Abstract

Abstract
This study was designed to determine the Skills Improvement Needs of Building Craftsmen in Building This study in This study in Industries for National Security in Bauchi State, Nigeria. The research adopted a descriptive Construction The target population for the study was 61 respondents made up of 34 Building survey resources and 27 Foremen in the Building Construction Industries. A 63 item structured questionnaire was Engineers and to ascertain the extent of sameness of the iterative experts and Cronbach alpha reliability estimate used for data was used to ascertain the extent of sameness of the items and reliability coefficient of 0.82 was obtained. Data was used and analysed using statistical package to a scenario of 0.82 was obtained. Data was used to an analysed using statistical package for social science (SPSS Version 22), Mean and standard deviation were used to answer the research question, while t-test was used to test the hypothesis at 0.05 level deviation work. The findings on skills required indicated that all the items are required by the respondents, and of significant on the techniques of improving skills gap indicated that the respondents agreed with all the items. the line respondents agreed with all the respondents agreed with all the lients.

Findings revealed that building craftsmen in building construction industries required all the practical skills need. for improvement in their work trade in brick/block work skills, plastering/rendering skills and foundation skills for national security. The study therefore recommended among others, that Building Construction Industries should organize retraining workshop for their Craftsmen on the areas where they require skill improvements.

Keywords: Skills Improvement Needs, Building Craftsmen, Construction Industries

Introduction

The building construction industries play a key role not only in terms of the national economy of any country but stands as a central function in providing the urban fabric necessary for man's progress towards greater civilization. The level of building achievement and activity in any country is a measure of the country's success that reflects the two relevant factors: a high level of building activity indicating a healthy vigorous national economy; and

highly developed building forms indicating a high level of civilized and cultural achievement in a country, (Obiegbu, 2003).

Construction industry in Nigeria is built on a foundation of skilled craftsmen who are primarily supplied through various sources such as craft training institutions, vocational or technical colleges, on the job training and apprenticeship (Yakubu,

Email: ijire@esut.edu.ng

2003). Ubenyi (1999) and Anigbogu (2002) opined that the labour-intensive nature of construction activities in Nigeria was attributed to the predominance of large number of construction firms that rely solely on skilled and unskilled labour for their operations. Studies by (Obiegbu, 2002; Bokini, 2005 and Njoku, 2007) have indicated the existence of shortages of quality craftsmen in the Nigerian construction industry. Typically, young workers are often recruited through friends or relatives (often foreman) they are low or unskilled, earn low wages, and hence are less effective, (Sugiharto, 2010). These young workers enter the pool of construction workers for it is the only industry that can provide employment for those without any academic qualifications even though continuous employment is not guaranteed, (Sugiharto, 2010). The Federal Republic of Nigeria (FRN, 2013) stated that practical competencies play an important role in preparing building craftsmen in building construction Industries. Vocational Education equips learners appropriate skills, abilities and competencies that contribute to the development of the society. Building construction is a form of Vocational and Technical Education as enshrined in the National Policy on Education, (FRN, 2013) to give training and impart the necessary skills for the production of craftsmen, technicians, technologists and other skilled personnel who shall be enterprising and selfreliant. For building construction industries to be very effective in the performance of their activities, these craftsmen might require skill improvement in their work.

Improvement is the process of making something better than what it was before. Improvement according to Olaitan, Amusa and Azouzu (2010) is the ability or condition for becoming better than before. According to Igweh and Bakare (2012), for a good work to be done, it requires knowledge and

Skill and knowledge demonstrate competence and promote a professional image within construction industries. Shah and Burke (2003) defined skill as an ability to carry out a productive task at a certain level of competence. For the construction industry in Nigeria to be able to service the economy, it has

to parade competent hands in its operations, which includes credible consultants and contractors with qualified and competent operatives inclusive or

