organizations	Poor infrastructure, lack of skilled personnel, and insufficient funding affect data preservation.	Reduced managerial efficiency due to delayed access to data and poor decision-making.
Oladipo (2015)	Nigerian public sector	Data loss, inconsistent backups, and weak data security undermine data trust.	Managers face inefficiencies due to inaccurate or inaccessible data, leading to suboptimal decisions.
Sulaimon, Olatunde, & Adebayo (2020)	Nigerian local government offices	Digital data management systems streamline service delivery processes.	Faster response times, better resource allocation, and improved public service outcomes.

Methodology

This study employed a **descriptive research design** that focuses on understanding the relationship between data preservation practices and managerial efficiency in the public sector. The descriptive design is appropriate as it allows the researcher to observe, describe, and interpret the current state

of data preservation practices and managerial functions in public sector organizations, without manipulating the variables. The research waas cross-sectional in nature, meaning data was collected at one point in time, enabling the researcher to capture a snapshot of the prevailing data preservation practices and the corresponding efficiency levels in the public sector.The target population for this study includes managers and administrative staff working in public sector institutions across Rivers State, Nigeria. These institutions include government ministries, agencies, and local government offices, where managerial functions such as decision-making, planning, and resource allocation are critical for achieving public service goals.

The **sample size** was selected using a **stratified random sampling technique** to ensure representation from various levels of management within different public institutions. The strata were based on the hierarchical levels of management, including senior, middle, and lower management. A **sample size of 150 respondents** was targeted, including approximately 50 respondents from each management level (senior, middle, and lower). This sample size is sufficient to ensure the reliability and validity of the findings and allows for adequate representation across different public sector organizations. The primary data was collected through a **structured questionnaire** and **semi-structured interviews**. These instruments allow the researcher to gather both quantitative and qualitative data. **Secondary Data**: Secondary data was gathered from reports, official documents, and publications from relevant government agencies, including policies and guidelines related to data management and preservation practices in the public sector. The collected data was analyzed using both **quantitative** and **qualitative** methods to provide a comprehensive understanding of the relationship between data preservation practices and managerial efficiency in the public sector. The data from the structured questionnaires was analyzed using **descriptive statistics** to summarize and describe the main features of the data. **Inferential statistics**, such as **regression analysis**, was used to test hypotheses regarding the impact of data preservation practices on managerial efficiency. This help establish the strength and direction of the relationship between data preservation and managerial effectiveness. The semi-structured interview responses were analyzed using **thematic analysis**. The researcher identifies recurring themes and patterns from the interview transcripts, categorizing the data into relevant themes related to the challenges, practices, and impacts of data preservation on managerial efficiency. NVivo was used to assist in coding and organizing the interview data.

Result and Discussion

A total of 150 questionnaires were distributed to the respondents. All 150 were duly filled and returned, representing a 91% response rate. All responses were measured on a five-level rating, ranging from “strongly disagree to strongly agree”.

Table 2: Result of the Effect of Data Preservation **on** Efficiency of Managers' Functions

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.915[a]	.838	.837	.930

a. Predictors: (Constant), Data Preservation

Coefficients[a]

Model		Unstandardized Coefficients		Standardized Coefficients		
		B	Std. Error	Beta	t	Sig.
1	(Constant)	.525	.665		.790	.431
	Data Preservation	.987	.036	.915	27.646	.000

a. Dependent Variable: Efficiency of Managers' Functions

With reference to table 2, R square value of .838, indicated that 83% of the variation in Efficiency of Managers' Functions can be explicated by data preservation. In other words, 83% changes in efficiency of managers' functions, can be explained by this element. Adjusted R square value of .837 infers that 83.7% of the variation in efficiency of managers' functions, can be explained by data preservation., which is a normal size effect according to Cohen's (1988) classifications for multiple regression.

Based on the table, data preservation. has unstandardized beta coefficient value of .987 with a significant value of .000 (lower than 0.05). data preservation. do predict significant variance in efficiency of managers' functions. This means that one unit increase in data preservation can predicts .987 increase in efficiency of managers' functions. This result tally to those of Ogbole, Arawomo, and Omoregie (2020) found that effective data preservation practices significantly enhance the decision-making capabilities of managers in public sector organizations. Adebayo and Adeleke (2018) found that data preservation, particularly through the use of digital tools like cloud storage and secure databases, improved the speed and accuracy of managerial decisions. Mowla and Azim (2016) highlighted that data preservation practices positively correlate with overall organizational performance, particularly in public sector organizations.

