Radiation-induced grafting of 1-vinylimidazole (1-VIm) onto electron beam preirradiated poly (ethylene-*alt*-tetrafluoroethylene) (ETFE) films was investigated. Effects of mineral acids (H_2SO_4 and HNO_3) addition on the degree of grafting [DG(%)] were carefully studied. In comparison with grafting of 1-VIm onto ETFE with deionized water as a solvent in the absence of mineral acids; it was observed that addition of H_2SO_4 enhanced DG(%) tremendously. It was also found that addition of 0.2M H_2SO_4 allows high DG(%) values of up to ca. 88%. To provide evidences of grafting, Fourier-transformed infrared spectroscopy (FTIR) analysis was performed on the grafted ETFE films in comparison with the original ETFE films.