A craftsman refers to a person male/female who A craftsman release in the fundamental theory of has been instructed in the fundamental theory of has been instructed in Craftsmen are expected to particular craftsmanship. Craftsmen are expected to particular craits in a changes and the new materials and construction that were brought into the construction changes and the construction methods that were brought into the construction methods that were brought into the construction construction construction methods that were (2009) describe construction industries. Sackey (2009) describe construction industries. industries. Sacrely construction as those trained and skilled operatives craftsmen as those trained and skilled operatives craftsmen as these who work manually with great expertise in various who work manually with great expertise in various who work manually stage of the construction work. However, this study stage of the construction work the practical skills round the stage of the construction work. stage of the construction stage of the concerned itself with the practical skills required techniques for improving the idea and the techniques for improving the identified and the technique practical skills gap of building craftsmen in building practical skills gap of building craftsmen in building practical skills gap construction industries. For good practical skills of construction industries and rendering of construction industring and rendering of walls of craftsmen in plastering and rendering of walls operation, the technique must be complied: ability operation, the technique of the craftsmen to clean the surface thoroughly, of the craftsmen up the working area. According ability to clean up the working area. According ability to clean up a specific and specific Baylor (2013), construction industry involve the skills required in accomplishing given tasks in ability of Mixing Mortars by hand, ability of Moulding of Blocks, ability of Rendering ability Laying of Blocks, ability of Rendering of Walls, ability of Wall Tiling, ability of Pointing Top Walls and Laying of Curved Walls (Arches) Brick/block work operations are based on actual jobs and not pseudo jobs. The training should be carried out to the extent where it gives the trainee a productive ability with which craftsmen can secure and hold employment and be able to profit their skills. For employment, craftsmen lack the skills to adhere to these regulations on foundation, Foundation skills are required at all stages of a person's working life. Throughout the world, the business environment within which construction organizations operate continues to change rapidly. Organizations that fail to adapt and respond to the complexity of the new environment tend to problems survival in building experience construction industries (Lee, Allen, Meyer & Rhee 2001). Building construction industries have the awareness for improving their performance for national security preventing crime on construction sites has become a major concern for building

contractors and losses from theft and destruction in contraction make difference between making a Nigeria can experiencing a loss on a job. The struction in the Nigeria our making a loss on a job. Theft and profit and is has a serious problem profit and is has a serious problem in the destruction industry and losing equipment, construction and tools as a result of theft, costs the materials, costs the contractor thousands of Naira each year average contractor security. because of lack of security.

According to Fischer and Green, 'security implies a According to According to Predictable environment in which stable, individual or group may pursue itsends without an individual or harm and without fear of such disruption or harm and without fear of such disruption or injury' (2004, p. 21). A traditional disturbation of security may be the provision of private genvices in the protection ofpeople, information and assets for individual safety or community wellness Craighead, 2003). In addition, private or commercial security may be considered as the provision of paid servicesin preventing undesirable, unauthorized or detrimental loss to an organization's assets (Post andKingsbury, 2009). According to Asad (2007) national security cannot be narrowed down to exclusively military term. Socio economic and cultural aspects, problems of growth and modernization, and national integration should be deemed important in considering national security. According to Umar (2014), global development now suggests the need for another analogous broadening definition of national security environmental to include resources, demographic issues. National security request involves a lot of issues. It practically touches on all spheres of human existence. It ranges from food security to issues of environmental degradation. It touches on health matters. It encompasses psychological security as well as arms security. It was on this note, thatthere's need for skills improvement needs of building craftsmen in building construction industries for national security in Bauchi State, Nigeria.