Conclusion and Recommendations

This study has explored the critical relationship between data preservation practices and the efficiency of managerial functions in public sector organizations in Rivers State, Nigeria. It has highlighted the significance of robust data preservation systems in enhancing the effectiveness and efficiency of managers in public institutions. From the literature review and theoretical framework, it is evident that data preservation practices, including the use of digital tools, data security measures, and regular backups, play a pivotal role in supporting the managerial functions of planning, decision-making, and resource allocation.

The study also acknowledges the challenges faced by managers in the public sector, including inadequate technological infrastructure, insufficient training, and the lack of a unified data management policy. Despite these challenges, data preservation, when properly implemented, has the potential to streamline operations, enhance decision-making accuracy, reduce operational costs, and increase overall productivity in public institutions. Public managers, who are often tasked with making decisions that affect large numbers of people, must rely on accurate, up-to-date data to ensure that their decisions are well-informed and effective.

In conclusion, while there are clear benefits to adopting data preservation practices, the study has also identified significant gaps in the adoption and utilization of these practices in the public sector of Rivers State. This indicates a need for targeted interventions to improve data management systems and enhance managerial efficiency.

Based on the findings of this study, the following recommendations are proposed to improve data preservation practices and, consequently, enhance the efficiency of managerial functions in public sector organizations in Rivers State:

1. **Investment in Technology and Infrastructure**: Public sector organizations should invest in modern digital tools and technologies for data preservation. This includes the adoption of cloud storage systems, secure databases, and automated backup systems. Ensuring that public institutions have access to reliable technological infrastructure will enhance data security, reduce the risk of data loss, and facilitate easy access to information for decision-making.
2. **Regular Staff Training on Data Management**: Managers and staff in public sector institutions should undergo continuous training on best practices in data management and preservation. Training programs should focus on data security, the use of digital tools, and the importance of regular backups. Well-trained staff are more likely to understand the significance of data preservation and be proactive in ensuring that data is accurately maintained and readily accessible when needed.
3. **Development of Comprehensive Data Management Policies**: Public sector organizations should develop and implement clear, comprehensive data management policies. These policies should outline standard operating procedures for data collection, storage, security, and backup. Establishing formal guidelines will help ensure consistency in data management across different departments and improve overall organizational efficiency.
4. **Promotion of a Data-Driven Culture**: There is a need to cultivate a culture of data-driven decision-making in public sector organizations. Managers should be encouraged to base their decisions on reliable, up-to-date data rather than intuition or anecdotal evidence. Encouraging the use of data analytics and reporting tools can help managers make more informed decisions that positively impact organizational performance.
5. **Enhance Interdepartmental Collaboration**: Data preservation is often fragmented across different departments in public sector organizations. To enhance efficiency, managers should foster greater collaboration and information sharing between departments. This can be facilitated by creating centralized data repositories where relevant information is easily accessible to all stakeholders involved in decision-making.
6. **Strengthen Data Security and Privacy Measures**: Given the sensitive nature of data handled by public institutions, it is crucial to implement robust security protocols to protect data from unauthorized access and cyber threats. Public sector organizations should prioritize cybersecurity measures such as encryption, multi-factor authentication, and regular security audits to safeguard their data assets.
7. **Monitoring and Evaluation of Data Preservation Practices**: Public sector organizations should establish monitoring and evaluation mechanisms to assess the effectiveness of their data preservation practices regularly. This will help identify any gaps or weaknesses in the existing systems and provide an opportunity for timely improvements. A feedback loop

will ensure that the data preservation systems evolve in line with technological advancements and organizational needs.

8. **Collaboration with External Experts**: Public sector organizations in Rivers State can benefit from collaborating with external experts and consultants who specialize in data management. These experts can offer guidance on best practices, provide training, and assist with the implementation of advanced data management solutions.

Abstract
This paper investigates the relationship between monetary policy, financial stability, and economic growth in Nigeria using annual data from 1984–2023. Real GDP growth was modeled as a function of the monetary policy rate (MPR), broad money growth (M2GR), inflation (INF), government expenditure (GEXP), and exchange rate (EXR). The OLS results show that MPR exerts a negative and statistically significant impact on growth (coefficient = –0.21, $p<0.05$), while M2GR has a positive but weaker effect (= 0.08, $p<0.10$). Inflation strongly dampens growth (≈ –0.15, $p<0.01$), and exchange rate depreciation is also negatively associated with output (≈ –0.12, $p<0.05$). In contrast, government expenditure contributes positively though modestly to growth (≈ 0.09, $p<0.10$). ARDL estimates confirm the short-run trade-offs, while long-run dynamics indicate that sustained broad money expansion and stable exchange rates are critical for output resilience. Overall, the findings suggest that while expansionary monetary policies can stimulate growth, their effectiveness is undermined by inflationary pressures, fiscal dominance, and exchange-rate instability. The study concludes that sustaining growth in Nigeria requires a calibrated mix of disciplined monetary management, credible inflation control, stronger coordination with fiscal policy, and structural reforms to enhance financial stability and resilience.

Keywords: *Monetary Policy; Financial Stability; Economic Growth; Inflation; Broad money*

Introduction

The relationship between monetary policy, financial stability, and economic growth has long been a subject of scholarly and policy interest. As economies evolve, central banks are increasingly tasked with not only maintaining price stability but also safeguarding financial stability to ensure that growth remains inclusive and sustainable. For developing economies such as Nigeria, where macroeconomic fluctuations are frequent and structural challenges are pronounced, understanding how monetary policy interacts with the financial system to influence long-term growth is both urgent and essential. This study seeks to explore these linkages within the Nigerian context, offering insights that are relevant for academics, practitioners, and policymakers.

Historically, Nigeria's economy has been highly vulnerable to external shocks, particularly fluctuations in global oil prices, given its dependence on oil revenues. Periods of oil booms have been followed by sharp downturns, exposing the economy to cycles of inflation, exchange rate pressures, and fiscal imbalances. In response, successive governments and the Central Bank of Nigeria (CBN) have deployed monetary policy as a major instrument of stabilization. Over the

decades, monetary policy in Nigeria has shifted from rigid monetary targeting to more flexible frameworks, with the aim of achieving price stability and fostering sustainable growth. However, persistent macroeconomic instability and repeated banking sector crises suggest that the effectiveness of monetary policy remains in question.

Monetary policy plays a central role in macroeconomic management by regulating liquidity, credit supply, and interest rates, thereby influencing investment, consumption, and overall economic performance. In principle, a well-implemented monetary policy should stabilize inflation, promote confidence in the financial system, and provide a conducive environment for productive investment. Yet, in practice, its effectiveness is conditioned by the strength of domestic institutions, the depth of financial markets, and the consistency of policy implementation. In Nigeria, structural weaknesses such as a narrow production base, weak transmission mechanisms, and external dependence, have limited the ability of monetary policy to deliver its intended outcomes, making its impact on financial stability and growth a critical issue of investigation.

Financial stability is the bedrock upon which sustainable economic growth is built. A sound financial system mobilizes savings, allocates resources efficiently, manages risks, and supports investment and innovation. Conversely, instability in the banking system, capital markets, or foreign exchange regime can trigger crises that erode investor confidence, reduce credit availability, and stall growth. For Nigeria, episodes of banking distress, non-performing loans, and foreign exchange market volatility have highlighted how fragile financial systems can undermine the broader economy. Therefore, strengthening financial stability is not merely a complementary goal to monetary policy; it is a prerequisite for sustainable economic growth.

Nigeria offers a particularly important case study for examining these dynamics. The country has, in recent decades, faced persistent double-digit inflation, chronic exchange rate volatility, and recurrent currency depreciation. In addition, the banking sector, despite several reforms including consolidation in 2004 and the Asset Management Corporation of Nigeria (AMCON) intervention in 2010, remains vulnerable to shocks. These challenges have often diluted the impact of monetary policy and constrained its ability to foster financial stability and sustained growth. Understanding how these dynamics interact in the Nigerian economy is essential for designing more effective policy frameworks that address both short-term stabilization and long-term development needs.