Statement of the Problem

The major goals of preparing building craftsmen are to succeed in building construction industries for national security, in the labour market and to equip them with the required skills that can enable them earn a living. Building craftsmen are expected to secure employment, set up their own businesses

and to be able to employ others based on the goals of technical education (FRN, 2013). The techniques for improving the identified practical skills gap of building craftsmen in areas of employment in building construction industries Electrician, Steel fixer, Bricklayers, Plasterer, Painter and Decorator, Carpentry and Joiner. FRN (2013) states the goals of Technical College Building craftsmen as follows: understand the processes, materials, tools and equipment used in building construction, construct or supervise the construction of a simple residential building for national security, prepare for further studies in the construction or allied professions, earn a living through participation in building construction work and inculcate safe working habits in building construction industries. However, in recent years there are complains about the ineffectiveness of some craftsmen in building construction industries. Joshua (2012) stated that there is a growing concern among industrialists that craftsmen from technical institutions do not possess adequate work skills necessary for employment in building construction industries for national security. Hence the problems of the study is what are the skills improvement needs of building craftsmen in building construction industries for national security in Bauchi State, Nigeria.

Research Questions

The following research questions were raise for this study:

- 1. What are the practical skills required by building craftsmen in building construction industries for National Security in Bauchi State, Nigeria?
- What are the techniques for improving the identified practical skills gap of building craftsmen in the building construction industries for National Security in Bauchi State, Nigeria?

Hypotheses

The following hypotheses were formulated for the study and were tested at .05 level of significance. Ho1: There is no significant difference in the mean responses of building engineers and building foremen on the practical skills required by building craftsmen in building construction industries for national security in Bauchi State, Nigeria.

H₀₂: There is no significant difference in the mean responses of building engineers and building foreman on the techniques for improving the building craftsmen practical skills gap identified for effective functioning in the building construction industries for national security in Bauchi State, Nigeria.

Methodology

The study used the descriptive survey research design. The area of this study was Bauchi State, Nigeria. The target population for this study was sixty one subjects which comprised thirty four building engineers and twenty seven foremen. Purposive sampling was used to select nine construction industries out of sixty one construction industries Bauchi State. This is because the building engineers / foremen in these building construction industries have a good number of craftsmen who are their staff and are in a good position to provide accurate and reliable judgment in terms of what are the practical skills are required of building craftsmen and finding out the techniques for improving the identified practical skill gap of building craftsmen to improved result in the building construction industries. A self-structured questionnaire developed by the researcher with

4-point respires of four-point scale was used and was validated by three experts from Federal University of Technology Minna. Cronbach Alpha Reliability Coefficient method was used to obtained using Cronbach alpha reliability estimate. A sixty three items questionnaire was used for data was used for data analysis (SPSS Version 22.00). Mean and Standard deviation were used to answer to test the null Hypotheses at .05 level of significance.

RESULTS

Research Question 1

What are the Practical Skills Required by building craftsmen in building construction industries for national security in Bauchi State, Nigeria?

The result shows that the entire 13 item were rated with a mean score "Between" 2.55-3.51 The standard deviation for the 13 items were in the range of 0.51-1.00; indicating that the responses of the respondents are clustered around the mean. This clustering of the responses gives credence to the reliability of the mean. The ground mean 2.97 while standard deviation 0.82 also showed that the entire 13 of the listed skills are agreed by the respondents; In essence, both the foremen and Building Engineers agreed that the 13 above

practical skills gap identified for effective functioning in the building construction industries in Bauchi State, Nigeria.

HYPOTHESES

Ho₁: There is no significant difference in the mean responses of building engineers and building foreman on the practical skills supposed to have been required by building craftsmen in building construction industries in Bauchi state, Nigeria.

Table 3: t-test Analysis of the Mean Responses of Building Engineers and Building Foreman on the Fractical Skills Required in Block/Brickwork Skills, Plastering/Rendering Skills and Foundation Skills

Levene's Test for Equality of Variances

t-test for Equality of Means

Equal variances assumed 2.3 Equal variances not assumed	Sig. 373 .129			.002	Mean Difference		95% Confident Interval of the Difference Lower Upper .17740 .75401	ie
Table 3 shows the re	esult of th	-,236	57.375	.002	.46571	.14296	.17947 .75195	

Table 3 shows the result of the analysis that the significant criterion (sig.) of the Levene's test for equality of variance was .129, which is less than

0.05. Thus, equal variance not assumed t value of 3.232 was compared with 0.05 level of significance. Since 3.232 is greater than 0.05, the hypothesis

was therefore not rejected. Thus there is no significant difference in the mean responses on the significant skills required by building craftsmen in practical skills required by building craftsmen in construction industries Bauchi State, Nigeria.