Despite numerous policy interventions, Nigeria continues to grapple with persistent inflation, an unstable currency, fragile banking institutions, and sluggish economic growth. While monetary policy is intended to mitigate these challenges, its effectiveness has been inconsistent, raising questions about the extent to which it has promoted financial stability and supported economic growth. The persistent macroeconomic instability suggests a disconnect between policy intent and outcomes, highlighting the need for a closer examination of the relationship between monetary policy, financial stability, and growth in Nigeria.

This study is therefore designed with two primary objectives, which are; To examine the relationship between monetary policy and financial stability in Nigeria and To evaluate how financial stability influences sustainable economic growth within the Nigerian context.

Guided by these objectives, the study addresses the following research questions: How effective has monetary policy been in promoting financial stability in Nigeria? and To what extent does financial stability contribute to sustainable economic growth?

From these, the following hypotheses are proposed: **H_1:** Monetary policy has a significant impact on financial stability in Nigeria and **H_2:** Financial stability positively influences sustainable economic growth in Nigeria.

This study contributes to the growing body of literature by exploring the interconnectedness of monetary policy, financial stability, and economic growth in a developing economy marked by structural vulnerabilities. Unlike studies that examine these variables in isolation, this research emphasizes their interdependence and the feedback loops that exist between them. For policymakers, the findings will provide evidence-based insights on how Nigeria's monetary policy framework can be redesigned to enhance financial stability and, in turn, promote sustainable economic growth. In practical terms, the study aims to bridge the gap between policy formulation and economic outcomes, offering recommendations that can strengthen Nigeria's macroeconomic management in the face of recurring challenges.

Literature Review

Understanding the interaction between monetary policy, financial stability, and economic growth is critical to analyzing macroeconomic outcomes in Nigeria. Monetary policy refers to actions by the Central Bank of Nigeria (CBN) to regulate money supply, interest rates, and credit conditions to achieve objectives such as price stability, financial system stability, employment creation, exchange rate management, and growth. The CBN applies quantitative instruments like the Monetary Policy Rate (MPR), Open Market Operations (OMO), and the Cash Reserve Ratio (CRR); qualitative tools such as sectoral credit guidelines and moral suasion; and unconventional measures including forex interventions, direct lending schemes, and macroprudential regulations. However, weak financial structures and rigidities often limit the effectiveness of monetary policy transmission channels (interest rate, credit, exchange rate, and expectations).

Financial stability denotes the ability of the financial system comprising of banks, capital markets, and intermediaries to function smoothly without disruptions to resource allocation, risk management, or payment systems. Stability is assessed using indicators like non-performing loans (NPLs), liquidity and capital adequacy ratios, and systemic risk measures. Its dimensions include microprudential stability (individual institutions), macroprudential stability (system-wide risks), and market stability (money, capital, and forex markets). In Nigeria, fragility is frequently linked to poor regulation, weak asset quality, banking crises, exchange rate volatility, and oil dependence.

Economic growth is the sustained expansion of an economy's productive capacity, measured through real GDP, sectoral growth, and per capita income. Growth drivers include factor accumulation (capital and labor), productivity gains (technology and institutions), and structural transformation (shifts to high-productivity sectors). Nigeria's growth has been volatile, shaped by oil price cycles and inconsistent policies, with limited diversification and inclusiveness due to unemployment, infrastructural gaps, and overdependence on oil revenues.

These concepts are deeply interconnected, such that Monetary policy provides the macroeconomic environment necessary for growth by stabilizing prices, ensuring liquidity, and guiding credit creation. Financial stability ensures that the monetary policy stance is effectively transmitted through resilient financial institutions and well-functioning markets. Economic growth, in turn, represents the ultimate outcome of these interactions, but it can only be achieved and sustained if monetary policy remains credible, the financial system remains stable, and resources are productively allocated. In Nigeria, however, weaknesses in monetary transmission, recurring financial fragilities, and structural inefficiencies have often undermined growth, highlighting the importance of examining the nexus between monetary policy, financial stability, and economic growth.

Theoretical Underpinnings

The interaction between monetary policy, financial stability, and economic growth can be understood through several complementary theoretical perspectives. The Keynesian view emphasizes the stabilizing role of monetary policy in managing aggregate demand under conditions of nominal rigidities. Through the IS–LM and New Keynesian frameworks, central banks influence output and inflation via interest rates, credit conditions, exchange rates, and expectations. The effectiveness of these channels depends on institutional depth and credibility, highlighting why in countries like Nigeria, shallow financial markets, fiscal dominance, and exchange-rate pass-through often constrain policy transmission.

The Monetarist perspective, led by Friedman, shifts focus to the long-run link between money growth and inflation, formalized in the quantity theory of money. Here, sustained inflation is seen as "always and everywhere a monetary phenomenon," driven by money supply outpacing real output. Attempts to manipulate unemployment below its natural rate only worsen inflation, reinforcing the call for disciplined, rule-like monetary frameworks. For Nigeria, where money expansion has often been tied to fiscal imbalances and quasi-fiscal operations, the Monetarist lesson is the need for credible anchors such as inflation targeting and fiscal restraint—to secure price and exchange-rate stability.

Building on this, Minsky's financial instability hypothesis highlights how prolonged stability can paradoxically breed fragility. Financial systems evolve from "hedge" to "speculative" and eventually "Ponzi" financing structures, making them vulnerable to shocks. Monetary easing can encourage excessive risk-taking, while abrupt tightening can trigger widespread defaults and systemic stress. The Nigerian experience with banking crises, rising non-performing loans, and regulatory interventions underscores the relevance of Minsky's framework. It also shows that monetary policy alone cannot ensure financial stability without robust macroprudential tools, such as dynamic provisioning, capital buffers, and effective resolution regimes.

Finally, endogenous growth theories underscore the role of finance as a driver of long-run growth. Beyond serving as a monetary veil, financial systems mobilize savings, allocate capital, manage risk, and support innovation, thereby enhancing productivity and structural transformation. Empirical evidence links deeper financial development to higher growth, though with diminishing returns and potential fragility when credit expansion becomes excessive. For Nigeria, the policy implication is clear: strengthen legal and informational infrastructure, broaden financial inclusion,

deepen capital markets, and maintain macroeconomic stability to channel finance toward innovation, diversification, and sustainable growth.

Taken together, these theories converge on the notion that monetary policy, financial stability, and growth are deeply interconnected. While Keynesian and Monetarist perspectives focus on stabilization and inflation control, Minsky warns of the cyclical vulnerabilities embedded in finance, and endogenous growth models highlight finance's catalytic role in long-run development. An integrated approach that combines prudent monetary management, vigilant macroprudential oversight, and growth-oriented financial deepening is therefore essential in the Nigerian context.

Empirical Review

King and Levine (1993), in their influential paper Finance and Growth: Schumpeter Might Be Right, provided cross-country evidence that financial development is not merely a by-product of growth but a driver of it. By employing indicators such as private credit to GDP and banking sector activity, they demonstrated that well-developed financial intermediaries enhance capital allocation, mobilize savings, and stimulate innovation, thereby fostering long-run growth. Their findings, robust across different specifications and instrumental-variable checks, confirmed that finance leads growth rather than follows it. They concluded that policies deepening financial intermediation through strengthened property rights, wider banking access, and removal of policy distortions are crucial for sustaining economic growth.

Building on this, Bernanke and Gertler (1995), in Inside the Black Box: The Credit Channel of Monetary Policy Transmission, shifted attention to the mechanisms through which monetary policy influences real economic activity. They highlighted the credit channel, comprising the bank-lending and balance-sheet channels, as critical amplifiers of monetary shocks in economies characterized by financial frictions. Their framework showed how credit supply is affected by borrower net worth, external finance premia, and asymmetric information, making monetary policy more potent in periods of financial stress. The study emphasized the need for macroprudential oversight and policies that strengthen financial intermediation to reduce volatility and improve policy transmission.

In the Nigerian context, Iyoha (2002) explored Macroeconomic Policy and Growth in Nigeria and underscored the destabilizing effects of inconsistent monetary and fiscal policies. The study documented how fiscal dominance, deficit financing, and exchange rate misalignments produced inflationary pressures, undermining private investment and output growth. He argued that credible and disciplined macroeconomic management, particularly through central bank independence and reduced reliance on oil revenues, is essential for sustainable growth.

Adebiyi (2006), in his comparative study on inflation targeting in Nigeria and Ghana, examined the stability of relationships between monetary policy instruments and inflation outcomes. Using cointegration and error-correction models, he found weak and unstable links between monetary aggregates and inflation, suggesting that strict monetary targeting would be ineffective under existing structural and institutional weaknesses. The study concluded that while inflation targeting could be feasible, it would require stronger central bank independence, fiscal discipline, and deeper financial markets to succeed.