Ho2: There is no significant difference in the mean responses of building engineers and building

foreman on the techniques for improving the building craftsmen practical skills gap identified for effective functioning in the building construction industries in Bauchi State, Nigeria.

Table 4: T-test Analysis of the mean responses of building engineers and building foreman on the techniques for improving the building craftsmen practical skills gap identified for effective functioning in building construction industries for National Security in Bauchi State, Nigeria.

	for Ec	ne's Test quality o riances			t-tes	st for Equalit	y of Means		-
	F	Sig.	t	df	Sig. (2-tailed)	Mean	Std. Error Difference	95% Co Interval Diffe	onfidence al of the erence Upper
Equal variances assumed	s .771	.384	1.760	59	.084	.33092	.18800	04526	.70709
Equal variances	S	1-17-18	1.791	58.582	.078	.33092	.18476	03884	.70067

Table 4 shows the result of the analysis that the significant criterion (sig.) of the Levene's test for equality of variance was .384, which is less than 0.05. Thus, equal variance not assumed t value of 1.76 was compared with 0.05 level of significance. Since 1.76 is greater than 0.05, the hypothesis was therefore not rejected. Hence, there is no significant difference in the mean responses on the techniques for improving the building craftsmen practical skills gap identified for effective functioning in the building construction industries in Bauchi State.

Discussion of Findings

Findings on research question 1 revealed that building craftsmen in building construction industries required all the practical skills need for improvement in their work trade in brick/block work skills, plastering/rendering skills and foundation skills for national security. The above results agreed with the findings of Igweh and Bakare (2012) who conducted a study on work skills improvement needs of graduates of technical colleges in electrical installation and maintenance

for employment in the 21st century Nigeria. The authors found that graduates need improvement in work skills in domestic, industries installation battery charging and repairs. The findings are in line with those of Onifade (2005) who conducted a study on industry based skill competencies required of graduates of tertiary technical institutions for employment in electronic industries in Lagos State where he found out that graduates require various industrial based skills for work in manufacturing industries. The findings emanating from table 2 revealed the mean responses of building engineers and foreman on the techniques for improving the building craftsmen practical skills gap identified for effective functioning in the building construction industries in Bauchi state. As revealed that all items raised for techniques for improving the building craftsmen practical skills gap identified for effective functioning in the building construction industries in Bauchi state, Nigeria were positively rated. The findings of this study is in line with those of Machanga (2008) who carried out a study on the strategies for improving practical skills acquisition in

Science and Technical Colleges of Kebbi and Sokoto States. The author found out that students of Science and Technology College identify strategies for improving practical skills acquisition to determine the adequacy of training facility, tools and equipment in building construction for effective instructional methods and techniques used in training of students.

Conclusion

Conclusively therefore, craftsmen required skills improvement for building operations, domestic and industrial used. This offers a good job opportunity for building craftsmen in building construction industries; however quite unfortunately most of them do not possessed the necessary skills to be either paid or self-employed. In conclusion, the study revealed the practical skills required in building construction industries and techniques to be adopted for improving practical skills gap identified for effective functioning in the building construction industries in Bauchi State.

Recommendation

Based on the foregoing, the following recommendation were proffered.

- 1. Building Construction Industries should organize retraining workshops for their craftsmen on the areas where skills improvement are required
- 2. National Board for Technical Education should consider inclusion of the identified skills in the curriculum used in schools presently.