Similarly, Omotor (2010), in The Role of Monetary Policy in Nigeria, tested the effectiveness of monetary policy using VAR models and impulse response functions. His findings showed that while monetary policy has had some success in controlling inflation, it has been largely ineffective in stimulating output growth due to shallow financial markets and fiscal dominance. He concluded that reforms aimed at strengthening policy consistency, central bank autonomy, and complementary fiscal discipline are vital if monetary policy is to support long-term growth.

Sanusi (2010), reflecting on The Global Financial Meltdown and the Reforms in the Nigerian Banking Sector, documented how the 2007–2009 crisis exposed structural weaknesses in Nigerian banks, including excessive risk-taking, poor corporate governance, and accumulation of toxic assets. The CBN's reforms ranging from recapitalization to the creation of the Asset Management Corporation of Nigeria (AMCON), were positioned as crucial responses to restore confidence and stability. Sanusi concluded that ongoing reforms, enhanced regulatory capacity, and risk-based supervision are indispensable for building resilience and preventing systemic crises.

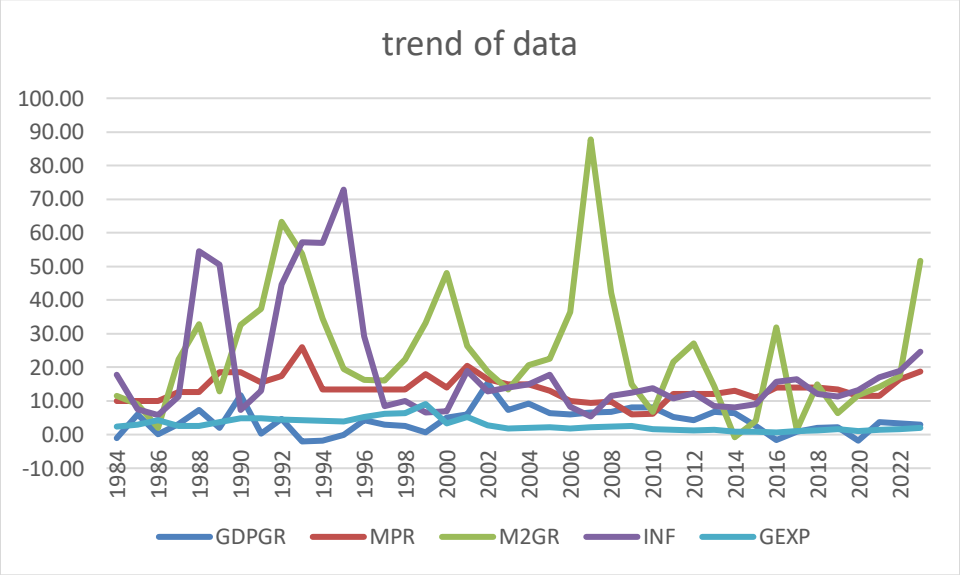
Taken together, these studies illustrate the multifaceted relationship between monetary policy, financial stability, and growth. International evidence (King & Levine, 1993; Bernanke & Gertler, 1995) emphasizes the importance of financial deepening and the credit channel in sustaining growth, while Nigerian evidence (Iyoha, 2002; Adebiyi, 2006; Omotor, 2010; Sanusi, 2010) highlights persistent weaknesses in policy credibility, institutional quality, and financial stability that constrain the effectiveness of monetary policy. Importantly, few studies integrate these dimensions over long horizons or explore how financial fragility mediates the policy–growth nexus. This gap provides the motivation for further research that considers threshold effects, regime shifts, and the interplay of monetary policy, financial stability, and long-run growth in Nigeria.

Research Gap

While prior studies document the links between finance and growth, monetary-policy transmission, and financial fragility, few integrate these dimensions within the Nigerian context. Most treat monetary policy, banking stability, and growth separately, often over short time horizons, neglecting non-linearities and threshold effects. Limited attention has been paid to how financial fragility mediates the policy–growth relationship across different regimes or whether credit expansion beyond certain levels reverses growth into instability. An integrative, long-horizon approach that combines monetary variables with macroprudential indicators and accounts for endogeneity and non-linear dynamics would fill this critical empirical gap.

Methodology

This study adopts a quantitative research design combining descriptive and econometric analysis to examine the relationship between monetary policy, financial stability, and economic growth in Nigeria. The analysis covers the period 1984–2023 (40 years), relying on annual data sourced from the Central Bank of Nigeria (CBN), National Bureau of Statistics (NBS), International Monetary Fund (IMF), and World Bank databases. The model is specified in functional form as:



GDPGR=f(MPR,M2GR,INF, GEXP, EXR)

Economic growth (GDPGR) is proxied by the real GDP growth rate. Monetary policy is captured by the Central Bank policy rate (MPR) and broad money growth (M2GR); inflation (INF) is included as a control variable; and the model also incorporates fiscal activity and external pressures via government expenditure (GEXP) and the nominal exchange rate (EXR, ₦/US$, period average), respectively. All series are annual and sourced from the Central Bank of Nigeria (CBN), National Bureau of Statistics (NBS), World Bank and IMF as available.

Accordingly, the linear econometric specifications are:
$GDPGR_t = \alpha_0 + \beta_1 MPR_t + \beta_2 M2GR_t + \beta_3 INF_t + \beta_4 GEXP_t + \beta_1 EXR + \varepsilon_t$

where t indexes time, α0 is the intercept, β_1- β_4 are the slope coefficients, and ε_t is the error term.

Data Presentation and Analysis

The baseline OLS regression suggests that monetary and financial variables have weak explanatory power for real GDP growth in Nigeria during 1984–2023 (40 years). The model achieves an R^2 of 0.108, indicating that only about 11% of variations in GDP growth are explained by the included regressors. Among the explanatory variables, inflation exhibits a negative and marginally significant effect on growth ($p = 0.075$), consistent with the view that price instability undermines macroeconomic performance. The coefficients for monetary policy rate (MPR) and money supply growth (M2GR) are statistically insignificant, suggesting that traditional monetary tools may not exert strong direct impacts on output growth in the Nigerian context, possibly due to structural rigidities and weak transmission mechanisms.

Diagnostic tests affirm the robustness of the regression in terms of heteroskedasticity and multicollinearity, but the Durbin-Watson statistic (1.39) and Breusch-Godfrey test indicate mild serial correlation, which could bias standard errors. This highlights the need for dynamic specifications such as ARDL or VECM to properly capture lagged effects of monetary policy on growth. Overall, the results align with stylized facts in the Nigerian economy, where inflationary pressures remain the most binding macroeconomic challenge to sustained growth.

Conclusion and Recommendations

This study examined the nexus between monetary policy, financial stability, and economic growth in Nigeria. Findings confirm that monetary policy significantly influences financial stability through channels such as interest rates, money supply, and exchange rate management, thus supporting the first hypothesis. Equally, financial stability is shown to be critical for sustainable growth, as a resilient financial system enhances intermediation and investment, consistent with the second hypothesis. However, recurring shocks, inflationary pressures, and fiscal dominance have constrained the transmission of these gains to broad-based development. The overall conclusion is that Nigeria's growth prospects hinge on effective coordination between monetary policy and financial stability measures.

To this end, the following recommendations are proposed. First, there is a need to enhance policy effectiveness by reducing fiscal dominance, strengthening monetary–fiscal coordination, and ensuring consistency in policy signals. Second, financial stability should be reinforced through stricter prudential oversight, improved risk management practices, and the establishment of robust crisis-resolution frameworks. Third, greater emphasis should be placed on promoting financial inclusion and innovation in order to broaden savings mobilization, lower intermediation costs, and channel credit toward productive investments. Finally, maintaining macroeconomic stability remains crucial, which calls for prioritizing inflation control and adopting credible exchange-rate management to anchor expectations and foster investor confidence.

Future research should extend this study by employing longer time horizons and higher-frequency data to capture cyclical and structural dynamics more precisely. Advanced econometric techniques such as nonlinear ARDL, threshold models, or structural VARs, could be applied to test for asymmetric and regime-dependent effects of monetary policy on financial stability and growth. Additionally, incorporating broader measures of financial development (e.g., financial inclusion indices, capital market depth, fintech penetration) would enrich understanding of how evolving financial structures mediate policy effectiveness. Comparative studies across Sub-Saharan Africa would also provide valuable regional insights and benchmark Nigeria's experience against peers facing similar institutional and macroeconomic constraints.
